The street manholes will be circular in shape with concentric cone depending on the depth and diameter of sewers. Based on the sewer diameters CPHEEO Manual for Sewerage and sewage treatment recommends the internal diameter of the manhole should not be less than internal diameter of largest sewer plus 150mm of benching on both sides. However, from practical considerations the benching width for sewer diameter greater than 450mm is kept as 300mm on both sides. The internal diameters of manholes for varying depths as recommended by CPHEEO Manual for Sewerage and sewage treatment will be as follows.

<table>
<thead>
<tr>
<th>Description</th>
<th>Dimension</th>
</tr>
</thead>
</table>

235
For depths above 0.90m and up to 1.65m  
900mm diameter  

For depths above 1.65m and up to 2.30m  
1200mm diameter  

For depths above 2.30m and up to 9.00m  
1500mm diameter  

For depths above 9.00m and up to 14.0m  
1800mm diameter  

It is desirable to place the first pipe joint (S/S) outside the manhole as close as practicable. This pipe shall be built inside the wall of the manhole flush with the internal periphery protected with an arch of masonry or cement concrete to prevent it from being crushed.

The inside and outside of brickwork should be plastered with cement mortar (1:3) inside finished smooth with a coat of neat cement.

Due to availability of plenty of bricks locally and less cost, Brick Masonry manholes are proposed wherein house connections / lateral sewers can be done conveniently. However, RCC manholes are also considered for sub-soil water conditions. RCC manholes are considered as square for ease in construction as the cost difference between circular and square type of RCC manholes are marginal. Precast concrete manholes are also considered for congested and narrow lanes for speedy construction for manhole depth upto 1.65m for pipes upto 400mm dia.

The type and size of manholes (depth-wise) is given below.

### 2.10.2. Drop arrangement

Drop arrangement is proposed for the laterals joining the manholes of main sewer wherein level between maximum water line (peak flow level) of main line and invert level of lateral/branch sewer is greater than 600mm.

### 3. Interception and Diversion of Nala

Interception and diversion of Nala shall be carried out as per the CPHEEO manual/ applicable standards. The design shall include Nala/drain Catchment area estimation, Design flood discharge, DWF, water way at weir, discharge per unit width, Head over weir, depth of cut-off and creep length required. Mechanical & manual screens shall be provided at each I&Ds. Periodic removal of trash and cleaning of screens need to be undertaken by the concessionaire during O&M period. Actuator gates and flow measuring instrument need to be provided at I&Ds.

Necessary power arrangement including standby need to be provided at the I&Ds.

DWF shall be considered as per actual flow measurement to be carried out by the concessionaire for a minimum period 14 days at all Nalas/Drains. Peak flow shall be considered for the designing of the I&Ds.

### 4. Sewage pumping station (SPS)

i. Sewage Pumping Stations are provided to lift sewage so as to discharge into another gravity sewer or inlet chamber of treatment plant. Hydraulic criteria adopted in the design of Sewage Pumping Station will be follows:

\[ V = 0.25 \times \frac{Q}{N} \] (Considering design year flows)

Where Q – pumping rate in cum/hr of largest pump installed for parallel arrangement.

### PRECAST CONCRETE MANHOLES

<table>
<thead>
<tr>
<th>Type of manhole</th>
<th>Depth of manhole</th>
<th>Diameter of pipe</th>
<th>Size of manhole</th>
<th>Size of opening</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type-E</td>
<td>For depth 1.2 m and upto 1.65m</td>
<td>Upto 400 mm</td>
<td>1000 mm dia</td>
<td>560mm dia</td>
</tr>
</tbody>
</table>
N- No. of starts & stops per hour considering manual start/stop also.

d) Velocity through the screen is 0.9 m/sec at peak flow.

e) Hazen William’s Coefficient will be considered as 120 for DI pipe.

f) Minimum residual head is considered as 2 m for pump head design.

g) The Pumps, Electro-Mechanical Units and other related accessories are designed considering present and ultimate design peak flows.

ii. The selection of pumps, pumping main size, Electro-Mechanical Units design shall be based on the following criteria besides head & discharge requirements.

a) Submersible non clog pumps will be considered for medium/small PS (<= 50 MLD), whereas horizontal type non-clog centrifugal pumps with positive suction pumps as appropriate are proposed for large pumping station (>= 50 MLD).

b) The pumps shall have single speed with low rpm (less than 1000 rpm) & as far as possible, of equal capacities.

c) The pump configurations will be selected as per NRCD/MoEF Guidelines as given in following table.

<table>
<thead>
<tr>
<th>Length of Rising Main</th>
<th>Pumps</th>
<th>No. of Pumps</th>
</tr>
</thead>
<tbody>
<tr>
<td>Where rising main is long and where head losses are the dominant factor</td>
<td>Peak Flow/2 pumps</td>
<td>3 nos. (including 1 standby)</td>
</tr>
<tr>
<td></td>
<td>Non Peak Flow pumps</td>
<td>2 nos. (including 1 standby)</td>
</tr>
<tr>
<td>Where rising main is short and static head is dominant</td>
<td>Peak Flow/4 pumps</td>
<td>6 nos. (including 2 standby)</td>
</tr>
</tbody>
</table>

d) In case the rising mains are long, head losses are dominant factor, in case the rising mains length is short, static head is dominant factor.

e) Depending on present & future flows (minimum, average and peak) suitable capacity of pumps will be selected.

f) For small sewage pumping stations upto 15.00MLD, equal duty pumps of half peak flow with the provision of 100% standby peak flow shall be considered.
g) For medium & large pumping stations above 15.00MLD capacity, equal duty pumps of 1/4th of peak flow with 50% standby and 50% spare shall be provided. 10% additional capacity for pumps shall be considered. Parallel operation of more than four number of pumps shall be avoided. A/C deficiency (losses) due to parallel operation of pump shall be minimized.

h) For pumping station, provision should be made for automatic start & stop, the system would be capable of being operated manually.

i) A maximum of two starts & two stops per hour should be considered for manual operations of the pump. A higher no. of starts & stops shall be considered for the automatic operation.

j) Pump shall have semi open impeller having not more than two vanes.

k) MOC of pumps shall be as per mentioned below,

<table>
<thead>
<tr>
<th>Casing</th>
<th>Cast Iron as IS 210 Grade F260 with Ni 2%</th>
</tr>
</thead>
<tbody>
<tr>
<td>Impeller</td>
<td>Stainless Steel (CF 8M)</td>
</tr>
<tr>
<td>Shaft</td>
<td>AISI 410</td>
</tr>
</tbody>
</table>

l) HT motors for more than 250 kW rating shall be considered. The incoming power supply for these pumps shall be preferable at 33 kV

m) Motor H.P rating shall be considered with additional margin over BKW at duty point as per section 11.1.9 latest CPHEEO Manual.

n) Mechanically operated Stainless steel screens for SPS would be provided ahead of the wet well to prevent large size solids entering the pump. Selection of rack shall vary on depth. Drum type screens shall be avoided. Rectangular screen to be installed on approx. 60° to 70° angles. Bar screens are to be avoided. Motors provided for screens, clarifiers, Detroiters shall have sufficient margin for overloading due to foreign materials such as jutes, plastics, nylon ropes etc.

o) All the sluice gates in the SPS area will be made from Cast Iron –Flush bottom Rising Spindle type.

p) Natural or forced ventilation system would be provided for deep pumping station, with dry-wet well configuration.

q) Level indicators would be provided for SPS.
r) Overhead travelling cranes of capacity as required shall be electrically operated. Also adequate loading platform shall be provided for material handling.

s) The material for rising main is considered as Ductile Iron as per IS: 8239:2000.

t) Electrically operated overhead travelling cranes of adequate capacity shall be provided. Also, adequate loading platform shall be provided for material handling.

5. Process requirements of STP(s)/FSTP(s)

The following main treatment processes and requirements must be provided:
✓ Preliminary treatment (screenings & grit removal)
✓ Secondary biological treatment
✓ Sludge digestion
✓ Sludge thickening, dewatering & storage
✓ [Any other facilities as required for co-treatment of septage]160
✓ Transportation of Screenings, Residual Grit and Digested Sludge from the Facilities and Associated Infrastructure to the Waste Disposal Site.
✓ Disinfection system

6. Description of process and facilities

This section outlines the major processes and Facilities that the Concessionaire is required to design, construct, and operate as per this Concession Agreement.

6.1. Stilling chamber

A stilling chamber shall be provided at the inlet of STP(s)/FSTP(s) to receive the raw sewage/faecal sludge/septage from the pumping station. The stilling chamber shall reduce the turbulence of raw water entering into it. The stilling chamber should be kept clean by removing silt, sand deposited and the algae growth at the bottom and sides.

6.2. Fine screens

The raw sewage/faecal sludge/septage from rising main shall flow to fine screen inlet channel by gravity. The mechanical fine screen shall be either bar/perforated screen. The screens shall have clear openings not exceeding 6 mm. The screens shall be equipped with an automatic cleaning system and can be controlled by both an adjustable timed cycle and a pre-set differential head across the screen using ultrasonic level sensors. All screens shall be provided with thimble

160 If Co-treatment of faecal sludge is proposed.
mounted isolation sluice gates (actuator operated with manual override) both on upstream and downstream. The Concessionaire should provide bypass channel with manual screen considering the overall screening capacity shall be 100% peak flow with one screen out of service.

6.3. **Grit basins with Grit washers and classifiers**

The Concessionaire shall provide Grit separators downstream of the screens. The Grit separators shall be capable of removing at least 95% of particles with a specific gravity of 2.65 g/cm³ and with a diameter of at least 0.2 mm. A Parshall Flume shall be provided downstream of Grit separators. The flow measurement shall be instantaneous and capable to transmit the data automatically to SCADA.

6.4. **Primary clarifiers**

If proposed, the primary clarifiers with scum removal shall be designed as per CPHEEO manual.

6.5. **Aeration systems**

The aeration system shall be designed to maximise oxygen transfer and to adapt to the changing oxygen demands in biological treatment systems. The aeration system shall be capable of complete and uniform mixing and suspension of mixed liquor suspended solids.

6.6. **Disinfection**

Disinfection shall be provided to comply with KPIs as required by the Concession Agreement, through chlorination systems or UV disinfection or ozonation. The Concessionaire shall ensure that disinfectants used shall not exceed the limits as per the provisions of the Environment (Protection) Rules, 1986. Such excess disinfectant levels, if any, need to be neutralized before disposal to inland surface water or land for irrigation.

6.7. **Sludge Thickeners**

The sludge thickeners may be either gravity thickeners or mechanical thickeners. All associated ancillaries such as all pumps and polymer dosing equipment shall be arranged. Required standby arrangement shall be provided.

6.8. **Sludge digestion**

The design of the sludge digestion system shall ensure that maintenance of all equipment and components can be safely and easily accomplished from outside the digester and without draining its contents.

If anaerobic digestion is proposed, the Concessionaire shall provide gas holders and gas burners. If provided, the sludge heating system may be complete with heat exchangers, sludge recirculation pumps, hot water pumps. The heat requirement of digesters during winter season will
be met through the heat available from biogas engine and additional requirement to be fulfilled through boiler, if required.

The Concessionaire shall ensure safety and security of operation as the result of the presence of biogas in both normal and abnormal operation.

6.9. **Dewatering system**

Digested Sludge shall be dewatered to produce a cake concentration of at least 20% dry solids and the solids recovery shall not be less than 95%. The dewatering facility and associated ancillaries such as all pumps and polymer dosing equipment shall be arranged in at least two parallel streams (1 working + 1 standby), each sized to handle the average daily sludge quantities over not more than 16 hours per day. The dewatered sludge shall be disposed of.

The concessionaire shall ensure at least 38% of reduction of Volatile solids for Vector Attraction Reduction during sludge treatment. The Concessionaire shall also ensure less than 20,00,000 most probable number per gram of total dry solids (20,00,000 MPN/gTS) in sludge before disposal.

6.10. **Facilities drain sump and pump station**

A drain pump station shall be provided to collect recyclables such as filtrates from thickener/dewatering units and other miscellaneous waste flows such as sewage/faecal sludge/septage generated from Facilities, cleaning and wash-down flows and pump them back up to the inlet chamber of the Facilities.

6.11. **Treated Effluent disposal pipe line**

A Treated Effluent disposal pipe line shall be provided to discharge the effluent to the Discharge Point either by gravity or by pumping as per site condition.

6.12. **Co-Treatment of septage in the Proposed STP(s)/FSTP(s)**

Process involved in co-treatment of septage in the STP(s)/FSTP(s) shall be as per CPHEEO Manual. The facilities shall be designed with adequate capacity to accept the septage without hampering the functioning of the STP(s)/FSTP(s). Increase in hydraulic and influent characteristic due addition of septage in liquid/solid stream of STP(s)/FSTP(s) should be considered in designing of facilities.

7. **Facilities within STP(s)/FSTP(s)**

7.1. **Energy generation**

The Concessionaire shall generate heat and electrical energy from the biogas produced by the sludge digestion process. The Concessionaire shall design the energy generation system to be
capable of using the maximum biogas produced by the sludge digestion process at design loadings to produce energy. The Concessionaire shall utilize electrical power generated by the energy recovery system where possible within the Facilities.

The design and specification of the units shall take into account the contaminants that will be present in the biogas from the digesters, such as hydrogen sulphide (H₂S) and ammonia (NH₃), and any harmful effects resulting from their combustion. The Concessionaire shall provide a H₂S gas scrubbing system, to protect the engine and maintain its design life.

7.2. **Gas holders**

The gas holders shall as per CPHEEO manual. A flame arrestor and flow meter shall be provided on the gas line from each digester.

7.3. **Biogas burner**

The bio gas burner (if provided) shall be designed as per CPHEEO manual and should be provided in 2 numbers (1 working /1 standby) for complete destruction of all contaminants in the gas. All gas pipework and weld on flanges shall be stainless steel 316L.

8. **Flood protection:**

The finished ground level (FGL) of the Facilities to be at or above the High flood level. Building plinth, top of wet wells, I&Ds, and other structures shall be at 0.45 m above HFL.
PART - B
TECHNICAL SPECIFICATIONS
**Section G1: General requirements**

1. **Executing Agency’s drawings**

The drawings listed in the Tender Document are the Executing Agency’s drawings and are provided by the Executing Agency as illustrative of the Specification.

All data and information furnished in the drawings by the Executing Agency is given in good faith but the Executing Agency does not accept the responsibility for the completeness and accuracy thereof. The same shall be verified by the Concessionaire promptly pointing out errors or discrepancies thereof to the Executing Agency.

2. **Drawing sheet format**

All drawings provided by the Concessionaire shall be on standard size sheets, in the form of black or blue lines on a white background and shall show the following particulars in a title block located in the lower right hand corner, in addition to the name of Concessionaire and equipment manufacturer, date, scale, drawing number, revision number (RO for drawings submitted initially, R1, R2, etc. for drawings submitted subsequently)

A blank space of 90 mm x 100 mm shall be provided for the Executing Agency’s approval stamp and provision shall be made for details of revisions to be recorded.

All drawings submitted by the Concessionaire shall use the English language and preferably SI units. All drawings shall be clearly and fully cross referenced to the other drawings as relevant.

3. **Operation and maintenance manuals**

The operation and maintenance manuals shall be arranged to provide separate volumes for each principal section of the Works and they shall relate to a “As-built” conditions and shall include all necessary drawings and diagrams for a proper understanding of the works.

The operation and maintenance manual shall be approved in draft form initially prior to commencement of erection by the Executing Agency and shall cover all items of the Works. For this purpose, three draft copies shall be submitted to the Executing Agency. A mere collection of manufacturers’ descriptive leaflets will not be acceptable in satisfaction of this Clause. The operation & maintenance manual shall comprise both operating instructions and maintenance instructions.

The manuals shall include, but not be limited to the following information:

(a) Descriptive overview of the whole of the works.

(b) Descriptions of all systems installed, including mechanical, electrical, instrumentation, control systems with relevant design and operating parameters.
(c) Descriptions of all equipment supplied including manufacturer’s leaflets, which shall be scheduled for easy reference.

(d) Schedules and manufacturer’s catalogues for all equipment supplied, giving duties, electrical load, etc.

(e) Schedules of all equipment suppliers (and their local agents) including names, addresses, telephone, fax and e-mail numbers.

(f) Start-up, operation and shutdown instruction for all parts of the Works. These shall include step-by-step directions on setting the Plant to work listing all adjustments and settings necessary for the current functioning of the Plant.

(g) Instructions on monitoring of Plant performance and sample log sheets for each Plant item, to be filled by operators on a routine basis.

(h) “Dos” and “Don’ts” in Plant operation. Operator’s attention shall be drawn to all operations considered dangerous to operators or likely to cause damage to the Plant.

(i) Procedures to deal with breakdown and emergencies.

(j) Safety requirements.

(k) Checking, testing and replacement procedures to be carried out on all Plant items on a daily, weekly and monthly basis or at longer intervals to ensure trouble free operation. Full maintenance instructions for all equipment including planned maintenance schedules or charts giving daily, weekly, monthly, quarterly, half yearly annually and overall instructions, together with recommended lubricants and spares. These shall also include details of routine maintenance work that will be within the competence of the normal maintenance staff and notification of maintenance work that will have to be done by the manufacturer, his agent or other specialist operator.

(l) Fault locations and remedy charts to facilitate tracing the cause of malfunctions or breakdown and correcting faults.

(m) Complete list of recommended lubricants and lubrications charts.

(n) A “Spares Schedule”, which shall consist of a complete list of item wise spares for all Plant items with ordering references and part numbers.

(o) A complete list of manufacturer’s instructions for operation and maintenance of all bought out equipment. The list shall be tabulated in alphabetical order, giving the name of supplier / manufacturer, identification of the Plant item, giving the model number and the literature provided including instruction leaflets and drawing numbers.

(p) Step by step procedure for the dismantling, repair and re-assembly of all items of
equipment.

(q) Part-list and drawings or exploded diagrams for each item of Plant with construction particulars, materials of construction, mating components, clearances and tolerances, maximum wear permitted before replacements are to be done, etc.

(r) Record drawings of all systems installed, including general arrangements, conduit and wiring trunking systems, wiring diagrams, control schematics and valve charts etc., to a reduced scale.

(s) Certified suppliers’ drawings of all equipment supplied, which shall be scheduled for easy reference.

(t) Site test reports for all mechanical, electrical and instrumentation systems. Site test process reports for proving tests, commissioning reports, and supplier’s test certificates.

(u) Copies of performance curves.

Each volume shall be durable and permanently bound within a stiff binder of a design to be approved by the Executing Agency.

4. Protection and Packing for Transportation

Before any Plant is dispatched from manufacturer’s works, it shall be properly prepared and packed and the Concessionaire shall give the Executing Agency at least fourteen (14) days’ notice that these preparations are to commence.

Prior to dispatch, the Plant shall be adequately protected by painting or by other approved means for the whole period of transit, storage and erection, against corrosion and incidental damage, including the effects of vermin, sunlight, rain, high temperatures and humid atmosphere. The Concessionaire shall be responsible for the Plant being so packed and / or protected as to ensure that it reached the Site intact and undamaged. The Plant shall be packed to withstand rough handling in transit and all packages shall be suitable for storage including possible delays in transit.

The Concessionaire shall be deemed to have included in the schedule of prices for all materials and packing cases necessary for the safe package, conveyance and delivery and storage of the Plant with all protective and preservation measures.

Cases containing rubber rings, bolts and other small items shall not normally weigh more than 50 kg, gross per case. No one package or bundle shall contain items of Plant intended for incorporation in more than one section of the Works. All items of Plant shall be clearly marked for identification against the packing list.

Eyebolts, lifting hooks and brackets shall be provided for lifting the boxes, crates and packages. Every crate or package shall contain a packing list in a waterproof envelope. A duplicate copy of
the packing list shall be sent by post to the Executing Agency at site. Consignments imported by ocean freight shall be packed and preserved as stipulated above.

All crates, packages, etc. shall be clearly marked with a waterproof material to show the weight and where the slings should be attached, and shall also have an indelible identification mark relating them to the packing lists. Packing cases shall be non-returnable. Concessionaire shall have to clear the site including packing material.

Electrical equipment shall be enclosed in sealed airtight package with hygroscopic material, before being placed in packing cases on shock absorbent materials and secured by means of battens.

5. **Delivery, Unloading and Storing at Site**

The Concessionaire shall be responsible for checking all materials delivered to site and shall keep the Executing Agency’s Representative fully informed of the state of deliveries. The Concessionaire shall carry out, at his cost, all instructions of Executing Agency for proper unloading, preservation, maintenance, storage and security of materials delivered to site until he fulfills all his obligations under the Contract.

The Concessionaire shall erect and maintain on the site any temporary storage facility as required and approved by the Executing Agency. If built up shed or area is provided by the Executing Agency depending upon availability, the Concessionaire shall have to pay rent as finalised by the Executing Agency.

Multiple handling and movement of materials during storage and retrieval shall be avoided.

6. **Spare Parts**

Spares during pre-commissioning trials, commissioning tests / maintenance, guarantee etc. shall be provided by the Concessionaire. The spares also include the consumables such as bulbs, fuses, wires, lubricating oil, gaskets, packing seals etc. The necessary spares shall be brought by the Concessionaire prior to the pre-commissioning test so as to avoid the downtime of equipment due to non-availability of them. All the spares have to be provided as required, by Concessionaire free of cost.

All spare parts shall be new, unused and strictly interchangeable with the parts for which they are intended to be replacements and shall be treated and packed for long storage under the climatic conditions prevailing at the site. Each spare part shall be clearly marked or labelled on the outside of its packing with its description, number and purpose. When more than one spare is packed in a single case or other container, a general description of its contents shall be shown on the outside of such case or container and a detailed list enclosed. All cases, containers and other packages shall be marked and numbered in an approved manner for the purpose of identification. Spares shall be delivered to site after the completion of erection but before start of commissioning of Plant along with technical leaflets and details. Spare parts shall be indicated in the assembly drawing showing clearly the part numbers.
All cases, containers or other packages are liable to be opened for such examination as the Executing Agency may require and packing shall be designed to facilitate opening and thereafter repacking. In the event of the some specific spares offered in the Contract being withdrawn from manufacture owing to changes in design of equipment or similar reasons viz., model being obsolete etc., the Concessionaire shall inform the Executing Agency before such withdrawal, so that the Executing Agency can take timely alternative steps.

7. **Tools**

Tools shall be delivered to site just prior to Tests on Completion.

The specified tools shall not be used for the erection of the Plant being supplied and except that the Executing Agency may call upon the Concessionaire to demonstrate their use or effectiveness, they must be handed over to the Employer in a completely new and unused condition. Should the Concessionaire require any such tools at site for erection, he shall provide his own.

The test equipment shall include special purpose items essential to the testing or recalibration of related items of Facilities.

8. **Works to be kept clear of water**

The Concessionaire shall keep the Works well drained until the Executing Agency certifies that the whole of the Works is substantially complete and shall ensure that so far as is practicable, work is carried out in the dry condition. Excavated areas shall be kept well drained and free from standing water.

Notwithstanding any approval by the Executing Agency of the Concessionaire’s arrangements for the exclusion of water, the Concessionaire shall be responsible for the sufficiency thereof and for keeping the Works safe at all times, particularly during any floods and for making good at his own expense any damage to the Works, including any that may be attributable to floods. Any loss of production or additional costs of any kind that may result from floods shall be at the Concessionaire’s own risk.

9. **Assistance for the Engineer’s Staff**

The Concessionaire shall provide all necessary assistance to the Executing Agency and his staff in carrying out their duties of checking the setting out, inspecting and measuring the Works. The Concessionaire shall provide staff men, office attendants and labourers, as may be needed, from time to time by the Executing Agency.

The Concessionaire shall provide for the Executing Agency and his staff such protective clothing, safety helmets and rubber boots of suitable sizes, hand lamps and the like, as may reasonably be required by them. These articles shall remain the property of the Concessionaire. No separate payment shall be made on this account.
Section G2
Materials and workmanship
Section G2: Materials and Workmanship

1. Introduction

This part of the Specification sets out the general standards of materials to be supplied and the workmanship required to be ensured by the Concessionaire. All components parts of the Works shall, unless otherwise specified, comply with the provisions of this part or be subject to the approval of the Executing Agency. Particular attention shall be paid to a neat orderly well-arranged installation carried out in a methodical competent manner.

2. Reference Specifications and Standards

The Concessionaire may propose at no extra cost to the Executing Agency, the use of any relevant authoritative internationally recognised Reference Standard, including Indian Standard (IS).

All details, materials and equipment supplied and workmanship performed shall comply with these Standards. If Concessionaire offers equipment to other Standards, the equipment/material should be equal or superior to those specified and full details of the difference shall be supplied.

In the event of conflict between any of these Specifications and the Codes referred, such specifications shall be defined, prepared by the Concessionaire and submitted to the Project Engineer for approval. The decision of Project Engineer in such case shall be final and binding on the Concessionaire. Certain specifications issued by national or other widely recognised bodies are referred to in this Specification. Such specifications shall be defined and referred to hereinafter as Standard Specification. In referring to the Standard Specifications the following abbreviations are used:

<table>
<thead>
<tr>
<th>Abbreviation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS</td>
<td>Indian Standard</td>
</tr>
<tr>
<td>ANSI</td>
<td>American National Standards Institute</td>

<td>American Society of Testing and Materials</td>
</tr>
<tr>
<td>AWS</td>
<td>American Welding Society</td>
</tr>
<tr>
<td>AWWA</td>
<td>American Water Works Association</td>
</tr>
</tbody>
</table>
3. **Materials - General**

All materials incorporated in the Works shall be the most suitable for the duty concerned and shall be new and of reputed make/approved quality, free from imperfections and selected for long life and minimum maintenance. Non-destructive tests, if called for in the Specification, shall be carried out. All submerged moving parts of the Plant, or shafts and spindles, etc. of the submerged moving parts or the faces etc. in contact with them shall be of corrosion resistant materials. All parts in direct contact with various chemicals, shall be completely resistant to corrosion, or abrasion by these chemicals, and shall maintain their properties without ageing due to the passage of time, exposure to light or any other cause.

4. **Workmanship - General**

Workmanship and general finish shall be of first class quality and in accordance with best workshop practice.

All similar items of the Plant and their component parts shall be interchangeable. Spare parts shall be manufactured from the same materials as the originals and shall fit all similar items. Machining fits on renewable parts shall be accurate and to specified tolerances so that replacements can be readily installed. All equipment shall operate without excessive vibration and with minimum noise. All revolving parts shall be truly balanced both statically and dynamically so that when running at normal speeds at any load upto the maximum there shall be no vibration due to lack of balance.

All parts, which can be worn or damaged by dust, shall be totally enclosed in dust proof housings. All materials incorporated in the Works shall be the most suitable for the duty concerned, free from imperfections and selected for long life and minimum maintenance. All necessary accessories required for satisfactory and safe operation of the Plant shall be supplied by the Concessionaire unless it is specifically excluded from his scope. Suitable provision by means of eyebolts or other means are to be provided to facilitate handling of all items that are too heavy or bulky for lifting and carrying by two men.

If, after installation, the operation or use of the materials or equipment furnished by the Concessionaire proves to be unsatisfactory, the Executing Agency shall have the right to operate or use such materials or equipment until correction of defects, errors or omissions, by repair or by partial or complete replacement, can be made without interfering with the Plant operations.
5. **Welding**

Welding shall comply with the latest revision of the BS 5135 Code.

Welders shall be qualified in accordance with the requirement of the appropriate section of BS 4871. The Executing Agency shall have the right to call for further qualifications from time to time from any welder who in the opinion of the Engineer does not produce weld in accordance with the qualifications. Each welder shall be assigned a number and letter. Each weldments shall clearly be identified as to its welder marking the welder's Code adjacent to the welds. A record chart shall be maintained for each welder showing the procedures for which he has qualified, the date of such qualification, the type of defects produced and their frequency. The Executing Agency shall disqualify the welder whose Work requires disproportionate repairs.

Inspection and quality of surveillance shall not be limited to the examination of finished welds. The techniques employed shall be based on methods which are known to produce good results and which have been verified at Site by actual demonstration.

Haphazard striking of the electrodes for establishing an arc shall not be permitted. The arc shall be struck either on the joint or on a starting tag. The starting tag shall be of the same material or a material compatible with the base metal base being welded. In case of any inadvertent strike on place other than the welding, the area affected shall be ground flushed and examined by liquid penetration method.

Generally, a stringer bead technique shall be used with a slight oscillation if necessary to avoid slag and to minimise the number of beads needed to fill exceed 3 times the wire diameter. Vertical welds shall be made in upward direction. For all pipes above 300 mm dia, welding shall be done wherever possible, by two (2) welders working simultaneously along both sides of the pipe.

The root pass shall have less than 1.5 mm internal reinforcement.

Final welds shall be suitable for appropriate fabrication of the non-destructive examination of the weld. If grinding is necessary, the weld shall be blended into the parent metal without gouging or thinning of the parent metal in any way. Uneven and excessive grinding may be a cause for rejection. Fillet weld shall preferably be convex and free from undercutting and overlap at the toe of weld. Convexity and concavity shall not exceed 1.5 mm. The leg lengths shall not exceed the specified size by more than 1.5 mm.

All attachments such as lugs, brackets and other non-pressure parts shall also be done by qualified welders in accordance with the design details and materials specifications. Temporary attachments shall be removed in a manner that will not damage the parent metal. Area of temporary attachments shall be dressed smooth and examined by ultrasonic or liquid penetration methods.

All tack welds shall be made using qualified procedure and welders, the number of size of tack
welds shall be kept as small as to consist of adequate strength and joint alignments. All tack welds shall be examined visually for defects and if found defective shall be completely removed. As welding proceeds, tack welds shall be either removed completely or shall be properly prepared by grinding or filling their starting ends so that they may be satisfactorily incorporated in the welds. Unacceptable defects shall be removed by grinding machine or chipping or gouging. Flame gouging may be permitted provided gouged surfaces are ground at least by 1.0 mm below the deepest indentation.

All weld repairs shall be carried out using the approved welding procedures and welders. Re-welded areas shall be re-examined by the methods specified for the original welds and repair procedures shall be duly qualified by the Executing Agency's Representative.

6. Pre-heating and Post-heating Treatment

Pre-heating and post heating treatment shall conform to the relevant application Codes. Pre-heating not exceeding 121 deg. C for all carbon steel construction above 25 mm thickness would be mandatory. Such pre-heating would be maintained during flame cutting, flame or arc gouging, welding and repairs and may be done by gas heating by gas torches/gas rings with neutral flame. The temperature shall be checked by temperature indicating crayons. However, such pre-heating will not be necessary for welds less than 6 mm size.

7. Electrodes

All electrodes shall be stored in their original sealed containers under dry conditions. Electrodes shall remain identified until consumed. All electrodes shall be dried before use. Drying ovens shall be provided in Work areas for drying purposes. Electrodes withdrawn from oven shall be promptly used and excess unused electrodes shall be promptly returned to oven.

8. Examination / NDT / Radiography

The various stages of examination and types shall be as stipulated in the respective fabrication Codes subject to the Executing Agency's approval.

9. Stainless Steel welding

All welding consumable such as electrodes, filler weirs, argon gas for shielding and purging shall be of high quality and the proposed brand shall be furnished for approval of the Executing Agency. Weld deposits shall have similar or higher physical properties and similar chemical composition to the members joined. All electrodes shall be purchased in sealed containers only and stored in their packing intact. The packets opened shall be consumed as early as possible. The electrodes removed from the containers shall be kept in holding ovens at temperatures recommended by electrode manufacturer. Special care shall be taken in avoiding mixing of electrodes in the oven. The electrodes and filling wires shall be free from rust, oil, grease, earth and other foreign matter.
Argon gas with purity 99.5% shall be used for shielding and purging. The purity of gas shall be certified by the gas manufacturers.

Non-destructive examination of the welds shall be carried out to ensure quality of weld.

The electric current for welding shall be direct current, straight polarity (electrode negative). The welding current shall be kept minimum possible to ensure minimum heat affected zone in the parent material. Other side of the weld joint shall be periodically flushed with argon gas.

10. **Castings**

Cast iron shall be of standard grey close-grained quality. The structure of the castings shall be homogeneous and free from non-metallic inclusions and other injurious defects. All surfaces of castings which are not machined shall be smooth and shall be carefully fettled to remove all foundry irregularities.

Minor defects in depth not exceeding 12.5 percent of total metal thickness and which will not ultimately affect the strength and serviceability of the casting may be repaired by approved welding techniques. The Executing Agency shall be notified of large defects and no repair welding of such defects shall be carried out without prior approval of the Executing Agency. If the removal of metal for repair should reduce the stress resisting cross section of the casting by more than 25 percent, or to such extent that the computed stress in the remaining metal exceeds the allowable stress by more than 25 percent, then casting shall be rejected. Test coupons cast simultaneously with the main castings shall be identified to check physical, chemical analysis of casting. Major defects on casting are not acceptable. Castings repaired by welding for minor defects shall be stress-relieved after such welding. Non-destructive tests as directed by the Executing Agency will be required for any casting containing defects whose extent cannot otherwise be judged, or to determine where repair welds have been properly made.

11. **Forging**

All major stress-bearing forging shall be made to a Standard Specification. Forging shall be subjected to magnetic particle testing or dye penetration test at the areas of fillets and change in section. The testing shall be conducted after rough machining (10 microns). Any defect which will not machine out during the final machining, will be gouged out fully, inspected by dye penetration or magnetic particle inspection to ensure that the defect is fully removed and repaired using an approved repair procedure. Any indication, which proves to penetrate deeper than 2.5% of the finished thickness of the component, shall be reported to the Executing Agency giving the details like location, length, width and depth. For the magnetic particle inspection, the choice of wet or dry particles shall be at the Concessionaire's discretion.

All forging shall be demagnetised after test and shall be heat treated for the relief of residual stresses.

12. **Design life**

The Works as a whole shall be new, of sound workmanship, robustly designed for a long reliable
operating life and shall be capable of 24 hours per day continuous operation for prolonged period in the climatic and working conditions prevailing at the Site, and with the minimum of maintenance. Particular attention shall be given to temperature changes, the stability of paint finish for high temperatures, the rating of engines, electrical machinery, thermal overload services, cooling systems and the choice of lubricants for possible high and prolonged operating temperatures. The Concessionaire shall be called upon to demonstrate this for any component part either by service records, or evidence of similar equipment already installed elsewhere or relevant type tests. Routine maintenance and repair shall as far as possible not require the services of highly skilled personnel. All equipment covered by this specification shall be designed to provide a minimum design service life of 20 years.

The plant shall be designed to provide easy access to and replacement of components parts, which are subject to wear, without the need to replace whole units. No parts in contact with water shall have a life from new to replacement or repair of less than five years. Where major dismantling is unavoidable to replace a part, the life of such part shall not be less than ten years.

Design features shall include the protection of Plant against damage caused by vermin, dirt, dust and dampness and to reduce risk of fire. Plant shall operate without undue vibration, and parts shall be designed to withstand the maximum stresses under the most severe condition of normal service. Materials shall have a high resistance to change in their properties due to the passage of time, exposure to light, temperature and any other cause, which may have a detrimental effect upon the performance of life of the Works.

Plant located outside lockable areas/building shall have additional features to prevent unauthorised operation.

13. **Lubrication**

A complete schedule of recommended oils and other lubricants shall be furnished by the Concessionaire. The number of different types of lubricants shall be kept to a minimum. The schedule and the name of the supplier of the lubricants shall be submitted to the Executing Agency.

Concessionaire shall indicate indigenously available equivalent lubricants, with complete specification, to enable the Executing Agency to arrange for regular supply.

Where lubrication is effected by means of grease, preference shall be given to a pressure system, which does not require frequent adjustment or recharging. Frequent, for this purpose, means more than once in a month and grease systems having shorter periods between greasing should be avoided. Where necessary for accessibility grease nipples shall be placed at the end of the extension piping, and, when a number of such points can be grouped conveniently, the nipples shall be brought to a battery plate mounted in a convenient position. All grease nipples shall be of the same size and type for every part of the Plant. Arrangements shall be provided to prevent bearings being overfilled with either grease or oil.

Where more than one special grease is required, a grease gun for each special type shall be
supplied and permanently labelled.

Oil containers shall be supplied complete with oil level indicators of the sight glass type, or where this is not practicable, with dipsticks. The indicators shall show the level at all temperatures likely to be experienced in service. The levels shall be clearly visible in the sight glass type from the normal access floor to the particular item of Plant and they shall be easily dismantled for cleaning. All sight glasses shall be firmly held and enclosed in metal protection in such manner that they cannot be accidentally dislodged.

All lubrication systems shall be designed so as not to cause a fire or pollution hazard and particular care shall be taken to prevent leakage of lubricants and to avoid leaking lubricants coming into contact with any electrical equipment, heated surfaces or any other potential source of fire.

14. Name Plate

Each item of the Plant shall have permanently attached to it in a conspicuous position, a nameplate and rating plate. Upon these shall be engraved or stamped, the manufacturer's name, type and serial number of Plant, details of the loading any duty at which the item of Plant has been designed to operate, and such diagrams as may be required by the Executing Agency. All indicating and operating devices shall have securely attached to them or marked upon them designations as to their function and proper manner of use.

Nameplates, rating plates and labels shall be of a no flame propagating materials, either non-hygroscopic or transparent plastic with engraved lettering of a contrasting colour. Fixing shall be by means of non-corrosive screws; drive rivets or adhesives shall not be used.

Warning labels shall be provided where necessary to warn of dangerous circumstances or substances. Inscriptions or graphic symbols shall be black on a yellow background.

Instruction labels shall be provided where safety procedures such as wearing of protective clothing are essential to protect personnel from hazardous or potentially hazardous conditions. These labels shall have inscriptions or graphic symbols in white on a blue background.

15. Nuts, Bolts, Studs and Washers

Nuts, bolts, studs and washers for incorporation in the Plant shall conform to the requirements of the appropriate standard. Nuts and bolts shall be of the best quality of specified grade, machined on the shank and under the head and nut. Bolts shall be of one piece construction and shall be of sufficient length so that only one thread shall show through the nut in the fully tightened condition.

Fitted bolts shall be a light driving fit in the reamed holes they occupy, shall have the screwed portion of such a diameter that it will not be damaged in driving and shall be marked in a conspicuous position to ensure correct assembly at Site.

Washers, locking devices & anti-vibration arrangements shall be provided where necessary.
Jointing hardware for the entire Plant shall be provided with sufficient spares to cater for site losses.

Where bolts pass through structural members taper washers shall be fitted, where necessary, to ensure that no bending stress is caused in the bolt. Where there is a risk of corrosion, bolts, nuts and studs shall be designed so that the maximum stress does not exceed half the yield stress of the material under any conditions. All bolts, nuts and washers which are subject to frequent adjustment or removal in the course of maintenance and repair shall be made of nickel-bearing stainless steel.

The Concessionaire shall supply all holding down, alignment and levelling bolts complete with anchorage, nuts, washers and packaging’s required to attach the Plant to its foundations, and all bedplates, frames and other structural parts necessary to spread the loads transmitted by the Plant to concrete foundations without exceeding the design stresses.

16. Allowance for Wastage

The Concessionaire shall supply reasonable excess quantities to cover wastages of those consumable, which will be normally subject to waste during erection, commissioning and setting to Work.

17. Painting - General

The Concessionaire shall be responsible for the cleaning, preparation for painting and priming or otherwise protecting, as specified, all parts of the plant at the place of manufacture prior to packing.

Parts may be cleaned but surface defects may not be filled in before testing at the manufacturer's works. Parts subject to hydraulic test shall be tested before any surface treatment. After test, all surfaces shall be thoroughly cleaned and dried out, if necessary by washing with an approved dewatering fluid prior to surface treatment. Except where the specification provides to the contrary all painting materials shall be applied in strict accordance with the paint manufacturer's instructions.

All protective coatings shall be suitable for use in warm humid climates. All primers, under coats and finishes shall be applied by brush or airless spray, except where otherwise specified. Consecutive coats shall be in distinct but appropriate shades. All paints shall be supplied from the store to the painters, ready for application, and addition of thinners or any other material shall be prohibited.

18. Painting at Place of Manufacture

Steel and cast iron parts shall be sand blasted to near white cleaning before painting. Edges, sharp curves etc. shall be ground to a curve before sand blasting. A primer coat of zinc rich epoxy resin-based coating with atleast a 50 microns dry film thickness is to be provided. In addition, the parts are to be provided with adequate number of coats coal tar epoxy polyamine coating to dry the
19. **Painting at Site**

Immediately on arrival at the site, all items of plant shall be examined for damage to the paint coat applied at the manufacturer's works, and any damaged portions shall be cleaned down to the bare metal, all rust removed and the paint coat made good with similar paint.

Before final painting is commenced, the Concessionaire shall submit for the approval of Executing Agency's Representative, full details of the paints he proposes to use together with colour charts for the gloss finishes. After erection, such items, which are not finish painted, shall be done so and, items that have been finish painted at the manufacturer's works shall be touched up for any damaged paintwork.

The dry paint film thickness shall be measured by Electrometer or other instruments approved by the Executing Agency. In order to obtain the dry film thickness specified, the Concessionaires shall ensure that the coverage rate given by the paint manufacturer will enable the thickness to be obtained. Painted fabricated steel work which is to be stored prior to erection shall be kept clear of the ground and shall be laid out or stacked in an orderly manner that will ensure that no water or dirt can accumulate on the surface. Suitable packagings shall be laid between the stacked materials. Where cover is provided, it shall be ventilated.

20. **Noise and Vibration**

The Concessionaire shall provide a quiet installation. All items of Plant and equipment shall be carefully chosen with a view to minimising sound levels.

The Concessionaire shall provide and fix all material for the prevention of transmission of noise and vibration through the structure. Where appropriate Plant shall be mounted on resilient mountings in such a manner that the Plant foundations are isolated from the floor or structure. In addition, all rotating Plant shall be statically and dynamically balanced. Mechanical vibration shall be eliminated by the use of anti-vibration mountings and flexible connections to ensure an isolation efficiency of 95% from the building structure.

21. **Galvanising**

Wherever galvanising has been specified, the hot dip process shall be used. The galvanised coating shall be of uniform thickness. Weight of zinc coatings for various applications shall not be less than those indicated below:

(a) Fabricated steel

<table>
<thead>
<tr>
<th>Thickness</th>
<th>Weight/gms/sq.m</th>
</tr>
</thead>
<tbody>
<tr>
<td>Thickness less than 2 mm but not less than 1.2 mm</td>
<td>340</td>
</tr>
<tr>
<td>Thickness 2 mm and above</td>
<td>460</td>
</tr>
</tbody>
</table>

(b) Fasteners
Up to nominal size M10: 270 gms/sq.m
Over M10: 300 gms/sq.m

Galvanising shall be carried out after all drilling, punching, cutting, bending and welding operations have been carried out. Burrs shall be removed before galvanizing. Any site modification of galvanised parts should be covered well by zinc rich primer and aluminium paint.

22. Support for pipework & Valves

All necessary supports, saddles, slings, fixing bolts and foundation bolts shall be supplied to support the pipe work. Valve and other facilities mounted in the pipe work shall be supported independent of the pipes to which they connect.

Sub Section - C1: Technical specification for excavation and backfilling

1.1 Scope

This section of the specification covers the technical requirements for excavation and filling for industrial plots in & around structures, buildings, pipes, foundations, trenches, pits, drains, channels, cable ducts, underground facilities & similar works. It also covers filling areas and plinths with selected materials, conveyance and disposal of surplus soils and/or stacking them properly as directed by the Project Engineer and Executing Agency.

The Concessionaire shall be fully responsible for proper setting out of works, profiling in excavation, stacking, etc., taking adequate safety measures etc. The Concessionaire shall carry out all works meant within the intent of this specification even if not explicitly mentioned herein. All work shall be executed to the satisfaction of the Project Engineer and Executing Agency.

Existing trees, shrubs, any other plants, pole lines, fences, signs, monuments, buildings, pipelines, drains, sewers, or other surface or subsurface systems/drainage/facilities within or adjacent to the works being carried out which are not to be disturbed, shall be protected from damage by the Concessionaire shall provide and install suitable safeguards approved by the Project Engineer and Executing Agency for this purpose.

During excavation, the Concessionaire shall take all necessary precautions against soil erosion, water & environmental pollution and where required to undertake additional works to achieve this objective. Before start of operations, the Concessionaire shall submit to the Project Engineer and Executing Agency for approval, his work plan and the procedure he intends to follow for disposal of waste materials etc. and the schedule for carrying out temporary and permanent control works. However, the approval of the Project Engineer and Executing Agency to such plans and procedures shall not absolve the Concessionaire of his responsibility for safe and sound work.

1.2 General requirements

The Concessionaire shall make his own surveying arrangements for locating the coordinates and positions of all work and establishing the reduced levels (RL’s) at these locations based on two reference grid lines and one benchmark, which will be furnished by the Executing Agency. The Concessionaire has to provide at site all the required survey instruments, along with qualified surveyors, to the satisfaction of the Project Engineer and Executing Agency so that the work can be carried out accurately and according to the specification and drawings.

The Concessionaire shall furnish all skilled and unskilled labour, plant, tools, tackle, equipment, men, materials required for complete execution of the work in accordance with the drawings and as described herein and/or as directed by the Project Engineer and Executing Agency.

The Concessionaire shall control the grade in the vicinity of all excavations so that the surface of the ground will be properly sloped or dyed to prevent surface water from running into the excavated areas during construction.
All materials obtained from excavation shall remain Executing Agency’s property. All salvaged materials of archeological importance or of value (in the opinion of the Project Engineer and Executing Agency) shall be segregated from the other materials and both stacked separately and in regular manner at locations indicated by the Project Engineer and Executing Agency.

Excavation shall include removal of trees including roots & organic remains, vegetation, grass, bushes, shrubs, plants, poles, fences, etc. that are in the area to be excavated as well as beyond the excavation line so as to ensure safety of the excavated side slopes, and of men and equipment operating in the area. Before start of excavation work, joint measurements of ground level shall be taken after cleaning all grass, vegetation, etc.

Excavation shall include the removal of all materials required to execute the work properly and shall be made with sufficient clearance as decided by the Project Engineer and Executing Agency to permit the placing and setting of forms, inspection and completion of all works to the satisfaction of the Project Engineer and Executing Agency for which the excavation was done.

Wherever reference is made to ‘drawings’ in this specification it shall mean the latest issue of the approved drawings.

1.3 Codes and standards

All standards, specifications, acts, and codes of practice referred to herein shall be the latest editions including all applicable official amendments and revisions.

In case of conflict between this specification and those (IS standards, codes etc.) referred to herein (in para 3.3) the former shall prevail.

Some of the relevant Indian standards, Acts and Codes are referred to here below:

IS:383 - Specification for coarse and fine aggregates from natural sources for concrete.
IS:2720 - (Part - II, IV to VIII, Methods of tests for soils - determination of water XIV, XXI, XXIII, XXIV content etc. XXVII to XXIX, XL)
IS:3764 - Safety code for excavation work
IS:4081 - Safety code for blasting and related drilling operations
IS:4701 - Code of Practice for earth work on canals
IS:9759 - Guide lines for Dewatering during construction.
IS:10379 - Code of practice for field control of moisture and compaction of soils for embankment and sub-grade.
IS:3812 - Pulverized fuel ash - specification part 2 for use as admixture in cement mortar and concrete

1.4 Excavation

Excavation in all types of soils, soft and disintegrated rock (ordinary rock), and hard rock shall be done up to the required level. Excavation shall also include breaking of existing concrete RCC,
Masonry work, tar and bitumen surfaces, and paving works etc. In case blasting is required, the same shall be subject to the approval of Project Engineer and Executing Agency. Sides and bottoms of excavation shall be cut sharp and true to line and level. Undercutting shall not be permitted. When machines are used for excavation, the last 300 mm before reaching the required level shall be excavated manually or by such equipment that soil at the required final level will be left in its natural condition. Suitability of strata (at the bottom of excavations) for laying the foundation thereon shall be determined by the Project Engineer and Executing Agency.

Excavation for foundations shall be to the bottom of lean concrete and as shown on drawings or as directed by the Project Engineer and Executing Agency. The bottom of all excavations shall be trimmed to required levels and when excavation is carried below such levels, by error, it shall be brought back to specified level by filling with concrete of nominal mix 1:3:6/1:4:8 (cement & Fly ash (20% replacement ratio of cement with fly ash): coarse sand : 20 mm down aggregates) as directed by the Project Engineer and Executing Agency.

The Concessionaire shall ascertain for himself the nature of materials to be excavated and the difficulties, if any, likely to be encountered in executing this work. Cofferdams, Sheeting, shoring, bracing, maintaining suitable slopes, draining etc. shall be provided and installed by the Concessionaire, to the satisfaction of the Project Engineer and Executing Agency.

All excavation for installation of underground facilities, such as piping, sewer lines, drain lines, etc. shall be open cuts. For deep and huge excavations and in other excavations, if required by the Project Engineer and Executing Agency, the Concessionaire shall submit for Project Engineer and Executing Agency’s approval showing the methodology to be adopted for excavation in order to maintain the stability of side slopes, means for ensuring safety of existing facilities nearby, dewatering as required etc. However, the Concessionaire shall be fully responsible for the scheme irrespective of any approvals granted. Benching shall be provided for deeper excavation wherever required.

When excavation requires bracing, sheeting or shoring etc., the Concessionaire shall submit drawings to the Project Engineer and Executing Agency, showing arrangements and details of proposed installation. The Concessionaire shall also furnish all supporting calculations as called for and shall not proceed until he has received written approval from the Project Engineer and Executing Agency. However, the responsibility for adequacy of such bracing, sheeting, shoring etc. will rest with the Concessionaire, irrespective of any approval of the Project Engineer and Executing Agency. All precautions shall be taken while excavations near existing structures are to be carried out till the backfilling is completed.

The Concessionaire shall have to constantly pump out any water collected in excavated pits and other areas due to rain water, ground water, springs etc. and maintain dry working conditions at all times until the excavation, placement of reinforcement, shuttering, concreting, backfilling is completed. The Concessionaire shall remove all slush/muck from the excavated areas to keep the work area dry. Sludge pumps, if required, shall be employed by the Concessionaire for this purpose.

The Concessionaire shall remove all materials arising from excavations from the vicinity of the
work either for direct filling, stacking and subsequent filling or for ultimate disposal as directed by the Project Engineer and Executing Agency. In no case shall the excavated soil be stacked within a distance of 1.5m from the edge of excavation or one third the depth of excavation whichever is more. Material to be used for filling shall be kept separately as directed by the Project Engineer and Executing Agency.

1.5 Filling

1.5.1 Materials

a) Materials to be used for filling purposes shall be stone, sand or other inorganic materials and they shall be clean and free from shingle, salts, organic, large roots and excessive amount of sod. Lumps concrete or any other foreign substances which could harm or impair the strength of the substructure in any manner. All clods shall be suitably broken to small pieces. When the material is mostly rock boulders, these shall be broken into pieces not larger than 150 mm size. Sand used for filling shall be clean, medium grained and free from impurities. Fines less than 5 microns shall not be more than 20%. In any case, the materials to be used for filling purposes shall have the prior written approval of the Project Engineer and Executing Agency.

b) If excavated materials are to be used for filling, then the Concessionaire shall select the materials from the stockpile, load and transport this material and execute the filling. This shall include excavation of earth which may become hard due to laying in stack yard for a long period of time.

c) In case the materials have to be brought from pits/quarries, then it shall be the Concessionaire’s responsibility for identification of such quarry areas, obtaining approval for their use from concerned authorities, excavation/quarrying, loading and carriage of such material, unloading and filling at specified locations. The Concessionaire shall pay any fees, royalties etc. that may have to be paid for utilization of borrow areas.

1.5.2 Filling procedure

a) After completion of foundation, footings, walls and other construction below the elevation of the final grades, and prior to filling, all temporary shoring, timber, etc. shall be sequentially removed and the excavation cleaned of all trash, debris and perishable materials. Filling shall begin only with the written approval of the Project Engineer and Executing Agency. Also, areas identified for filling shall be cleared of all soft pockets, vegetation, bushes, slush etc. In case of plinth and similar filling the ground shall be dressed and consolidated by ramming and light rolling.
b) Fill materials shall not be dropped directly upon or against any structure or facility where there is danger of displacement or damage. Filling shall be started after the concrete / masonry has fully set and shall be carried out in such manner so as not to cause any undue lateral thrust on any part of the structure.

c) All space between foundation (concrete or masonry) and the sides of excavation shall be filled to the original surface after making allowance for settlement. Fill shall be placed in horizontal layers not exceeding 200 mm loose thickness. Each layer shall be watered and compacted with proper moisture content and with such equipment as may be required to obtain a compaction/density as specified. Trucks or heavy equipment for depositing or compacting fill shall not be used within 1.5 metres of building walls, piers or other facilities which may be damaged by their weight or operations. The methods of compaction shall be subject to the approval of the Project Engineer and Executing Agency. Pushing of earth for filling shall not be adopted under any circumstances.

d) Fill adjacent to pipes shall be free of stones, concrete, etc. and shall be hand placed and compacted uniformly on both sides of the pipe and where practicable up to a minimum depth of 300 mm over the top of pipes. While tamping around the pipes, care should be taken to avoid unequal pressure.

e) Filling shall be accurately finished to line, slope, cross section and grade as shown on the drawings. Finished surface shall be free of irregularities and depressions and shall be within 20 mm of the specified level.

f) Where filling with stone from excavated materials is required, as per design and functional requirements, it shall be from broken pieces of boulders. At first a 75mm thick cushion of selected earth shall be laid over which the 200 mm thick graded stones shall be laid in loose layers of 200 mm and then the interstices filled with properly graded fine materials consisting of selected earth brought from borrow areas. Each layer shall be watered and compacted to the required density as per design and functional requirements before the next layer is laid. However, no cushion shall be required where filling is over non-rocky surface.

g) Where clean stone fill is required as per design and functional requirements it shall consist of clean selected stone metal of 40 mm nominal size. It shall be laid in layers not exceeding 150 mm (loose) and lightly tamped before the next layer is laid. No compaction shall be required for this type of stone filling.

1.5.3 Compaction

a) Where compaction of 90% Standard Proctor Density is called for, such compaction shall be by mechanical means but the Concessionaire may be permitted to adopt manual means only
if the Project Engineer and Executing Agency finds that the desired compaction is achievable in the field.

b) Where compaction to 95% Standard Proctor Density is called for, it shall be by mechanical means only. Where access is possible, compaction shall be 12 tonne rollers smooth wheeled, sheep foot or wobbly wheeled and directed by the Project Engineer and Executing Agency. A smaller weight roller may be permitted by the Project Engineer and Executing Agency in special cases, but in any case not less than 10 passes of the roller will be accepted for each layer. Each layer shall be wetted or the material dried by aeration to a moisture content of 3-5% above the Optimum Moisture Content to be determined by Concessionaire. Each layer shall be watered, rammed and compacted to the density as specified in the Schedule of Quantities.

c) For compacting each sand layer, water shall be sprayed over it to flood it and it shall be kept flooded for 24 hours to ensure maximum compaction. Vibro-compactors shall also be used if necessary to obtain the required degree of compaction. Any temporary works required to contain sand under flooded condition shall also be undertaken. The surface of the consolidated sand shall be dressed to required levels or slope.

d) After the compacted fill has reached the desired level, the surface shall be flooded with water for 24 hours, allowed to dry and then rammed and consolidated to avoid any settlement, at a later date. The compacted surface shall be properly shaped, trimmed and consolidated to an even gradient or level. All soft spots shall be excavated, filled and consolidated.

e) The degree of compaction of compacted fill in place will be subject to tests in accordance with relevant Indian Standards as desired by the Project Engineer and Executing Agency. As the work progress, the Concessionaire shall provide the necessary facilities to make such tests. If any test indicates that the compaction achieved is less than the required as per design and functional requirements degree of compaction, the Project Engineer and Executing Agency may require all fill placed subsequent to the last successfully test to be removed and re-compacted by the Concessionaire. Compaction procedure shall be amended as necessary to obtain satisfactory results.

f) When semi-compacted fill is required as per design and functional requirements by the Project Engineer and Executing Agency, the Concessionaire shall fill up such areas with available earth from stockpiles or borrow pits or directly from excavation without special compaction except that obtained by moving trucks, etc.
1.6 Sampling testing and quality control

1.6.1 General

a) The Concessionaire shall carry out all sampling and testing in accordance with the relevant Indian Standards and/or International Standards and shall conduct such tests as are called for by the Project Engineer and Executing Agency. Where no specific testing procedure is mentioned, the tests shall be carried out as per the prevalent accepted engineering practice to the directions of the Project Engineer and Executing Agency. Tests shall be done in the field and at a laboratory approved by the Project Engineer and Executing Agency and the Concessionaire shall submit to the Project Engineer and Executing Agency, the test results in triplicate within three days after completion of a test. The Project Engineer and Executing Agency may, at his discretion, waive some of the stipulations given below, for small and unimportant operations.

b) Work found unsuitable for acceptance shall be removed and replaced by the Concessionaire. The work shall be redone as per specification requirement and to the satisfaction of the Project Engineer and Executing Agency.

c) Only as a very special case and that too in non-critical areas, the Project Engineer and Executing Agency may accept filling work which is marginally unacceptable as per the criteria laid down. For such accepted work, payment shall be made at a reduced rate prorate to the compaction obtained against that stipulated.

1.6.2 Quality assurance programme

The Concessionaire shall submit and finalize a detailed field Quality Assurance Programme of the Contract according to the requirements of the specification. This shall include setting up of a testing laboratory, arrangement of testing apparatus / equipment, deployment of qualified/experienced manpower, preparation of format for record, Field Quality Plan, etc. On finalized field quality plan, the Executing Agency shall identify customer hold prints beyond which work shall not proceed without written approval from the Project Engineer and Executing Agency. Frequency of sampling and testing including the methods for conducting the tests are given in Table - 1. The testing frequencies set forth are the desirable minimum and the Project Engineer and Executing Agency shall have the full authority to carry out or call for tests as frequently as he may deem necessary to satisfy himself that the materials and works comply with the appropriate specifications.

1.6.3 Acceptance criteria

Following acceptance criteria shall be followed.
a) All individual samples collected and tested should pass without any deviation when only one set of sample is tested.

b) For re-test of any sample two additional samples shall be collected and tested, and both should pass without any deviation.

c) Where a large number of samples are tested for a particular test than 9 samples out of every 10 consecutive samples tested shall meet the specification requirement.

d) Tolerance on finished levels for important filling areas at approved intervals shall be + 20 mm. However, for an unimportant area, tolerance upto + 57 mm shall be acceptable at the discretion of the Project Engineer and Executing Agency. However, these tolerances shall be applicable for localized areas only.

Sub Section - C2: Technical specification for properties, storage and handling of common building materials

2.1 Scope

The scope of this section of the specification is to specify the properties, storage and handling of common building materials namely, coarse aggregates, cement, water, sand masonry units, reinforcement and structural steel.

Properties of the materials in general have been discussed. Specific requirements of the materials have been stipulated separately under specification for relevant items of work.

2.2 General requirements

The work shall include, providing of all necessary plants and equipment, providing adequate engineering supervision and technical personnel, skilled and unskilled labour etc. as required to carry out the entire work as directed by the Project Engineer and Executing Agency to his complete satisfaction.

All materials proposed for use in the work shall conform to the requirements laid down in this section, and also subject to the approval of the Project Engineer and Executing Agency. After specific materials have been accepted, the source of supply of such materials shall not be changed without prior approval of the Project Engineer and Executing Agency.

Approval of any material by the Project Engineer and Executing Agency shall not relieve the Concessionaire of his responsibility, for the requisite quality and performance of the material used.

Any material considered to be sub-standard, or not upto satisfaction of the Project Engineer and Executing Agency, shall not be used by the Concessionaire and shall be removed from the site immediately.

Representative samples shall be procured by the Concessionaire and submitted to the Project Engineer and Executing Agency, for approval before bulk procurement. The representative samples shall be retained by the Project Engineer and Executing Agency for future comparison and reference.
2.3 Codes and standards

In the event that state, city or other local governmental bodies have requirements more stringent than those set forth in this specification, the former shall govern.

All applicable standards, acts, specifications, codes of practice, hand books, referred to herein shall be the latest editions, including all official amendments and revisions.

In the event of conflict between any of these Specifications and the Codes referred, such specifications shall be defined, prepared by the Concessionaire and submitted to the Project Engineer for approval. The decision of Project Engineer in such case shall be final and binding on the Concessionaire.

Any special materials used, but not covered here, shall conform to relevant Indian Standards, if any, or as specified by the Project Engineer and Executing Agency for any special purpose.

Some of the applicable Indian standards, codes are referred to here below:

- IS:383 Specification for coarse and fine aggregates from natural sources for concrete.
- IS:432 Specification for mild steel and medium tensile steel bars and (Parts 1 & 2) hard-drawn steel wires for concrete reinforcement.
- IS:1077 Specification for common burnt clay building bricks.
- IS:1077 Specification for Burnt clay bricks/Fly ash bricks.
- IS:1127 Recommendations for dimensions and workmanship of natural building stones for masonry work.
- IS:1129 Recommendation for dressing of natural building stones.
- IS:1542 Specification of sand for plaster.
2.4 Burnt clay Bricks

Burnt clay bricks, for general masonry work, shall conform to IS:1077 and for face brick work, shall conform to IS:2691. Fly ash lime bricks shall conform to IS:12894.

Bricks for general masonry work shall be table moulded/machine made, well burnt without being vitrified, of uniform size, shape, having sharp edges and cherry red colour. These shall be free from cracks, flaws or nodules of free lime and shall emit clear ringing sound (metallic sound) when struck. These shall not show any signs of efflorescence either when dry or subsequent to soaking in water. Fractured surface shall show uniform texture free from girts, lumps, holes etc.
Unless otherwise specified, minimum compressive strength shall correspond to class designation 75 as per IS: 107 with a minimum crushing strength of 75 kg/sq.cm. for general masonry work. However, for non-load bearing walls, bricks pavements, etc. bricks of class designation 50 shall only be used, wherever specified or shown on the drawings. Water absorption after 24 hours immersion shall not exceed 20% by weight for common bricks and 15% for face bricks.

On the basis of finish and dimensional tolerance, the bricks shall be classified as sub class A and B. Dimensional tolerance shall not exceed 3% and 8% of the size, of common bricks for sub-class A & B respectively and 3% for face bricks. All bricks shall have rectangular faces and sharp straight edges. Maximum permissible chip page for the face bricks shall be 6mm at the edges and 10mm for corners. The face bricks shall show no efflorescence after soaking in water and drying in the shade.

The size of the bricks used shall be either modular size as per IS:1077 or locally available conventional size as approved by the Project Engineer and Executing Agency.

Each brick shall have the manufacturer’s identification mark clearly marked on the frog. The colour and texture of face bricks shall be limited to the range of samples submitted. Any brick not found upto the satisfaction of the Project Engineer and Executing Agency shall be removed immediately from site by the Concessionaire.

### 2.5 Fly Ash Bricks

Fly ash bricks (cement bonded) shall be locally made. Bricks shall have smooth rectangular faces with sharp and square corners. Bricks shall be hand or machine moulded and shall be made from the admixture of suitable good quality of fly ash, sand and cement as per the composition mentioned below:

- Fly ash : 50-60%
- Sand : 32-40%
- Cement : 8-12%

The fly ash bricks will be as per latest relevant IS code. The bricks will be of dimension as per standard clay brick, suitable for making 230 mm thick full brick wall, 115 mm thick half brick wall and 75 mm thick minor partition walls, as applicable, as per drawing/specification/BOQ. A maximum tolerance of (+/-) 2 mm shall be allowed as the manufacturing tolerance. The bricks shall have frog of 100 mm in length 40 mm in width and 10 to 20 mm deep of one of its flat sides.

The bricks when tested in accordance with the procedure laid down in IS 3495 (part 2): 1992 after immersion in cold water for 24 hrs. Water absorption shall be within 13-15% by weight. Similarly, the porosity of the fly ash bricks shall be within 12-20%. The bricks shall have a minimum crushing strength of 80 Kg/Sqcm.

Fly ash bricks, for general masonry work, shall conform to IS:2212-1991
Unless otherwise specified, minimum compressive strength shall correspond to class designation 80 as per IS: 107 with a minimum crushing strength of 80 kg/sq.cm. For general masonry work. However, for non-load bearing walls, bricks pavements, etc. bricks of class designation 50 shall only be used, wherever specified or shown on the drawings. Water absorption after 24 hours immersion shall not exceed 20% by weight for common bricks and 15% for face bricks.

On the basis of finish and dimensional tolerance, the bricks shall be classified as sub class A and B. Dimensional tolerance shall not exceed 3% and 8% of the size, of common bricks for sub-class A & B respectively. All bricks shall have rectangular faces and sharp straight edges. Maximum permissible chip page for the face bricks shall be 6 mm at the edges and 10 mm for corners. The face bricks shall show no efflorescence after soaking in water and drying in the shade.

The size of the bricks used shall be either modular size as per IS:1077 or locally available conventional size as approved by the Project Engineer and Executing Agency.

Each brick shall have the manufacturer’s identification mark clearly marked on the frog. The colour and texture of face bricks shall be limited to the range of samples submitted. Any brick not found upto the satisfaction of the Project Engineer and Executing Agency shall be removed immediately from site by the Concessionaire.

2.6 Stones

All stones shall be from approved quarries. These shall be hard, tough, and durable, compact grained, uniform the texture and colour and free from decay, flaws, veins, cracks and sand holes. The surface of a freshly broken stone shall be bright, clean and sharp and shall show uniformity of texture, without loose grains and free from any dull, chalky or earthy appearance. Stone with round surface shall not be used.

Stones showing mottled colours shall not be used for face work. A stone shall not absorb more than 5% of its weight of water after 24 hours immersion. The type of stone shall be as specified or shown on drawings and/or as instructed by the Project Engineer and Executing Agency. Stones used for masonry work shall conform to IS:1597 (Part – I) No soft stone shall be used for masonry or for filling purpose.

Any stone not found up to the satisfaction of Project Engineer and Executing Agency shall be removed immediately from site by the Concessionaire.

2.7 Lime

Lime shall be stone lime and it shall conform to IS:712. Hydrated lime shall be mixed with water to form a putty. This shall be stored with reasonable care to prevent evaporation of water for at least 24 hours before use. Quick lime shall be slaked with enough water to make a cream and then stored with reasonable care to prevent evaporation of water for at least seven days before use. Type of lime to be used for different purposes such as concreting, plastering, white washing etc. shall be according to the satisfaction made hereunder:
2.8 Cement and fly ash

Cement shall be Portland pozzolana cement conforming to IS:1489 or Portland slag cement conforming to IS:455 or sulphate resistant cement confirming to IS 12330 as per the specific site condition and exposure. As per CPHEEO Manual guideline, all civil works in contact with sewage/faecal sludge/septage shall be constructed with either brick work or RCC and in both cases sulphate resistant cement alone shall be used. However, any lower grade of OPC, PPC and PSC should never be mixed with higher grade cement.

Fly ash is generated by burning of coal in coal fired power plants. It has the characteristic of pozzolonic additive to cement. Continuous research studies by various engineering research laboratories revealed its varied usefulness as an additive for enhancing the various qualities of concrete including its workability, strength and durability if handled and cared properly. Partial replacement of cement with fly ash in concrete save much of the energy required for production of OPC and also facilitates the economical disposal of millions of tons of fly ash.

At present most of the fly ash blended cements commercially produced in India has 18 to 25% fly ash by weight and addition of fly ash to this extent has a beneficial effect on the workability and economy of concrete. It has been found that in order to improve the other qualities of concrete like resistance of sulfate attack and thermal cracking, larger percentage of fly ash is to be used in concrete.

Indian standard specification No. 3812-2003, Specification for Pulverized Fuel Ash, Part 2: For Use as Admixture in Cement Mortar and Concrete [CED 2: Cement and Concrete] covers the extraction and the physical and chemical requirements of pulverized fuel ash for use as admixture in cement mortar and concrete. Fly ash confirming to this standard shall be used in place of cement.

The chemical, physical requirements and testing of fly ash shall be in accordance with the IS 3812-2003

2.9 Water

Water used for cement concrete, mortar, plaster, grout, curing, washing of coarse aggregate, soaking of bricks, etc. shall be clean and free from injurious amount of oil, acids, alkalis, organic matters or other harmful substances in such amounts that may impair the strength or durability of the structure. Potable water shall generally be considered satisfactory for all masonry and
concrete works, including curing. The Concessionaire shall carry out necessary tests in advance to prove the suitability of the water proposed to be used. As a guide, the following concentrations represent the maximum permissible values:

a. To neutralize 200 ml sample of water, it should not require more than 2 ml of 0.1 normal NaOH.
b. To neutralize 200 ml sample of water, it should not require more than 10 ml of 0.1 normal HCL.
c. Percentage of solids shall not exceed the following:

<p>| | | |</p>

<td>0.20</td>
</tr>
</tbody>
</table>

2.10 Aggregates

Aggregates mean both coarse and fine inert materials used in the preparation of concrete. Aggregates shall consist of natural sands, crushed stone and gravel from a source known to produce satisfactory aggregate for concrete and shall be chemically inert, hard, strong, durable against weathering, of limited porosity and free from such quantities of deleterious materials as may cause corrosion of reinforcement or may impair the strength and/or durability of the concrete. Total percentage of all deleterious materials, including coal, lignite, clay lumps, and materials finer than 75 microns, soft fragments and shale but excluding mica shall not exceed 5%. However, for crushed fine aggregate, total percentage of coal and lignite and clay lumps, shall be limited to 2%. Both coarse and fine aggregates shall conform to IS:383 for concrete, shotcreting, etc. unless otherwise mentioned.

Sample of aggregates for mix design and determination of their suitability shall be sent to the laboratory well in advance in scheduled placing of concrete. Sampling, testing, and interpretation of test results shall be subject to the approval of the Project Engineer and Executing Agency. Aggregates shall be properly graded.

2.11 Sand

Sand shall be hard, durable, clean and free from adherent coatings of organic matter and shall not contain clay balls or pellets. The sand shall be free from impurities such as iron pyrites, alkalis, salts, coal, mica, shale, or other laminated materials, in such forms or quantities as to affect adversely the hardening, strength, durability or appearance on mortar, plaster, etc. or to cause corrosion of any metal in contact with such mortar, plaster etc. In no case, the cumulative percentage of impurities in sand shall be more than 5% by weight. All sand shall be properly graded. Unless otherwise directed by the Project Engineer and Executing Agency, sand for masonry mortars shall conform to IS:2116 and sand for plaster shall conform to IS:1542. Sand,
when used as fine aggregate, in concrete, shall conform to IS:383. For filling, medium grained sand (having fines less than 75 microns not exceeding 20%) shall be used.

2.12 Reinforcement steel, structural steel (including embedded steel) and wire mesh

**Billet: (Primary steel)**

A semi-finished product obtained by forging or rolling, usually square and not exceeding 125 x 125 mm in cross section with rounded corners and is intended for further processing into suitable finished product by forging or re-rolling.

Steel shall be manufactured by open hearth, electric, duplex, basic oxygen or a combination of these processes. In case any other process is employed by the manufacturer, prior approval of the purchaser should be obtained.

The ladle analysis of the material when analyzed in accordance with the various parts of IS: 228, shall be confirmed with IS: 8056-1976- Table 1 (Chemical composition).

| Table 1 Chemical Composition (As per IS: 8056-1976 clauses 3.1 & 6.1) |
|--------------------------|------------------|
| **Constituent** | **Percent** |
| Carbon | 0-45 to 0.80 |
| Silicon | 0.15 to 0.35 |
| Manganese | 0.40 to 1.00 |
| Sulphur, Max | 0.050 |
| Phosphorus, Max | 0.050 |

In case of continuous cast billets, the billet analysis shall be taken as ladle analysis.

Permissible variation in case of product analysis from the limits specified in IS: 8056-1976 clause-6.1 shall be as follows:

<table>
<thead>
<tr>
<th>Constituent</th>
<th>Variation Over the Specified Maximum or Under the Minimum Limits in %</th>
</tr>
</thead>
<tbody>
<tr>
<td>Carbon</td>
<td>0.03</td>
</tr>
<tr>
<td>Silicon</td>
<td>0.03</td>
</tr>
<tr>
<td>Manganese</td>
<td>0.04</td>
</tr>
<tr>
<td>Sulphur, Max</td>
<td>0.005</td>
</tr>
<tr>
<td>Phosphorus, Max</td>
<td>0.005</td>
</tr>
</tbody>
</table>

*Note: Variations shall not be applicable both over and under the specified limits in several determinations in a heat.*

**Sampling**

At least one ladle sample analysis shall be taken per cast.
If required, the samples for product analysis shall be prepared by forging or rolling down to 30-mm round section.

In case of wire rods the test piece size shall be the size of wire rods.

Drilling shall be taken from the sample representing two-thirds, half and one-third of height from bottom of the billet separately.

In case of continuous cast billets and billets produced from ingots of masses 3 tonnes and more, the sample may be taken from anywhere from the billets.

**Freedom from defects**

The billets and continuous cast billets shall be free from harmful defects, such as pipe, laminations, segregation, inclusions and cracks.

Subject to agreement between the purchaser and the manufacturer, the billets and continuous cast billets may be supplied with suitable surface dressing.

billets shall either be supplied free from harmful segregation, piping, cracks, inclusions, and blow-hole by appropriate top and bottom discard and dressing or supplied with suitable surface dressing only, without top and bottom discard if agreed to between the purchaser and the manufacturer, to ensure the requirements of freedom from defects specified in the relevant product specifications.

If agreed to between the purchaser and the manufacturer the following tests may be carried out from the samples prepared under IS: 8056-1976

**Dimensions**

The size and tolerance of billets shall be subject to agreement between the purchaser and the manufacturer. However, the nominal sizes of billets generally supplied as per guidance given in IS: 8056-1976

The preferred sizes of billets shall be 50, 63, 71, 80, 90, 100 and 125 mm.

The sizes other than those specified may be supplied by agreement between the purchaser and the manufacturer.

A tolerance of the billets shall be confirmed with IS: 8056-1976

The ends of ingots and billets shall be painted with a suitable colour code conforming to IS: 2049-1963.

Each ingot and billet shall be legibly stamped or painted with the cast number, grade and the name or trade-mark of the manufacturer.
The material may also be marked with the IS1 Certification Mark.

All steel for reinforcement shall be clean and free from loose mill scales, dust, loose rust, oil, grease, paint or other harmful matters, which may affect its bond with concrete. Mild steel and medium tensile steel bars and hard drawn steel wire for concrete reinforcement shall conform to grade-1 of IS:432 (Part-1). High strength deformed steel bars shall conform to grade Fe 415 of IS:1786. All steel bars shall be of tested quality. Actual grade and type steel, to be used, shall be as specified or shown on drawings.

Structural steel (including embedded steel) shall be straight, sound, free from twists, cracks, flaws, laminations and all other defects. Structural steel shall be of tested quality conforming to IS:226, IS:2062 or IS:8500. These shall be free from lamination defects. Grade and type of steel to be used shall be as specified.

Hard drawn steel wire fabric shall conform to IS:1566. Wire fabric shall be electrically cross welded.

2.13 Storage and handling of materials

Generally, all materials shall be stacked and stored by the Concessionaire as described in IS:4082 unless otherwise mentioned and in a manner affording convenient access for identification and inspection at all times. The storage area and arrangements shall be subject to the approval of the Project Engineer and Executing Agency. Any material rendered unserviceable during the Concessionaire’s custody, shall be replaced or repaired by the Concessionaire as determined by the Project Engineer and Executing Agency.

All materials shall be as stored as to prevent deterioration or intrusion of foreign matter and to ensure the preservation of their quality and fitness for the work. Any material, which has deteriorated or has been damaged or is otherwise considered defective by the Project Engineer and Executing Agency, shall not be used and shall be removed.

Bricks shall not be dumped at site. These shall be stacked on dry firm ground in regular tiers even as they are unloaded to minimize breakage and defacement of bricks. Bricks of different class, selected for various categories of use in the work, shall be stacked separately. Each stack shall contain equal number of bricks, preferably not more than 3000.

Dressed stone for all facing, paving etc. shall be stored with special care to avoid defacement of faces and edges or damp and rust stains.

Lime shall be stored in weather-proof sheds. Lime which has been damaged by rain, moisture or air slaking, shall not be used. If the lime is supplied as hydrated lime, it shall be stored in the same manner as cement.

2.13.1 Cement and fly ash
a. Consignments of cement shall be stored as received and shall be consumed in the order of their delivery. Cement held in storage for more than ninety days shall invariably be tested, and only if test results are satisfactory, the Project Engineer and Executing Agency may consider permitting its use.

b. Different consignments of different types of cement, i.e. OPC, PPC, PSC shall be stacked separately with clear identifiable stack number.

c. The cement shall be stored in dry, leak proof and weather proof are closed sheds. Storage under tarpaulins shall not be permitted. The cement bags shall be stored well away from the walls and insulated from the floor, using planks etc. to avoid contact with moisture. The cement shall be stacked in easily countable stacks and in a place of easy access so as to facilitate proper inspection and removal on a first in first out basis. Not more than 15 bags shall be stacked in any tier to prevent lumping up under pressure. However, in stacks more than 8 bags high, the cement bags shall be arranged alternately lengthwise and crosswise so as to tie the stacks together and minimize the danger of toppling over. The cement bags shall be gently kept to avoid leakage of cement from the bags. Substandard or partially set cement shall be immediately removed from the site as soon as it is detected.

d. Pulverized fuel ash (Fly ash) shall be stored in accordance with the recommendation given in IS 4082. Additionally, during bulk storage, the fly ash should be suitably covered to avoid getting airborne.

g. Supplies of pulverized fuel ash (Fly ash) may be made in bulk in suitable quantities or in bags (jute, jute-laminated, multiple paper or polyethylene lined) bearing the net mass (may be 15 kg, 30 kg, 300 kg, 600 kg as agreed by the Concessionaire)

h. Pulverized fuel ash in bulk storage for more than 6 months or in bags for more than 3 months after completion of tests, may be re-tested before use and standard. May be rejected, if it fails to conform to any requirements of this standard.

i. Pulverized fuel ash may be rejected if it does not comply with any of the requirements stipulated in IS 3812 Part 2 of 2003
2.13.2 Coarse and fine aggregates/sand

a. Coarse and fine aggregates shall be stacked separately. Contamination with foreign materials and earth during storage and while heaping the materials shall be avoided. Coarse aggregates shall be stacked in layers not exceeding 120 cm in height such that corning and segregation do not occur. Each layer shall cover the entire area of the stock pile before succeeding layers are placed. Segregated aggregates from stock-pile shall be rejected.

b. Aggregates shall be stored on brick soling or an equivalent platform so that they do not come in contact with dirt, clay, grass or any other injurious substance, at any stage. For lifting aggregates from stock piles, rakers shall be used. Aggregates of different sizes shall be kept in separate and easily measurable stacks. If so desired by the Project Engineer and Executing Agency, aggregates from different source shall be stacked separately with proper care to prevent intermixing.

2.13.3 Reinforcement and Structural Steel (including steel required for embedment)

a. Reinforcement and structural steel (including steel required for embedment) shall be stored consignment wise and size wise, off the ground by at least 150mm and protected by the suitable cover, or as desired by the Project Engineer and Executing Agency. The steel shall be protected from rusting, oil grease and distortions. The reinforcing steel shall be coated with cement wash before stacking to prevent scale and rust, in areas having accelerating corrosion effect like marine atmosphere. The stacks shall be easily measurable. Steel needed for immediate use only shall be removed from storage. Fabricated steel shall be carefully stored to prevent damage, distortion, corrosion and deterioration.

b. Reinforcement shall be stored according to the diameter, grade and length in such a place as to permit easy approach for inspection and identification.

c. The area shall be such that water does not accumulate and reinforcement does not get distorted or corroded. It shall not be stacked directly over ground or near any harmful materials. It shall be cleaned of excessive rust before use.

d. Steel plates of different specifications shall be stacked separately. Steel of IS:2062 and IS:8500 quality shall be given a grade wise, distinctive identification mark. Passage and space between the stacks shall be sufficient for rigging operations.

2.14 Testing

All materials provided by the Concessionaire shall be tested for conformity of the specification and the test results shall be submitted to the Project Engineer and Executing Agency for acceptance. In addition to above, the Concessionaire shall carry out the relevant tests at site as specified under different items of work.

Sub Section - C3: Technical specification for cast-in-situ concrete and allied works

3.1 Common requirement

3.1.1 Scope

The work shall include providing of materials, all necessary plant and equipment, providing adequate engineering supervision and technical personnel, skilled and unskilled labour, etc. as required to carry out the entire work as indicated on the drawings and/or described herein subsequently and/or as directed by the Project Engineer and Executing Agency.

The Concessionaire shall carry out all works meant within the intent of this specification even if not explicitly mentioned herein. All works shall be executed to the satisfaction of the Project Engineer and Executing Agency.

This specification is divided into 13 sections. The Section - 1 deals with common requirements and the other 12 sections deal with specifications for 12 different items/activities. The stipulations contained in Section-1, ‘Common Requirements’ shall form a part of the specifications of 12 different items/activities described in section 2 to 13.

All these eight sections are as follows:

Section - 1 Common requirement
Section - 2 Cast-in-Situ Concrete
Section - 3 Reinforcement
Section - 4 Formwork and staging
Section - 5 Embedded parts
Section - 6 Foundation bolt assembly
Section - 7 Shotcreting
Section - 8 Grouting
Section - 9 Encasement of steel structures/elements
Section - 10 Joints in Concrete
Section - 11 Water proofing / damp proofing of underground concrete structures.
Section - 12 Dismantling / Demolishing works - RCC and PCC.
Section - 13 Cement Additives/Admixtures in concrete.

3.1.2 General

Any approval, instructions, permission, checking, review, etc. whatsoever by the Project Engineer and Executing Agency, shall not relieve the Concessionaire of his responsibility and obligation regarding adequacy, correctness, completeness, safety strength, quality, workmanship, etc.

The Concessionaire shall make his own surveying arrangements for locating the coordinates and positions of all work and establishing the reduced levels (RLs) at these locations, based on two reference grid lines and one bench mark, which will be furnished by the Executing Agency. The Concessionaire has to provide at site, faction of the Engineer so that the work can be carried out accurately and according to the specifications and drawings.
3.1.3 Codes and standards

All applicable standards, specifications, etc. and codes of practice shall generally be the latest editions, including all applicable official amendments and revisions. A complete set of all these documents shall generally be available at site, with the Concessionaire.

All work shall be carried out as per the stipulations contained in various sections of these specifications and the latest Indian Standards, Acts, Codes and best practices.

In case of conflict between the stipulations contained in various sections of these specifications and stipulations of Indian Standards, Codes, etc. the requirements of stipulations contained in various sections of these specifications, shall prevail over that of Indian Standards, Codes, etc.

Some of the applicable Indian Standards, Codes, etc. are referred to here below:

IS:73 - Specification for paving bitumen
IS:2062 - Specification for structural steel
IS:269 - Specification for Ordinary Portland cement, 33 grade.
IS:280 - Specification of mild steel wire for general engineering purposes
IS:383 - Specification for coarse and fine aggregates from natural sources for concrete.
IS:432 - Specification for mild steel and medium tensile steel (parts I & II) bars and hard drawn steel wire for concrete reinforcement.
IS:455 - Specification for Portland slag cement
IS:516 - Method of test for strength of concrete
IS:650 - Specification for standard sand for testing of cement
IS:702 - Specification for industrial bitumen
IS:816 - Code of practice for use of metal arc welding for general construction in mild steel.
IS:1199 - Method of sampling and analysis of concrete
IS:1200 - Method of measurement of building (Part-II and civil engineering works. V, VIII, XVIII)
IS:1367 - Technical supply conditions for threaded steel fasteners.
S:1786 - Specification for high strength deformed steel bars and wires for concrete reinforcement.
IS:1791 - General requirements for batch type concrete mixers.
IS:1838 - (Part 1) Specification for preformed fillers for expansion joints in concrete pavements and structures (non extruding and resilient type)
IS:2210 - Criteria for the design of reinforced concrete shell structures and folded plates.
IS:2386 - Methods of test of aggregates for (Parts concrete I to VIII)
IS:2438 - Specification for roller pan mixer
IS:2502 - Code of practice for bending and fixing of bars for concrete reinforcement
IS:2505 - General requirements for concrete vibrators, immersion type.
IS:2506 - General requirements for concrete vibrators, screed board type.
IS:2514 - Specification for concrete vibrating tables.
IS:2645 - Specification for Integral cement water proofing compounds.
IS:2722 - Specification for portable swing weigh batchers for concrete. (Single and double bucket type)
IS:2750 - Specification for Steel scaffoldings
IS:3025 - Methods of sampling and test waste water.
IS:3067 - Code of practice for general design details and preparatory work for damp proofing & water proofing of buildings.
IS:3150 - Specification for hexagonal wire netting for general purposes.
IS:3366 - Specification for Pan vibrators.
IS:3370 - Code of practice for concrete (Part I structures for the storage of to IV) liquids.)
IS:3414 - Code of practice for design and installation of joints in buildings.
IS:3550 - Methods of test for routine control for water used in industry
IS:3696 - Safety code for scaffolds (Part I ladders & II)
IS:3812-2 - Specification for pulverized fuel ash for use as admixture in cement mortar and concrete
IS:4014 - Code of practice for steel tubular scaffolding (Parts I & II)
IS:4031 - Methods for physical tests for hydraulic cement.
IS:4326 - Code of practice for earthquake resistant design and construction of buildings.
IS:4461 - Code of practice for joints in surface hydro-electric power stations.
IS:4925 - Specification for batching and mixing plant.
IS:4990 - Specification for plywood for concrete shuttering work.
IS:4995 - Criteria for design of reinforced concrete bins for the storage of granular and powdery materials. (Parts I & II)
IS:5121 - Safety code for piling and other deep foundations.
IS:5256 - Code or practice for sealing joints in concrete lining on canals.
IS:5525 - Recommendations for detailing of reinforcement in reinforced concrete work.
IS:5624 - Specification for foundation bolts.
IS:6461 - Glossary of terms relating to cement concrete.
IS:6494 - Code of practice for water proofing of underground water reservoirs and swimming pools.
IS:7193 - Specification for glass fiber base coal-tar pitch and bitumen felts.
3.1.4 Sampling, testing and quality assurance

Facilities required for sampling materials, concrete, reinforcement, formwork, etc. in the field and in the laboratory shall be provided by the Concessionaire. The Concessionaire shall carry out all sampling and testing in accordance with the relevant Indian Standards and/or International Standards and this specification. Where no specific testing procedure is mentioned, the tests shall be carried out as per the prevalent accepted engineering practice to the directions of the Project Engineer and Executing Agency. Tests shall be done in the field in the presence of the Project Engineer and Executing Agency or his authorized representative and at a laboratory, approved by the Project Engineer and Executing Agency, and the Concessionaire shall submit the test results in triplicate within three days after completion of any test.

The Concessionaire shall maintain records of all inspection and testing, which shall be made available to the Project Engineer and Executing Agency. The Project Engineer and Executing Agency at his discretion, may waive some of the stipulations for small and unimportant concreting operations and other works.

Work found unsuitable for acceptance shall be removed and replaced by the Concessionaire. The work shall be redone as per specification requirements and to the satisfaction of the Project Engineer and Executing Agency at no extra cost to the Executing Agency.

Quality assurance programme

a) The Concessionaire shall submit and finalize a detailed field Quality Assurance Programme within 30 days from the date of award of the contract, before commencement of work at site, according to the requirements of the specification. This shall include setting up of a
testing laboratory, arrangement of testing apparatus / equipment, deployment of qualified/experienced manpower, preparation of format for record, field quality plan, etc. On finalized field quality plan, the Executing Agency shall identify, customer hold points, beyond which work shall not proceed without written approval from the Project Engineer. The testing apparatus/equipment installed in the field laboratory shall be calibrated/corrected by the authorized persons as frequently as possible to give accurate testing results.

b) Frequency of sampling and testing, etc. and Acceptance Criteria are given in respective sections. However, the testing frequencies set forth are the desirable minimum and the Project Engineer and Executing Agency shall have the full authority to carry out or call for tests as frequently as he may deem necessary to satisfy himself that the materials and works comply with the appropriate specifications.

3.2 Cast-in-situ concrete

3.2.1 Scope

This section of the specification deals with plain or reinforced cement concrete for general use and in structures and covers the requirements for concrete, materials, their properties, storage, handling, grading, mix design, strength and quality, pouring at all levels, testing, casting, protecting, curing, finishing, etc.

3.2.2 General requirement

The provision of IS:456 shall be followed as general guidance, along with all other relevant Indian Standards, unless otherwise specifically mentioned.

Before starting a concrete pour, the Concessionaire shall obtain the approval of the Project Engineer and Executing Agency on a ‘Pour Card’ maintained for this purpose. He shall obtain complete instructions about the materials and proportions, water cement ratio, etc. to be used, slump/workability, number of test cubes/samples to be taken, type of finishing to be done, any admixture to be added, any limitation on size of pour and location for interruption of a pour in case of premature stopping of pour, etc.

The mixers and weigh-batchers, shall be maintained in clean and serviceable condition. Accuracy of all equipment shall be periodically checked. All concrete shall be mixed in mechanically operated batch mixers complying with IS:1791 and these shall be of approved make, with suitable provision for correctly controlling the water delivered to the drum. Weigh batchers shall conform to IS:2722 and shall be capable of controlling the weights to within one percent of the desired value.

The Concessionaire’s procedures for casting massive concrete sections (as noted on the drawings or as identified by the Project Engineer and Executing Agency) shall take account of the release
of the heat of hydration, drying shrinkage behavior. The procedures shall be such that cracking or loss of strength of the concrete from these effects is prevented. At least one week before commencing the construction of any massive concrete section, the Concessionaire shall submit, for approval of the Project Engineer and Executing Agency, detailed proposals for placing the concrete together with supporting calculations to demonstrate the suitability of the methods.

3.2.3 Materials

In general, all the materials used in the manufacture of concrete shall be in accordance with the Technical specification for properties, storage and handling of common building materials, (vide module C2) which shall be deemed to form a part of this specification.

The Project Engineer and Executing Agency shall have the right to inspect the sources of materials, method of procurement and storage of materials, method of procurement and storage of materials, quality control procedures, etc.

➢ Cement

The cement used shall be the Ordinary Portland cement conforming to IS:269 or Portland Pozzolana cement conforming to IS:1489 or Portland slag cement conforming to IS:455 or any other type of cement, specified in IS:456 with the prior approval of the Project Engineer and Executing Agency. However, any special type of cement such as High strength cement or sulphate resisting cement, may be used under special circumstances.

➢ Aggregates

a) For reinforced concrete work, aggregates conforming to IS:383 & IS:2386 having a maximum size of 20 mm shall be used. For certain reinforced concrete works, aggregates having a maximum size other than 20 mm size shall also be used as called for in the drawings. However, for lean concrete provided as mud mat below structural concrete, maximum size upto 40 mm shall be used.

b) Aggregates (coarse or fine) with a specific gravity below 2.6 shall not be used without special permission of the Project Engineer and Executing Agency. Machine-made sand will be acceptable provided the constituent (rock/gravel) is sound, hard, dense and is acceptable to the Project Engineer and Executing Agency. Sand, natural gravel and crushed rock shall be prepared for use by such screening or washing, or both, as necessary to remove all objectionable foreign matter.

c) Type of aggregates: Petro graphic examination shall be carried out to ascertain the structure and rock type of aggregate including presence of strained quartz and other reactive minerals. Moreover, in case the coarse aggregate sample is of composite nature, the proportions (by weight) of different rock types in the composite sample and petrographic evaluation of each rock should also be ascertained. While determining
different rock type is in the composite sample, special emphasis should be given on identification of known reactive rocks like chalcedony, opal etc. and procedure laid down in IS:2430 for sampling of aggregates may be followed. The sample should not contain weathered rock and reduced to required quantity by quartering and coning.

The results of petro graphic test shall be submitted to the Project Engineer and Executing Agency. The Project Engineer and Executing Agency shall review the results on consultation with some specialist agencies, if required, to determine potential activity of the aggregate (siliceous minerals) which may lead to reaction of silica in aggregate with the alkalis of cement. In additional, potential of some aggregate like lime stone to residual expansion due to repeated temperature cycle is also to be reviewed. Further, the Concessionaire shall submit the results of Alkali aggregates reactivity carried out as per IS:2386 (Pt. VII).

In case of any apprehension about the properties of the aggregate, the Project Engineer and Executing Agency shall ask the Concessionaire to send samples of coarse and fine aggregate to any of the established research laboratory including National Council for Cement and Building Materials (NCB).

In case, it is established from the tests that the aggregates contain reactive silica which would react with alkalis of the cement, the Concessionaire shall be asked to change the source of supply of the aggregate and take additional measures as suggested. In case aggregates indicate residual expansion, under repeated temperature cycle test, the material shall not be used for concreting of equipment foundations, which are likely to be subjected under repeated temperature cycle. The Concessionaire shall use different type of aggregate as approved by the Project Engineer and Executing Agency.

- **Admixtures**

Admixtures in concrete for promoting workability, improving strength, entraining air for similar purposes may be used only after the written permission from the Project Engineer and Executing Agency is obtained. These shall be free from injurious amount of chloride, etc. Addition of admixtures should not reduce the specified strength or durability of concrete and should not have detrimental effect on reinforcement. The admixtures shall conform to IS:9103 and shall be of proven make and from a reputed manufacturer. Calcium chloride as accelerating admixture is not permitted to be used other than in mass concrete works. The Concessionaire shall produce latest test results carried out at approved Government Test Houses for the approval of the Project Engineer and Executing Agency.

**3.2.4 Water**

Water used for mixing and curing shall be clean and free from injurious amounts of oils, acids, alkalis, sugar, organic materials or other substances that may be deleterious to concrete or steel. Potable water is generally considered satisfactory for mixing concrete. The maximum permissible values of impurities shall be as given in Clause no. 4.3 of IS:456-1978.
In case of doubt regarding development of strength, the suitability of water for making concrete shall be ascertained by the compressive strength and initial setting time tests specified in IS:456.

Average 28 days compressive strength of at least three 150 mm concrete cubes prepared with water proposed to be used shall not be less than 90% of the average strength of three similar concrete cubes prepared with distilled water. The cubes shall be prepared, cured and tested in accordance with IS:456.

The initial setting time of a concrete test block made with the appropriate cement and the water proposed to be used shall not be less than 30 minutes and shall not differ by ± 30 minutes from the initial setting time of control test block prepared with the same cement and distilled water. The test shall be carried out as per IS:4031.

Where concrete, made from water, proposed to be used does not satisfy the above requirements and/or contains an excess of acid, alkali, sugar, salt or other deleterious, substances, then the Project Engineer and Executing Agency may refuse to permit its use. Sea water shall not be used for curing besides mixing in concrete.

### 3.2.5 Grades of concrete

All concrete shall be “design mix concrete” as defined in IS:456, unless an nominal mix concrete such as 1:2:4, 1:3:6, 1:4:8 of 1:5:10 proportion is specified. The proportion referred to is by weight (mass). The grades for ‘design mix’ concrete shall be designated M-15, M-20, etc. as specified in IS:456. (20% replacement ratio of cement with fly ash shall be considered):

- **Nominal mix concrete**
  
  a) Nominal mix concrete shall be used only for plain Cement concrete works and where shown on drawings or specifically allowed by the Project Engineer and Executing Agency. Such concrete shall not require preparation of trial mixes and all such concrete shall be mixed in a mechanical mixer. Proportions for nominal mix concrete shall be according to Table-3 of IS:456-1978. In addition, standard proportion by volume shall be used wherever specified.

  b) In proportioning concrete, the cement & fly ash shall be measured by (mass) weight. The quantities of fine and coarse aggregates may be determined by volume (for corresponding weight) but preferably by weight. If fine aggregates are moist, the amount of surface water shall be determined. Also an allowance shall be made for bulking in case of volume batching, in accordance with IS:2386 (Part-III). Allowance shall also be made for surface water present in the aggregates, when computing the water requirement. All the above data shall be maintained properly, to the satisfaction of the Project Engineer and Executing Agency.
c) The recommended maximum water cement ratios are specified in Table 1.

<table>
<thead>
<tr>
<th>Nominal mix concrete</th>
<th>Quantity of water per 50 Kg. of cement (max.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1:5:10</td>
<td>60 litres</td>

<tr>
<td>1:4:8</td>
<td>45 litres</td>
</tr>
<tr>
<td>1:3:6</td>
<td>34 litres</td>
</tr>
<tr>
<td>1:2:4</td>
<td>32 litres</td>
</tr>
</tbody>
</table>

d) Nominal mix concrete 1:5:10 shall correspond to grade M5, 1:4:8 shall correspond to grade M7.5, 1:3:6 to grade M10 and 1:2:4 to grade M15 of IS:456.

e) If Nominal mix concrete made in accordance with specified proportions does not yield the specified strength of the corresponding grade and fails to satisfy the requirements of “acceptance criteria for concrete” as specified in IS:456. Such concrete shall be treated in the following manner:

i) In case the Project Engineer and Executing Agency is satisfied that lower strength of concrete is attributed to material and workmanship of the Concessionaire, then such concrete shall be replaced by concrete of specified strength. The Project Engineer and Executing Agency may however, also accept such lower strength concrete but such lower strength concrete shall be classified as belonging to the appropriate lower grade proportion.

ii) In case the Project Engineer and Executing Agency is satisfied that lower strength of concrete is not attributable to the Concessionaire, he may direct in writing to increase the cement content to obtain specified strength. The use of richer mix shall be continued until the Project Engineer and Executing Agency instructs otherwise.

f) Nominal mix proportion shall not be classified as higher grade proportion either on the ground that the test strengths are higher than the minimum specified or in the case where the Project Engineer and Executing Agency directs use of additional cement over the quantity specified for the particular mix proportion to achieve the minimum specified strength.

➢ Design mix concrete

a) Design mix concrete shall be used on all concrete works, except where specified otherwise or specially permitted by the Project Engineer and Executing Agency. The mix shall be designed for all grades of concrete (except those specified under Nominal Mix Concrete (20% replacement ratio of cement with fly ash):) such as to obtain for works cubes, the required workability and the characteristic strength not less than the appropriate values given in Table 2. Using Standard Deviation specified in IS:10262 corresponding to good
quality control, the Minimum value of target strength of design mix of various grades of concrete shall be as per Table 2.

However, the Project Engineer and Executing Agency may allow to change the target strength values based on adequate numbers of works test results.

### Table 2: Grades of concrete

</tr>
<tr>
<td>M 35</td>
<td>45.4</td>
<td>35</td>
</tr>
</tbody>
</table>

b) In proportioning concrete, the quantity of cement, fly ash and aggregates shall be determined by mass. However, only in some exceptional cases including concreting in some isolated areas, the Project Engineer and Executing Agency may allow the quantity of aggregates to be determined by an equivalent volume basis after the relationship between weight and volume is well established by trials and the same shall be verified frequently. Water shall be either measured by volume in calibrated tanks or weighed. All measuring equipment at site, shall be maintained in a clean and serviceable condition, and their accuracy shall be periodically checked.

c) To keep the water-cement ratio to the designed value, allowance shall be made for the moisture contents in both fine and coarse aggregates and determination of the same in accordance with IS:2386 Part (III) shall be made as frequently as directed by the Project Engineer and Executing Agency.

In some of the structures, water-cement ratio shall be restricted even below 0.45. To increase the workability, plasticizer may have to be used in such cases. Trial mix shall be carried out accordingly.

d) With the permission of the Project Engineer and Executing Agency, for any of the above mentioned grades of concrete, if the water quantity has to be increased, proportionately cement quantity shall also be increased, to keep the ratio of water to cement same as adopted in Preliminary tests for the corresponding grade of concrete. The extra cement required on account of this shall also be considered for reconciliation purposes.

> **Mix design**
a) IS:10262 shall be followed as general guidance for mix design. Preliminary tests/trial mix, as specified or as required by the Project Engineer and Executing Agency, shall be carried out sufficiently ahead of the actual commencement of the work with different grades of concrete made from representative samples of aggregates and cement & fly ash expected to be used on the works. These tests are to be conducted to arrive at the grading of aggregates, water cement ratio, workability and the quantity of cement required to give Preliminary (target) compressive strengths as specified in Table - 2.

b) Minimum cement contents, from durability consideration, or different exposures and sulphate attack shall be as given in Table - 19 and 20 of IS:456. In case, higher value is obtained from trial mix from strength consideration, same shall be considered.

c) At least four trial mixes are to be made and minimum. Six test cubes taken for each trial mix noting the slump for each type of mix. The cubes shall then be properly cured and three cubes for each mix shall be tested in a laboratory (approved by the Project Engineer and Executing Agency) at 7 days and others at 28 days and others at 28 days for obtaining the compressive strength. The test reports shall be submitted to the Project Engineer and Executing Agency. The design mix particulars shall indicate, with the help of graphs and curves etc. the extent of variation in the grading of aggregates which can be allowed. While designing mixes, over wet mixes shall be avoided. For chimney, natural draft cooling tower, etc. where assessment of early strength is required, the concrete cubes shall also be tested for early age strength at 1 day and 3 days for establishing the values.

d) The Concessionaire shall submit the test reports of mix design to the Project Engineer and Executing Agency for his view, indicating design criteria, analysis and proportioning of materials, etc. On the basis of the above test reports, a mix proportion by mass and the water cement ratio, shall be determined by the Concessionaire such that concrete prepared with this mix yield the desired characteristic strength and shall have suitable workability. The mix design to be adopted on the works shall be subject to the approval of the Project Engineer and Executing Agency. The proportions, once decided for different grades of concrete, shall be adhered to, during all concreting operations as long as the quality of the materials does not change. If, however, at any time, the quality of materials being used has changed from those for Preliminary mix design, or there is a change either in the required strength of concrete, or water cement ratio or workability, the Concessionaire shall have to make similar trial mixes and Preliminary tests to ascertain the revised mix proportions and water cement ratio to be used for obtaining the desired strength and consistency.

e) In the situations, like casting of piles, where the compaction of concrete is not possible by vibration, the method of compacting concrete cubes of Preliminary / trial mixes and work tests shall be in the same manner as the method of compacting concrete at site is proposed.
Workability of concrete

a) The workability of concrete shall be checked at frequent intervals. The workability of concrete measured in accordance with IS:1199 for every sample taken for testing shall be recorded with the corresponding cube test result.

b) The degree of workability necessary to allow the concrete to be well compacted and to be worked into the corners of formwork and round the reinforcement to give the required surface finish shall depend on the type and nature of the structure and shall be based on experience and tests. The suggested ranges of values of workability for concrete for some placing conditions, measured in accordance with IS:1199 as stipulated under Clause No. 6.0 of IS:456, are given below in Table - 3, for guidance only. In addition, in some special cases like casting of pile, very high degree of workability (up to 180 mm slump) shall be used.

<table>
<thead>
<tr>
<th>Placing</th>
<th>Degree of workability</th>
<th>Value of workability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Concreting of shallow sections with vibration factor</td>

</tr>
<tr>
<td></td>
<td></td>
<td>aggregate the values will be lower)</td>
</tr>
</tbody>
</table>

Note: Notwithstanding the values given above, the slump to be maintained for work in progress shall be as per directions of the Project Engineer and Executing Agency.
Mixing of concrete

a) Concrete shall be mixed in a mechanical mixer conforming to IS:1791. However, mixing shall preferably be done at a single central batching plant, conforming to IS:4925, situated within the area allocated for the Concessionaire’s particular use as shown on the drawing or as directed by the Project Engineer and Executing Agency. The plant shall have a mechanically operated mixer of an approved size and type, capable of ensuring a uniform distribution of the materials throughout the mass and the mass is uniform in colour and consistency.

b) Water shall not be added into the drum of the mixer, until all the cement and aggregates constituting the batch are already in the drum and dry mixed for at least one minute and are uniformly distributed. Water shall then be added and mixing of each batch shall be continued until there is a uniform distribution of the materials and the mass but in no case shall mixing be done for less than two minutes and for at least 40 revolutions after all the water and materials are in the drum. When absorbent aggregates are used or when the mix is very dry, the mixing time shall be extended as directed by the Project Engineer and Executing Agency. Mixers shall not be loaded above their rated capacity as this prevents thorough mixing.

c) The entire contents of the drum shall be discharged before the ingredients for the next batch are fed into the drum. No partly set or remixed or excessively wet concrete shall be used and it shall be immediately removed from site. Each time if the work stops for more than 30 minutes, the mixer shall be thoroughly cleaned and when the next mixing commences, the first batch shall have 10% additional cement.

d) In exceptional circumstances and/or work in remote areas, hand mixing may be allowed by the Project Engineer and Executing Agency, subject to adding 10% extra cement which shall be considered for reconciliation purposes. The mixing shall be carried out on watertight platform and mixing shall be continued till a uniform colour and consistency of the mix is achieved.

Concrete conveying

a) Concrete shall be handled and conveyed as rapidly as practicable, from the place of mixing to the place of final laying, by approved means, before the initial setting of the cement starts. Concrete shall be conveyed in such a way that there is no segregation or loss of any of the ingredients and maintaining the required workability. If segregation does occur during transport, the concrete shall be remixed.

During very hot or cold weather, if directed by the Project Engineer and Executing Agency, concrete shall be transported in deep containers, which will reduce the rate of
water loss by evaporation in hot weather and heat loss in cold weather, at no extra cost to the Executing Agency.

b) Conveying equipment for concrete shall be mortar tight, well maintained and thoroughly cleaned before commencement of concrete mixing. Such equipment shall be kept free from set concrete. Chutes shall not be used for transport of concrete without the written permission of the Project Engineer and Executing Agency. The chute in case permitted to be used shall be of such size and design as to ensure practically continuous flow. Slope of the chute shall be so adjusted that the concrete flow without the use of an excessive quantity of water and without segregation of its ingredients. The delivery end of the chute shall be as close as possible to the point of deposit.

c) Concrete may be conveyed and places by mechanically operated equipment, e.g. pumps or pneumatic placers only with the written permission of the Project Engineer and Executing Agency, who shall also review the entire scheme for which comprehensive details shall be furnished by the Concessionaire.

Concrete placing

a) Concrete shall be placed and compacted in its final position before the cement reaches the initial set and normally concrete shall be compacted in its final position within minutes of leaving the mixer.

b) Where direct placement is not possible, the Concessionaire shall provide suitable arrangements such as chutes, tremie, elephant trunks, etc. to confine the movement of concrete as directed by the Project Engineer and Executing Agency. Concrete shall not be dropped from a height or handled in a manner which may cause segregation.

c) If concrete is placed by pumping, the consistency shall be the minimum necessary for such conveyance of concrete. Before commencement of regular pumping, the pipeline shall be lubricated by cement mortar (1:2), and once pumping commences, stoppages shall be avoided.

d) Concrete shall not be placed in foundations on soft areas or where there is standing water or debris. Such soft areas shall be removed and filled with 1:4:8/1:3:6 nominal mix concrete, as directed by the Project Engineer and Executing Agency.

For rock surfaces, it shall be ensured that the rock is not unsound. On sloping rock faces, rough steps or benches shall be formed and concrete shall not be placed on a sloping rock surface. Prior to pouring concrete, the rock surface shall be cleaned with a high pressure water and air jet and kept wet for three hours. Also, before placing concrete, water shall be removed from depressions, the rock surface shall be dried and a 10mm thick cement sand
mortar (1:6) layer shall be placed and worked into all crevices, cracks, depression, etc.

e) The placing of concrete shall be a continuous operation with no interruption in excess of 30 minutes between the placing of continuous portions of concrete. Concrete shall be placed in continuous horizontal layers of 150 mm or higher thickness as directed by the Project Engineer and Executing Agency and thoroughly compacted before placing next layer. The thickness of each layer shall be such that it will be deposited before the previous layer has stiffened. When placing concrete through reinforcing steel, care shall be taken to prevent segregation of the coarse aggregates.

f) Approval by the Project Engineer and Executing Agency of any of the materials and/or work as required herein shall not relieve the Concessionaire of his obligation to produce finished concrete in accordance with the drawings and specifications. Slots, openings, holes, pockets, etc. shall be provided in the concrete as directed by the Project Engineer and Executing Agency.

g) Slabs, beams and similar members shall normally be poured in one operation. In special circumstances, with the approval of the Project Engineer and Executing Agency, these can be poured in horizontal layers, but it must be ensured that the under layer is not already hardened. Bleeding of under layer, if any, shall be effectively removed. Molding, throating, drip course, etc. shall be poured as shown on the drawings or as desired by the Project Engineer and Executing Agency.

h) After the concrete has been placed, it shall be spaded and thoroughly compacted by approved mechanical vibrators to a maximum subsidence without segregation and thoroughly worked around reinforcement or other embedded fixtures into the correct form and shape. Hand tamping in some cases may be allowed subject to the approval of the Project Engineer and Executing Agency. Care must be taken to ensure that the inserts, fixtures, reinforcement and formwork are not displaced or disturbed during placing of concrete.

i) Whenever vibration has to be applied externally, the design of formwork and the disposition of vibrators shall receive special consideration to ensure efficient compaction and to avoid surface blemishes. Surface vibrators and form attached vibrator shall not be permitted under normal conditions. Their use shall require written approval of the Project Engineer and Executing Agency.

j) Vibrators shall penetrate both the layer poured and the under layer to ensure good bond homogeneity and to prevent the formation of cold joints. Immersion vibrators shall not be allowed to come in contact with steel reinforcement after start of initial set. Also, they shall not be allowed to come in contact with forms or finished surfaces.
Immersion vibrators shall have a ‘no load’ frequency, amplitude and acceleration as per IS:2505 depending upon the size of the vibrator. Immersion vibrators shall be operated by experienced men. These vibrators shall be immersed not more than 450 mm apart and withdrawn when air bubbles cease to come to the surface. Such vibrators shall in no case be used to push concrete inside the forms and vibrators shall be withdrawn slowly.

No concrete shall be placed in wet weather or on a water covered surface. If there have been any signs of washing of cement or sand, the concrete shall be entirely removed immediately. Suitable precautions shall be taken in advance to guard against possible rains before leaving the fresh concrete unattended.

Mass concrete shall be poured in lifts not exceeding 1.0 m in height unless otherwise indicated on drawings or as directed by the Project Engineer and Executing Agency. Horizontal lift shall not be more than 150 cm in thickness, according to provision of IS:457.

Formwork and reinforcement shall be approved in writing by the Project Engineer and Executing Agency before concrete is placed. Concrete shall be placed only after all preparations for casting have been approved by the Project Engineer and Executing Agency and approval given to proceed with the casting in writing on pour card to be maintained by the Concessionaire for this purpose.

Concrete, when deposited, shall have a temperature of not less than 5 degrees Centigrade and not more than 40 degree Centigrade. When depositing concrete in very hot weather, precautions shall be taken so that the temperature of wet concrete does not exceed 40 degrees Centigrade while placing. This shall be achieved by stacking aggregates under the shade and keeping them moist, starting curing before concrete dries out, etc. However, before mixing / placing concrete, when the above temperature conditions vary on either side, approval of the Project Engineer and Executing Agency shall be obtained for the method of execution.

**Protection and curing of concrete**

Newly place concrete shall be protected by approved means from rain, sun and wind. Concrete placed below ground level, shall be protected from falling earth, during and after placing. Concrete placed in ground containing any deleterious substances, shall be kept free from contact with such ground or with water draining from such ground, during placing of concrete and for a period of atleast three days or as otherwise instructed by the Project Engineer and Executing Agency.

The ground water around newly poured concrete shall be kept down to an approved level by pumping or other approved means of drainage. Adequate steps shall be taken to prevent floatation or flooding. Steps, as approved by the Project Engineer and Executing Agency,
shall be taken to protect immature concrete from damage by debris, excessive loading, vibration, abrasion, mixing with earth or other deleterious materials, etc. that may impair the strength and durability of the concrete.

c) As soon as the concrete had hardened sufficiently for the surface not to be marked, it shall be kept in a damp or wet condition by pounding or by covering with a layer of sacking, canvas, hessian or similar materials and kept continuously wet for at least seven days after final setting. This period may be extended, at the discretion of the Project Engineer and Executing Agency, up to fourteen days. Curing of horizontal surfaces exposed to drying winds shall begin immediately after the concrete has hardened. Concrete slabs and floors shall be cured for the periods mentioned above by flooding with water of minimum 25mm depth.

d) Approved curing compounds may be used in lieu of moist curing with the permission of the Project Engineer and Executing Agency. However, such permission may be granted only in specific cases. Such compounds shall be applied to all exposed surfaces of the concrete, as soon as possible after the concrete has set.

e) Quantity of water applied shall be such as to prevent erosion of freshly placed concrete.

**Construction joints**

a) When work has to be interrupted, the concrete shall be rebated and/or keyed at the joint to such shape and size as may be required by the Project Engineer and Executing Agency or as shown on the drawings. All vertical construction joints shall be made with stop boards, which are rigidly fixed and slotted to allow for the passage of the reinforcing steel. In the case of water retaining structures, basements, tunnels, etc. water stop of approved material shall be provided, if so specified on the drawings or as directed by the Project Engineer and Executing Agency.

b) Construction joints shall be located as shown or described on the drawings. Where it is not described, the joints shall be in accordance with the following guidelines.

i) In a column, the joints shall be formed about 75 mm below the lowest soffit of the beams framing into it, including haunches, if any. In flat slab construction, the joint shall be 75 mm below the soffit of the column capital.

ii) Concrete in a beam shall be placed throughout without a joint. If unavoidable, the joint shall be vertical and within the middle-third of the span. When a beam intersects a girder, the joints in the girder shall be given an offset equal to a distance twice the width of the beam and additional reinforcement provided for shear. The joints shall
be vertical throughout the full thickness of the concrete member with suitable shear key wherever shown on the drawing.

iii) A joint in a suspended floor slab shall be vertical at one quarter points of the span and at right angle of the principal reinforcement.

iv) Construction joints in equipment foundations shall not be provided without specific concurrence of the Project Engineer and Executing Agency.

v) Vertical construction joints in water retaining structures shall not be permitted unless shown on the drawings.

However, if the Concessionaire desires any adjustments in the location of construction joints (to suit site conditions) from those shown on drawings or from those explained above, he shall obtain prior approval from the Project Engineer and Executing Agency.

c) Before fresh concrete is placed, the cement skin of the partially hardened concrete which was poured earlier shall be thoroughly removed and the surface made rough and aggregate exposed, by wire brushing, hacking, water jetting, air jetting or any other method as directed by the Project Engineer and Executing Agency. The rough surface shall be thoroughly wetted for about ½ hour and shall be dried and coated with 10 to 15 mm thick layer of 1:1 freshly mixed cement and sand slurry. Special care shall be taken to see that the first layer of concrete placed after a construction joint is thoroughly rammed against the existing layer.

d) In forming a joint, concrete shall not be allowed to slope away to a thin edge. The locations of construction joints shall be planned by the Concessionaire well in advance of pouring and they will have to be approved by the Project Engineer and Executing Agency. The Concessionaire’s proposals shall include at least the location of construction joints, the sequence of pouring, formwork details and their stripping times.

e) Where the concrete has not fully hardened, all laitance shall be removed by scrubbing the wet surface with wire or bristle brushes. Care being taken to avoid dislodgement of particles of aggregates. The surface shall be thoroughly wetted and all free water removed. The surface shall then be coated with neat cement slurry. On this surface, a layer of concrete not exceeding 150 mm in thickness shall first be placed shall be well rammed against old work, particular attention being to corners and close spots. Work thereafter, shall proceed in the normal way.

f) For multiple lift work a suitable gap shall be maintained between setting of the earlier placed concrete and the commencement of concrete pour. After depositing concrete in columns, piers or walked time gap of minimum 4 hours, preferably 24 hours shall be
maintained before depositing concrete in beams, girders or slabs, supported there in order to avoid cracking due to settlement.

- **Work in extreme weather conditions**

  During hot weather (atmospheric temperature above 40 degree centigrade) of cold weather (atmospheric temp at 5 degree centigrade and below) the concreting shall be done as per the procedures and precautions set out in IS:7868 (Parts I and II).

- **Cleaning and finishing of concrete**

  a) All concrete surfaces shall have an even and clean finish free from honeycombs, air bubbles, fins or other blemishes unmarred, reasonable smooth. The formwork joint marks on concrete work exposed to view shall be rubbed with carborandum stone and defects patched up with paste of cement sand mortar (1:2) and cured. The finish shall be made to the satisfaction of the Project Engineer and Executing Agency. Concrete surfaces to be subsequently plastered or where brickwork is to be built against them, shall be adequately hacked as soon as the form is stripped off so that proper bond can develop.

  b) Immediately after removal of forms, the concrete shall be inspected and defective areas as pointed out by the Project Engineer and Executing Agency shall be removed partially or entirely as directed. Holes, left by form bolts, etc. shall be filled-up and made good with cement sand mortar of approved mix. All superficial defects such as honeycombing, rough patches, etc. shall be similarly made good. If the defective area is at a vulnerable location, e.g. at the ends of beams & columns etc then it may be necessary to cut out the member completely or in part and reconstruct as directed by the Project Engineer and Executing Agency. If epoxies have to be used, the same shall be subject to the approval of the Project Engineer and Executing Agency. Poured concrete affected by faulty formwork shall be removed totally and replaced. If so directed, the Concessionaire shall have to resort to grouting / shotcreting.

  c) A smooth finish shall be obtained with the use of forms having smooth and even surfaces and edges. Panels and form linings shall be of uniform size and be as large as practicable and installed with closed joints. Upon removal of forms, the joint marks shall be smoothened off and all blemishes, projections etc. removed leaving the surfaces reasonably smooth and unmarred.

  d) Where integral cement concrete finish is called for, the surface shall be compacted and then floated and treated with a straight edge and any high and low spots eliminated. The work shall be carried out as per IS:2571
3.2.6 Sampling, testing and quality assurance including construction tolerances

- General
  
a) Concrete cubes for works tests shall be cured under laboratory conditions, except when in the opinion of the Project Engineer and Executing Agency, extreme weather conditions prevail at which time, these may require curing under job conditions.

b) For the purposes of statistical analysis, any substandard cube result, which in the opinion of the Project Engineer and Executing Agency, is due to improper sampling, molding or testing shall be discarded and a dummy result shall be substituted. The value of a dummy result shall be equivalent to the average value of the cubes from the same grade of concrete tested immediately before and after the discarded result. The number of such substandard cubes shall not exceed 5%.

c) If the ‘strength’ of the laboratory controlled cubes, for any portion of the concrete work, falls below the compressive strength specified, the Project Engineer and Executing Agency shall have the right to order a change in the proportions or the water content for the remaining portion of the surface.

d) If the ‘strength’ of the works cured test cubes falls below the specified strength, the Project Engineer and Executing Agency shall have the right to require provisions for temperature and moisture control during the period of curing as necessary to secure the required strength, and may require retest in accordance with the standard method of securing, preparing and testing specimens from hardened concrete for compressive and flexural strengths, or load tests to be made on the portion of the building so affected. All such tests shall be made at the Concessionaire’s expense.

e) Unacceptable concrete work shall be dismantled by the Concessionaire and replaced by fresh work, meeting the specification requirements. In the course of dismantling, if any damage is done to the embedded items or adjacent structures, the same shall be made good, by the Concessionaire, to the satisfaction of the Project Engineer and Executing Agency, at no extra cost to the Executing Agency.

f) Only as a very special case and that too in non-critical areas, the Project Engineer and Executing Agency may accept concrete work which is marginally unacceptable as per the criteria laid down in IS:456.

g) Before placing concrete, the inside of forms shall be checked to ensure that they are clean and thoroughly wetted or adequately treated. So as to prevent absorption of water from the concrete.

h) Ultrasonic tests on the foundations of major equipment to ascertain the quality and grade of concreting shall be carried out. The Executing Agency shall arrange for the specialized
agency for conducting the test at his cost. The Concessionaire shall provide all the necessary facilities and arrangement for conducting the test at site in terms of access, scaffolding etc. In case of any defects, the Concessionaire shall rectify the same as directed by the Project Engineer and Executing Agency.

i) Rebound hammer test shall be carried out for ascertaining the quality of concrete work, as directed by the Project Engineer and Executing Agency.

j) Test shall be conducted for the water tightness of the liquid retaining structures as per IS:3370 and IS:6494. The details and sequence of tests shall be as given hereunder:

i) All arrangements, including supply of water for testing purposes, shall be kept ready when the tank is nearing completion.

ii) Water supply to the tank shall be in stages of 300 to 450 mm height in order to check the water tightness of the tank and location of leakage of various levels.

iii) The permissible drop in level in 24 hours shall be 6 mm in case of covered reservoir/tank and 12 mm in the case of open reservoir/tank.

iv) The leakage points shall be marked and separately treated after dewatering.

v) The reservoir / tank shall be retested for water tightness after rectification.

vi) For basement type structures like cable vault, track-hopper, tunnel, neutralizing pit, etc. the Concessionaire shall examine the water tightness against ingress of sub-soil water.

➢ **Sampling of concrete**

Samples from fresh concrete shall be taken according to IS:1199 and tested as per IS:516.

a) Normally only compressive test shall be performed but the Project Engineer and Executing Agency may require other tests to be performed in accordance with IS:516.

b) i) **Trial Mixes:**

Atleast four trial mixes shall be made with; min. 6 test cubes for each mix.

ii) **Works Tests:**

The min. frequency of sampling of concrete of each grade shall be according to clause 14.2.2 of IS:456-1978. However, after getting continuous satisfactory results and in the case of voluminous concrete works, the Project Engineer and Executing Agency, may at
his discretion reduce the frequency of sampling as follows.

For each grade of concrete, and for each 8 hours (shift) of work or part thereof, at least one sample consisting of six specimens shall be taken from each 150 cum. of concrete or part thereof, 3 specimens shall be tested at 7 days and remaining 3 shall be tested at 28 days. However, in all cases, the 28 days compressive strength shall alone be the criterion for acceptance or rejection.

c) To control the consistency of concrete from every mixing, slump tests and compaction factor tests in accordance with IS:1199 shall be carried out by the Concessionaire every two hours or as directed by the Project Engineer and Executing Agency. Slumps corresponding to the test specimens shall be recorded for reference.

d) The strength of sample shall be the average of the strength of three specimens. The individual variation should not be more than ±15% of the average.

➢ Unless otherwise specified, the tolerance in construction shall be as follows:

The dimensions of concrete as cast when compared with those on the drawings shall be within the tolerance given below:

<table>
<thead>
<tr>
<th>Description of item / structural element</th>
<th>Permissible deviation in mm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Faces of concrete in foundations and structural members against which backfill is placed.</td>
<td>+25   -10</td>
</tr>
<tr>
<td>Location of footing (for RCC framed structures only).</td>
<td>+25   -25</td>
</tr>
<tr>
<td>Eccentricity of footing</td>
<td>2% of footing width of direction of misplacement but limiting to 50mm</td>
</tr>
<tr>
<td>Top surface of slabs and of concrete to receive base plates to be grouted.</td>
<td>+5   -5</td>

</tr>
<tr>
<td>Tread</td>
<td>+3.0   -3.0</td>
</tr>
<tr>
<td>Plumb</td>
<td>3mm for every metre subject to a maximum of 10mm.</td>
</tr>
</tbody>
</table>

➢ Acceptance criteria
The acceptance criteria of concrete shall be in accordance with Clause no.15 of IS:456. However, in exceptional circumstances, the Project Engineer and Executing Agency may, at his discretion, accept a concrete of lower strength than that specified at reduced rates. The concrete shall be deemed to comply with the strength requirements if:

a) Every sample has a test strength not less than the characteristic value or  
b) The strength of one or more samples, though less than the characteristic value, in each case is not less than the greater of:
   i) The characteristic strength minus 1.35 times the Standard Deviation and
   ii) 0.80 times the characteristic strength; average strength of all the samples, is not less than the characteristic strength + \[1.65 - \frac{1.65}{\text{square root of (No. of samples)}}\] times the standard deviation.

➢ Load test

If any work is found unacceptable whereupon the Project Engineer and Executing Agency requires its removal and reconstruction, the Concessionaire may request that it should be load tested in accordance with the provision of Clause no. 16.50 of IS:456-1978 as given below:

a) The test load shall be 125 percent of the maximum superimposed load for which the structure or element was designed. This load shall not be applied earlier than 28 days after the effective hardening of concrete. This test load shall be maintained for 24 hours and during the entire duration of the test, struts, strong enough to take the whole superimposed, dead and other loads shall be placed in position, leaving a small gap under the members.

b) The maximum deflection shall be measured after the test load is in position for 24 hours. Thereafter, the test load shall be removed.

c) If 24 hours after the removal of the load, the structure does not show a recovery of atleast 75 percent of the maximum deflection, registered as in (b) above, the test shall be repeated after a lapse of 72 hours. The structure shall be considered to have failed to pass the test if the recovery after the second test is not atleast 80% of the maximum deflection during the second test.

d) If the maximum deflection in mm, shown during 24 hours under load, is less than \(40 \frac{l}{D}\) where \(l\) is the effective span in metres and \(D\) is overall depth of the section in mm, it is not necessary for the recovery to be measured and the recovery position of the above mentioned clause (c) will not apply.

3.3 Reinforcement
3.3.1 **Scope**

This section of the specification deals with reinforcement for all reinforced concrete works and covers the requirement of materials, their properties, storage, handling, furnishing of bar bending schedules and the cleaning, bending, binding and placing of reinforcement with suitable cover blocks. This shall also include the supply of reinforcement, wherever required.

3.3.2 **General requirements**

The Concessionaire shall prepare and furnish to the Project Engineer and Executing Agency, bar bending schedules for all RCC works for his review and approval. No work shall commence without the approval of bar bending schedule by the Project Engineer and Executing Agency, in writing.

The Concessionaire shall have to obtain prior written approval from the Project Engineer and Executing Agency, if he desires any adjustments in diameter or spacing of reinforcement. However, the Concessionaire shall modify the bar bending schedule, when a particular type and size of reinforcement would not be available, with the approval of the Project Engineer and Executing Agency.

3.3.3 **Materials**

All steel for reinforced concrete works shall be in accordance with Technical Specification for Properties, Storage and Handling of common Building Materials, (vide module C2) which shall be deemed to form the part of this Specification.

All bars shall be thoroughly cleaned before being fabricated. Pitted and defective bars shall not be used.

3.3.4 **Bending and placing**

- **Bending**
  
a)  Reinforcing bars supplied bent or in coils, shall be straightened before these are cut to size. Straightening of bars shall be done in cold and without damaging the bars. This is to be considered as a part of reinforcement bending and fabrication work.

  b)  Unless otherwise specified, reinforcing steel shall be bent in accordance with procedure specified in IS:2502 and/or as approved by the Project Engineer and Executing Agency. Bends and shapes shall comply strictly with the dimensions shown on the approved bar bending schedules and they shall be rechecked by the Concessionaire before bending and he shall be entirely responsible for their correctness. Bars correctly bent, shall only be used. Unless specified otherwise or directed by the Project Engineer and Executing Agency, the detailing of reinforcement shall be in accordance with IS:5525 and SP:34.
c) No reinforcement shall be bent, when in position in the work without approval of the Project Engineer and Executing Agency, whether or not it is partially embedded in concrete. Where the reinforcement bars are bent aside, at construction taken to ensure that, at no time, the radius of the bend is less than 4 times the bar diameters for plain mild steel or 6 times the bar diameters for deformed bars. Care shall also be taken while bending back bars, to ensure that the concrete around the bar is not damaged.

d) Welding of bars to obtain continually shall not be allowed, particularly for cold twisted bars, unless specifically approved by the Project Engineer and Executing Agency. If welding is approved, the work shall be carried out as per IS:2751 and IS:9417, according to the best practice and as directed by the Project Engineer and Executing Agency.

➢ Placing in position

a) All reinforcement shall be accurately fixed and maintained in position as shown on the drawings by such approved means as steel chairs, and/or concrete spacer blocks as per IS:2502. Bars intended to be in contact at crossing points by two numbers annealed steel wire of 0.9 mm to 1.6 mm size conforming to IS:280 in such a manner that they do not slip over each at the time of fixing & concreting. The tying of bars shall be in crisscross manner.

b) Binders shall tightly embrace the bars with which these are intended to be in contact and shall be securely held. The vertical distance between successive layers of bars shall be maintained by provision of spacer bars. These shall be so spaced that the main bars do not sag perceptively between adjacent spacers.

Bundled bars shall be provided wherever shown on the drawing to facilitate concreting. Location of laps and development lengths, shall be as indicated on the drawings.

c) The placing of reinforcement shall be completed well in advance of concrete pouring. Just prior to concrete pouring, the reinforcement shall be checked by the Project Engineer and Executing Agency, for accuracy of placement and cleanliness. Necessary corrections, as directed by the Project Engineer and Executing Agency shall be carried out. Care shall be taken to ensure that projecting ends of ties and other embedded metal do not encroach into the concrete cover. Where concrete blocks are used for ensuring the cover and positioning of reinforcement, these shall be made of mortar 1:2 (1 cement : 2 sand) by volume and cured for at least seven days. The sizes and locations of the concrete blocks shall be approved by the Project Engineer and Executing Agency. The 28 days crushing strength of cover blocks shall be atleast equal to the specified strength of concrete in which the blocks will be embedded.
d) Laps and anchorage length of reinforcing bars shall be in accordance with IS:456, unless otherwise specified. If the bars in a lap are not of the same diameter, the smaller diameter will guide the lap length. Laps shall be staggered as far as practicable and as directed by the Project Engineer and Executing Agency and not more than 50% of bars shall be lapped at a particular section. Mechanical connections, for splicing reinforcement bars in congested locations may be used by the Concessionaire, only if approved by the Project Engineer and Executing Agency. Reinforcement bars shall not be lapped unless the length required exceeds the maximum available lengths of bars at site.

3.3.5 Cover to reinforcement

a) Unless shown otherwise on the drawings, minimum clear concrete cover for reinforcement (exclusive of plaster or other finishes) shall be as follows:

- At each end of a reinforcing bar, not less than 25 mm, nor less than twice the bar diameter.
- For a longitudinal reinforcing bar in a column, 40 mm or bar diameter whichever is more. 25 mm cover may be adopted for columns of minimum dimension 200 mm or under and with longitudinal reinforcement diameter not exceeding 12 mm.
- For longitudinal reinforcing bars in a beam, not less than 25 mm or less than the bar diameter.
- For reinforcement in slabs and walls; not exposed to weather or ground not less than 15 mm nor less than the bar diameter.
- For bottom reinforcement in footings: 75 mm, if concrete is laid against the ground or 40 mm if laid on a layer of lean concrete.
- For retaining walls, grade beams, top and sides of footings and similar surfaces exposed to weather or ground; 50 mm for bars larger than 16 mm and 40 mm for bars upto 16 mm.
- For concrete members exposed to the action of harmful chemicals, acids, alkalis, atmosphere, sulphurous smoke, seawater etc., the cover shall be as shown on the drawings.
- For liquid retaining structures; 40 mm or diameter of main bars, whichever is larger. This shall be increased to 50 mm in case of seawater or corrosive environment.

b) Clean distance between reinforcing bars shall be in accordance with IS:456 or as shown on drawings.

3.3.6 Sampling, testing and quality assurance

➢ General

Sample bent bars shall be checked to ensure that they conform to the bar bending schedules.
Reinforcement in position shall be checked for proper positioning, and rigidity, cover, spacing of bars, placement of chairs and spacers, etc. Also it shall be checked that all bars at crossings are properly tied.

➢ Tolerance

Tolerance in construction, unless otherwise specified or as approved by the Project Engineer and Executing Agency shall be as follows:

<table>
<thead>
<tr>
<th>Description of item / structural element</th>
<th>Permissible deviation in mm (Max.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Placing of reinforcement</td>

</tbody>
</table>

3.4 Formwork and staging

3.4.1 Scope

This section of the specification deals with the requirements for the supply, erection, dismantling of formwork and staging required for cast-in-situ concrete works including for making pockets / block outs.

3.4.2 General conditions

The Concessionaire shall supply, fabricate, erect, and dismantle (after use) all staging that is required for all activities covered under the specifications. He shall prepare the scheme and submit along with the supporting calculations for approval of the Project Engineer and Executing Agency.

3.4.3 Materials

Formwork shall compose of steel, best quality wood or non-absorbent type plywood. Timber shall be free from significant knots and shall be of medium grain as far as possible and hard woods shall be used as caps and wedges under or over posts. Timber shall be well seasoned, free from sap, shakes, worm holes, warps or other surface defects and shall have smooth finish.

Staging, unless specified otherwise, shall generally be of mild steel tubes, steel beams and channels etc. or strong sal ballies 150 mm in diameter or above. Bamboos, small diameter ballies etc., shall not be used unless approved by the Project Engineer and Executing Agency in specific
3.4.4 Classification of formwork

a) Ordinary

This shall be used in places where ordinary surface finish is required and shall compose of steel and/or approved good quality seasoned wood. Plywood shuttering can also be used by the Concessionaire.

b) Plywood

This shall be used in exposed surfaces as shown on drawings or as directed by the Project Engineer and Executing Agency where a specially good finish is required. Such surfaces shall be formed using approved brand of heavy quality water resistant plywood to produce a perfectly leveled, uniform and smooth surface. Reuse of such forms may be permitted only after inspection and approval by the Project Engineer and Executing Agency, for each such reuse.

c) Formwork for shell roofs

For this item, the detailed design of formwork shall be submitted by the Concessionaire to the Project Engineer and Executing Agency, well in advance, for his approval. Units of shell forms may be used repeatedly but prior approval shall be required for each repetition. Extra care shall be taken to keep correct levels and profiles.

3.4.5 Quality of formwork and staging

Formwork shall consist of all materials required for forming the boxing to pour concrete, including steel / wood / plywood forms, ties, anchors, hangers, inserts, etc. Formwork shall be so constructed that vertical and horizontal adjustments can be made as required. The design and engineering of formwork including staging as well as its erection and dismantling shall be the responsibility of the Concessionaire.

The staging shall be true and rigid and thoroughly braced in both directions as well as cross braced, strutted and propped such that it will not deform unduly under weight of concrete and other loads due to men, equipment, etc. Vertical member or props should not be supported on an unpropped lower suspended floor or beam unless it is ensured by the Concessionaire that the lower floor or beam can safely carry the loads. No propping shall take place until the Project Engineer and Executing Agency’s approval has been given to the Concessionaire’s scheme submitted along with supporting calculations.

The forms and staging shall be sufficiently strong to carry without under deformation, the dead weight of the concrete as liquid as well as anticipated working loads. Where the concrete is vibrated, the formwork shall be strong enough to withstand the effects of vibration, without
appreciable deflection, bulging, distortion or loosening of its components. The joints in the formwork shall be sufficiently tight to prevent any leakage of mortar. The formwork shall be such as to ensure a smooth uniform surface free from honeycombs, air bubbles, bulges, fins and other blemishes. Any blemish or defect found on the surface of the concrete, must be brought to the notice of the Project Engineer and Executing Agency immediately and rectified as directed.

To achieve the desired rigidity, ample studs, braces, bolts, spacer blocks, wires, clamps, ties, straps, shores, etc. shall be used to hold the form in proper position without undue distortion. These shall be approved by the Project Engineer and Executing Agency but they must in no way impair the strength of concrete or leave stains or marks on the finished surface. Where there are chances of these fixtures being embedded, only mild steel or concrete of adequate strength shall be used. Bolts passing completely through liquid and or earth retaining walls / slabs, basement walls etc. For the purpose of securing and aligning the formwork, shall not be permitted.

For exposed interior and exterior concrete surfaces of beams and columns, plywood or other approved forms thoroughly cleaned and tied together with approved corrosion resistant devices shall be used. Rigid care shall be exercised ensuring that all column forms are plumb and true and thoroughly cross-braced to keep them so.

Beveled strips 25x25 mm shall be provided to form angles and in corners of columns and beam boxes for chamfering of corners if shown on drawings or directed by the Project Engineer and Executing Agency. Temporary openings for cleaning, inspection and for pouring concrete shall be provided at the base of vertical forms and at other places, where these are necessary and as may be directed by the Project Engineer and Executing Agency. The temporary openings shall be so formed that they can be conveniently closed rigidly when required and must not leave any mark on the concrete.

If it is so desired by the Project Engineer and Executing Agency, the Concessionaire shall prepare, before commencement of the actual work, designs and drawings for formwork and staging and get them approved by the Project Engineer and Executing Agency. Formwork shall be so designed and positioned that it can be removed without damage to concrete.

The Concessionaire shall maintain necessary camber in centering for all floor slabs and beams in all spanning directions, so as to offset the deflection and assume correct shape. The camber shall have the crown of not less than 8 mm for every 5 metres span unless otherwise shown on the drawings. For cantilever, camber at free end shall be 1 in 100.

The Concessionaire shall provide the shuttering for complete stretch of work upto expansion joints for the structures like shell, folded plate etc. and/or as directed by the Project Engineer and Executing Agency.

3.4.6 Cleaning and treatment of forms

All forms shall be thoroughly cleaned of old concrete, wood shavings, saw dust, dirt and dust sticking to them before these are fixed in position. All rubbish, loose concrete, chippings, shavings, saw dust etc. shall be scrupulously removed from the interior of the forms before
concrete is poured. Wire brushes, brooms, compressed air jet and/or water jet etc. shall be kept handy for cleaning, if directed by the Project Engineer and Executing Agency.

Before formwork is placed in position, the form surfaces that will be in contact with concrete shall be treated with approved non-staining oil or composition, which is insoluble in water and not injurious to concrete. Care shall be taken that the oil or composition does not come in contact with reinforcing steel or stain the concrete surfaces. Burnt oil shall not be allowed to be used specially where the concrete surface will require finishing and/or plaster.

3.4.7 Removal of forms

The Concessionaire shall begin the removal of formwork only after the approval of the Project Engineer and Executing Agency. He shall place on record the dates on which the concrete is placed in different parts of the work and the dates of the removal of formwork therefrom. This record shall be checked and countersigned by the Project Engineer and Executing Agency. The Concessionaire shall be responsible for the safe removal of formwork but the Project Engineer and Executing Agency may delay the time of removal if he considers it necessary. Any work showing signs of damage through premature removal of formwork, shall be entirely removed and reconstructed by the Concessionaire at no extra cost to the Executing Agency.

The formwork shall be so designed and erected that the forms for slabs and the sides of beams, columns and walls may be removed first, leaving the beam bottoms and their supports in position. Re-propping of beams shall not be done except with the approval of the Project Engineer and Executing Agency. Formwork for columns and walls at each stage of concreting shall be erected only upto the particular lift of construction. Wedges, spacer bolts, clamps or other suitable means shall be provided to allow accurate adjustment of the formwork and to allow it to be removed gradually without jerking the concrete.

Forms of various types of structural components shall, under normal circumstances, not be removed before the minimum periods specified in Cl. 10.3 of IS:456-1978, which shall also be subject to the approval of the Project Engineer and Executing Agency. However, in any case formwork shall not be struck until the concrete has reached strength, atleast twice that of the stress to which the concrete may be subjected to at the time of removal of forms.

In normal circumstances and where ordinary Portland cement is used, forms may generally be removed after the expiry of the following periods, according to clause no. 10.3 of IS:456-1978.

<p>| i.          | Walls, columns and vertical faces of all structural members as directed by the Project Engineer and Executing Agency. | 1 to 2 days |
| ii.         | Slabs (Props left under)                                                                                   | 3 days      |
| iii.        | Beam soffits (props left under)                                                                           | 7 days      |
| iv.         | <strong>Removal of props under slabs</strong>                                                                          |             |
|             | Spanning up to 4.5 m                                                                                       | 7 days      |
|             | Spanning up to 4.5 m                                                                                       | 14 days     |
| v.          | <strong>Removal of props under beams</strong>                                                                           |             |</p>
<table>
<thead>
<tr>
<th>Spanning up to 6 m</th>
<th>14 days</th>
</tr>
</thead>
<tbody>
<tr>
<td>Spanning over 6 m</td>
<td>21 days</td>
</tr>
<tr>
<td>vi. Cantilever slabs</td>
<td>14 days</td>
</tr>
</tbody>
</table>

The number of props left under, their sizes and disposition shall be such as to be able to safely carry the full dead load of the slab, beam or arch as the case may be together with any live load likely to occur during curing or further construction.

Where the shape of the element is such that the formwork has reentrant angles, the formwork shall be removed as soon as possible after the concrete has set, to avoid shrinkage cracking occurring due to the restraint imposed.

In case of cantilever slabs, the removal of forms shall begin from the outer edge and proceed towards the support, where as in the case of slabs supported on two/four sides, the removal of forms shall begin from centre to supports.

The formwork shall be so made as to produce a finished concrete, true to shape, lines, plumb and to dimensions as shown on the drawings. The Project Engineer and Executing Agency may call for finished work at any time to set standards of workmanship. Once approved, these will become the accepted Sample.

In case PPC/PSC is used instead of OPC, the removal of shuttering/support shall be after 50% more time from that being applied for OPC, unless otherwise permitted by the Project Engineer and Executing Agency. For concrete temperature above 40 °C, stripping time shall be increased. In case of special structures, such as shells, folded plates, etc., the sequence of removal of forms shall be as per drawings or as directed by the Project Engineer and Executing Agency.

### 3.4.8 Reuse of forms

Before reuse, all forms shall be thoroughly scraped, cleaned, all nails and adhering substances removed, holes and leaks satisfactorily plugged, joints examined and where necessary repaired and inside surfaces treated as specified herein before. Formwork shall not be used/re-used, if declared unfit or unserviceable by the Project Engineer and Executing Agency.

### 3.4.9 Testing and quality assurance (including dimension tolerance)

- **General**

  Staging shall be checked for its soundness as a whole and for adequacy of the joints and its foundations. All joints shall be either vertical or horizontal and shall be such as to avoid loss of liquid through the formwork.

- **Dimensional tolerance for formwork**

  Levels and heights \( \pm 6 \text{ mm} \)
Plumb 3 mm for every metre subject to a maximum of 10 mm.
Unevenness of any surfaces ± 3 mm
Length or breadth ± 12 mm
Diagonals ± 15 mm

In case of inclined surfaces like track hopper wall, folded plates etc., the deviation in the alignment of inclined surfaces, shall not exceed 3 mm with reference to the theoretical alignment, for a length of 1000 mm measured vertically, subject to a maximum of 10 mm.

In addition to above, requirement of clause no. 10.3 shall be complied with, which shall be the final acceptance criteria of concrete work.

3.5 Embedded parts

3.5.1 Scope

This section of specification deals with the supply, fabrication (where called for) and/or erection of embedded steel parts and PVC pipes.

3.5.2 General requirements

Embedded steel parts shall be furnished by the Executing Agency for transportation & erection by the Concessionaire or supplied, fabricated and erected by the Concessionaire as stipulated. If supplied by the Executing Agency, these parts shall be furnished anywhere within the project area and the Concessionaire shall transport the same to the work site.

a) Embedded steel parts supplied, fabricated and erected by the Concessionaire shall include items such as, but not limited to, foundation grillages, anchor bolts, pipe sleeves, equipment mounting plates, steel pieces properly welded with necessary lugs as shown on the drawings, auxiliary framing for equipment supports, pesty plugs for door and window frames, dowel bars for concrete work, miscellaneous frames, etc.

b) Embedded steel parts supplied, fabricated/erected by the Concessionaire shall also include items such as, but not limited to plate inserts, edge protection angles, rolled sections with or without properly welded lugs.

c) Cold work deformed steel bars shall not be used for lugs.

3.5.3 Materials

The materials shall be in accordance with the relevant clauses of Technical Specification for ‘Properties, Storage and Handling of Common Building Materials (vide module C2), which shall be deemed to form a part of this specification. Mild steel pipes shall conform to IS:1161. Unless otherwise specified, medium class pipes shall be provided/ PVC pipes shall conform to IS:4985. Minimum pressure rating shall be 2 Kgf/cm².
3.5.4 Fabrication, erection etc.

The Concessionaire shall fabricate, transport to site and erect accurately in position all embedded steel parts either by welding, bolting or any other means as approved by the Project Engineer and Executing Agency. Exposed surfaces of embedded parts other than holding down bolts, unless otherwise stated, are to be painted with two coats of approved anticorrosive paint (as per IS:2074) and/or bituminous paint as directed. The threads of holding down bolts shall be greased and protected with waterproof tape.

During erection, the Concessionaire shall provide necessary strong temporary bracings and supports to ensure proper installation of the embedded parts which shall be erected at the true locations as shown on the drawings and these shall be in plumb and level (unless otherwise shown on drawings). The Concessionaire shall furnish the Project Engineer and Executing Agency with fabrication and assembly drawings prepared for embedded steel parts showing the erection procedure, for major items, wherever necessary.

Fabrication & erection shall be carried out as per IS:800. Welding rods & site / field welding shall conform to IS:816 and IS:9595. IS:7634 (Part - III) shall be followed for PVC pipe works.

3.6 Foundation bolt assembly

3.6.1 Scope

This section of the specification deals with the requirements of supply, fabrication and erection of foundation bolt assembly etc.

3.6.2 General requirements

Supply, fabrication, erection and installation of Foundation bolt assembly shall comprise of foundations bolts, stiffener plates, washers, nuts, lock nuts, pipe sleeves etc.

3.6.3 Materials

Foundation bolts shall generally conform to IS:5624. Mild steel bars used for the fabrication of bolt assembly shall conform to grade-I of IS:432, IS:226, IS:2062 or any other material including high carbon/high tensile steel as specified.

Hexagonal nuts and lock nuts shall conform to IS:1363 & IS:1364 upto M 36 dia and IS:3138 and M 42 to M 150 dia.

Flat plain washers shall be of mild steel and punched/machined type conforming to IS:5369.

Steel pipe sleeves shall conform, to Medium class of IS:1161.
3.6.4 Fabrication, erection, etc

The fabrication and erection of bolt assemblies shall include threading, cutting, grinding, drilling, welding, etc., complete. All bolts, bolts assemblies, etc. shall be fabricated by the Concessionaire to the correct dimensions and shapes as shown on drawings, supplied by the Engineer. The bolts shall have coarse pitch screw thread in the diameter range, 8 to 64 and 6 mm pitch screw for diameter > 64 mm as per IS: 4218.

For fabrication of any particular size of bolt indicated on the drawing, the diameter of the threaded portion of the bolt shall be considered as the diameter of the bolt.

Every bolt shall be provided with steel washer, under the nut. The washer shall be flat and min. outside circle have a diameter 2.50 times that of the bolt and of suitable thickness. All nuts shall be of steel with well formed hexagonal heads unless specified otherwise, forged from solid metal and shall be dipped in hot boiled linseed oil as soon as these are made. The nuts shall fit good on the bolts.

During erection, the Concessionaire shall provide necessary template, temporary bracings, supports, etc. to ensure proper positioning of the assemblies and holding them firmly until they are cast / grouted and the grouted has set. All materials shall be erected in plump and in level (unless otherwise specified) and at true locations as shown on the drawings. Threads shall be protected by using PVC taps.

Fabrication & erection shall be carried out as per IS:800. Welding shall conform to IS:816 and 9595.

3.7 Shotcreting

3.7.1 Scope

This section of the specification deals with the requirements of furnishing and placement of shotcreting.

3.7.2 General requirements

Generally, shotcreting shall be done in accordance with IS:9012.

Reinforcement for shotcreting shall be as detailed below, unless specified otherwise.

a) Reinforcement in one direction consisting of 6 mm M.S. bars at 750 mm c/c shall be connected to the lugs of fastening of the wire fabric. This shall be used in case of 50 mm or above thick shotcreting.

b) Wire fabric conforming to IS:1566 shall be used as reinforcement and shall consist of wire, 3 mm diameter, spaced 50 mm both ways and shall be electrically cross welded. Wire fabric shall be securely tied to 6 mm bars for 50 mm (min) thickness. Adjacent sheet of wire fabric shall be lapped at least 100 mm tied.
c) Clear cover to reinforcement mesh shall not be less than 15 mm.

This work shall be executed only by experienced operators, approved by the Project Engineer and Executing Agency.

Minimum thickness shotcreting shall be 50 mm. for abrasion resistant and 25 mm for ordinary surface protection work.

3.7.3 Materials

Generally, the materials shall be in accordance with the relevant clauses of Technical Specification for properties. Storage and Handling of common Building Material, which shall be deemed to form a part of this Specification.

a) Fine aggregates shall consist of natural sand or crushed stone from a known source and shall be strong, hard, coarse, sharp chemically inert, clean and free from any coating. It shall be free from clay, coal or coal residue, organic or any other impurities that may impair the strength or durability of the concrete and shall conform to IS:383.

b) Fine aggregate (sand) shall be well graded and particles shall range in size within the following limits. The Project Engineer and Executing Agency, may approve the use of any other grading as per the requirements of IS:9012.

<table>
<thead>
<tr>

<td>0 – 10</td>
</tr>
</tbody>
</table>

c) The fineness modules shall be preferably between 2.5 & 3.3. Any other value can be used, with prior approval of the Project Engineer and Executing Agency.

Water shall be clean & free deleterious matter and shall have same properties, stipulated for use in concrete work.

Set accelerating and water-proofing shotcreting admixtures of approved make shall be used wherever required.

3.7.4 Application

After the placement of reinforcement and/or welded mesh and not more than six hours prior to the
application of shotcrete, the surface shall be thoroughly cleaned of all loose material and dirt. The Concessionaire shall properly prepare the surfaces, reinforcement and/or welded mesh to receive the shotcrete. Cleaned surfaces shall be wetted not more than one hour prior to shotcreting.

The mix as placed on surface shall one part cement to three parts approved sand by volume. Cement and sand shall be dry mixed; no water shall be added after mixing and before using in the gun. The quantity of water when added, shall be only that which is sufficient to hydrate the cement. For average atmospheric conditions, the water cement ratio for shotcrete in place shall be between 0.35 and 0.5. Suitable admixture shall be used wherever required.

A uniform pressure of not less than 2.5 Kgf/cm$^2$ at the nozzle shall be maintained. Necessary adjustments shall be made to ensure this pressure, taking into account the length of hose and height of the place to be shotcreted.

The application shall proceed in an upward direction. Beams, stiffener and intermediate walls, if any, shall be wrapped with wire fabric and completely covered with shotcreting. All rebound shall be removed from the area of application as the work progresses and such rebound material shall not be reused.

3.7.5 Curing

As soon as the freshly shotcreted surface shows the first dry patches, a fine spray of water shall be applied to keep it moist. After the surface has hardened, it shall be kept continuously moist for minimum seven days. If there is extreme heat, especially when accompanied by hot winds, the shotcreted surface, immediately upon completion, shall be covered with burlap of similar covering, which must be kept continuously moist for 14 days after shotcreting. The temperature of the lining shall not be permitted to exceed 38 Degrees Centigrade during placing and curing.

3.8 Grouting

3.8.1 Scope

This section of the specification deals with the requirements of furnishing and placement of grout in block outs and foundation bolt holes and underpinning of base plates In case special type of grouting is required for the machine base plate, the Concessionaire shall submit the details of the same and get it approved from the Project Engineer and Executing Agency.

3.8.2 General requirements

The space between the top surface of the foundation and the underside of the base plate shall be filled with appropriate grout. Crushing strength of grout shall be one grade higher than the foundation concrete. Minimum crushing strength shall be 25N/sq.mm. Unless otherwise specified.

The contact area between the grout and base plate shall not be less than 80%.
3.8.3 **Materials**

Cement shall be Ordinary Portland Cement slag cement or Pozzolana Portland Cement conforming to IS:269, 455 and 1489 respectively.

Sand shall be clean and well graded conforming to IS 383. For flow able grout, sand conforming to Zone - 4 grade shall be used. Coarse aggregate wherever used shall also conform to IS:383.

Clean potable water as recommended for concrete mix shall be used.

- **Admixtures**
  
a) Non-shrink admixtures of approved make shall be used.
b) Plasticizer conforming to IS:9103 shall be used to increase the workability, wherever required.

3.8.4 **Mixing and placing**

- **Type of mix**
  
There shall generally be following three types grout mix::

  i) Ready mixed non-shrink cementations grout
  ii) Cement-Sand Grout: The proportion of cement to sand shall generally be 1:2, unless otherwise specified.
  iii) Cement Aggregate Grout: The approximate proportions of cement, sand and coarse aggregate shall be 1:1:25:2, with a maximum size of aggregate as 10 mm. This mix shall generally be used for grout thickness above 40 mm for dry pack application.

- **Mixing**
  
Depending upon the case of placement and method of application, there shall be following three grout consistencies.

  a) **Fluid Mix**: Water cement ratio shall be 0.6 (max.) may be added to increase workability, wherever required. This grout mix shall be suitable for application with low pressure grouting equipment or self flowing and suitable for grouting of pockets/block outs, etc.
  b) **Plastic Mix**: Water-Cement ratio shall be about 0.5. This grout mix shall be suitable for application with trowel or rod.
  c) **Stiff Mix**: Water-cement ratio shall generally be 0.4. This grout mix shall be suitable for dry-pack application. The consistency should allow pressurizing into firm hardball without cracking.
Placing

The block outs, bolts holes etc. Which have to be grouted, shall be cleaned thoroughly by use of compressed air just prior to taking up the grouting operations.

Cement, sand, aggregate, and non-shrink admixture of approved quality and proven make shall be first blended thoroughly in the required proportion as per manufacturer’s specifications. Grout shall then be prepared by mixing this admixture with water. Any grout which has been mixed for a period longer than half an hour shall not be used on the work.

Immediately after preparation, a grout of suitable mix shall be poured into the block outs, pockets and bolt holes either from the sides or through the holes provided for this purpose in the base plate, by using special equipment for pressure grouting. It shall be ensured by Roding and by tapping of bolts that the block out is completely filled without leaving any voids. The pouring shall cease as soon as each hole is filled and any excess grout found on the surface of the concrete foundation shall be completely removed and the surface dried.

The space between the top surface of the foundation concrete and the underside of the base plate shall be filled with appropriate grout type. Grouting, once commenced, shall be done continuously. Grout shall be worked from one end to the other (to prevent air entrapment) and until the grout oozes out through the grout holes provided in the base plates.

In case of stiff mix, the space between the top surface of foundation concrete and the underside of the base plate shall be dry packed by firmly pressing or ramming into place against fixed supports.

When it is clear that the centre of base has been properly filled, the grout outside the base plate shall be briefly rammed to ensure compaction below the edges. Shims provided for the alignment of plant bases shall be positioned at the edges of the base to permit subsequent removal, which shall take place not less than 7 days after the grouting has been executed. The resulting cavities shall be made good with the same grade of grout as has been used for grouting under the rest of the base plate.

Curing

The work shall be cured for a period of at least 7 days commencing 24 hours after the completion of the grouting. The curing shall be done by covering the surfaces with wet gunny bags and flooding.

3.9 Encasement of steel structures / elements

3.9.1 Scope

This section of specification deals with the requirement for encasement of steel work in concrete
with necessary formwork, placing, finishing and curing, complete as per drawings and specifications.

3.9.2 General requirements

All concrete work, reinforcement, formwork & staging work shall be done as per stipulations of section 2, 3 and 4 of this specification.

The reinforcement to be provided for encasement of steel elements shall be mild steel bars or in the form of wire netting. Such reinforcement shall be kept 20 mm away from the steel member and held securely to it.

The minimum grade of concrete to be used for encasing shall be M-20 unless specified. The aggregate to be used in concrete shall be 12.5 mm maximum size unless specified otherwise. In case of box type steel sections, encasement shall be done with cement, sand mortar (1:4) with thickness of 50mm over 0.9 mm size wire netting conforming to IS:3150, or as shown on the drawings.

In the case of encasement of beams with concrete, if the gap between the edge of the shuttering and flange is hardly sufficient for placing the concrete, the workability of the concrete shall be increased suitably by increasing the water-cement ratio. Minimum cover for concrete encasement shall be 50 mm

3.9.3 Materials

The materials shall be in accordance with the relevant clauses of Technical Specification for Properties, Storage and handling of common Building Materials which shall be deemed to form the part of this specification.

3.9.4 Wire netting

Hexagonal wire netting shall be 0.9 mm dia and 19 mm aperture size, conforming to IS:3150.

3.10 Joints in concrete

3.10.1 Scope

This section of the specification deals with the requirement of furnishing and installing of joints including joint filler materials, water bars, resilient pads type vibration damping material in an around the side of concrete works etc.

3.10.2 General requirements
Details of joints shall be as approved by Project Engineer and Executing Agency or as per approved drawings. Where necessary or / and specified, joints shall be made water tight by use of water stops.

3.10.3 Classification of joints

From the point of view of utility, the joints as provided may be classified as below:

a) **Construction joints**

Construction joints are produced by placing fresh concrete against surface of hardened concrete. Construction joints are generally, but not necessarily, vertical or horizontal. Requirements of construction joints shall be as per clause specified elsewhere.

b) **Contraction joints**

These are provided to eliminate tensile stresses due to shrinkage and are commonly used where temperature variations are small and where there is no likelihood of expansion, such as spaces below water and earth levels and unexposed to atmosphere. At contraction joints, the reinforcement is discontinued and bond is not allowed to develop between the joint faces, thereby introducing a structural discontinuity. A contraction joint also serves as a construction joint so far as break in the pouring of concrete is concerned.

c) **Expansion joints**

These are provided either to completely eliminate or to significantly reduce comprehensive stresses in concrete that would otherwise result from thermal expansion and might crush, buckle or crack part of the structure. Expansion joints serve the purpose of contraction and also construction joints.

d) **Control joints**

At places where cracking is inevitable, places of weakness are introduced by the provision of control joints so that the cracking takes place along these joints instead of allowing it to develop in a haphazard manner.

e) **Separation joints**

The places where the expansion of the structure is not expected but they are required to be kept structurally separate so that stresses, vibrations, etc. are not transferred, a separation joint should be provided. Like expansion joint, a gap is provided in separation joint also, but this is not expected to be used by the expansion of members. In case, no gap is required, the separation joint can be obtained by using an approved alkathene sheet stuck on the surface against which concrete shall be placed.

f) **Settlement joints**
Structures, which are likely to settle with respect to the adjacent structures, shall be separated by a settlement joint so that the adverse effects of differential settlement are obviated. It is like an expansion joint but with a different sealing arrangement.

3.10.4 Materials

- **Joint filler**
  
  a) **Bitumen board:**

  The bitumen impregnated fiber board; a preformed material shall be used as joint filler which shall fill space between the concrete surfaces at the joints. The minimum thickness of board shall be 12 mm and the material shall conform to IS:1838.

  b) **Expanded polystyrene:**

  The expanded polystyrene slab shall be of fire retarding grade (type-2) conforming to IS:4671 Density of material shall not be less than 25 kg/cum.

- **Water stops**

  a) Water stops shall be provided at the joints as a continuous diaphragm to contain the filler material and/or to exclude passage of water or any other material into or out of the structure.

  b) The water stops shall be either metallic like Copper, or non-metallic like P.V.C. the material is to be procured from reputed manufacturers having proven records of satisfactory supply of Water Stops of similar make and shape of other jobs. Only PVC water stop shall be used, unless, otherwise, specifically approved by the Project Engineer and Executing Agency.

  c) **Non-metallic Water Stop:**

  These will be normally in PVC and can be of shape having any combination of the following features:

  i) Plain
  ii) Central Bulb
  iii) Dumb-bell or flattened ends
  iv) Ribbed and Corrugated Wings
  v) V-shaped
  vi) Kicker type (Externally placed)

  Water bars shall generally meet the stipulations of IS:12200. The minimum thickness of PVC Water Stops shall be 5 mm and the minimum width 225 mm, unless otherwise specified in the schedule of items. However, for some non-critical areas 150 mm wide and
5 mm thick water stop can be used. The actual size and the shape will be as shown on drawings and/or as directed by the Project Engineer and Executing Agency. The material should be of good quality Polyvinyl Chloride, highly resistant to tearing, abrasion and corrosion as well as to chemicals likely to come in contact with during use. The performance requirements shall generally be as follows:

<table>
<thead>
<tr>
<th>Property</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sp. Gr</td>
<td>1.3 to 1.4</td>
</tr>
<tr>
<td>Shore hardness</td>
<td>60A to 80A</td>
</tr>
<tr>
<td>Tensile strength</td>
<td>116kgf / cm² min.</td>
</tr>
<tr>
<td>Max. Safe continuous temp.</td>
<td>70 degree C.</td>
</tr>
<tr>
<td>Ultimate elongation</td>
<td>Not less than 300%</td>
</tr>
<tr>
<td>Tear resistance</td>
<td>45kgf / cm² min.</td>
</tr>
<tr>
<td>Stiffness in flexure</td>
<td>25kgf / cm² min.</td>
</tr>
</tbody>
</table>

**Accelerated extraction**

- **i)** Tensile strength : 110kgf / cm²
- **ii)** Ultimate elongation : 250%
- **iii)** Water absorption in 7 days : 5% (max.)

**Effect of Alkali**

- **1.** Weight increase : 0.25% max.
- **2.** Weight decrease : 0.10% max.
- **3.** Hardness change : +5%

**Effect of Alkali**

- **a)** Weight increase : 0.40% max.
- **b)** Weight decrease : 0.30% max.
- **c)** Dimension change : ±1%

➢ **Sealing compound**

- **a) Bitumen sealing compound:**

The bitumen sealing compound shall be from approved manufacturer and shall conform to the requirements of IS:1834. For joints in concrete lining on canals/reservoirs, sealing compound conforming to IS:5256 shall be used.

- **b) Polysulphide sealing compound:**

This shall be two-part polysulphide sealant and shall be from approved manufacturer, conforming to IS:12118. Materials shall consist of polysulphide polymer and a curing agent. Gun grade material shall be used unless otherwise specified. The application of the sealant shall be strictly followed as per manufacturer’s guidelines.
Metal cover strips

Metal cover strips shall be made from aluminium or mild steel sections as shown on drawings. The min. thickness of aluminium strips shall be 3 mm and that of mild steel 6 mm. Aluminium alloy strip shall be corrosion resistant grade 31000 as per IS:737. Mild Steel shall conform to IS:226 or IS:2062.

Resilient pads

i) The vibration damping material shall be resilient rubber pads made up of natural or synthetic rubber and shall have the following physical properties

   a) Shore ‘A’ durometer hardness : 50 (+) / (-) 5
   b) Min. elongation : 450%
   c) Ultimate min. tensile strength : 145 kg/sq.cm

   d) Rubber pads shall not absorb more than 10% of weight of water in a 7 days test.

ii) The minimum thickness of the resilient pads shall be 12 mm.

3.10.5 Installation

Bitumen board / Expand polystyrene

The bitumen impregnated fiber board may be secured to vertical concrete by nails in the first placed concrete. The joint filler shall be coated on both faces with coal-tar pitch conforming to IS:216 or bitumen grade conforming to IS:73 or IS:702.

i) Water stops shall not have any longitudinal joints and shall be procured and installed in largest practicable lengths having a minimum number of transverse joints. The jointing procedure shall be as per the manufacturer’s recommendations and shall be reviewed and approved by the Project Engineer and Executing Agency. Suitable field splicing kit including heater shall be used for this purpose. The edges shall be neatly crimped and bent to ensure proper bond with the concrete.

ii) As Non-metallic Water Stops can be easily handled in very large lengths unlike metal strips, transverse joints will be allowed only under unavoidable circumstances and with the specific approval of the Project Engineer and Executing Agency. The method of forming these joints, laps etc. shall be as specified by the Manufacturer and/or approved by the Project Engineer and Executing Agency, taking particular care to match the centre and the edges accurately.
iii) Particular care shall be taken for the correct positioning of the water stops to prevent any faulty installation, which may result in joint leakage.

Adequate provisions shall be made to support the water stops during the progress of work and to ensure their proper embedment in the concrete. The symmetrical halves of the water stops shall be equally divided between the concrete pours adjacent to the joints.

Max. Density and imperviousness of the concrete shall be ensured by thoroughly working in the vicinity of joints. However, particular care should be exercised in use of vibrators in the proximity of joints to avoid dislodging of the water stops.

iv) Splices

Splices in the continuity of intersections of runs of water stops shall be jointed as per manufacturer’s stipulations depending on the type of water stops used. In case of a cross section, overlapping must not be done but, instead factory made cross joint should be used. It is essential that the material is not damaged during the splicing operation and that the continuity of the entire water stops across the section be maintained.

v) Inspection

All water stops installations shall be subject to inspection and approval by the Project Engineer and Executing Agency, before concreting operations, encasing water stops, are performed.

➢ Sealing compound

When directed, the gap in joints shall be thoroughly cleaned and sealing compound laid as per manufacturer’s specification and approved drawings. Primer shall be applied wherever required. For reservoir/canal lining, procedure as stipulated under clause 9.0 of IS:5256-1969 shall be followed.

➢ Metal cover strips

The metal cover strips shall be pinned (using stainless steel) at one end and slotted at the other end. Exposed surface of mild steel shall be painted with two coats of approved anti-corrosive paint (as per IS:2074) and/or bituminous paint. Welding of aluminium shall be in accordance with IS:2812.

3.10.6 Resilient pads:

The resilient pads shall be installed around the foundation or at other locations as shown on the drawings. The pads shall be installed in position by sticking the same to the foundations by using approved glue.
3.11 Waterproofing / damp proofing of underground concrete structures

3.11.1 Scope

This section of specification deals with the retirements of all works for completing water proofing / damp proofing of underground concrete structure. This shall include water retaining and basement type structures.

3.11.2 General requirements

As a general guidance, the provisions of IS: 6494 shall be followed unless otherwise mentioned.

The Concessionaire shall do the proper concreting so that concrete is water tight in itself without any waterproofing treatment. The waterproofing treatment shall be provided in exceptional cases, as additional precaution, as shown on the drawings or directed by the Project Engineer and Executing Agency.

The work of waterproofing / damp proofing of underground concrete structures by course of bitumen felt, blown bitumen or any other operations shall be entrusted by the Concessionaire to one of the well known expert agencies approved by the Project Engineer and Executing Agency. Actual type of waterproofing treatment to be provided for particular structure, shall be as shown on the drawings or directed by the Project Engineer and Executing Agency.

3.11.3 Bitumen felt treatment

- **Materials**
  
  a) The materials shall be in accordance with the relevant clauses of Technical specification for properties, Storage and Handling of Common building materials
  
  b) The bitumen felt shall conform to IS: 1322 and the workmanship to IS:1609 and IS: 3067. The bitumen felt shall be hessian based. Bitumen primer shall conform to IS: 3384. The bonding materials shall consist of blown type bitumen conforming to IS: 702 or residual bitumen conforming to IS:73 or a mixture of the two, to withstand local conditions of prevailing temperature gradient of surface. The Concessionaire shall satisfy the Project Engineer and Executing Agency that the bonding materials proposed to be used are suitable for the particular job.

- **Installation**
  
  a) Waterproofing / Damp proofing for horizontal surfaces, unless specified otherwise with two layers of felt on which subsequently concrete shall be placed, shall be provided with the following treatments:
i) A minimum of 12mm thick plaster 1:4 (1 cement : 4 sand) with waterproofing admixture / additives over PCC

ii) One coat of bitumen primer @ 0.4 kg/Sqm min.

iii) One layer of hot applied bitumen @ 1.5kg/sq.m. min.

iv) One layer of self-finished felt (type - 3, grade II as per IS: 1322).

v) One layer of hot applied bitumen @ 1.5 kg/Sqm min.

vi) One layer of self-finished felt (type - 3, grade - II as per IS: 1322).

vii) One layer of hot applied bitumen @ 1.5 kg/Sqm min.

viii) One layer of self-finished felt (type - 3, grade II as per IS: 1322).

ix) A minimum of 12mm thick plaster 1:4 (1 cement: 4 sand).

b) Water proofing / Damp proofing for other surfaces (including vertical) unless specified otherwise, with two layers of felt shall be provided with following treatments:

i) One coat of bitumen primer @ 0.4 kg/Sqm min.

ii) One layer of hot applied bitumen @ 1.5 kg/Sqm min.

iii) One layer of self-finished felt (type - 3, grade II as per IS: 1322).

iv) One layer of hot applied bitumen @ 1.5 kg/Sqm min.

v) One layer of self-finished felt (type - 3, grade II as per IS: 1322).

vi) One layer of hot applied bitumen @ 1.5 kg/Sqm min.

vii) One layer of self-finished felt (type - 3, grade II as per IS: 1322).

viii) One layer of hot applied bitumen @ 1.5 kg/Sqm min.

ix) Half brick masonry work in cement mortar 1:4 (1 cement: 4 sand) using bricks of class designation 75, unless otherwise specified.

3.11.4 Miscellaneous treatment

➢ Plastering treatment

After the side walls are constructed and allowed to undergo the specified curing, the surface of the walls and the flooring should be made rough with a hacking tool, washed clean with water and wire brushed so as to remove all the loose material, and a waterproof cement plaster 1:3 mix, with suitable proportion of an integral waterproofing compound shall be applied in two coats, the first coat being 12mm thick and the next 10mm thick. The second coat shall be applied after allowing a time interval of at least 24 hrs for the first coat to harden. Hexagonal galvanized netting of 0.90mm dia, 19 mm aperture size shall be used in the plastering. The netting shall be fixed with the help of MS Screws, fixed with the help of fibrous plugs provided before application of first layer of plaster.

➢ Hot applied bitumen treatment

The external concrete of plastered surface shall be carefully cleaned, cured and allowed to dry for some time before the application of a coat of hot bitumen of the industrial grade 85/25 conforming to IS : 702 against ground water seepage. Rate of application of bitumen shall not be less than 1.7 kg/Sqm and it should be heated to about 120 C before application. Anti-stripping
compound shall be added. Anti-stripping and adhesion improving agent shall be 100% mixable in bitumen. The stripping and adhesion improving agent shall be 100% mixable in bitumen. The stripping value tested as per IS: 6241 should be nil when recommended quantity of anti-stripping compound is mixed. Nominal mix proportion of the compound shall be 1 percent by weight of bitumen. However, actual mix proportion shall be as per manufacturer's recommendation.

➢ Polymer modified cementitious coating treatment

a) Materials

i) Modified liquid polymer blend shall be a dispersion containing 100% acrylic based polymer solids.
ii) Portland cement based dry powder
iii) Clean, fine specially prepared quartz sand approximately 0.6 mm size.

b) Mixing

The liquid polymer shall be stirred well and cement base powder shall then be added slowly to make a slurry mix. For preparation of brush topping mix, quartz sand shall be added slowly and mixed well till a homogenous mixture is obtained. The mix shall be used within half an hour of the preparation. Addition of quartz sand may not be necessary, in case dry power contains the same.

c) Properties of the coating

i) It must adhere to the wet surface
ii) It should develop adequate bond strength with the concrete surface, not less than 2 N / Sqm
iii) Co-efficient of permeability shall be about 5 x 10 Cms
iv) Water absorption after continuous soaking shall not be more than 1%.
v) The materials shall be permeable under water vapor.
vi) The material shall be resistant to acids and alkalis’ present in the soil and underground water with normal pH value between 4 and 14.
vii) The co-efficient of thermal expansion of the material shall be close to that of concrete.

d) Application

The concrete surface shall be cleaned and made free from grease, oils or loosely adhered particles. The surface shall be damp without any free water.

i) For slurry mix: a minimum of 2 coats shall be applied on the surface. The first coat being applied when the surface is still damp and left to harden for 4 to 6 hours. After
4 to 6 hours of the application of second coat, it shall be finished by rubbing down with a soft dry sponge. The coverage shall not be less than 1.1kg/sq.m in the 2 coats. A lap of 75mm shall be provided at the joints.

The coating shall be air dried for 4 to 6 hours and, thereafter, cured for 7 days after the application of last coat.

ii) For brush topping mix: This shall be applied in two coats. A primary coat of slurry mix can also be first applied on the surface as first coat. After the coating has dried up, a coat of brush topping mix shall be applied over it with a push broom or any other similar brush. It shall be left in broom finished condition. The nominal thickness shall be 1.5mm and minimum thickness shall be 1.0mm. A lap of 75mm shall be provided at the joints. It shall be ensured that no pinhole exists and re-brushing shall be done to cover the pinholes if any.

The coating shall be air dried for 4 to 6 hours and thereafter cured for 7 days after application of last coat.

3.11.5 Chemical injection treatment

Wherever shown on the drawing or directed by the Project Engineer and Executing Agency, min 12mm dia (N.B.) threaded nozzle of suitable length, shall be provided over the surface ad along the construction joint line in a grid pattern at a spacing not exceeding 1.5m c/c before concreting operation. Adequate precaution shall be taken to keep the nozzles plugged at both ends to prevent them from getting closed by concrete.

For fixing of any nozzle in set concrete suitable size hole shall be drilled, preferably by using repercussive hammer drill electrically operated, in grid pattern and grouting nozzle shall be fixed in these holes.

After the nozzles are fully set, neat cement slurry admixed with water-soluble non-shrink polymer/monomer based chemical shall be injected through the network of nozzles with low pressure grout pumps at a pressure of about 2.0 kg/sq.cm. Water cement ratio of the slurry shall not be more than 1:2. The resultant solution shall not have viscosity greater than 1:2 centipoises. Plasticizing agent shall be added wherever required. The grouting shall be started at very low pressure and increased gradually to a required pressure. The grouting shall continue till the hole refuses to take any further grout, even at an increased pressure. Applied pressure shall not be more than the designed strength of the concrete. After completion of grouting operation, the nozzles shall be sealed properly to the satisfaction of the Project Engineer and Executing Agency.

3.12 Dismantling / demolishing work - RCC and PCC
3.12.1 Scope

This section of specification deals with the requirements of dismantling / demolishing RCC and / or PCC work.

3.12.2 General requirements

The dismantling implies, carefully taking up or down and removing without damage, this shall consist of dismantling one or more parts of a structure. This includes chipping work, making holes/ opening etc in concrete members according to the required shape, size and profile at all elevations.

The term demolition implies, taking up or down or breaking up of a structure / member in part or full as specified or shown on drawings or as directed by the Project Engineer and Executing Agency.

In a structure / member, both dismantling and demolishing work may be involved. In such case, the portion of work treated as demolishing shall be as shown on the drawing or as decided by the Project Engineer and Executing Agency.

All materials obtained from the demolition/dismantling work shall be the property of the Executing Agency, unless otherwise specified.

All serviceable materials obtained, shall be separated out and stacked properly upto a lead of 500 metres and all unserviceable materials, rubbish etc shall be disposed off as directed by the Project Engineer and Executing Agency.

The dismantling / demolishing operations shall be carried out in proper sequence so that the serviceable material can be salvaged, without being damaged during the process of work.

Necessary propping, shoring and under pinning shall be provided for the safety of the adjoining work or property which is to be left intact, before dismantling / demolishing work

3.12.3 Safety

All demolition work shall be carried out in conformity with the local safety regulations, extreme caution being exercised to avoid damage to the work and the equipment, which are to be left intact. Necessary precautions shall be taken to keep the dust nuisance down. Safety requirements in IS: 4130 shall also be followed.

As and where necessary, the dismantled / demolished materials shall be lowered to the ground and not thrown and then properly stacked as directed by the Project Engineer and Executing Agency. Wherever required, temporary enclosures shall be erected to minimize the dust or moisture infiltration.

3.13 Cement additives / admixtures in concrete
3.13.1 Scope

This section of specification deals with the requirements of furnishing, placing and mixing cement additives / admixtures, in all kinds of cement concrete, (plain or reinforced) for all kinds of structures at all levels.

3.13.2 General requirements

The Concessionaire shall furnish all labour and equipment to place and mix waterproofing cement additive and cement plasticizer in concrete of any grade and cement mortar. Thereafter he shall carry out the work as specified earlier in relevant clauses of this specification for concrete and hence complete the work as indicated on the drawing and as per the specification listed hereunder.

Waterproofing additive and other types of admixtures shall be as far as possible, free from aggressive chemical like chloride, sulphide etc., which can cause corrosion of steel reinforcement in RCC.

The Concessionaire shall have the services of the manufacturer's supervisor, at no extra cost to the Executing Agency, to supervise the work, if directed by the Project Engineer and Executing Agency.
Admixtures in concrete for promoting workability, improving strength, entraining air or for similar purposes may be used only after the written permission from the Project Engineer and Executing Agency, is obtained. Addition to admixtures shall not reduce the specified strength or durability of concrete in any case. The admixtures shall conform to IS: 9103 and shall be of proven make and from a reputed manufacturer. Calcium chloride shall not be permitted to be used other than in mass (plain) concrete works.

3.13.3 Materials

Waterproof cement additive shall conform to IS: 2645 and shall be of proven make and from a reputed manufacturer.

Admixtures in concrete shall conform to IS: 9103 and shall be of proven make and from a reputed manufacturer. In addition, for plasticizer cum waterproofing compound materials shall meet the permeability requirements as per IS: 2645. Similarly, for plasticizer cum retarder admixture material shall satisfy the setting time requirements of retarder and other properties of plasticizer as per IS: 9103.

3.13.4 Mixing

Admixtures / waterproofing additive shall be used at the rate specified by the manufacturer or as indicated on the drawings and shall be mixed with water, as required by the Project Engineer and Executing Agency. Samples of concrete in which admixture and / or waterproofing cement additive is added shall be tested for water proofness, workability, compressive strength, water
absorption, density, setting time, etc., the results shall conform to relevant IS specifications.

### 3.14 Slab on grade

#### 3.14.1 Scope

This section of specification deals with carrying out the work of “slab on grade”. In all medium duty industrial floors

#### 3.14.2 General requirements

The Concessionaire shall furnish all material/ labour and equipment. The specifications covered under section C-3, sub section 1 to 13 for cast in situ concrete and allied works shall generally be applicable unless otherwise specified here under.

The work includes right from preparation of sub grade to completing and curing slab on grade in all respects to the satisfaction of the Project Engineer and Executing Agency.

#### 3.14.3 Materials

(a) Materials for filling shall be crushed stone dust, sand or other inorganic materials and they shall be clean and free from shingle, salts, organic matters, roots and excessive amount of sod, concrete or any other foreign substances which could harm or impair the strength of the substructure in any manner.

(b) Stones for Granular sub base shall be broken stones to gauge not exceeding 63 mm and shall be free from dust, organic matters etc.

(c) Maximum size of 40 mm stone aggregate shall be used for concrete.

(d) Cement shall be ordinary Portland cement conforming to IS:269, Grade 43

(e) Admixtures in concrete for improving workability, strength etc may be used only after the written permission from the Project Engineer and Executing Agency.

(f) Water shall be clean, free from injurious matters. Potable water is generally considered satisfactory.

(g) Reinforcing steel bars shall conform to grade 1 of IS:432 (part 1)

(h) Polysulphide sealant shall conform to IS 12118 Gun Grade.
Concrete curing compound shall be CONCURE WB of M/s. Fosroc Chemicals (India) Ltd., or equivalent.

3.14.4 Laying of slab on grade

i) Uneven (but fairly level) sub grade shall be dressed, leveled by necessary Excavation / Scraping / Filling, watered, rolled by 10T roller and consolidated to desired level.

ii) On consolidated sub grade, two layers of granular sub base each of 75 mm thickness shall be laid Total consolidated thickness of sub base shall be 150 mm. Refer specification No.C-1.6.0 - Granular Sub Base (Hard core)

iii) On consolidated sub base water proof paper shall be placed with minimum 150mm overlaps on all sides.

iv) Concrete grade M20, 150 mm thick shall be poured in strips as per drawing and as directed by the Project Engineer and Executing Agency.

The strips shall be prepared by placing formwork in straight line and level. Each strip may be of size 4 metre wide x 20 metre long alternate strips shall be cast by leaving 24 hours interval in between.

Form work shall be strong enough to hold the screed vibrator.

The concrete shall be vibrated by screed vibrator / surface vibrator and when it becomes touch dry it shall be machine trowel led to smooth uniform level surface. Ramp surfaces shall then be “Broom Finished”.

Under no circumstances dry cement or cement slurry shall be separately spread on concrete at any time.

Special care shall be taken to pour and vibrate the concrete along the form work to avoid any segregation of aggregate and honey combing.

v) 24 hours after concreting, the form work shall be removed and immediately the grooves of size 10mm x 50mm as shown on the drawing shall be cut in concrete at an interval of about 4.0 metres or as shown on the drawing.

The grooves shall be cleaned and concrete surface shall then be sprayed by water based concrete curing compound as specified. The grooves shall be filled up by poly sulphide sealant after fourteen days.

vi) Dowels shall be provided along transverse and longitudinal construction joints as shown on the drawing.

vii) Any expansion / contraction joints in slab on grade shall be provided at locations and as per the details indicated on the drawing.
3.14.5 Acceptance criteria

All finished surface shall be smooth, uniform and at desired line and level within a tolerance of ± 3.0 mm. It shall be free from cracks and warping.

Section - C4: Technical specifications for masonry and allied works

4.1 Scope

This section of the specification covers furnishing, installation including handling, transportation, batching, mixing, laying, scaffolding, centering, shuttering, finishing, curing, protection and repairing till handing over of brick masonry and allied works including DPC, plinth protection and dismantling.

4.2 General requirements

The Concessionaire shall furnish all skilled and unskilled labour, plant, equipment, scaffolding, materials, etc. required for complete execution of the work in accordance with the drawings and as described herein and/or as directed by the Project Engineer and Executing Agency.

All workmanship shall be in accordance with the latest standards and best possible practice. Masonry work shall be true to line & level as shown on drawings. All such masonry shall be tightly built against structural members and bonded with dowels, anchors, inserts, etc. as shown on the drawings.

The Concessionaire shall carry out all works for settling out the building lines, locating the coordinates and establishing the reduced levels (RL’s) on the basis of reference grid lines and bench mark, which shall be furnished by the Executing Agency, at one or more locations.

Any approval, instructions, permission, checking, review, etc. whatsoever by the Project Engineer and Executing Agency shall not relieve the Concessionaire of his responsibility and obligation regarding adequacy, correctness, completeness, safety, strength, quality, workmanship, etc.

4.3 Codes and standards

All applicable standards, acts and codes of practice referred to shall be the latest editions including all applicable official amendments and revisions. A complete set of all these documents shall generally be available at site, with the Concessionaire.

In case of conflict between this specification and those (IS Standards, Codes etc.) more stringent shall prevail.

Some of the applicable Indian Standards, Codes, etc. are referred to here below:

4.4 Brick masonry

4.4.1 Materials

Properties of common building materials for the construction of brick masonry, viz. burnt clay bricks, sand lime and cement shall be in accordance with the technical specification for ‘Properties, Storage and Handling of Common Building Materials’ (vide Mode C2). Besides clay bricks, other type of bricks like, fly ash-lime bricks cured by autoclave process shall also be used, whenever specified, or shown on the drawing.

4.5 Fly ash brick masonry

4.5.1 Materials

Properties of common building materials for the construction of brick masonry, viz. fly ash bricks, sand lime and cement shall be in accordance with the technical specification for ‘Properties, Storage and Handling of Common Building Materials’ (vide Mode C2). Besides fly ash bricks, other type of bricks like, fly ash-lime bricks cured by autoclave process shall also be used, whenever specified, or shown on the drawing.

4.5.2 Mortar

IS: 2250 shall be followed as general guidance for preparation and use of mortar. Only cement & Fly ash-sand mortar shall be used. Lime shall be added for composite mortar with specific approval of the Project Engineer and Executing Agency.

Unless otherwise specified, mortar for brickwork having one or more brick thickness shall be 1 part cement & fly ash (20% replacement ratio of cement with fly ash): and 6 parts sand by volume. Mortar for half-brick thick walls shall be 1 part cement & fly ash (20% replacement ratio of cement with fly ash): and 4 parts sand by volume. Richer mix proportion shall be used, whenever specified or as per design requirement. Mortar shall meet the compressive strength requirement as per IS: 2250 and IS: 1905.

Sand shall conform to IS: 2116. Grading of sand when tested as per IS: 2386 shall be as specified in Table -1.
Table 1: Grading of sand for use in masonry mortars

</table>

Sand, whose grading falls outside the specified limits due to excess or deficiency of coarse or fine particles, may be processed to comply with the standard by screening through a suitably sized sieve and/or blending with required quantities of suitable sizes of sand particles. Based on test results and in the light of practical experience with the use of local materials, deviation in grading of sand given in Table 1 may be considered by the Project Engineer and Executing Agency. The various sizes of particles of which the sand is composed, shall be uniformly distributed throughout the mass. The required grading may often be obtained by screening and/or by blending together either natural sands or crushed stone screenings, which are by themselves of unsuitable grading.

Cement, fly ash (20% replacement ratio of cement with fly ash): and sand shall be thoroughly mixed dry in a mechanical mixer and water shall then be added to obtain a mortar of the consistency of a stiff paste, care being taken to add just sufficient water for the purpose. Water shall be clean and free from injurious amount of deleterious matter such as oil, acid alkali, salt and vegetable growth. Hand mixing may be allowed by the Project Engineer and Executing Agency on clean approved platform in special cases only. Mortar shall be used as soon as possible after mixing, before it begins to set and preferably within 30 minutes after water is added to the dry mixture. Mortar unused for more than 30 minutes shall generally be rejected and removed from site of work. However, the Project Engineer and Executing Agency may allow the use of mortar up to 2 hours.

Surplus mortar droppings while laying masonry, if received on a surface from dirt, may be mixed with fresh mortar if permitted by the Project Engineer and Executing Agency, where direct for addition of extra cement and this shall be implemented.

4.5.3 Laying

IS:2212 shall be followed as general guidance for construction of brick masonry Vat/tank of suitable size shall be provided by the Concessionaire for soaking of bricks. Bricks shall be soaked in water before use for a period generally not less than 6 hours so that the water just penetrates the whole depth of the bricks. Bricks shall be laid in by hand and not thrown inside the tank. Bricks shall be taken out sufficiently in advance so that these are skin dry at the time of laying.

Bricks shall be laid in English Bond unless otherwise specified. Half or cut bricks shall not be used except where necessary to complete the bond. Closers in such cases shall be cut to the required size and used near the ends of the walls, next to quoin headers.
Bricks shall be laid generally with frogs upwards. A layer of mortar shall be spread on the full width and over a suitable length of the lower course. Each brick shall be properly bedded and set home (in position) by gently tapping with the trowel handle or with a wooden mallet. It’s inside face shall be buttered with mortar before the next brick is laid and pressed against it. On completion of a course, all vertical joints shall be fully filled from the top with mortar. The thickness of joints shall be kept uniform and shall not exceed 10 mm. Bricks shall be so laid that all joints are full of mortar.

All face joints shall be raked to a minimum depth of 15 mm by raking tools during the progress of brickwork, when the mortar is still green, so as to provide proper key for the plaster or pointing to be done. When plastering or pointing is not required to be done, the joints shall be struck flush and finished at the time of laying.

Brickwork in walls shall be taken up truly plumb. All courses shall normally be laid truly horizontal unless indicated to be laid on slope and all vertical joints shall be truly vertical. Vertical joints in alternate courses shall come directly one over the other. Brick wall shall be construed with at least one plain face with proper alignment.

All connected brickwork shall be carried up simultaneously and no portion of work shall be left more than one metre below the rest of the work. Where this is not possible, in the opinion of the Project Engineer and Executing Agency, the work shall be raked back according to bond (and not toothed) at an angle not steeper than 45 deg. The work done per day should not be more than one metre height.

All iron fixtures, pipes, water outlets, holdfasts for doors and windows, etc. which are required to be built into the brickwork shall be embedded in their correct position in mortar or cement concrete as the work proceeds as per directions of the Project Engineer and Executing Agency.

All brickwork shall be built tightly against columns, floor slabs or other structural parts and around door and window frames with proper distance to permit caulked joint. Where drawings indicate that structural steel columns and spandrel beams are to be partly or wholly covered with brickwork, the bricks shall be laid closely against all flanges and webs with all spaces between the steel and brickwork filled solid with mortar not less than 10 mm in thickness.

The top courses of all plinth, parapet, steps and top wall below CRC shall be laid with brick on edge (other than modular size bricks) unless otherwise specified. Care shall be taken that the bricks forming the top courses and ends of walls are properly radiated and keyed into position as shown on the drawings.

Scaffolding shall be strong enough to withstand all the dead, live and impact loads which are likely to come upon it. It shall also be so designed as to ensure the safety of the workmen using them.

For all brick masonry except for exposed brickwork, single scaffolding shall be permitted. In such cases, the inner end of the horizontal scaffolding pole shall rest in a hole provided only in header
course for the purpose. Only one header for each pose shall be left out. Such holes for scaffolding shall, however, not be allowed in pillars/columns less than one metre in width. The holes left in masonry works for scaffolding purposes shall be filled and made good before plastering.

In case of joining old brickwork with new brick work, the old work shall be toothed to the full width of the new wall and to the dept of quarter of a brick in alternate courses. It shall be cleaned of all dust, loose mortar, etc., and thoroughly wetted before starting new brick work. Thickness of each course of new work shall be made equal to the thickness of the corresponding course of the old work by adjusting thickness of horizontal mortar joints.

The face of the brickwork shall be cleaned on the same day on which brickwork is laid and all mortar dropping removed promptly.

Template (bed-block) of plain or reinforced cement concrete shall generally be provided to support ends of RCC beams. Top surface of the wall shall be suitably treated as per direction of the Project Engineer and Executing Agency so as to minimise the friction to movement of the concrete slab over the bearing.

Brickwork shall be protected from rain by suitable covering when the mortar is green. Masonry work shall be cured by keeping it constantly moist on all faces for a minimum period of seven days. Brickwork carried out during the day shall be suitably marked indicating the date on which the work is done so as to keep a watch on the curing period.

4.5.4 Half brick masonry

The work shall be done in the same manner, as mentioned in 4.03 except that all course shall be laid with stretchers. In cases where reinforcement is considered necessary from structural consideration, 2 nos. 8 mm dia bars shall be provided generally at every 4th layer of bricks or as specified on the drawings. Before laying reinforcement, it shall be cleaned of rust and loose flakes with a wire brush. They shall be securely anchored at their ends where the partitions bond. Half the mortar thickness for the bedding joint shall be laid first and then 8mm dia bars laid straight out near each face of the brickwork maintaining a side cover of 12mm mortar. Subsequently the other half of the mortar thickness shall be laid covering the reinforcement fully.

4.5.5 Exposed brickwork

Exposed brickwork i.e. brickwork is superstructure which is not covered by plaster shall be as shown on the drawings and shall be done by specially skilled masons. All courses shall be laid truly horizontal and all vertical joints shall be truly vertical. Vertical joints in alternate courses shall come directly one over the other. Thickness of brick courses shall be kept uniform and for this purpose wooden straight edge with graduations indicating thickness of each course including joint shall be used. The height of window sills, bottom of lintels and other such important points in the height of the wall shall be marked on the graduated straight edge. Masons must check workmanship frequently with plumb, spirit level, rule and string.

For all exposed brick work, double scaffolding having two sets of vertical supports shall be
provided. The supports shall be sound and strong, tied together with horizontal pieces over which scaffolding planks shall be fixed.

If face bricks are specified on the drawings, the brickwork shall be in composite work with face bricks on the exposed face and balance in standard bricks, but maintaining the bond fully. Where face bricks are not specified, bricks for the exposed face shall be specially selected from available stack of bricks. All exposed brickwork on completion of work shall be rubbed down, washed clean and pointed as specified. Where face bricks are used, carborundum stone shall be used for rubbing down.

4.5.6 Reinforcing anchorage

For external walls, the anchorage in the form of flats or rods from spandrel beams and columns and any other anchoring and reinforcement as shown on the drawing shall be adequately embedded in the masonry.

4.6 Stone masonry

Rubble stone masonry which is commonly used in stone work has been covered under this specification. Details of construction for Random Stone Masonry (uncoursed) and Coursed Rubble Masonry (first and second sorts) are given in the following clauses. IS: 1597 shall be followed as general guidance for construction of stone masonry.

4.6.1 Stone masonry

The stone shall be of the type specified, such as granite, sand stone, quartzite and/or best locally available stone which shall be subject to approval of the Project Engineer and Executing Agency. It shall be obtained only from an approved quarry. Colour of the stone shall be as shown on the drawings or approved by the Project Engineer and Executing Agency. It shall be hard, sound, durable and free from decay, weathering. It shall also be free from defects like cavities, cracks, sand holdes, flaws, veins, patches of soft and loose materials, etc. Stones with round surface shall not be more than 5 percent when tested in accordance with IS: 1124. The minimum crushing strength of stone shall be 200 kg/sq cm unless otherwise specified.

4.6.2 Size of stone

Normally, stones used should be small enough to be lifted and placed by hand. The length of stone, shall not exceed three times the height and the breadth on base shall not be greater than three fourth of the thickness of wall not more than 15 cm. The height of stone may be upto 30 cm.

4.6.3 Mortar

Unless otherwise specified, mortar for stone masonry shall be 1 part of cement & fly ash (20% replacement ratio of cement with fly ash): and 6 parts sand by volume. Properties, preparation and use of mortar shall be same as specified for brick masonry work.
4.6.4 Dressing of stone

The dressing of stone shall be as specified below for individual types of masonry work and it shall also conform to the general requirements for stone covered in IS:1129.

a) For Random Rubble Stone Masonry, stone shall be hammered ---- the face, the sides and the beds to enable it to come into close with the neighbouring stone. the bushing on the face shall be than 4 cm on an exposed face, and 1 cm on a face, to

b) For coursed Rubble Masonry (First sort) Face stones, shall dressed on all beds, and joints, so as to give them approx. angular shape.

4.6.5 Laying

a) Random rubble masonry

All stones shall be wetted before use. The wall shall be carried up truly plumb or to the specified batter. Every stone shall be carefully fitted to the adjacent stones, so as to form neat and close joints. Stones may be brought to level courses at plinth, window sills and roof level. Levelling up shall be done with concrete comprising of one part of mortar (used for the masonry) and two parts of graded stone aggregate of 20 mm nominal size. The bond shall be obtained by fitting in closely, the adjacent stones and by using bond stones.

Face stones shall extend and bond well into the backing. These shall be arranged to break joints as much as possible, and to avoid long vertical lines of joints, the hearting or interior filling of the wall shall consist of rubble stones which may be of any shape but shall not pass through a circular ring of 15 cm inner diameter. Thickness of these stones in any direction shall not be less than 10 cm. These shall be carefully laid, hammered down with a wooden mallet into the position and solidly bedded in mortar. Clips and spells of stone shall be used where necessary to avoid thick mortar beds or joints and at the same time ensuring that no hollow spaces are left any where in the masonry. The hearting shall be laid nearly level with facing and backing except that at about one metre intervals, vertical ‘plumb’ projecting about 15 cm to 20 cm shall be firmly embedded to form a bond between successive courses. The chips shall not be used below the hearting stone to bring these upto the level of face-stones. The use of chips shall be restricted to the fillings of interstices between the adjacent stones in hearting and these shall not exceed 20% of the quantity of stone masonry. The masonry in a structure shall be carried regularly. Where the masonry of one part has to be delayed, the work shall be raked back at an angle not steeper than 45 deg. Toothing in masonry shall not be permitted.

Bond or through stones running right through the thickness of walls shall be provided in walls upto 60 cm thick and in case of walls above 60 cm thickness, a set of two or more bond stones overlapping each other by atleast 15 cm shall be provided in a line from back to back.
In case of highly absorbent type of stones (porous lime stone and sand stone etc.) the bond stone shall extend about two third into the wall. Through stones in such cases may give rise to damp penetration and therefore, for all thickness of such walls, a set of two or more bond stones overlapping each other by atleast 15 cm shall be provided.

Where bond stones of suitable length are not available, cement concrete block of mix 1:3:6 (with 20mm nominal size graded stone aggregate) shall be used. Atleast one bond stone or a set of bond stones shall be provided for every 0.5 sq m of the wall surface. All bond stones in stone masonry shall be marked suitably as directed by the Project Engineer and Executing Agency.

The quoins shall be selected stones, neatly dressed with the hammer or chisel to form the required angle, and laid header and stretcher in the alternate layers. Volume of these stones shall not be less than 0.03 cu m.

Stones shall be so laid that all joints are fully packed with mortar and chips. Face joints shall not be more that 20mm think. When plastering or pointing is not required to be done, the joints shall be struck flush and finished at the time of laying. Otherwise the joints shall be raked to a minimum depth of 20 mm by raking tool during the progress of work, when the mortar is still green.

Single scaffolding having one set of vertical support shall be allowed. Masonry work shall be kept constantly moist on all faces for a minimum period of seven days. Green work shall be protected from damage, mortar dropping and rain during construction.

b) Coursed rubble masonry (First Sort)

All stones shall be wetted before use. The walls shall be built up truly plumb or to specified batter. All courses shall be laid truly horizontal and all vertical joints shall be truly vertical. The height of each course shall not be less than 150 mm nor more than 300 mm. Every stone shall be carefully fitted to the adjacent stones, so as to form neat and close joints. Face stones shall be laid in alternate header and stretcher fashion. No face stone shall be less in breadth than its height and at least one third of the stones shall tail into the work for length not less than twice their height. These shall be so arranged as to break joints by 7 atleast 75 mm. Each face stone shall be of the same height in any given course. The bond shall be obtained by fitting in closely the adjacent stones and by using bond stones.

Stones shall be laid with grains horizontal so that the load is transmitted along the direction of the maximum crushing strength.

The hearting or the interior filling of the wall shall consist of stones carefully laid on their proper beds in mortar; chips and spalls of stone being used where necessary to avoid thick beds or joints of mortar and at the same time ensuring that no hollow spaces are left anywhere in the masonry. The chips shall not be used below the hearting stone to bring these upto the level of face stones. The use of chips shall be restricted to the filling of interstices between the adjacent stones in hearting and these shall not exceed 10% of the
total volume of stone masonry. All bed joints shall be horizontal and all side joints vertical. All joints shall be fully packed with mortar. Face joints shall not be more than 10 mm thick. When plastering or pointing is not required to be done, the joints shall be struck flush and finished at the time of laying. Otherwise, the joints shall be raked to a minimum depth of 20mm by raking took during the progress of work, when the mortar is still green.

Stone may be brought to level courses at plinth, window sills and roof level. Levelling up at plinth level, window sills and roof level shall be done with concrete comprising of one part of the mortar (use for the masonry) and two parts of graded stone aggregate of 20mm nominal size.

The masonry in a structure shall be raised up uniformly and regularly but where breaks are unavoidable, the work shall be raked back at angle not steeper than 45 deg. Too things shall not be allowed. Masonry on any day should not be raised by more than 1 metre in height.

Bond or through stones running right through the thickness of walls shall be provided in walls upto 600 mm thick and in case of walls above 600 mm thickness, a set of two or more bond stones overlapping each other by atleast 150mm shall be provided in a line from face to back.

In case of highly absorbent types of stones (porous limestone and sand stone etc.) the bond stone shall extend about two-third into the wall. Through stones in such cases may give rise to damp penetration. Therefore, for all the thickness of such walls, a set of two or more bond stones overlapping each other by atleast 150mm shall be provided.

Where bond stones of suitable lengths are not available, cement concrete blocks of 1;3:6 mix (1cement : 3 sand : 6 graded stone aggregate 20mm nominal size) shall be used.

A bond stone or a set of bond stones shall be inserted 1.5 to 1.8 metres apart, in every course. All bond stones shall be suitably marked during construction for subsequent verification and shall be staggered in subsequent layers. The quoins shall be of selected stones, neatly dressed with the hammer or chisel to form the required angle. These shall be of the same height in which these occur. These shall be atleast 450 mm long and shall be laid stretchers and headers alternately. These shall be laid square on the beds, which shall be rough chisel dressed to a depth of atleast 100 mm. In case of exposed work, these stones shall have a minimum 25mm wide chisel drafts at four edges, all the edges being in the same plane. Single scaffolding having one set of vertical support shall be allowed. The supports shall be sound and strong, tied together by horizontal scaffolding member may rest in a hole provided in the masonry. Such holes, however, shall not be allowed in pillars less than one metre in width. The holes left in masonry work for supporting scaffolding shall be filled and made good with cement concrete 1:3:6 (1 cement : 3 sand : 6 stone aggregate 20 mm nominal size)

Masonry work shall be kept constantly moist on all faces for a minimum period of seven days. Green work shall be protected from rain by suitable covering. The work shall also be suitably protected from damage, mortar dropping and rain during construction.
c) **Coursed rubble masonry (second sort)**

Laying of this type of masonry shall be in the same manner as First Sort masonry described above except for the following:

The use of chips for filling of interstices of adjacent stones in hearting shall not exceed 15% of the total volume of stone masonry, and stone in each course need not be of the same height, but more than two stones shall not be used in the height of a course. Face joints shall not be more than 20mm thick.

**4.7 Mouldings and cornices**

The bricks or stones shall be cut and dressed to the required shape as shown on architectural drawings. If no subsequent finish is envisaged, these shall be rubbed to correct profile with carborundum stone.

**4.8 Plinth protection**

Plinth of buildings shall be protected with brick on edge paving of minimum 750mm width unless otherwise shown on the drawings. The treatment shall consist of laying bricks conforming to class 50 (min.) of IS:1077 in cement mortar 1:6 (1 cement & fly ash (20% replacement ratio of cement with fly ash): 6 sand) over a 75 mm thick bed of dry graded brick aggregate, 40mm nominal size, grouted with sand. the top shall be finished with 1:3 cement mortar pointing (1 cement & fly ash (20% replacement ratio of cement with fly ash): 3 sand). Plinth protection shall be laid with a minimum outward slope of 1 in 50. The brick aggregate shall be well graded, broken from well burnt or slightly over burnt and dense brick bats. It shall be homogeneous in texture, roughly cubical in shape, clean and free from dirt or any other foreign matter.

The ground shall first be prepared to the required, slope around and building. The high portions of the ground should be cut down, hollows and depressions filled upto the required level from the excavated earth and rammed so as to give uniform outward slope. The bed shall be watered and rammed and heavy iron square rammers. Surplus earth, if any, shall be disposed off beyond a lead of 50 m or as directed by the Project Engineer and Executing Agency.

Over this, 75mm thick bed of dry brick aggregate of 40mm nominal size shall be laid with a minimum outward slope of 1 in 50. Aggregates shall be carefully laid and packed, bigger sized being placed at the bottom. The brick aggregates shall be consolidated dry with heavy iron rammers.

The aggregates shall then be grouted evenly with sand at the rate of 0.06 cubic metre per square metre area, adequately watered to ensure filling of voids by sand and again rammed with heavy iron rammers. The finished surface shall give uniform appearance. After the sub grade has been compacted thoroughly, brick flooring with bricks of specified strength in cement mortar 1:6 (1 cement & fly ash (20% replacement ratio of cement with fly ash): 6 sand) shall be laid. The soaking of bricks shall be done as per the relevant standard. The bricks shall be laid on edge in Diagonal / herring Bone Bond or other pattern as specified or as directed by the Project Engineer.
and Executing Agency. Bricks shall be laid on 12mm thick mortar bed and each brick shall be properly bedded and set home by gentle tapping with handle of trowel or wooden mallet. It’s inside face shall be buttered with mortar before the next brick is laid and pressed against it. On completion of the portion of flooring, the vertical joints shall be fully filled from the top with mortar. The surface shall present a true plain surface with the required slope.

The point shall be done in cement mortar 1:3 (1cement & fly ash (20% replacement ratio of cement with fly ash): 3 sand). The mortar shall be pressed into the joints and shall be finished off flush and level with the edges of the bricks so as to give a smooth appearance. The edges shall be neatly trimmed with a trowel and a straight edge the mortar shall not spread over surface of the masonry.

Brick flooring and pointing shall be kept wet for a minimum period of seven days. These shall be protected from rain by suitable covering when the mortar is green.

4.9 **Damp Proof Course (DPC)**

All walls in a building shall be provided with a damp proof course generally immediately below the underside of the ground floor or as shown on the drawings. This shall run without break throughout the length of the wall, even under door or other openings.

Damp proof course shall be 50 mm thick (unless, otherwise specified) consisting of cement concrete in proportion 1:1.5:3 (1 cement: 1.5 sand: 3 graded stone aggregate 10mm nominal size) mixed with water proofing cement additive as approved by the Project Engineer and Executing Agency. The additive shall be used in proportion recommended by the manufacturer.

The surface of masonry work shall be levelled and prepared before laying the cement concrete. Edges of DPC shall be straight and even. The side shuttering shall consist of wooden forms and shall be strong and properly fixed so that it does not get disturbed during compaction and mortar does not leak through. The concrete mix shall be of workable consistency and shall be tamped thoroughly to make a dense mass. When the side shuttering are removed the surface should be smooth without any honeycombing. The top surface shall be double chequered and cured by pounding for atleast 7 days. The cement concrete shall be allowed to dry for atleast 24 hours after curing and hot bitumen of grade 85/25 conforming to IS:702 at the rate of 1.7 kg/sq metre shall be applied over the dried up surface of cement concrete after being properly cleaned with brushes and finally with a cloth soaked in kerosene oil. The bitumen shall be applied uniformly so that no blank spaces are left anywhere.

4.10 **Dismantling and demolition**

The term ‘Dismantling’ implies carefully removing without damage (up or down). This shall consist of dismantling one or more part of the building as specified or shown on the drawings.

The term ‘Demolition’ implies breaking up. This shall consist of demolishing whole or part of work including all relevant items as specified or shown on the drawings.
4.10.1 General requirements

(a) All materials obtained from dismantling or demolition shall be the property of the Executing Agency, unless otherwise specified and shall be kept in safe custody until handed over at Executing Agency’s stores. Demolition shall be carried out in the shape and profile shown on the drawings or as directed by the Project Engineer and Executing Agency.

(b) The dismantling or demolition shall always be planned before hand and shall be done in reverse order of the one in which the structure was constructed. The scheme shall be got approved from the Project Engineer and Executing Agency before starting the work.

4.10.2 Precautions

(a) Necessary propping, shoring and under pinning shall be provided for the safety of the adjoining work or property before dismantling or demolition is taken up and the work shall be carried out in such a way that no damage is caused to the adjoining work or property. Wherever specified, temporary enclosures or partitions shall also be provided.

(b) All demolition work shall be carried out in conformance with the local safety regulations, ensuring the safety of men and materials.

(c) Necessary precautions shall be taken to keep down the dust nuisance.

(d) All materials which are likely to be damaged during the operation shall be carefully removed first.

(e) Dismantling shall be done in a systematic manner. The dismantled articles shall be passed by hand, where necessary, lowered to the ground (and not thrown) and then properly stacked as directed by the Project Engineer and Executing Agency.

(f) Where fixing is done by nails, screws, bolts, rivets, etc. dismantling shall be done by taking out the fixing with proper tools and not be tearing or ripping off.

(g) All serviceable materials obtained shall be separated out and stacked properly as directed by the Project Engineer and Executing Agency, upto a lead of 500m or handed over at Executing Agency’s stores. All unserviceable materials, rubbish etc. shall be disposed off, as directed by the Project Engineer and Executing Agency.

4.11 Sampling testing and quality control

4.11.1 General
(a) The Concessionaire shall carry out all sampling and testing in accordance with the relevant Indian Standards and/or International Standards and shall conduct such tests as are called for by the Project Engineer and Executing Agency. Where no specific testing procedure is mentioned, the tests shall be carried out as per the prevalent accepted engineering practice to the directions of the Project Engineer and Executing Agency. Tests shall be done in the field and at a laboratory approved by the Project Engineer and Executing Agency and the Concessionaire shall submit to the Project Engineer and Executing Agency, the test results in triplicate within three days after completion of a test. The Project Engineer and Executing Agency may at his discretion, waive off some of the stipulations given below, for small and unimportant operations.

(b) Material / work found unsuitable for acceptance shall be removed and replaced by the Concessionaire. The works shall be redone as per specification requirements and to the satisfaction of the Project Engineer and Executing Agency.

4.11.2 Quality assurance programme

The Concessionaire shall submit and finalise a detailed field Quality Assurance Programme according to the requirements of the specification. This shall include setting up of a testing laboratory, arrangement of testing apparatus / equipment, deployment of qualified / experienced manpower, preparation of format for record, field quality plan etc. On finalised field quality plan, the Executing Agency shall identify, customer hold points beyond which work shall not proceed without written approval from the Project Engineer and Executing Agency.

Frequency of sampling and testing including the methods for conducting the tests are given in Table - 2. The testing shall be done at site. The testing frequencies set forth are the desirable minimum and the Project Engineer and Executing Agency shall have the full authority to carry out or all for tests as frequently as he may deem necessary to satisfy himself that the materials and works comply with the appropriate specifications. Some of the type tests and performance tests which are not included in the table shall be carried out at the manufacturer’s premises or at an independent Government approved laboratory.

All masonry shall be built true and plumb within the tolerances prescribed as below. Care shall be taken to keep the pretends properly aligned.

a) Deviation in vertically in total height of any wall of a building more than one storey in height shall not exceed +/- 12.5 mm.

b) Deviation from vertical within a storey shall not exceed +/- 6mm per 3 m height.

c) Deviation from the position shown on the plan of any brickwork more than one storey in height shall not exceed 12.5 mm.
d) Relative displacement between load bearing walls in adjacent storeys intended to be in a vertical alignment shall not exceed 6 mm.

e) Deviation of bed joint from horizontal in any length upto 12 m shall not exceed 6 mm, and in any length over 12m it shall not exceed 12.5mm total.

f) Deviation from the specified thickness of bed-joints, cross joints or pretends shall not exceed +/- 3 mm.

Section - C5: Technical specification for plastering and allied works

5.1 Scope

This part of the specification covers the requirements for plastering and allied works for all types of masonry and concrete surfaces.

5.2 General requirements

The Concessionaire shall furnish all skilled and unskilled labour, plant, equipment, scaffolding, materials, etc. required for complete execution of the work in accordance with the drawings and as described herein and/or as directed by the Project Engineer and Executing Agency.

The Concessionaire shall follow all safety requirements/rules during execution of the work.

I.S:1661 shall be followed as a general guidance for plastering work.

5.3 Codes and standards

All applicable standards, acts and codes of practice referred to shall be the latest editions including all applicable official amendments and revisions. A complete set of all these documents shall generally be available at Site with the Concessionaire.

In case of any conflict between this specification and those (IS Standards, Codes etc.) more stringent shall prevail.

Some of the applicable Indian Standards, Codes, etc. are referred to here below:

<table>

</tr>
</tbody>
</table>

5.4 Materials

Materials namely, cement, sand, water, Coarse aggregate, shall be in accordance with Technical Specifications for properties, storage and handling of common building materials.

Lime for preparation of putty or neeru for punning work shall be according to class B & C of I.S:
For rough cast plaster, coarse aggregate of size 6 to 12 mm shall be used in the finishing coat. Coarse aggregate shall be as per IS: 383.

Gypsum, for use in plaster-of-paris punning work shall be according to IS:2333.

For lath plastering, galvanised hexagonal wire netting with wire 0.9mm dia and 12.5 mm mesh conforming to IS:3150 shall be used.

5.5 Mortar

Unless otherwise specified cement & Fly ash (20% replacement ratio of cement with fly ash): sand mortar shall be used. Cement mortar shall be prepared by mixing cement & fly ash (20% replacement ratio of cement with fly ash): and sand in specified proportions by volume. Sand shall be measured on the basis of its dry volume using gauge boxes. Suitable allowance in quantity shall be made to cater for the bulkage. Cement and fly ash shall preferably be measured by weight. For the purpose of determining the corresponding volume, one cubic metre of cement shall be taken to weigh 1440 Kg and one cubic metre of fly ash shall be taken to weigh 641 Kg (i.e. coal ash)

The mixing of mortars shall be done in mechanical mixer. However, depending on nature, magnitude and location of the work, the Project Engineer and Executing Agency may relax the condition of use of mechanical mixer and allow hand mixing.

Cement, fly ash and sand in the specified proportions shall be fed into the mixer and mixed dry thoroughly in the mixer. Water shall then be added gradually and the wet mixing continued for at least 3 minutes. Hand mixing shall be carried out on a clean, water tight platform. Only that quantity of mortar, which can be used within 30 minutes of its mixing, shall generally be prepared at a time. Care shall be taken, not to add more water than that which shall bring the mortar to the consistency of a stiff paste. IS: 2250 and IS:1661 shall be referred for ascertaining the quantity of water.

In case of cement mortar, the mortar that has stiffened because of evaporation of water from the mortar may be retempered under special circumstances, with the approval of the Project Engineer and Executing Agency, by adding water as frequently as needed to restore the requirements of consistency but this retempering shall be permitted only upto one hour from the time of addition of cement.

Cement mortar shall be used as soon as possible after mixing and before it begins to set, preferably within half an hour from the time water is added to cement during mixing and in any case within one hour thereof.

Sweep mortar shall not be used.
5.6 Plastering

5.6.1 Mix proportion and plaster thickness

The mix proportion and thickness of plaster for various surfaces shall be as specified or shown in the drawings. Unless otherwise specified the following shall be adopted.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>

</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>iii.</td>
<td>Plaster on plain face of masonry work or concrete surface.</td>
</tr>
</tbody>
</table>

*In case of special application like water proofing surface, base course of decorative finish etc., richer mix proportion not leaner than 1:4 shall be used.

5.6.2 Preparation of surface

The surface shall be cleaned of all dust, loose mortar droppings, traces of algae, efflorescence and other foreign matter by water or by brushing. Smooth surfaces shall be roughened by wire brushing, if it is not hard and by hecking when it is hard. In case of concrete surface, if a chemical retarder has been applied to the framework, the surface shall be roughened by wire brushing and all the resulting dust and loose particles cleaned off and care shall be taken that none of the retarders is left on the surface.

Trimming of projections, wherever necessary shall be done to achieve an even surface. Ranking of joints in case of brickwork where necessary shall be done. The masonry shall be allowed to dry out for sufficient period before plastering.

For ceiling plaster, the concrete surface shall be pock marked with a pointed tool to ensure a proper key for the plaster.

The wall shall be dampened evenly and not soaked before application of plaster. If the surface becomes dry in spots, such areas shall be moistened again.

5.6.3 Sequence of plastering operations

For external plaster, the plastering operations shall be started from the top and carried downwards. To ensure even thickness and a true surface, plaster about 15 x 15 cm shall be first applied horizontally and vertically, at not more than 2m intervals over the entire surface to serve as gauges. The surfaces of those gauged areas shall be truly in the plane of the finished plastered surface. For internal plaster, the plastering operations may be started wherever the building frame and cladding work are ready; the temporary supports of the ceiling resting on the wall have been
removed.

The first undercoat shall then be applied to ceilings. After the ceiling plaster is completed and scaffolding for the same removed, the first undercoat on walls shall then be applied.

After a suitable time interval as detailed under application of plaster, the second coat (finishing coat) shall be applied, first to the ceiling and then to the walls.

Where corners and edges have to be rounded off, such rounding off shall be completed along with the finishing coat to prevent any joint marks.

5.6.4 Application of plaster

➤ Wall / vertical surface plaster

Unless otherwise stated, the plastering above 12mm thick shall be carried out in two coats only.

d) The backing or first coat

The backing coat shall be 10 to 12 mm thick and carried to the full length of the all or to natural breaking points like doors and windows. Before the rendering coat hardens, it shall be roughened to provide mechanical key for the second coat.

Masonry walls on which plaster is to be applied directly, shall be properly set and cured with the joints raked to a depth of at least 10 mm. The rendering coat shall be troweled hard and tight, forcing it into surface depressions to obtain a permanent bond.

On smooth concrete walls, the surface shall be roughened and the rendering coat shall be dashed on to ensure adequate bond. The dashing of the rendering coat shall be done using a strong whipping motion at right angles to the face of the wall, or it may be applied with a plaster machine or cement gun.

e) Finishing coat

Before starting to apply the finishing coat, the surface of the backing coat shall be dampened evenly. The final plastered surface shall be cured and kept continuously damp for minimum 7 days.

➤ Ceiling plaster

Stage scaffolding shall be provided for ceiling plaster. This shall be independent of the walls. Projecting burrs of mortar formed due to gaps at the joints is shuttering shall be removed. The surface shall be scrubbed clean with wire brushes. In addition, the concrete surfaces shall be pock marked with a pointed tool at a spacing of not more than 50 mm centres, the pocks being made not less than 3 mm deep, to ensure a proper key for the plaster. The mortar shall be washed off and all surface cleaned of all oil, grease, etc. and well wetted before the plaster is applied.
Ceiling plaster shall not be commenced until the slab above has been furnished and centering has been removed. The average thickness of plaster shall not be less than 6 mm. The minimum thickness over any portion of the surface shall not be less than 5 mm.

The Surface shall be cured at least twice a day for a minimum period of seven days.

- **Grooves in plaster**

Where specified in drawings, rectangular grooves 12 to 20 mm wide and 8 to 10 mm deep shall be provided in external plaster by means of timber battens or metal strips, fixed on plaster when plaster is still green. Battens or strips shall be carefully removed after initial set of plaster and broken edges and corners made good. All grooves shall be uniform in width and depth and shall be truly plumb and correctly aligned.

- **Drip course**

Drip course wherever indicated in the drawings shall be provided at the time of plastering to prevent travelling of water drops from the projections. Unless otherwise specified, projected strip form drip course shall be provided.

- **Metal lathing**

The lathing shall be tightly stretched with the long way of the mesh across the supports before nailing. This shall be secured with 25 mm galvanised steel staples or nails at 200 mm centres, if the studding is of wood and with 0.90 mm iron tying wire, if the studding is of steel. Edges of lathing shall be lapped not less than 25 mm at the sides and ends and wired together with galvanised wire of diameter not less than 1.25 mm, every 100 mm between supports.

Before plastering, the surface of metal lathing shall be brushed over with thin cement slurry or given a protective coat of bitumen oil paint.
Plastering to lathing

It shall be carried out in two coats. Mortars for the first coat shall be of stiff consistency and applied as evenly as possible to give a uniform good cover to the lathing. It shall be allowed to dry until all shrinkage movement has ceased before the second coat is applied. Too much pressure shall not be used in applying plaster to lathing to guard against its deflection.

➤ Rough cast finish

The plaster base over which the rough cast finish is to be applied shall be done in general as per Clause no. 5.6.2 under sub head "Application of Plaster".

It shall be ensured that the base surface which is to receive rough cast mixture is in plastic state. Coarse aggregate of size 6 to 12 mm shall be used in the finishing coat. The grading and size shall vary according to the texture required.

The rough cast mix shall be wetted and shall be dashed on the plaster base in plastic state by hand scoop so that the mix gets well pitched into the plaster base. The mix shall again be dashed over the vacant spaces, if any, so that the finished surface represents a homogeneous surface of sand mixed with grovel. The surface shall be cured for a minimum period of 7 days.

5.6.5 Punning work

➤ Lime punning or Neeru finish

Materials

Lime putty: It shall be obtained by slaking lime with fresh water and sifting it. The slaking shall be done in accordance with IS: 1635.

Neeru: It shall be obtained by mixing lime putty and sand in equal proportion and chopped jute @ 4 Kg. per cu.m. of mortar. The mixture shall be properly ground to a fine paste between two stones.

Application of punning

Lime punning consists in finishing the interior with a thin coat (3 mm) of fat lime putty mixed with an equal amount of sand. Before actual use, putty shall be matured for 2 to 3 days.

The mortar for punning shall be applied in 3 mm thick layer just after the undercoat has hardened. It shall be finished to a smooth surface by means of a plaster's trowel.

The curing shall be started as soon as the punning has hardened but in any case not earlier than 24 hours after the punning has been completed. The punning shall be kept wet for a period of seven days.
Plaster of paris punning

The plaster of paris (gypsum Anhydrous) conforming to IS: 2547 shall be used for plaster of paris punning. The plaster of paris shall be mixed with water to a workable consistency and shall be applied on the plastered surface and finished to a smooth surface by steel float. The finished surface shall be smooth and true to plane, slopes or curves as required. The nominal thickness of the punning shall be 2 mm.

Neat cement punning

The plastered surface over which neat cement punning is to be done, shall be uniformly treated over its entire area with a paste of neat cement and rubbed smooth, so that the whole surface is covered with neat cement coating. The quantity of cement applied shall be 1 kg. per sq. metre. Smooth finishing shall be completed with a float immediately and in no case later than half an hour of adding water to the cement.

5.6.6 Trueness of plastering system

The finished plastered surface shall not show any deviation more than 4 mm when checked with a straight edge of 2 metre length placed against the surface.

5.6.7 Thickness of plaster

The thickness of the plaster shall be measured exclusive of the thickness of key i.e. grooves or open joints in brickwork. The average thickness of plaster shall not be less than the specified thickness. The minimum thickness over any portion of the surface shall not be less than the specified thickness by more than 3 mm for plaster thickness above 12 mm and 1 mm for ceiling plaster. Extra thickness required in dubbing behind rounding of the corners at junctions of wall or in plastering of masonry cornices etc. shall be ignored.

5.6.8 Inspection and testing

a) The plastered surface shall be checked for following defects and the remedial measures for the same shall be adopted as per IS: 1661.

i) Blistering
ii) Bound failure or loss of adhesion
iii) Cracking
iv) Crazing
v) Efflorescence
vi) Grinning
vii) Irregularity of surface texture
viii) Popping or blowing
ix) Recurrent surface dampness
x) Softness or chalkiness

b) Trueness of the plaster shall be checked as per Clause no. 5.6.6
c) Thickness of the plaster shall be checked as per Clause no. 5.6.7

5.7 Pointing

The materials, preparation of mortar etc. shall be same as specified for cement plaster works. The mix proportion shall not be leaner than 1:3, unless otherwise specified. For all exposed brickwork or stone masonry work, self supporting double scaffolding, having two sets of vertical supports shall be provided so as to avoid openings in the wall.

5.7.1 Preparation of surface

The joints shall be raked out properly to such a depth that the minimum depth of the new mortar measured from either the sunken surfaces of the finished pointing or from the edge of the brick shall not be less than 10 mm. Dust and loose mortar shall be brushed out. Efflorescence, if any shall be removed by brushing and scraping. The surface shall then be thoroughly washed with water, cleaned and kept wet before commencement of pointing.

5.7.2 Application of mortar and finishing

The mortar shall be pressed into the raked out joints, with a pointing trowel, either flush, sunk or raked, according to the type of pointing required. The mortar shall not spread over the corner, edges or surface of the masonry. The pointing shall then be finished with the proper tool according to the type of pointing required.

5.7.3 Type of pointing

➢ Ruled pointing

Unless otherwise specified ruled pointing shall be adopted for all exposed brick/block masonry work. However, for rubble masonry works, recessed pointing shall be adopted.

The mortar shall be pressed into the raked out joints and shall be finished off flush and then while the mortar is still green, a groove of shape and size as shown in drawings shall be formed by running a forming tool straight along the centre line of joints. This operation shall be continued till a smooth and hard surface is obtained. The vertical joints shall also be finished in a similar way. The vertical joints shall make true right angles at their junctions with the horizontal lines and shall not project beyond the same. For recessed pointing in rubble masonry recess shall be provided along the centre line of the joint profile.

➢ Flush pointing
The mortar shall be pressed into the joints and shall be finished off flush and level with the edges of the brick, tiles or stones so as to give a smooth appearance. The edges shall be neatly trimmed with a trowel and straight edge. Unless otherwise specified, flush pointing shall be adopted for drains and brick on edge paving.

Raised and cut pointing

Raised and cut pointing shall project from the wall facing with its edges cut parallel so as to have a uniformly raised band about 6 mm raised and width 10 mm or more as directed. The superfluous mortar shall be cut off from the edges of the lines and the surface of the masonry shall also be cleaned off all mortar. Unless otherwise specified, raised and cut pointing shall be adopted for stone masonry pointing, and shall be provided along the Centre line of the joint profile.

5.7.4 Curing

The pointing shall be kept wet for 7 days.

Sub section - C6: Technical specification for flooring and other allied works

6.1 Scope

This specification cover the supplying, installation, finishing, curing, testing, protecting, maintaining until handling over of various types of floor finishes and allied items of works as listed below:

6.1.1 In situ finishes

Integral finishes to concrete base.

Terrazzo finish.

Metallic hardener like “Ironite” finish.

6.1.2 Tile finishes

Terrazzo tile

Glazed tile

Rubber based vinyl tiles

6.1.3 Base

The base to receive the finish is covered under other relevant specifications.

6.1.4 Sequence

The commencement, scheduling and sequence of the finishing works shall be planned in details and must be specifically approved by the Project Engineer and Executing Agency, keeping in view the activities of other agencies working in the area. However, the Concessionaire shall remain fully responsible for all normal precautions and vigilance to prevent and damage whatsoever till handling over to the Executing Agency.
6.2 Installation

6.2.1 Special materials

Materials required for individual finishing items are specified under respective items. In general, all such materials shall be in accordance with the relevant IS Codes (Latest edition) where applicable. In all cases these materials shall be of the best indigenous quality unless specified otherwise.

The materials for finishing items must be procured from well-reputed specialized manufactures and on the basis of approval of samples by the Project Engineer and Executing Agency. The materials shall be ordered, procured and stored well in advance to avoid possible delays to the construction programme.

6.2.2 Workmanship

Workers specially experienced in particular items of finishing work shall carry out the work. Where such workers are not readily available, experienced supervisors recommended by the manufacturer shall be engaged with the prior permission of the Project Engineer and Executing Agency. In particular cases, Project Engineer and Executing Agency may desire the installation of finishing items by the manufacturer. This arrangement shall be made by the Concessionaire.

6.2.3 Preparation of the base surface

The surface to be treated shall be thoroughly examined by the Concessionaire. Any rectification necessary shall be brought to the notice of the Project Engineer and Executing Agency and his approval shall be obtained regarding the method and extent of such rectification required. For all types of flooring, skirting, dado and similar locations, the base to receive the finish shall be adequately roughened by chipping, raking of joints and thoroughly cleaning of all dirts, grease etc., using water hard brushes and detergent as required, unless otherwise directed by the manufacturer of any special finishing materials, or specifically indicated in this specification under the individual item. To prevent absorption of water from any wet finishing treatment, the base shall be thoroughly soaked with water and all excess water mopped up. However, the surface shall be dry where adhesive are used for fixing the finishes. The actual finishing work shall not commence until the Project Engineer and Executing Agency has approved the surface.

6.2.4 In-situ-finishes

- Integral finishing to concrete base

While the surface of the concrete laid in accordance with the specification for “Cement Concrete” has been fully compacted and levelled but the concrete is still green, a thick slurry made with neat cement shall be applied evenly and worked in with iron floats. When the slurry starts to set, it shall be pressed with iron floats, to achieve a firm, compact and smooth surface without any trowel marks or undulations. The finish shall be as thin as possible by using 2.2 kg.
of cement per sq.m. of area. The surface shall not be subjected to any loads or abrasion for at least 21 days after laying.

When desired by the Project Engineer and Executing Agency, the surface while still ‘green’ shall be intended by pressing strings. The markings shall be of even depth, in straight lines and the panels shall be of uniform and symmetrical patterns.

**Terrazzo finish: In-situ**

It shall consist of an underbed and a topping laid over an already laid and matured concrete base.

**Thickness**

Unless otherwise specified, the total thickness of the finish shall be a minimum of 40 mm for horizontal surfaces and 25 mm for vertical surfaces of which the topping shall be not less than 10 mm. The topping shall be of uniform thickness but the underbed shall vary in thickness as necessary to provide any slopes. The finished vertical surface shall project 6 mm from the adjacent plaster or other finishes. The surface receiving the finish shall be cut back as necessary to accommodate the specified thickness. All junctions between vertical and horizontal surfaces shall be rounded neatly to a uniform radius of 25 mm.

**Mix**

**i) Underbed**

The underbed for floors and similar horizontal surfaces shall consist of a mix of 1 part cement, 1 part sand and 3 parts sand by volume. The sand shall be coarse. The stone chips shall be 10 mm down well graded. Only sufficient water shall be added to provide a mortar of workable consistency.

**ii) Topping**

The mix for the topping shall be composed of cement, colour pigment, marble dust and marble chips. The proportions of the ingredients shall be such as to produce the terrazzo of the colour, texture and pattern approved by the Project Engineer and Executing Agency. The cement shall be white or grey or a mixture of the two in which the pigment shall be added to achieve the desired colour. To 3 parts of these mixture, 1 part marble powder by volume shall be added and thoroughly mixed dry to 1 part of this mix, 1 to 1.5 parts of marble chips by volume shall be added and thoroughly mixed dry again.

The pigment must be stable and non-fading. It must be very finely ground. The marble powder shall be from white marble and shall be finer than I.S. Sieve No. 30. The size of marble chips may be between 1 mm to 20 mm but at least 5 mm smaller than the topping thickness.
Sufficient quantity to cover each visible area shall be prepared in on lot to ensure uniform colour. Water to make it just workable shall be added to a batch immediately before it is laid. The size of batch shall be such that it can be laid before it starts setting.

(c) Laying

The underbed shall be laid in panels. The panels shall not the more than 5 sq.m. in area of which no side shall be more than 2.5 m long. For locations exposed to the sun, the maximum ate of a panel shall be 2.0 sq.m. The panels shall be laid in alternate bays or chequered board pattern. No panel shall be in contact with any other already laid until the later has contracted to the full extent.

Dividing strips made of aluminium 40 mm wide and 2 mm thick (min) shall be used for forming the panels. The strips shall exactly match the total depth of underbed plus topping.

After laying, the underbed shall be levelled, compacted and brought to proper grade with a screed or float. The topping shall be laid after about 24 hours while the underbed is still ‘green’ but firm enough to receive the topping. Slurry of the mixture of cement and pigment already made shall be spread evenly and brushed in just before laying and topping. The topping shall be rolled for horizontal areas and thrown and pressed for vertical areas of extract all superfluous cement and water and to achieve a compact dense mass fully bonded with the underbed. The surface of the topping shall be trowelled over, pressed and brought to a smooth dense surface showing at least 75% exposure of marble chips in an even pattern of distribution over the area covered.

(d) Curing

The surface shall be left for curing for 12 to 18 hours and then cured by allowing water to stand on the surface or by covering with wet sack for four days.

(e) Grinding and polishing

When the surface has sufficiently hardened it shall be watered and ground evenly with rapid cutting coarse grade (No. 60) grit blocks till the marble chips are exposed and the surface is smooth. Then the surface shall be thoroughly washed and cleaned. A grout already prepared from a mixture of cement and pigment shall be applied to fill up all pinholes. This surface shall be cured for 7 days by keeping it moist and then ground with fine grit block (No. 120). It shall again be cleaned with water, the grout reapplied to fill up any more pinholes that might have appeared and allowed be cured again for 5 days. Finally the surface shall be ground a third time with very fine grid blocks (No. 320) to achieve a smooth surface free from pinholes. Where a grinding machine cannot be used, hand grinding may be allowed where the first rubbing shall be with carborundum stone of coarse grade No. 60, the second rubbing with medium grade NO. 80 and the final rubbing and polishing with fine grade (No. 120). The surface shall be cleaned with water, dried and covered with oil free clean saw dust if directed by the Project Engineer and Executing Agency.
Just before handing over to the Executing Agency, the surface shall be dusted with oxalic acid at the rate of 0.33 gm per sq.m., water sprinkled on to it and finished by buffing with felt or hessian mops. The floor shall be cleaned with soft moist rag and dried, if desired by the Project Engineer and Executing Agency, wax polish shall be applied. However, all excess wax polish has to be wiped off and the surface left glossy but not slippery.

➢ Metallic hardener like "ironite" finish

It shall consist of an underbed and a topping (incorporating iron particles) laid over an already laid and matured concrete base.

(a) Thickness

Unless otherwise specified the total thickness of the finish shall be minimum of 52 mm for horizontal surfaces of which topping shall not be less than 12 mm. The topping shall be of uniform thickness, but the underbed shall vary in thickness to provide and slopes. Vertical surfaces shall project 6 mm from adjacent plaster or other finishes. The surface receiving the finish shall be cut back as necessary to accommodate the specified thickness.

(b) Material

The hardening compound shall be uniformly graded iron particles, free from non-ferrous metal impurities, oil, grease, sand, soluble alkaline compounds or other injurious materials. When desired by the Project Engineer and Executing Agency, actual samples shall be tested for impurities.

(c) Mix

i) The underbed for floors and similar horizontal surfaces and for vertical surfaces shall be prepared in accordance with Clause 6.2.4(b).

ii) The Proportion of the metallic hardener shall be as specified or as indicated by the manufacturer. However, in absence of any such direction 1 part metallic hardener shall be mixed dry with 4 parts cement, by weight. To this mixture 6 mm nominal size stone chips shall be added in proportion of 1 part cement (mixed with hardener) to 2 parts of stone chips by volume and uniformly mixed. A minimum quantity of water shall be added to make it workable.

(d) Laying

The concrete floor shall be laid in panels of 1m x 1m or as directed by the Project Engineer and Executing Agency. Alternate panels shall be laid on the same day followed by the
other group of alternate panels the next day. The edges of the panels shall be supported either by wooden strips or flat angle iron pieces fixed securely in position. The underbed shall be laid to the required grade. The forms, if any, shall remain sufficiently projecting to take the topping. The surface of the underbed shall be roughened by wire brush as soon as possible.

The junction of floor and walls, floors and dado or skirting shall be rounded off as directed.

The Wooden strips or flat iron pieces shall be removed from their places before the succeeding alternate layers are laid.

The topping shall be laid while the concrete underbed is still ‘very green’ about 3 hours after laying of the later. The topping shall be of uniform thickness and even dense surface without trowel marks, pinholes, etc. The topping layer shall be pressed firmly, worked vigorously and quickly to secure full bond with the underbed. Immediately after the initial setting starts, the surface shall be finished smooth with a steel trowel.

The finished floor shall be cured for 7 days by keeping it wet.

6.2.5 Tile finishes

These shall included tiles, stone slabs and similar manufactured or natural items over an already, laid and matured base of concrete or masonry by means of an underbed or an adhesive layer.

➢ Terrazzo tiles

This tiles finish shall consist of precast terrazzo tiles laid over an underbed.

(a) Thickness

The total thickness including the underbed shall be a minimum of 40 mm for floors and 30 mm for walls unless otherwise specified.

The skirting, dado and similar vertical surfaces shall project 6 mm uniformly from the adjacent plaster or other wall finishes. The surface receiving the finish shall be cut back as necessary to accommodate the specified thickness.

(b) Tiles

The tiles shall be composed of an underbed and topping. The topping shall be of uniform thickness not less than 10 mm. The total thickness including the topping shall be as specified but not less than 20 mm. The underbed shall be composed of 1 part ordinary grey cement and 3 parts of stone ships by weight, mixed with water.

(c) Topping

The tiles for the topping shall be as specified under Clause 6.2.4 (b).
The tiles shall be cured at the shop for at least 14 days before delivery to the site. First grinding shall be given to the tiles in the shop before delivery. Tiles shall be packed properly to prevent damage during transit and storage. The tiles must be stored carefully to prevent staining by damp, rust, oil, grease or other chemicals.

Tiles made in each batch shall be kept and used separately so that the colour of each area of the floor shall be uniform. The manufacturer of the tiles shall also supply the grout mix containing cement and pigment in the exact proportions as used in finishing the tiles. The containers for the grout mix shall be suitably marked to ensure that they can be related to the particular type and batch of tiles.

(d) Mix-underbed

The underbed for floors and similar horizontal surfaces shall be 1 part lime putty; 1 part surkhi; 2 parts coarse sand by weight mixed with sufficient water to form a stiff workable mass. For skirting and dados and all vertical surfaces it shall be about 10 mm thick and composed of 1 part cement and 3 parts sand by weight.

(e) Laying

The underbed mortar shall be evenly spread and brought to the appropriate grade and consolidated to a smooth surface. The surface shall be roughened for better bond with the tiles. While the underbed is still fairly moist but firm, cement shall be hand dusted over it or cement slurry applied. The tiles shall immediately be placed in position and firmly pressed by wooden mallet on to the underbed so that the tile surface achieves the desired level. The tiles shall be soaked in water for about 10 minutes just before laying. The joints between tiles shall be as narrow as possible and not more than 1.5 mm wide.

Special care shall be taken to check the level, the surface and the lines of the joints frequently so that these are perfect.

When tiles are required to be cut to match the dimensions, they shall be sawn and edges rubbed smooth. The location of cut tiles shall be planned in advance and approved by the Project Engineer and Executing Agency.

At the junction of horizontal surface with vertical surfaces the tiles on the former shall enter at least 12 mm under the later.

After fixing, the floor shall be kept moist sand allowed to mature undisturbed for 7 days. Heavy traffic shall not be allowed.

If desired, diving strips as specified under Clause 6.2.4 (c) may be used for dividing the work into suitable panels.

(f) Grinding and polishing
The procedure shall be the same as specified in Clause 6.2.4 (e) but grinding shall not commence until 14 days have elapsed after laying of tiles.

- **Glazed tiles**

This finish shall be composed of glazed, earthen, coarse tiles with an underbed laid over a concrete or masonry base.

**a) Thickness**

The total thickness shall be between 20 mm and 25 mm including the underbed. The tile finish on vertical surface shall project 6 mm uniformly from the adjacent plaster or other wall finishes. The surfaces receiving the finish shall be cut as necessity to accommodate the specified thickness.

**b) Tiles glazed**

The tiles shall be earthenware, covered with glazed, white or coloured, plain or with designs, of this size approved by the Project Engineer and Executing Agency and 6 mm thick. The tolerance shall be +/-1.5 mm for length and breadth and +/-0.5 mm for thickness. Specials like internal and external angles, beads, covers, cornices, corner pieces etc., shall match. The top surface of the tiles shall be glazed with an unfading stable gloss finish as desired by the Project Engineer and Executing Agency. The tiles shall be flat and to shape. The colour shall be uniform and a fractured section shall be fine grained in texture, dense and homogenous. The tiles shall be strong and free from flaws like cracks, chips craze, spacks, crawlings etc., and other imperfections. The edges and the underside of the tiles shall be completely free from glaze and the underside shall have ribs or indentations for better anchorage with the fixing mortar.

The coloured tiles, when supplied, shall preferably come from one batch to avoid difference in colour.

**c) Mix-underbed**

This mix for the underbed shall consist of 1 part cement and 3 parts coarse sand by weight mixed with sufficient water or any other mix if specified.

**d) Laying**

The under and tiling shall be laid as specified in Clause 6.2.4 (e).

**e) Finishing**

The joints shall be cleaned and flush pointed with white cement and cured for 7 days by keeping
it wet. The surface shall be cleaned with soap or suitable detergent, washed fully and wiped with soft cloth to prevent scratching immediately before handing over to the Executing Agency.

- **PVC tiles and rolls as per IS-3462-1986**

  This covers PVC based vinyl Tiles and Rolls set with adhesive on to a concrete or masonry base. An underbed may be required to secure a desirable surface and grade.

  **Tiles**

  Unless otherwise mentioned the tiles shall be squares of approved dimensions. The tolerance of dimensions shall be +/-1.5 mm.

  The tiles should be cladded laminated solid resilient unbreakable and flexible PVC Vinyl tiles in sizes of 305 mm x 305 mm x 3 mm thick. This shall have properties of a high wear resistance and resilience, designed to withstand high traffic and abrasion. All edges shall be cut true and square. The colour shall be non-fading and uniform in appearance, insoluble in water and resistant to alkalies cleaning agents and usual floor polishes.

  Rubber based adhesive to be used for fixing tiles shall be Dunlop S-758 or Fevicol SR-998 or equivalent or a recommended by the manufacture. The adhesive shall have a short drying time and long life. Each container shall show the shelf life, date of manufacture and over age container shall be immediately removed from the site.

  **Rolls**

  It should be cladded laminated solid resilient unbreakable and flexible PVC Vinyl Flooring of size 1.5 mtrs. (Width) x 20 mtrs (Length) x 3 mm thick with inherent characteristics of wear resistance, dimensional stability, elegance etc.

  Each packet of tile or roll shall be legibly and indelibly marked with the manufacturer’s trade mark, thickness, size batch number and date of manufacture.

  Tiles shall be delivered securely packed and store in clean, dry, well ventilated places.

  **Joint welding**

  This can be provided where ever the PVC Rolls are installed in order to avoid dust accumulation leakage of water and prevention from wear and tear in joints. In this, a PVC cord is put into the joint after making groves with machine and is welded with hot thermo welding machine.

  **(a) Mix Underbed**

  The underbed, where required to make up the specified thickness or to achieve the required grade of the right type of surface shall be composed of 1 part cement, 2 parts sand and 4 parts stone
chips mixed with just sufficient water to make the mix workable.

(b) Laying

The tiles shall be stored in the room to be tied for atleast 24 hours to bring them to the same temperature as the room. In air conditioning spaces, the air conditioned space, the tiles shall be stored in the room to be tiled for at least 24 air conditioning shall be fully operational before the tiling is laid.

The surface to receive this finish shall be firm, even textured but not too smooth, without undulations and other deficiencies. If an underbed is laid, the same shall be cured for at least 7 days by keeping it moist and then is shall be fully dried.

The surface shall be thoroughly cleaned. All loose dust particles shall be removed. Oil and grease, if any shall be removed completely by the use of detergent.

The adhesive shall be applied uniformly to the fully dry surface in the desired thickness. The adhesive shall also be applied to the backs and edges of the tiles and surface shall be allowed to dry. The tiles shall then be placed neatly on the surface exactly to the approved pattern and set with a suitable tool. If the edges tend to curl up, weights are to be applied to keep the edges down. Special care shall be taken to avoid the formation of air pockets under the tiles. The joints shall be very fine. Any adhesive squeezed out through the joints shall be removed immediately.

(c) Finishing

Any adhesive marks on the surface shall be removed by wiping with a soft cloth soaked in solvent. The surface shall be cleaned with soft soap dried and then polished with approved type of polish just before handling over to the Executing Agency.

6.2.6 Ground floor with earth subgrade

For ground floors having an earthen subgrade, the floor finish shall consist of the following:

- Compacted Earth
  i) 150 mm thick dry rubble soling on rammed earth. Rubble shall be hand packed as directed by the Project Engineer and Executing Agency. This shall be laid closely in position on the subgrade. All interstices between the stones shall be wedged in with smaller stones of suitable size well driven to ensure tight packing and complete filling of the interstices. The filling shall be carried out simultaneously with the placing in position of the rubble stone and shall not lag behind. The small interstices shall be filled with hard clean sand well watered and rammed.
  ii) 100 mm thick sand cushion.
  iii) PVC sub-base 75 mm thick, 1:4:8 mix.
iv) Floor finish with underbed as specified elsewhere.

**Acceptance criteria**

The finish shall be checked specially for:

(a) Level, slope, plumb as the case may be (The surface of the finish shall be smooth and within +/-5 mm of the specified level or position. Local irregularities shall be within +/-3 mm when measured against a 3 metre straight edge. Abrupt changes of alignment shall not exceed 2 mm).

(b) Pattern and symmetry

(c) Alignment of joints, dividing strips, etc.

(d) Color, texture

(e) Surface finish

(f) Thickness of joints

(g) Details of edges, junctions, etc.

(h) Performance

(i) Precautions specified for durability

**External wall treatment**

**Madrasi danna, vineratex, granotex, etc.**

Madrasi Danna, Vineratex, or Granotex finishes, where indicated shall be applied with materials as manufactured by the approved agencies. Stone finish, unless otherwise specifically mentioned, shall be used.

Samples of materials shall be submitted to the Project Engineer and Executing Agency to approval before the bulk purchase is made. The Concessionaire shall prepare test panels 1m x 1m in size and obtain approval from the Project Engineer and Executing Agency before commencing actual application of each type of finish.

The thickness of the finish shall not be less than 3 mm.

All surfaces to be finished shall be smooth and level and shall be thoroughly cleaned to remove any grease, dirt or loose particles and shall be free from surface water.

Extremely porous surfaces shall be pre-sealed with a thin coat of suitable primer. Previously painted surfaces shall be prepared by scrapping off all loose paints, washing with a suitable detergent and rinsing thoroughly with clean water. The finish shall be applied strictly in accordance with the manufacturer’s instructions.

After application, the Concessionaire shall protect the surfaces against rain & sun until complete hardness of the finish is achieved without any extra cost to the Executing Agency. This type of work shall be carried out by specialized agencies only.
I.S. codes

Some of the important applicable Indian Codes for this section are listed below. Latest editions of these codes shall be follows:

IS : 777 - Glazed earthenware tiles
IS : 1237 - Cement concrete flooring tiles
Sub section - C7
Technical specification for roof waterproofing insulation and allied works
Sub section - C7

Sub section - C7: Technical specification for roof waterproofing insulation and allied works

7.1 Scope

This specification covers furnishing, installing, finishing, curing, testing, protecting, maintaining till handing over of roof waterproofing, thermal insulation and allied works for buildings.

7.2 General requirements

The Concessionaire shall furnish all skilled and unskilled labour, plant, equipment, scaffolding, materials etc., required for complete execution of the work in accordance with the drawings and as described herein and / or as directed by the Project Engineer and Executing Agency.

The Concessionaire shall follow all safety requirements / rules during execution of the work.

The Concessionaire should have adequate experience in execution of such works. Alternatively, he should engage specialized agency for executing the work after obtaining approval from the Project Engineer and Executing Agency.

7.3 Codes and standards

All applicable standards, acts and codes of practice referred to shall be the latest editions including all applicable official amendments and revisions. A complete set of all these documents shall generally be available at site, with the Concessionaire.

In case of any conflict between this specification and those (IS Standards, Codes etc.) more stringent shall prevail.

Some of the applicable Indian Standards, Codes, etc are referred to here below:

7.4 Materials

Bitumen felt for waterproofing treatment shall be Hessian base self - finished felts of specified type and grade conforming to IS: 1322.

Bitumen primer shall conform to IS: 3384.

The bonding material between the felt and the roof surface and between the successive felts shall be industrial blown type bitumen of specified grade(s) conforming to IS: 702.

Cellular concrete (foam concrete) for insulation of roof shall be cast-in-situ of specified type conforming to IS: 6598.

Materials for cement mortar under bedding and cement sand plaster over cellular concrete shall be as specified for plastering and allied works.

Materials for cement concrete under bedding work shall be as specified for concrete and allied works.

7.5 Layers of treatments

Various layers of treatment required for roof waterproofing and insulation work shall be as given below.

However different layers which are to be actually provided for various areas shall be as shown in the drawings and directed by the Project Engineer and Executing Agency.

a) Grading underbed
b) Insulation (Cellular concrete)
c) Cement plaster and
d) Waterproofing treatment

7.6 Grading underbed

The underbed shall be laid to provide an ultimate run-off gradient not less than 1 in 100 or as specified in the drawing and as directed by the Project Engineer and Executing Agency. Upto an average thickness of 25mm the underbed shall usually be composed of cement and sand plaster. For higher thickness the underbed shall be made with cement concrete. However actual thickness and other details shall be as per approved drawings well defined cracks other than hair cracks in the roof structure shall be cut to 'V' section, cleaned and filled up flush with cement - sand slurry or with cold applied bituminous caulking compound conforming to IS: 1580. The roof surface shall be cured prior to the application of underbed.
The surface of roof and that part of the parapet, gutters, drain mouths etc., over which the underbed is to be applied shall be roughened and thoroughly cleaned of all foreign matter namely fungus, moss and dust, with wire brushing and dusting. Oil patches if any shall be removed with detergent. The surface shall be soaked with water and all excess water removed just before laying of the underbed.

The underbed shall not be laid under direct sunlight and shall be kept in shade immediately after laying, so as to avoid quick loss of water from the mix and separation from the roof surface. The underbed shall be cured under water twice a day for at least 7 days.

The underbed shall be finished to receive the waterproofing treatment directly or insulation as the case may be.
7.6.1 Cement mortar underbed

The grading plaster shall have an average thickness of 25mm. It shall consist of cement and sand in the ratio of 1:4 by volume. The sand and cement shall be thoroughly mixed dry before water is added. Each batch of mix shall be consumed before the initial set starts.

The plaster shall be laid to proper grade in continuous operation and fully compacted. The surface shall be even and reasonably smooth. For detailed specification of plastering work Section -C5 shall be followed.

7.6.2 Cement concrete underbed

The concrete shall be used where the underbed is more than 25mm (average) thick. It shall consist of cement concrete 1:2:4 mix by volume (1 cement: 2 sand: 4 graded stone aggregate. 12.5 mm down stone nominal size). The aggregate shall be thoroughly mixed dry and minimum quantity of water shall be added to make the mix workable.

The mix shall be laid to proper grade in continuous operation and full consolidated. The surface shall be even and smooth. For detailed specification of concrete work Section C3 shall be followed.

7.7 Insulation

Insulation shall consist of cast-in-situ cellular concrete conforming to IS: 6598.

The cellular concrete of thickness 40 mm (minimum) shall be laid over the grading underbed over precast/cast-in-situ RCC roofs. The cellular concrete shall be laid directly over the surface of the roof without separate under bedding and the slope be provided by cellular concrete, wherever shown in the drawings and / or as directed by the Project Engineer and Executing Agency.

7.8 Cellular concrete

It shall consist of cast - in - situ light weight concrete formed by producing gas or air bubbles in cement slurry or a cement - sand slurry. The cement slurry or cement - sand slurry. The material shall be cured under natural conditions i.e., under ambient pressure and temperature by water. The material shall have a density of 320 kg/cu.m. crushing strength of minimum 2.5 kg/sq.m. value of thermal conductivity of maximum 0.7 mW/cm deg at 50 degree Centigrade mean temperature i.e., Type A.

Before start of the laying of the cellular concrete, samples shall be prepared at site got tested. The approval of the Project Engineer and Executing Agency shall necessarily be obtained.

Cellular concrete laid shall be sufficiently strong to take the usual workloads and standard loads expected on the roof. Any damaged portion shall be removed and replaced forthwith.

While laying the cellular concrete, samples from each batch of the mix shall be kept for test, if so
desired by the Project Engineer and Executing Agency.

The approval of the Project Engineer and Executing Agency shall be taken before laying the layer of cement plaster over the cellular concrete.

7.9 Cement plaster

After laying the insulation (cellular concrete), the surface shall be regarded with cement plaster and made ready as required to receive the waterproofing treatment.

The top surface of insulation shall be finished, with 12mm (minimum) thick, or as specified in the item 1:4 cement - sand plaster by volume to get an even and smooth surface. The sand and cement shall be thoroughly mixed dry before water is added to it. Each batch of the mix shall be consumed before the initial set starts. It shall be cured twice a day for at least seven days before laying the waterproofing course. For detailed specification of plastering work MODULE / shall be followed.

7.10 Waterproofing treatment

7.11.1 Preparatory work

IS: 3067 shall be followed as a general guidance for preparatory work.

Waterproofing treatment shall be carried out into the drain pipe or outlets by at least 100mm. The waterproofing treatment laid on the surface shall overlap the upper age of the waterproofing treatment in the drain outlets by at least 100 mm. Drain outlets shall be suitably placed with respect to the roof gradient to ensure rapid drainage and prevent local accumulation of water on the roof surface. Masonry drain mouths shall be widened two and a half times the diameter of the drain and rounded with cement mortar.

Forecast iron outlets a groove shall be cut all round to tuck the treatment.

When a pipe passes through a roof on which waterproofing treatment is to be laid, a cement concrete angle - fillet shall be built round it and the waterproofing treatment taken over the fillet.

In case of parapet walls above 450mm in height, for tucking in the waterproofing treatment a horizontal groove at a minimum height of 150mm above roof level shall be left in the vertical face at the time of construction. This groove shall be 75mm wide and 65mm deep. The horizontal face of the groove shall be shaped with cement mortar 1:4.

In case of low parapets, where the height does not exceed 450mm, no groove shall be provided and the waterproofing treatment shall be carried right over the top.

In the case of existing RCC and stone walls, cutting the chase for tucking in the waterproofing treatment is not recommended.
At the junction between the roof and the vertical face of the parapet wall, a fillet 75mm (min) in radius shall be constructed.

At the drain mouths, the fillet shall be suitably cut back and rounded off for easy application of the waterproofing treatment and easy flow of water.

Outlets at every low dividing wall, about less than 300mm in height, shall be cut open to full depth and the bottom and sides shall be rendered smooth and corners rounded off for easy application of waterproofing treatment.

The surface to be coated with bitumen primer shall be cleaned with wire brushes and cotton or gunny cloth. All loose materials shall be removed and surface shall be further cleaned with a piece of cloth lightly soaked in kerosene oil. The surface shall be painted when it is completely dry.

Bitumen primer (priming coat) shall be used prior to the application of the first mopping coat of hot molten bitumen to promote the bonding of the bitumen with the surface. The bitumen primer shall be liquid bitumen of low viscosity which shall penetrate into the prepared surface upon application. It shall be free from water and it shall conform to IS: 3384. It shall preferably be made from the same grade of bitumen as used in bonding.

The bitumen primer shall be brushed over the surfaces and allowed to dry. Generally, a quantity of 0.27 litres per sq.m. (Minimum) is recommended.

The bonding material between the felt and the roof surface and between the successive felts shall be industrial blown type bitumen of Grade 85/25 or 90/15 conforming to IS: 702 to withstand local conditions of prevailing temperature and gradient of roof surface. For top dressing bitumen used shall be industrial blown type of allowable penetration not more than 40 when tested in accordance with IS: 1203.

For vertical surface upto 1 meter height blown type bitumen of grade 85/25 or 90/15 and above 1 metre height grade 115/25 shall be used.

Bitumen tar felt of type 3, grade 1 conforming to IS: 1322 shall be used for roof waterproofing and the treatment shall be done as per IS: 1346.

The Concessionaire shall state the source from where he proposes to procure the materials. The Concessionaire shall satisfy the Project Engineer and Executing Agency that the bonding material proposed to be used is suitable for the particular job. Test certificates for the bonding material shall also be submitted and samples, if desired by the Project Engineer and Executing Agency shall be provided for confirmatory tests. Sample of the self-finished felt shall be submitted in advance to the Project Engineer and Executing Agency along with test certificates for his review. Samples of stone grit shall be submitted if instructed by the Project Engineer and Executing Agency. The stone grit shall be 6mm and down size and shall be devoid of fine sand. Test certificates shall be furnished with each batch of bulk supply for Project Engineer and Executing Agency's approval.
7.11.2 Course of treatment

The waterproofing treatment shall consist of a seven course treatment. Each layer of bonding materials, self-finished bitumen felt or stone grit is counted as one course.

Brief description of various courses of treatment shall be as follows:

Heavy treatment - seven courses for severe conditions:

1. Primer conforming to IS: 3384 at the rate of 0.27 litre / sq.m minimum
2. Hot applied bitumen at the rate of 1.2 kg/sq.m minimum
3. Hessian - base self finished felt, Type - 3, Grade 1
4. Hot applied bitumen at the rate of 1.2 kg/sq.m minimum
5. Hessian - base self finished felt, Type 3, Grade 1
6. Hot applied bitumen at the rate of 1.2 kg/sq.m, minimum and
7. Grit, devoid of fine sand, at the rate of 0.006 cu.m/sq.m

7.11.3 Surface finish

When the roof surface is subjected to foot traffic or used as a working area, a cement mortar (1:4) shall be applied over the top most layer of roofing treatment. Over this, a layer of cement concrete flooring tiles conforming to IS: 1237 shall be provided in place of stone grit and cement painted. The tiles shall be laid as per IS: 1443. Alternatively, a screening of proportion of 1:4 of cement and sand 45mm thick can be laid over the roof treatment wherever shown in the drawing and marked off into square of 600mm made with expansion joints provided at a distance of 3 metre which shall be properly caulked with bituminous sealing compound conforming to grade A of IS: 1834.

Waterproofing treatment shall be carefully carried out from the time the surface is prepared to receive the felt to the finishing of the treated surface. Special attention and strict supervision shall be necessarily paid to overlapping of joints in felts, treatment around drainage openings in the roof and treatment of the parapet walls. The sticking of the felt to the roof by means of hot bitumen also requires skill. In order to achieve this, the waterproofing treatment shall be laid by a specialist firm with long experience in this particular line. The surface to receive the waterproofing treatment must be cleaned of all foreign matter, namely fungus, moss, dust etc by wire brushing and dusting and dried satisfactorily and the approval of the Project Engineer and Executing Agency taken before starting the work. If any existing top course shall be completely removed and all damaged felts or other defects repaired. The Project Engineer and Executing Agency may instruct the Concessionaire to lay part of the stipulated course at the first instant to be followed later on with the balance courses. This interim finish shall be done with a course of hot applied bitumen. While doing the balance, hot bitumen shall be applied again to start with after repair of all damages to the already laid courses.

The bitumen bonding material of specified grade shall be prepared by heating to the correct working temperature specified by the manufacturer and maintained at that temperature. It shall
then be conveyed to the point of work in a bucket or pouring can, poured and spread on the surface in a uniform continuous coating at the specified rate. For very large roofs, use of a spray machine is recommended to secure even spreading. The surface shall be carefully examined for gaps or pin holes, which on location shall be carefully filled up with the bitumen. Bitumen shall be applied carefully so that the exposed faces are not disfigured by splashing or spattering the bitumen all over.

The coat of bitumen shall be continued at least 15cm along the vertical surfaces joining the roof. In case of parapet walls, it shall be continued upto the drip course.

The self finished felt shall be cut to the required lengths, brushed clean of dusting material and laid out flat on the roof and allowed to soften, to eliminate curls and subsequent stretching. The felt shall normally be laid in lengths at right angles to the direction of run-off gradient, commencing at the lowest level and working upto the crest so that the over-laps of the adjacent layers of felt shall offer minimum obstruction to the flow off of water. The felt shall not be laid in single piece of very long lengths as they are likely to shrink. Six to eight metres are suitable lengths. Each length of felt prepared for laying as described above shall be laid in position and rolled up for a distance of half its length. The hot bonding material heated to correct working temperature as specified by the manufacturer, shall be poured on to the roof across the full width of the rolled felt as the latter is steadily unrolled and pressed down. The excess bonding material which squeezes out at the ends shall be removed as the laying proceeds. The pouring shall be so regulated that the correct weight of bonding material per unit area is spread uniformly over.

When the first half of the strip of felt has been bonded to the roof, the other half shall be rolled up and then unrolled on to the hot bonding material in the same way. Subsequently strips shall also be laid in the same manner. Each strip shall overlap the preceding one by at least 75mm at the sides of strip of felt and at least 100mm at the ends. All overlaps shall be firmly bonded with hot bitumen. Streaks and trailings of bitumen near edges of laps shall be levelled by heating the overlaps with a blow lamp and leveling down unevenness.

In a seven course treatment the fourth and sixth layers of bonding material and the fifth layer of self-finished felt shall be laid in the manner already described, taking care that the joints are staggered with those in the layer beneath it i.e., third layer. The sixth layer shall be carried out after the flashing is done. Immediately after application of top layer of bitumen stone grit shall be evenly spread and levelled over the surface when the bitumen is still hot.

After completion, the surface shall be cleaned taking care that loose gravels, felt cuttings, etc. do not find their way into rain down corners.

The surface level shall be such as to allow quick draining of rains without leaving any pool anywhere. The finishing course shall be fully secured and shall have an even density. There shall not be any bubble formation or crushed or squeezed insulation or underbed.

For heat reflecting surface or for aesthetic reasons bitumen based aluminium paints or coloured bituminous emulsions may be used as directed by the Project Engineer and Executing Agency.
7.11.4 Flashing

Felt shall be laid as flashings in widths wherever junctions of vertical and horizontal structures (i.e., roof surface and parapet wall or any other vertical structure) occur with minimum overlap of 100mm. The lower layer of flashing felt in seven course treatment shall overlap the roof waterproofing by not less than 200mm while upper layer shall overlap the roofing felt by 100mm. On the vertical and sloping faces last course of flashing should not be of stone grit or pea-sized gravel, but it shall be replaced by providing two coats of bituminous paint at the minimum rate of 0.1 litres/sq.m per coat or a single coat of bituminous emulsion at the rate of 0.5 litre/sq.m may be applied.

The lower edge of flashing shall overlap the felt laid on flat portion of the roof and the upper edge of the flashing shall be tucked into the horizontal groove 75mm thick wide 65mm deep, provided at a minimum height of 150mm from top of the roof surface. The flashing treatment shall be firmly held in place in the grooves with wooden wedges at intervals and the grooves shall be filled with cement mortar 1:4 (1 cement: 4 coarse sand) or cement concrete 1:2:4 (1 cement: 2 coarse sand: 4 graded stone aggregate 6 mm nominal size) and surface of flashing.

After the top flashing felt layer has been laid, the penultimate layer of bonding material shall be applied over the roofing felt and horizontal overlaps and vertical and sloping surfaces of flashing at the specified rate. Then grit or gravel shall be spread uniformly over the hot bonding material on the horizontal surface and pressed into it with a wooden roller.

Where waterproofing treatment is required to be isolated from the roof structure, bitumen saturated felt shall be spread over the roof surface and tucked into the flashing grooves. To keep these felts free from the structure, no bonding material shall be used below these felts.

7.11.5 Fillets

All along the junction of the roof surfaces and vertical walls cement mortar (1:4) fillet shall be provided. The fillets shall be 150mm x 150mm in size unless otherwise shown on drawing or instructed by the Project Engineer and Executing Agency. The shape of the fillet shall slightly be concave.

Cast-in-situ cement concrete (1:2:4 with 12.5mm down aggregate) or cement mortar 1:4 shall be used to provide fillet.

7.11.6 Expansion joints

Expansion joints shall be designed to suit the requirements of each roof. Expansion joint coverings shall be of bitumen felt. In this case, a minimum of two layers of bitumen felt, Type 2, Grade 2 as specified in IS: 1322 shall be used with top dressing gravel or other suitable finish.

7.11 Acceptance criteria

The surface level shall be such as to allow quick draining of rains without leaving any pool
anywhere. The finishing course shall be fully secured and shall have an even density. There shall not be any bubble formation or crushed or squeezed insulation or underbed.

Sub section - C8: Technical specification for painting, white washing, etc.

8.1 Scope

This specification covers painting, white washing, etc. of both interior and exterior surfaces of masonry, concrete, plastering, plaster of Paris, rain water down comers, floor and roof drains, waste and service water pipes and other items, as directed by the Project Engineer and Executing Agency.

If the surface to be finished cannot be put in a suitable condition for painting by customary preparatory method, the Concessionaire shall notify the Project Engineer and Executing Agency in writing and assume responsibility for any rectification and unsatisfactory finishing that might result.

Before commencing painting, the Concessionaire shall obtain the approval of the Project Engineer and Executing Agency in writing regarding the scheduling of work to minimise damage, disfiguration or staining by other trades. He shall also undertake necessary precautions to prevent damage, disfiguration or staining of other trades or other installations.

8.2 Materials

Materials shall be the highest grade products of well known approved manufacturers and shall be delivered to the site in original sealed containers, bearing brand name, manufacturer’s name and colour shade, with labels intact and seals unbroken. All materials shall be subject to inspection and approval by the Project Engineer and Executing Agency. It is desired that materials of one manufacturer only shall be used as far as possible and paint of one shade be obtained from the same manufacturing batch. All paints shall be subjected to analysis from random samples taken at site from the painter’s bucket, if so desired by the Project Engineer and Executing Agency.

All primer coats shall be compatible to the material of the surface to be finished as well as to the finishing coats to be applied.

All unspecified materials shall be of the highest quality available and shall conform to the latest IS standards. All such materials shall be made by reputable recognised manufacturers and shall be approved by the Project Engineer and Executing Agency.

All colours shall be as per the painting schedule and tinting and matching shall be done to the satisfaction of the Project Engineer and Executing Agency. In such cases, where samples are required, they shall be executed in advance with the specified materials for the approval of the Project Engineer and Executing Agency.

8.2.1 Synthetic enamel paint

Shall be made from synthetic resins and drying oil with rutile titanium dioxide and other selected pigments to give a smooth, hard, durable and glossy finish to all exterior and interior surfaces. White and pastel shades shall resist yellowing and darkening with ageing. The paint shall conform to IS:2932 and IS:2933.
8.2.2  **Waterproof cement paint**

Shall be made from best quality white cement and lime resistant colours with accelerators, waterproofing agents and fungicides. The paint shall conform to IS:5410.

8.2.3  **Dry distemper**

Dry distemper of required colour conforming to IS: 427 of approved brand and manufacturer shall be used. The primer where used shall be cement primer or distemper primer. These shall be of same manufacturer as that of distemper.

8.2.4  **White washing**

White washing shall be done from pure shell lime or fat lime, or a mixture of both as instructed by the Project Engineer and Executing Agency and shall conform to IS:712 (latest edition) Samples of lime shall be submitted to the Project Engineer and Executing Agency for approval and lime as per the approved samples shall be brought to site in an unslaked condition. After slaking, it shall be allowed to remain in a tank of water for two days and then stirred up with a pole, until it attains the consistency of thin cream. 100 grams of gum to 6 litres of white wash water and a little quantity of indigo or synthetic ultramarine blue shall be added to the lime.

8.2.5  **Colour wash**

Shall be done with mineral colours not affected by lime added to white wash. No colour wash shall be done until a sample of the colour wash to the required tint or shade has been approved by the Project Engineer and Executing Agency. The colour shall be of even tint or shade over the whole surface. If it is blotchy or otherwise badly applied, it shall be redone by the Concessionaire at his own cost.

8.2.6  **Acrylic emulsion paint**

Shall be water based acrylic copolymer emulsion with rutile titanium dioxide and other selected pigment and fungicide. It shall exhibit excellent adhesion to plaster and cement surface and shall resist deterioration by alkali salts. The paint film shall allow the moisture in wall to escape without pelling or blistering the paint. After it is dried, the paint should be able to withstand washing with mild soap and water without any deterioration in colour or without showing flaking, blistering or peeling.

8.2.7  **Oil bound distemper**

Oil bound distemper (IS:428-1969) of approved brand and manufacture shall be used. The primer where used be cement primer or distemper primer. These shall be of same manufacturer as that of distemper. The distemper shall be diluted with prescribed thinner in a manner recommended by
the manufacturer. Only sufficient quality of distemper required for a day’s work shall be prepared.

8.2.8 Chemical resistant paint

Chemical resistant paint as per IS:157 of approved brand and manufacture shall be used. Primer coat to be used shall be as per manufacturer’s specifications.

8.2.9 Fire resistant paint

Fire resisting paint (silicate type) shall be as per IS:162 and of approved brand and manufacture. Primer to be used shall be as per manufacturer’s specifications.

8.2.10 Oil resistant paint

Oil resistant paint shall be as per IS:161 and of approved brand and manufacturer. Primer coat shall be as per manufacturer’s specifications.

8.3 Storage

The Concessionaire shall arrange for safe and proper storage of all materials and tools. Paints shall be kept covered at all times and mixing shall be done in suitable containers. All necessary precautions shall be taken by the Concessionaire to prevent fire.

8.4 Preparation of surface

Before starting the work, the Concessionaire shall obtain the approval of the Project Engineer and Executing Agency regarding the soundness and readiness of the surface to be painted on.

8.4.1 Masonry, concrete and plastered surface

The surface shall be free from all oil, grease, efflorescence, mildew, loose paint or other foreign and loose materials. Masonry cracks shall be cleaned out and patch filled with mortar similar to the original surface and uniformly textured. Where this type of resurfacing may lead to the finishing paint being different in shade from the original surfaces, the resurfaced area shall be treated with a minimum of one coat of cement primer and should be continued to the surrounding area for a distance of at least 100mm.

Surfaces with mildew or efflorescence shall be treated as below:

a. Mildew

All mildewed surfaces shall be treated with an approved fungicide such as ammonical wash consisting of 7 gm. of copper carbonate dissolved in 80 ml liquor and diluted to 1 liter with water or 2.5 percent magnesium silica fluoride solution and allowed to dry thoroughly before paint is applied.
b. Efflorescence:

All efflorescence shall be removed by scrubbing the affected surface with a solution of mariatic acid and in water (1:6 to 1:8) and then washed fully with clear water and allowed to dry thoroughly.

8.4.2 Metal

All metal surfaces shall be absolutely clean, dry and free from wax, grease and soap films. All steel and iron surfaces in addition shall be free from rust. All galvanized iron surfaces shall be pretreated with a compatible primer according to the manufacturer’s direction. Any abrasion in shop coat shall be touched up with the same quality of paint as the original coat.

8.5 Application

8.5.1 General

The method of application shall be as recommended by the manufacturer. In case of selection of a special shade and colour (not available in standard shades) the Concessionaire shall prepare test panels in different shades of minimum size 1 metre square as instructed by the Project Engineer and Executing Agency and obtain his approval prior to applications of the finishing paints.

Proper tools and implements shall be used. Scaffolding if used shall be independent of the surface to be painted to avoid shade differences of the freshly repaired anchor holes. Painting shall be done by skilled labour in a workman like manner. All materials shall be evenly applied, so as to be free of sags, runs, crawls or other defects. All coats shall be of proper consistency. In case of application by brush, no brush marks shall be visible. The brushes shall be clean and in good condition before application of the paint.

All priming undercoats for painting shall be applied by brush only. Roller and spray equipment, etc., shall not be used.

No work shall be done under conditions that are unsuitable for the production of good results. No painting shall be done when plastering is in progress or is drying. Paint which seals the surfaces to moisture shall be applied only after the moisture on and below the surface has dried out.

All coats shall be thoroughly dry before being sand papered or before the succeeding coat is applied. Coats of painting as specified are intended to cover surfaces perfectly. In case the surface is not covered properly by applying the specified number of coats, further coats shall be applied by the Concessionaire when so directed by the Project Engineer and Executing Agency.

All primers and under coats shall be tinted to approximate the colour of the finishing coats. Finished coats shall be of exact colour and shade as approved samples and all finish shall be uniform in colour and texture. All parts of mouldings and ornaments shall be left clean and true
to finish.

8.5.2 Synthetic enamel paint

Shall be applied on properly primed surface. Subsequent coat shall not be applied till the previous coat is dry. The previous coat shall be lightly sand papered for better adhesion of subsequent coats.

8.5.3 Waterproof cement paint

Surface to be coated with cement paint shall be washed and brushed down. As soon as the moisture has disappeared, the surface shall be given one coat of paint. Care shall be taken so that the paint does not dry out too rapidly. After 4 to 6 hours, the water shall be sprinkled over the surface to assist curing and prevent cracking. After the first, coat has dried (24 to 48 hours), the second coat shall be applied.

In a similar manner the finished surface shall be kept moist by occasional sprinkling with water for seven days after painting.

8.5.4 Dry distemper

New plastered surface shall be allowed to dry for atleast two months. New lime or lime plastered surface shall be washed with a solution of 1 part of vinegar to 12 parts water or 1:50 sulphuric acid solution and left for 24 hours after which the wall shall be thoroughly washed with clean water. For cement plastered surface, the surface shall be washed with a solution of 100 gms of zinc sulphate to 1 litre of water and then allowed to dry.

Dry distempering shall be done as per manufacturer’s instruction. In applying the distempers, the brush should first be applied horizontally and immediately crossed off perpendicularly. Brushing shall not be continued too long as otherwise brush marks may result.

8.5.5 White washing

The surface where white washing is to be applied shall be cleaned of all loose material and dirt. All holes and irregularities of the surfaces shall be filled up with lime putty and shall be allowed to dry out before application of the lime solution.

One coat of white wash shall consist of one stroke from top downwards, another from bottom upwards over the first stroke and another from left to right and right to left before the vertical stroke dries out. A second coat shall be applied and similarly a third coat shall be applied whenever the Project Engineer and Executing Agency feels that more than two coats are required and the Concessionaire shall do so without any extra cost to the Executing Agency. No brush marks shall show on the finished surface.
8.5.6 Colour wash

For new work, the priming coat shall be of white wash with lime or with whiting. Two or more coats shall then be applied on the entire surface till it represents a smooth and uniform finish. The finished dry surface shall not be powdery and shall not readily come off on hand when rubbed. Indigo or synthetic ultramarine blue shall, however, not be added.

8.5.7 Acrylic emulsion paint

Lime gauged cement plastered surfaces shall not be painted for at least one month after plastering. All sample patch shall be painted to check alkali reaction if so desired by the Project Engineer and Executing Agency. Painting shall be strictly as per manufacturer’s specification.

8.5.8 Oil bound distemper

Any unevenness in surface shall be made good by applying putty. The patched surface shall be allowed to dry thoroughly before the coat of distemper is applied. One coat of distemper properly diluted with thinner as specified by the manufacturer shall be applied by brush in horizontal strokes followed immediately by vertical ones which together will constitute one coat. Two or more coats of distemper as found necessary shall be applied to obtain even shade.

8.5.9 Chemical resistant, fire resistant and oil resistant paints

In general, method of application of these paints shall be strictly as per manufacturer’s specification.

8.6 Painting of iron work

Paint to use for various items of work shall be of best quality and shall be obtained ready mixed in sealed containers from approved manufacturer. The Concessionaire shall obtain the Project Engineer and Executing Agency’s approval for the make and colour of the paint he proposes to use.

All surfaces shall be thoroughly cleaned of all dirt, loose particles and rust and approved prior to application of paint. Workmanship shall conform to IS:1477 (Part I & II)

Specified number of coats shall be applied and atleast 24 hours shall elapse between the application of successive coats. No painting shall be carried out on exterior work in wet weather or on surfaces which are not entirely dry.

Painting rate shall include all necessary scaffolding, cradles and plant.

8.7 Protection

Furniture and other movable objects, equipments, fittings and accessories shall be moved,
protected and replaced upon completion of the painting work. All stationary items of equipments shall be well covered so that no paint can fall on them. Work finished by other agencies shall be well protected. All protection shall be as per instruction of the Project Engineer and Executing Agency.

8.8 Cleaning up

The Concessionaire shall upon completion of painting etc. remove all marks and make good surfaces, where paint has spilled, splashed or splattered, including all equipments, fixtures, glass furniture, fittings, etc. to the satisfaction of the Project Engineer and Executing Agency.

8.9 Acceptance criteria

All painted surfaces shall be uniform and pleasing the appearance. The colour, texture etc. shall match exactly with approved samples.

All stains, splashes and splatters of paint shall be removed from surrounding surfaces.

8.10 Painting of structural steel / miscellaneous steel

8.10.1 Scope

The specification covers painting of the structural/ miscellaneous steel supplied and erected either by other agencies or by the Concessionaire for work under the scope of this contract. One shop coat of red oxide zinc chromate primer including necessary touching up has already been completed by the concerned agency. One coat of red oxide zinc chromate primer followed by a coat of undercoating and two or more finishing coats of synthetic enamel paint as described hereunder are only required to be provided under the item for painting structural / miscellaneous steel.

8.10.2 Type of structures to be painted

Painting shall be done on all exposed surfaces (including undersides wherever exposed) of various structural steel members like columns, trusses, beams, roof girders, oil tanks, trestles, bracings, crane girders, chequered plates, gratings, brackets, base plates etc. in the plant as directed by the Project Engineer and Executing Agency. It should be clearly noted that all structures are already erected / placed in position or are under erection, hence the quoted rate by Concessionaire shall account for all aspects involved in painting keeping in view the heights, available access to members etc. It is advised that the Concessionaire should visit the site and get himself acquainted with the nature of work completely including the extent and type of scaffoldings etc, required, before quoting his rate.

8.10.3 Material
Paint shall be synthetic enamel paint conforming to IS:2932 of approved colour and brand.

### 8.10.4 Painting

In general, painting work shall be in accordance with IS:1477 (Part I & II).

Surface of steel work to be painted shall be thoroughly cleaned of all grease, oil dirt, rust, foreign matter like cement splashings, etc. by suitable solvent and mild rubbing with abrasive paper/ hand scraping to the full satisfaction of the Project Engineer and Executing Agency. Clearing with solvents/ scraping shall be limited to the affected areas only.

In cases where the existing primer is removed while cleaning the surface as detailed in 12.4.2, damaged portions shall be provided with a coat of wash or etching primer on suitable chemical pretreatment solutions and another coat of red oxide Zinc chromate primer. The payment for red oxide primer will be made as per relevant item of Schedule of items.

After the surface is prepared in a manner described above, the primer coat shall be dry cut without scratching or in any way damaging the primer coats and clean the surfaces from dust.

Over this dry surface apply an optimum coat of undercoating (synthetic enamel paint) by brush or spray with minimum brush marks. Allow the film to dry hard, wet rub, cutting down to a smooth finish (ensuring that at no place the undercoat is completely removed) Allow the water to evaporate.

The total dry film thickness of each coat shall be not less than 25 microns.

The paint shall be applied by brushing / spraying. Spraying shall be adopted with prior approval of Project Engineer and Executing Agency generally on large surface areas. Paints shall be stirred frequently to keep the pigment in suspension. Paint shall be ready mixed in original sealed containers as packed by the paint manufacturers and no thinners shall be permitted. No painting shall be done in frosty/ foggy / rainy weather or when humidity is high enough to cause condensation on the surface to be painted. Paint shall not be applied when the temperature of the surface to be painted is 5 deg or lower.

Concessionaire shall provide and use sufficient number of drop clothes, covers, tarpaulins and other screens to protect adjacent surfaces and shall remove all splatter and stains from such surfaces. The Concessionaire shall also protect his own work.

Any and all damage to adjacent work or any part of the premises due to painting carelessness or accidental performance of the Concessionaire shall be repaired or made good at the Concessionaire’s expense.

Painting shall be discontinued when exposed to rain and dust storm and shall not commence until the surfaces are perfectly dry and clean. Wherever practicable. Surfaces shall be painted when in shade or when temperature is falling.
8.10.5 Cleaning up

The Concessionaire upon completion of painting etc. shall remove all marks and make surfaces good, where paint has been spilled, splashed or splattered, including all equipment, fixtures, glass, furniture, fittings, etc. to the satisfaction of the Project Engineer and Executing Agency.

8.10.6 Acceptance criteria

a. All painted surfaces shall be uniform and pleasing in appearance.
b. The colour, texture, etc. shall match exactly with the approved samples.
c. All stains, splashes and splatters of paints shall be removed from surrounding surfaces.

Sub section - C9: Technical specification for fabrication and erection of structural steel works

9.1 Scope

This section of specification deals with the technical specifications needed for the fabrication and erection of structural steel works coming under the scope of this contract. All connections shall be of welded type unless specifically approved by the Project Engineer and Executing Agency otherwise.

The specification cover providing, fabrication, erection, alignment etc. complete including preparation of fabrication drawings of structural steel work involving rolled sections, pipes and built up sections fabricated out of plates, rolled section and or combination of plates and rolled sections in columns, beams, gantry girders, roof trusses, portals, purlins, space frames, shear connector, monorails, galleries, wall beams, brackets, stub columns bracings, trestles, base plates, chequered plate floorings, gratings with binders, walk way platform, ladders, stairs complete with stringers, treads, landings, hand rails posts, erection bolts and nuts, permanent bolts and nuts, dismantling, modification and re-erection of fabricated/erected steel, etc. including all sampling and testing as given in Annexure-B for the areas of work as specified above.

9.2 General requirements

The Concessaire shall furnish all structural steel material, labour, plant, equipment, consumables, scaffolding, tools, tackles, materials and everything that is required for complete executions of the work on schedule in accordance with the drawings and as described herein and/or as directed by the Project Engineer and Executing Agency.

9.2.1 Reference points and bench marks

The Concessaire shall make his own arrangements for locating the coordinates and positions of all work and reduced level (RL) at these locations based on two reference grid lines and one bench mark which shall be furnished by the Executing Agency. The Concessaire has to provide at site all the required survey instruments to the satisfaction of the Project Engineer and Executing Agency so that the work can be carried out accurately according to the specifications and drawings.

9.2.2 Safe working

The Concessaire shall strictly follow, at all stages of fabrication, transportation and erection of steel structures, the stipulations contained in the Indian standard safety code for erection of structural steel work IS:7205 and the provisions of the safety rules as specified in the general conditions of the contract for ensuring safety of men and materials. This shall include proper approach and working platform during erection of the structures.

9.2.3 Drawings
The fabrication drawings are to be prepared and furnished by the Concessionaire. These shall be based on the design drawings. These drawings shall indicate complete details of fabrication and erection including all splicing details, lacing details, weld sizes of lengths, detailing of all joints, and bill of materials in the proforma approved by the Project Engineer and Executing Agency, and all other customary details in accordance with standard structural engineering practice whether or not given by the Executing Agency. He shall furnish along with the fabrication drawings, necessary calculations regarding design of joints viz. Size and length of welds, dia and number of bolts, and calculations justifying other fabrication details as well as design of erection and fabrication splices in accordance with IS:800 and other relevant standards. He shall also furnish scheme of erection.

The fabrication drawings shall indicate identification (erection) marks for purposes of despatch and erection etc.

In addition, the total quantity as well as abstract of quantities is indicated in the fabrication drawings. The Concessionaire shall prepare a consolidated schedule of permanent bolts and nuts, showing the length, size, weight and numbers required for each fabricated member.

Three copies of the detailed fabrication drawings including bolts and nuts schedule shall be submitted by the Concessionaire for approval in the first instance along with Bill of materials showing the description of members, their erection marks, quantity, etc. (Proforma to be approved by the Project Engineer and Executing Agency). In case the approval accorded to the fabrication drawings is subject to any modifications, additions, and alterations, the Concessionaire shall submit two sets of the revised drawings for final approval after incorporating these changes.

In case the drawings are approved as submitted, he shall submit thirteen additional prints of such approved fabrication drawings. In addition, the Concessionaire shall also be required to furnish one reproducible copy of final fabrication drawings (as actually fabricated).

The design drawings may require revision either before or after the preparation and approval of fabrication drawings. Such revision shall be duly incorporated in the fabrication drawings and nothing extra shall be payable on this account for preparation / revision of fabrication drawings. The Concessionaire is expected to make his own assumptions regarding the quantum of such revisions involving preparation/revision of fabrication drawings, while quoting.

The fabrication work shall start only after the approval to the fabrication drawings is accorded by the Project Engineer and Executing Agency.

Such approval shall, however, not relieve the Concessionaire of his responsibility for the safety of the structure, good connections, erectability, etc.

9.2.4 Samples

Samples for checking the quality of materials procured by the Concessionaire and workmanship in the execution of the works may be called for at any time by the Project Engineer and Executing Agency. In case such samples are found to be of sub standard/unacceptable quality, the
Concessionaire shall immediately discontinue use of such materials and workmanship and get fresh samples approved by the Project Engineer and Executing Agency. Nothing shall affect the liberty of the Project Engineer and Executing Agency to reject whole or portions of structures where such defective materials and workmanship has already been used before detection.

9.2.5 Test at works

The Concessionaire shall arrange for all materials procured by him to be tested as and when required and in the presence of the representative of Project Engineer and Executing Agency.

For structural steel test samples shall be cut out of the materials from the locations indicated by the Project Engineer and Executing Agency and samples shall be prepared in accordance with the requirements of Indian Standards Specifications for conducting such tests. For each set of tests three samples shall be taken for tensile strength test and bend test. One set of tests will include test of three individual specimens of samples.

9.2.6 Fabrication shop at project site

Fabrication shop of the Concessionaire at project site shall have all facilities required for carrying out the work. The Concessionaire shall get the details of the shop approved by the Project Engineer and Executing Agency.

9.3 Applicable standard and codes

Except where otherwise specified herein or authorized by the Project Engineer and Executing Agency, all items of work shall conform to the requirements of relevant latest Indian standards. Any item of work, for which there is no Indian Standard available, shall conform to the latest British standard (B.S.). The item of work shall be best of its kind and subject to approval of the Project Engineer and Executing Agency. In case of conflict between this specification and those referred to in the standard, the former shall prevail.

List of certain important codes and standards applicable to this work is given below. However the applicable standards and codes shall be as per but not limited to the list given below.

9.3.1 Materials

| IS : 808 | Rolled steel, beam, channel and angle sections |
| IS : 2062 | Structural steel (fusion welding quality) |
| IS : 1363 | Hexagon head bolts, screws and nuts of production grade C. |
| IS : 1364 | Hexagon head bolts, screws, and nuts of production grade A & B. |
| IS : 1367 | Technical supply conditions for threaded fasteners. |
| IS : 1161 | Specification of steel tubes for structural purposes. |
| IS : 814 | Specification for covered electrodes for metal arc welding for weld steel. |
| IS : 1852 | Specification for rolling and cutting tolerances for hot rolled steel products. |
9.3.2 Codes of Practice

IS : 816 Code of practice for use of metal arc welding for general construction.

IS : 817 Code of practice for training and testing of metal arc welders
IS : 1811 Qualifying tests for metal arc welders (engaged in welding structures other than pipes).
IS : 1182 Recommended practice for radiographic examination of fusion-welded butt joints in plates.
IS : 3696 Safety code of scaffolds and ladders.
IS : 7293 Safety code for working with construction machinery.
IS : 7205 Indian Standard safety code for erection of structural steel.
IS : 7215 Tolerances for fabrication steel structures.
IS : 12843 Tolerance for erection of structural steel.
IS : 4353 Recommendation for submerged arc welding of mild steel and low alloy steels.
SP : 6 ISI Hand book for structural engineers. (Part 1 to 7)

9.3.3 Standards for testing

IS: 1608 Method of tensile testing of steel products other than sheets, strip, wire and tube.
IS : 1599 Method of bend tests for steel products other than sheets, strip, wire and tube.
IS : 228 Methods of chemical analysis of pig iron, cast iron and plain carbon and alloy steel
IS : 2595 Code of practice for radio graphic testing.
IS : 1182 Recommended practice for radiographic examination of fusion welded butt joints in steel plates.
IS : 3664 Code of practice for ultrasonic testing by pulse echo method.
IS : 3613 Acceptance tests for wire flux combination for submerged arch welding.
IS : 5334 Code of practice for magnetic particle flaw detection of welds.

9.4 Materials
Structural steel rolled sections and plates shall conform to specified grade of IS:2062. However rolled sections and plates up to 20mm conforming to IS:226 may be used in place of grade-A of IS:2062. Pipes used in Handrails, embedments etc. Shall conform to IS:1161. Chequered plate shall conform to IS:3502. High strength steel shall conform to IS:8500 of specified grade. All other materials shall be as per the list of standards codes given above or mentioned elsewhere in the relevant sections.

All steel sections and plates shall be straight, sound, free from twists, cracks, flaws, laminations, rough, jagged and imperfect edges and other defects.

In case any defect like laminations is noticed in the steel sections and plates during fabrication and erection, the same shall be brought to the notice of the Project Engineer and Executing Agency. These sections and plates shall be rejected unless specifically approved for acceptance by the Project Engineer and Executing Agency.

9.5 Fabrication

The fabrication and erection of works shall be carried out generally in accordance with IS:800 as well as the stipulations contained in this specification. All materials shall be completely fabricated at his own shop or at the shop established by him at project site and finished with proper connection materials for ready assembly in the field. Check list format, inspection certificate for fabrication, erection, alignment and protocol for handling over of structural steel shall be submitted by the Concessionaire in the form as agreed to by the Project Engineer and Executing Agency. Fabrication work shall be taken up based on the approved fabrication drawings.

9.5.1 Cutting plans

Fabrication work shall be taken up based on the fabrication drawings duly approved by the Project Engineer and Executing Agency. The Concessionaire shall prepare necessary cutting plans before commencement of fabrication for all fabrication drawings.

9.5.2 Straightening

All steel material shall be straight and free from bends or twists. If the sections are distorted or twisted during transit, storage, etc. They shall be straightened and/or flattened by straightening machine at ambient temperature, though minor kinks or bends may be corrected by limited heating under careful supervision.

9.5.3 Bending

The bending of plates and sections to specially required shapes shall be done either on
appropriate machine or by angle smithy and black smithy processes.

9.5.4 Cutting

Cutting may be effected by shearing, cropping, sawing or by gas cutting by mechanically controlled torch. Gas cutting by hand may only be used when specifically authorized in writing by the Project Engineer and Executing Agency. The edges of all plates shall be perfectly straight and uniform throughout. Shearing, cropping and gas cutting shall be clean, square and free from distortion and burrs, and should the Project Engineer and Executing Agency find it necessary the edges shall be ground afterwards by the Concessionaire.

9.5.5 Grinding

All the edges cut by flame shall be ground before they are welded. Ends of all bearing stiffeners shall be ground to fit tightly at both top and bottom. The maximum permissible gap between the bearing stiffeners and the flanges shall not be more than 0.2 mm locally.

In case of gantry girders, the bottom of the knife-edge support shall be accurately ground to provide effective bearing on the column bracket with a clearance not exceeding 0.2 mm locally at any place. The top surface of the column bracket shall also be ground similarly. The column splices and butt joints of struts and compression members shall be accurately ground and closely butted over the whole section with tolerance not exceeding 0.2 mm locally at any place. Notwithstanding the above, full load shall be transferred through welds.

The ends of shafts together with attached gussets, angles, channels, etc. After welding together shall be accurately ground so that the parts connected, butt over the entire surface of contact. Care shall be taken to see that these connecting angles or channels are fixed with such accuracy that they are not reduced in thickness by grinding by more than 1 mm.

The slab bases shall be similarly ground over the bearing surface and shall have effective contact with the end of the shaft. The bearing face which is to be grouted direct to a foundation need not be ground if such face is true and parallel to the upper face. To facilitate grouting and escape of air, holes shall be provided wherever necessary in column bases.

9.5.6 Clearances

The erection clearance for cleated ends of members connecting steel to steel shall not be greater than 2 mm at each end unless specifically approved by the Project Engineer and Executing Agency.

9.5.7 Holes

Holes through more than one thickness of material for members, such as compound stanchion and girders, flanges, shall where possible, be drilled after the members are assembled and tightly clamped or bolted together. Sub-punching may be permitted before assembly, provided the holes are punched 3 mm less in diameter than the required size and reamed after assembly to the full
size. Punching shall not be adopted where the thickness of metal exceeds 16 mm.

When holes are being drilled in one operation through two or more separable parts, those parts, when so specified by the Project Engineer and Executing Agency, shall be separated after drilling and burrs removed.

Holes in connecting angles and plates, other than splices, also in roof members and light framing, may be punched full size through material not over 12 mm thick, except where required for close tolerance.

Matching holes for rivets and black bolts shall register with each other so that a gauge of 1.5 mm or 2.0 mm (as the case may be, depending on whether the diameter of the bolt is less than or more than 25 mm) less in diameter than the diameter of the hole will pass freely through the assembled members in a direction at right angles to such members. Finished holes shall not be more than 1.5 or 2.0 mm (as the case may be) larger in diameter than the diameter of the black bolt passing through them unless otherwise specified by the Project Engineer and Executing Agency.

Holes for bolts shall not be formed by a gas cutting process, except in special cases with specific permission of the Project Engineer and Executing Agency. Wherever a horizontal member is likely to collect water, suitable holes for drainage shall be provided.

9.5.8 Notches

The ends of all joints, beams and girders shall be cut truly square unless required otherwise and joist flanges shall be neatly cut away or notched where necessary, the notches being kept as small as possible.

9.5.9 Assembly

The component parts shall be assembled in such a manner that they are neither twisted nor otherwise damaged and shall be so prepared that the specified chamber, if any, is provided. In order to minimize distortion in a member the component parts shall be positioned by using clamps, clips, dogs, jigs and other suitable means and fasteners (bolts and welds) shall be placed in a balanced pattern. If the individual components are to be bolted, parallel and tapered drifts shall be used to align the parts so that the bolts can be accurately positioned.

Items like roof trusses, galleries, plate girders etc. shall be trial assembled keeping in view the actual site conditions, prior to despatch to site for erection so that they can be conveniently preassembled before erection or conveniently preassembled during erection. Necessary match marks shall be made on these components before disassembly in the shop and despatching.

For columns which are fabricated in two or more parts, controlled assembly shall be carried out in the fabrication yard before despatch to the erection site.

9.5.10 Bolting
Every bolt shall be provided with a washer under the nut so that no part of the threaded portion of the bolt is within the thickness of the parts bolted together.

Flat washers shall be circular of a diameter 2.5 times that of bolt and of suitable thickness. Where bolt heads/nuts bear upon the beveled surfaces they shall be provided with the square tapered washers of suitable thickness to afford a seating square with the axis of the bolt.

All bolts and nuts shall be of steel, with well-formed hexagonal heads unless specified otherwise, forged from the solid and shall be dipped in hot boiled linseed oil as soon as they are made. The nuts shall be good fit on the bolts and two clear threads shall show through the nut when it has been finally tightened up.

Notwithstanding anything to the contrary contained in IS:1363, IS:1364, and IS:1367, the unthreaded length of the bolt shall be equal to total thickness of metal being bolted together plus 2 mm. The threaded length shall be equal to at least the diameter of bolts plus 6 mm.

9.6 Welding

The works shall be done as per approved fabrication drawing which would clearly indicate various details of joints to be welded, type of weld, length and size of weld, whether shop or site weld. Symbols for welding on fabrication drawings shall be according to IS:813. Efforts shall be made to reduce site welding so as to avoid improper welding due to constructional difficulties.

9.6.1 Welding of structural steel work

Welding of Structural Steel shall be done by an electric arc process. The procedure to be followed, materials, plant and equipment to be used, testing and inspection procedures to be applied shall be subject to the approval of the Project Engineer and Executing Agency and shall conform generally to relevant acceptable standards viz. IS:816, IS:9595, IS:814, IS:4354 and Indian Standard Hand Book for metal arc welding, and other standard codes of practice internationally accepted.

Submerged-Arc-Welding/MIG (using Carbon dioxide) welding process employing semi-automatic welding machine and fully automatic welding machine (of approved make) shall be used for welding all butt joints and longitudinal fillet welds (connecting flange with web) respectively for fabrication of columns, framing beams & crane gantry girders, unless manual arc welding is specifically approved by the Project Engineer and Executing Agency. Necessary jigs & fixtures and rotation of structures shall be so arranged that vertically down-hand position of welding becomes possible.

‘Open-Arc-Welding’ process employing coated electrodes shall be employed for fabrication of other welded connections not covered under 6.02.02 and field welding.

Wherever welding is done for assembling the components of structures, the job shall be so positioned that down hand welding is possible. In cases where positioning of job is not possible
other manual welding positions could be resorted to.

Any structural joint shall be welded only by those welders who are qualified for all welding procedures and positions required in such joint that is welded. The entire weld of any structure joint shall be made by one welder.

Each welder shall be assigned an identification mark and such mark shall be marked on the structure adjacent to the weld on completion of any structural welded joint.

The Concessionaire shall maintain records of all the welders identification marks, the joints welded by each welder, the welding procedure adopted, welding machine employed, pre and post heating done & any non destructive test done and stress relieving heat treatment performance on such joints. All such records for entire welding operation shall be accessible to the Project Engineer and Executing Agency for scrutiny & such record shall be countersigned by Project Engineer and Executing Agency for welding work accomplished in the preceding months as token of acceptance. But such acceptance shall not relieve the Concessionaire of his responsibility regarding adequacy & safety of welding operation.

9.6.2 Edge preparation for welding

Proper edge preparation shall be made for jointing of materials before welding. Suitable edge preparation shall be done for all processes of welding except for square-butt welds. Type of edge preparation shall depend on the thickness of parent materials that are to be joined. The edge forms shall be chosen to suit the design, technology and production conditions and shall be subject to the approval of the Project Engineer and Executing Agency. The edge form of weldments shall be prepared either by machines or by automatic gas cutting with surface roughness of the welding area not exceeding Rs.50/- All edges cut by flame shall be ground before they are welded.

9.6.3 Electrodes

The electrodes used for welding shall be of suitable type and size depending upon specifications of the parent materials, the method of welding, the position of welding and quality of welds desired e.g. normal penetration welds or deep penetration welds. However, only low Hydrogen electrodes shall be used for plates thickness above 40 mm for IS:2062 steel and for all thickness of high strength steel conforming to IS:8500.

All low hydrogen electrodes shall be baked and stored before use as per manufacturers recommendation. The electrodes shall be rebaked at 250°C - 300°C for one hour and later on cooled in the same oven to 100°C. It shall be transferred to an holding oven maintained at 60°C - 70°C. The electrodes shall be drawn from this oven for use. Rutile type electrodes shall not be kept in the same oven.

Where coated electrodes are used they shall meet the requirements of IS:814 and relevant ASME-SEC IX and IIC. Coating shall be heavy to withstand normal conditions of handling and storage. They shall be free from all defects which would interfere with performance of electrodes.
Only those electrodes which give radiographic quality welds shall be used for welds which are subjected to radiographic testing.

Where bare electrodes are used these shall correspond to specification of the parent material. The type of flux-wire combination for submerged arc welding shall conform to the requirements of IS:3613. The electrodes shall be stored properly and the flux shall be baked before use in an oven in accordance with the manufacturer’s requirements as stipulated.

Specific approval of the Project Engineer and Executing Agency shall be taken by the Concessionaire for the various electrodes proposed to be used on the work before any welding is started.

### 9.6.4 Preheating inter-pass temperature and post weld heat treatment

Mild steel plates conforming to IS:2062 and thicker than 20 mm, may require preheating of the parent plate prior to welding as mentioned in Table - 1. For high strength steel conforming to IS:8500 the minimum preheat temperature shall be as specified in Table - 1. However, higher preheat temperature may be required as per approved welding procedure and same shall be followed. In welding materials of unequal thickness, the thicker part shall be taken for this purpose.

Base metal shall be preheated, not withstanding provisions of IS:9595 to the temperature given in Table - 1 prior to welding or tack welding. When base metal not otherwise required to be preheated is at a temperature below 0 deg. C it shall be preheated to at least 20 deg.C, prior to tack welding or welding. Preheating shall bring the surface of the base metal to the specified preheat temperature and this temperature shall be maintained as minimum interpass temperature while welding is in progress.

#### Table - 1: Minimum Preheat Interpass Temperature for Welding

</tbody>
</table>

Preheating may be applied by external flame which is non-carbonising like LPG, by electric resistance or electric induction process such that uniform heating of the surface extending upto a
distance of four times the thickness of the plate on either side of the welded joint is obtained.

Thermo-chalk, thermo-couple or other approved methods shall be used for measuring the plate temperature.

All butt welds with plater thicker than 50 mm require post weld heat treatment as per procedure given in AWS D-1.1. Post heating shall be done upto 600 deg c and rate of application shall be 200 deg C per hour. The post heat temperature shall be maintained for 60 minutes per 2.5 cm thickness. For maintaining slow and uniform cooling, asbestos pads shall be used for covering the heated areas. The Concessionaire shall submit and finalize post weld heat treatment procedure at the time of finalization of quality plans.

9.6.5 Sequence of welding

The sequence of welding shall be carefully chosen to ensure that the components assembled by welding are free from distortion and large residual stresses are not developed. The distortion should be effectively controlled either by a counter effect or by a counter distortion. The direction of welding should be away from the point of restraint and towards the point of maximum freedom.

Each case shall be carefully studied before finally following a particular sequence of welding.

Butt weld in flange plates and/or web plates shall be completed before the flanges and webs are welded together.

The beam and column stiffeners shall preferably be welded to the webs before the web and flanges are assembled unless the web and flanges to the beam or column are assembled by automatic welding process.

Approval of welding sequence and procedure shall not relieve the Concessionaire of the responsibility for the correct welding and for minimizing the distortion in the finished structure which in no case shall exceed that laid down in Indian Standards.

All welds shall be finished full and made with correct number of runs, the welds being kept free from slag and other inclusions, all adhering slag being removed from exposed faces immediately after such run.

Current shall be appropriate for the type of electrode used. To ensure complete fusion, the welding procedure should go proper and rate of arc advancement should not be so rapid as to leave the edges unmelted.

Puddling shall be sufficient to enable the gases to escape from the molten metal before it solidifies.

Non-uniform and heating and cooling should be avoided to ensure that excessive stresses are not locked up resulting ultimately in cracks.
The welding shrinkage shall be minimized by adopting the correct welding procedure and method. In long and slender members extra length should be provided, at the time of fabrication, for shrinkage.

The ends of butt welds shall have full throat thickness. This shall be obtained on all main butt welds by the use of runoff and run on pieces adequately secured on either side of main plates. Additional metal remaining after the removal of extension pieces shall be removed by grinding or by other approved means and the ends and surface of the welds shall be smoothly finished.

The fusion faces shall be carefully aligned. Angle shrinkage shall be controlled by presetting. Correct gap and alignment shall be maintained during the welding operation.

All main but welds shall have complete penetration and except where it is impracticable they shall be welded from both sides, back surface of the weld being gauged out clean before first run of the weld is given from the back. However, partial penetration butt weld shall be permitted, when specifically shown in the fabrication drawings.

Intermittent welds shall not be permitted without the approval of the Project Engineer and Executing Agency. These shall be permitted only when specifically approved in the fabrication drawings.

9.6.6 Testing of welders

All the welders to be employed for the job shall have to qualify the appropriate tests laid down in IS:817 and IS:1181. If the welder fails in these tests, two further set of tests shall be undertaken and the welder to qualify must pass both these sets of tests.

The Project Engineer and Executing Agency also reserves the right to have any welder retested at any time. All the necessary arrangements required for the testing of welders are to be provided by the Concessionaire.

9.6.7 Inspection of welds

- Visual inspection

100 percent of the welds shall be inspected visually for external defects. Dimensions of welds shall be checked. The lengths and size of weld shall be as per approved fabrication drawings. It may be slightly oversized but should not be undersized. The profile of weld is affected by the position of the joint but it should be uniform. The welds should have regular height and width of beads. The height and spacing of ripples shall be uniform. The joints in the weld run shall as far as possible be smooth and should not show any humps or craters in the weld surface. Welds shall be free from unfilled craters on the surface, under-cuts, slags on the surface and visible cracks. Such inspection shall be done after cleaning the weld surface with steel wire brushes and chisel to remove the spatter metal, scales, slag etc. If external defects mentioned above are noticed, there is every possibility of internal defects and further radiographic / ultrasonic examination shall be
undertaken as per Indian Standards. Weld gauges shall be used to measure the size of the welds.

- **Mechanical testing**

  Test plates shall be incorporated on either side of 10% of main butt welds & the weld shall be continuous over the test plate. The test plate shall be cut from extensions of the main plates and shall be fixed so that metal lies in the same direction as that of the main plate. Test plates shall be prepared and tested in accordance with the accepted Standards, in the presence of the Project Engineer and Executing Agency or his authorized representative. All testing equipment and facilities for carrying out these tests shall be provided by the Concessionaire should any of these tests fail, further radiographic examination of the welds in question on the main members, shall be undertaken by the Project Engineer and Executing Agency as specified in the specification. These tests for the test plates and radiographic examination are additional to those contemplated under routine inspection and testing. The Concessionaire shall carry out these additional radiographic tests as per normal testing procedure.

- **Non-destructive and special testing**

  In addition to the normal supervision and testing procedure, radiographic/ultrasonic or other non-destructive examination shall be carried out, as stipulated in the Fabrication/Erection checklist on butt or fillet welded joints and/or on test specimens, as per Annexure - B. All test of welds shall be carried out by the Concessionaire at his own cost as per Annexure - B. However, for checking the quality of weld, the Executing Agency shall carry out additional tests at his own cost. The Concessionaire shall provide necessary supporting facilities free of cost, as may be required by the Project Engineer and Executing Agency, including cordonning of radiation zone while Radiography testing is in progress. Prepared etched section of the welds may be required for examination. The Concessionaire shall, at his own cost, provide these prepared sections.

  The case of failure of any of the tests, the cost of re-test of that portion of the test shall be recovered from the Concessionaire.

  Rectification of defective welding work wherever defects like improper penetration, extensive presence of blow holes, undercuts, cracking, slag inclusion, etc. are noticed by visual inspection / other tests, the welds, in such location shall be removed by gouging process. The joints shall be prepared again by cleaning the burrs and residual matters with wire bushes and grinding, if necessary, and rewelded. The gouging shall as far as possible be done using gouging electrodes. Flame gouging shall be resorted to only in special cases with specific permission of the Project Engineer and Executing Agency.

9.7 **Acceptance of welded structures**

  The acceptance of the welded work shall depend upon current dimensions and alignment, absence of distortion in the structure, satisfactory results from the inspection and testing of the joints and the test specimens as per quality check list and upon general workmanship being good meeting the tolerance requirements given in the quality check list as per Annexure - B.
9.8 Erection procedure

9.8.1 Erection marks

The erectability of the structures shall be checked by the Concessionaire before commencement of the fabrication work to avoid future modification.

Before any steel work leaves the Concessionaire’s fabrication site, it shall be suitably marked in accordance with the approved fabrication drawings and according to an approved marking plan.

The erection marks assigned to various components of the structural steel work, excepting secondary beams, shall also contain an erection sequence number indicating the sequence in which the various components are to be erected.

Erection marks shall be clearly painted on the work item, each piece being marked in at least two places. Each piece shall also have its weight marked thereon. In order to help identification, each erection piece, i.e. erection mark item, shall bear its items erection mark and erection sequence number. Erection marks shall be painted on the structures, during the process of fabrication to facilitate their identification during inspection. Where a number of components are identical and bear the same erection mark, these components shall be further identified by assigning numerals in addition to the common erection mark.

The centre lines of all column, elevations and girder bearings shall be marked on the sections with the utmost care to ensure proper alignment and assembly of the pieces at site.

9.8.2 Erection

The Concessionaire shall submit for approval of the Project Engineer and Executing Agency his Erection Scheme for the erection of all types of structures. Erection shall commence only after approval of the Concessionaire’s proposed erection scheme.

The erection scheme shall give full details of the method of handling, transport, hoisting and erection including false work/staging, temporary bracing, guyng temporary strengthening etc. It will also give the complete details of the quantity and capacity of the various items of erection equipment that will be used. Any modifications to the erection scheme as directed by the Project Engineer and Executing Agency for various reasons or due to the interference with the work of other agencies shall be incorporated by the Concessionaire.

The Concessionaire shall examine the site conditions and transportation clearances before deciding whether columns are to be fabricated and erected in one piece or more than one piece. Erection of structures is to be carried out preferably with a crane and in case this is not possible, only the upper portion of the columns can be erected with a derrick. Further, the erection of columns and portals etc. shall be carried out in one single piece as far as practicable. No column shall be fabricated and erected in more than 3 pieces. Proper splicing shall be provided at the erection joints indicated in fabrication drawings. When erection joints are provided in columns, their location shall generally be just above a floor level.
The structural steel shall as far as practicable be erected frame wise. Thereafter, the frames shall be progressively aligned and all erection welding completed. The secondary beams shall thereafter be erected, aligned and welded completely as per the approved schedule of work. Touch up painting in these areas shall be completed and as soon as a particular portion of the structure/floor is completed in all respects, it shall be handed over to other Concessionaires for carrying out other civil works as well as mechanical/electrical erection works. Conveyor galleries shall generally be erected as a completely fabricated box, i.e. the bottom chord and bracings, top chord and bracings, side vertical posts and bracings, end portals and roof-trusses shall be completely welded prior to erection. The inside sheeting runners and roof sheeting purlins may be erected individually.

9.8.3 Protection against damage in transit

All steel work shall be efficiently and sufficiently protected against damage in transit to site from any cause whatsoever. All projecting plates or bars and ends of members at joints shall be stiffened, all straight bars and plates shall be bundled, all screwed ends and machined surfaces shall be suitably packed and all bolts, nuts, washers and small loose parts shall be packed separately in cases so as to prevent damage or distortion during transit. Should there be any distortion of fabricated members the Concessionaire shall immediately report the matter to the Project Engineer and Executing Agency. Distorted steel received from stores or distorted during transport from stores to the fabrication yard shall not be used in fabrication unless the distortions are minor which in the opinion of the Project Engineer and Executing Agency can be removed by acceptable methods.

These distortions shall be rectified by the Concessionaire by cold-bending. If heating is necessary to rectify the defects, the details of the procedure shall be intimated to the Project Engineer and Executing Agency whose approval shall be taken before such rectification. The temperature of heat treatment shall not exceed the limits beyond which the original properties of the steel are likely to be impaired.

If in the opinion of the Project Engineer and Executing Agency the steel has been unduly bent in transit from the project stores to the fabrication yard or during handling by the Concessionaire which cannot be rectified in the opinion of the Project Engineer and Executing Agency, such steel shall be counted as wastage.

9.8.4 Stability of structures

The Concessionaire shall be responsible for the stability of the structure at all stages of its erection at site and shall take all necessary measures by the additions of temporary bracings and guying to ensure adequate resistance to wind and also to loads due to erection equipment and their operations. Guying and bracing shall be done in such a way that it does not interfere with the movement or working of other agencies working in the area. For the purpose of guying, the Concessionaire shall not use other structures in the vicinity which are likely to be damaged by the guy.
Setting column bases

Column bases shall be set so that the column load is uniformly transmitted to the foundation. The Concessionaire shall carefully check the location and layout of anchor bolts embedded in foundations constructed to ensure that the structures can be properly erected as shown on the drawings.

The Concessionaire shall be responsible for the correct alignment and leveling of all steel work on site to ensure that the columns are in plumb. The permissible erection tolerances for the structural members are given in Table ‘A’ given at the end of this specification.

Before erection of columns on their foundations, the top surface of base concrete shall be thoroughly cleaned with wire brushes and by chipping to remove all laitance and loose material. The Concessionaire shall also be responsible to provide all packing and shim, plates. No steel structure shall be erected on their foundation unless such foundations have been certified fit for erection of steel by the Engineer. Adequate number of air release holes and inspection holes shall be provided in the base plate. The grouting/under pinning of base plate and chipping of foundation to desired level are also in scope of Concessionaire.

9.8.5 Painting

After inspection and issue of test and acceptance certificate, all steel surfaces shall be painted or otherwise treated. Except where encased in concrete, all steel work shall be given one coat of approved metal protection as may be specified, applied evenly and thoroughly and well worked into the joints and other open spaces.

Materials

i) The touch-up primers and paints shall consist of Red oxide Zinc Chromate conforming to the requirements of IS:2074 with a pigment to be specified by the Executing Agency. However, the Concessionaire may have to use other type of primer wherever specified.

ii) The contents of paint drums shall be thoroughly mixed so that no material remains at the bottom before the paint is used and the paint shall be stirred at regular intervals while being applied.

iii) The primers should not be diluted or thinned except as hereinafter specifically provided. Where the paint has thickened due to loss of Solvent by evaporation in partially used tins it may be brought to consistency for application, in consultation with the manufacturer who shall give necessary information particularly with regard to appropriate viscosity.

iv) Material shall be of best quality available and procured directly from approved manufacturers. Samples shall be submitted to the Executing Agency or approval before procurement.
**Preparation of surface**

ii) The surface shall be cleaned and degreased in accordance with one or more of the methods given in Clause 6.1 of IS:1477 (Part I).

iii) The surface shall be derusted and de-scaled either mechanically or chemically by one or more of the methods given in Clause 6.2 of OS:1477 (Part I) to the satisfaction of the Executing Agency. However flame cleaning, sand, blasting, and shot blasting are excluded from the scope of Concessionaire.

iv) While cleaning with power wire-brush, care shall be taken not to do it excessively, since mill scale easily gets burnished to a smooth even surface to which paints does not adhere, and this will be detrimental to the performance of paint. All accessible weld flux and splatter shall be removed by power tools.

**Application of priming coat, touch-up paint**

i) Primers are generally applied by brushing. In areas which are difficult to reach either by brushing or spraying, daubers, mops or both may be used by dipping the same in paints and pulling or pushing them through the narrow spaces unless otherwise specified one coat of primer of 25 micron thickness shall be applied in shop.

ii) During the painting, the air temperature shall be well above the dew point and not less than 4 C and relative humidity not greater than 80%. The time of painting shall be such that moisture does not condense on the structure before or during painting or until the painting is dry.

iii) Primer coats shall be applied without any time lag after the pre-cleaning or pretreatment and care shall be taken to ensure that paint is not applied to damp surface (in early morning, under humid conditions dew etc.)

iv) Surfaces of fabricated steel where shop priming coat has been removed or damaged during transit or defaced during welding including site welded locations shall be cleaned and applied with touch up primer coat of paint.

**Shop connections**

i) Surfaces to be permanently in contact shall receive a priming coat immediately prior to being jointed together at the works except where jointed by welding.

ii) Galvanised steel shall not be prepared or painted at site.

Machined, sliding or rocking surfaces of casting blocks, slabs or pins shall be coated with a mixture of white lead and tallow after the work has been inspected and approved by the Executing Agency. Molybdenum disulphate (grease) will be used in rider pin connections.
Surfaces not in contact, but inaccessible after shop assembly shall receive two coats of shop paints, positively of different colours or such material to prove use of two coats before assembly. This does not apply to the interior of sealed hollow sections.

Shop contact surfaces shall be cleaned by effective means before assembly, but not painted.

In the case of surface to be welded, the steel shall not be painted or metal coated within minimum 50 mm distances of any edges to be welded, if the paint specified or the metal coating would be harmful to welders or impair the quality of the welds. Welds and adjacent parent metal shall not be painted prior to deslaggings, inspection and acceptance.

**Site preparation of contract surface**

i) The paint, on all contact surfaces, which was applied in the fabrication shop shall be carefully removed and a fresh coat of priming paint shall be applied to all surfaces in permanent contact, and the surfaces shall be brought together while the paint is still wet.

ii) The Concessionaire shall provide and use sufficient number of drop cloths, covers, tarpaulin and other screens to protect adjacent surfaces and shall remove all spatter and stains from such surfaces. The Concessionaire shall also protect his own work.

iii) The Concessionaire shall provide and use sufficient number of drop cloths, covers, tarpaulin and other screens to protect adjacent surfaces and shall remove all spatter and stains from such surfaces. The Concessionaire shall also protect his own work.

iv) Painting shall be discontinued during rain and dust-storm and shall not commence until the surfaces are perfectly dry and clean. Wherever practicable, surfaces shall be painted when in shade or when the temperature is failing.

v) Welds and adjacent metal shall not be painted or touched up prior to deslagging inspection and approval.

vi) Parts of the steel structures to be encased in concrete shall not be painted.

vii) One coat of primer and touch-up paint shall be applied except for the item which shall be not dip galvanized.

**9.9 Steel grading**

All grating units shall be rectangular in pattern and welded grating assembly. The size and the spacing of the bearing bars and cross bars shall be as approved in detailed drawings. The detail fabrication drawings for gratings shall be prepared by Concessionaire on the basis of approved design for grating.
The gratings shall be made up in panel units designed to coincide with the span of the structural steel framing as indicated in the drawings or as directed by the Project Engineer and Executing Agency. The size of each panel shall be as approved by Project Engineer and Executing Agency.

The grating unit shall be accurately fabricated and finished, free from wraps, twists or any defects that would impair their strength, serviceability and appearance.

Grating work shall include cut outs and clearance opening for all columns, pipes, ducts, conduits or any other installation penetrating through the grating work. Such cut outs and clearances shall be treated as follows.

The gratings shall be notched, trimmed and neatly finished around flanges and webs of the columns, moment connections, cap plates and such other components of the steel structures encountered during the placement of the gratings. In all such cases, the trimming shall be done to follow the profile of the components encountered. After trimming, the binding strip shall be provided on the grating to suit the profile so obtained.

Opening in gratings for pipes or ducts that are 150 mm in size or diameter or larger shall be provided with steel bar toe plates of not less than 5 mm thickness and appropriate width, set flush with the bottom of the bearing bars.

Penetrations in gratings that are more than 50 mm but less than 150 mm in size or diameter shall be welded with plates of size shown in the detailed drawings set flush with the bottom of the grating panel.

Unless otherwise indicated on the drawings, grating units to all penetrations shall be made up in split section, accurately fitted and neatly finished to provide for proper assembly and erection at the job site.

Grating units shall be provided with all necessary clips, bolts, nuts and lock washers required for proper assembly and rigid installation and fastening to abutting units and supporting structural steel framing members.

All fabricated grating section and accessories shall be primed and finish painted in the shop prior to erection at site. Painting shall consist of two coats of red lead primer and two coat of black enamel finish.

Prior to painting all surfaces shall be cleaned free from rust, millscale, grease, oil, or any other foreign matter that might affect the adherence of the paint by sand blasting. While the primer shall be applied by spray guns or by brushes, the final coat of finished paint shall necessarily be applied by means of spray guns only.

The applied coatings shall be uniform, free from voids and streaks, drilled or punched holes shall be touched up prior to erection or assembly.

Maximum deviation in linear dimension from the approved dimension shall exceed 12 mm.
9.10 Stairs, railings and ladders

All stairs and intermediate landings shall be constructed to size dimensions and design, as indicated on the detailed drawings. Such stairway shall be fabricated as a complete unit which shall include struts, hangers, posts, cross bracings, cleats and accessories, as required for connection to structural steel framing and concrete.

Stair treads shall be furnished complete with punched and slotted carrier plates attached ready to bolt to stair stringers. Treads shall be provided with antislip nosing using chequered plate and set flush with the stair treads.

Pipe handrails, as specified in detailed drawings shall be assembled with flush type fittings and welded joints, ground and polished smooth. Railings shall be provided with all necessary fittings posts brackets, bolts, plates and similar accessories as shown on the approved drawings and as required for proper installation. Hand rails shall be of standard weight black steel pipes of flush welded construction, ground smooth using 32 mm nominal bore medium class pipes with double rail about 1 metre above platform level and pipe posts spread not more than 1.5 metres apart.

Smooth uniform curves and bends are to be provided at stair returns and also wherever specified/required. The open ends of all pipe posts shall be plugged and welded. A minimum radius of 3 times the pipe diameter shall be provided at all points of direction changes in the hand rails.

Vertical ladders shall be as called for on the approved drawings. The ladders shall be provided with support arms formed of bent steel plate or clip angles. Where shown on the drawings the ladders shall have loose neck supports, designed to form hand grabs and end brackets for fastening to abutting construction. Maximum deviation in the linear dimensions of railings, stairs and ladders, from the approved dimensions, shall not exceed 12 mm.

9.11 Chequered plate

Chequered plates shall be fixed to supporting members by welding as specified in relevant drawings or as directed by the Project Engineer and Executing Agency. The edges shall be made smooth and no burrs or jagged ends shall be left. While splicing care should be taken so that there is continuity in pattern between the two portions. Care should also be taken to avoid distortion of the plate while welding of stiffening angles/vertical stiffening ribs.

9.12 Ash storage silo / intermediate hopper

Shape of the silo/intermediate hopper shall be circular in plan. Bottom hopper portion shall be of conical shape and/or flat bottom type as specified in mechanical section.

For general requirements, fabrication and construction details, including design criteria, IS:9178 (Pt.I, II & III) shall be followed as general guidance.
Side walls shall be made of mild steel plates having horizontal and vertical stiffeners at regular interval as per the design requirements. Stiffeners shall be provided on the external face. Joints between the walls inside the silos should be continuously welded to ensure complete sealing. However, for the stiffeners provided on the outer shell, intermittent welding may be adopted. Bending of plates and rolled sections to the required shape for fabrication shall be done by plate bending machine or cold bending process without resorting to heating, hammering, angle smithy and black smithy process.

Poking hole and 10 mm thick striking plate shall be provided to facilitate ash flow. Poking holes shall have circular m.s. pipe and cover cap as shown in the drawing.

9.12.1 Lining

To cater for corrosion, abrasion or smoothness lining shall be provided in sloping/conical portion as specified in mechanical section. Lining shall generally be in the form of stainless steel sheet of 3 mm thickness of grade SS 316 or 10 mm thick alloy C.I. liners of 300-350 BHN (min.).

9.12.2 Intermediate/buffer and storage silos hoppers

The hoppers shall be conical in shape with valley angle as 55 degrees and the details of hopper specifications are covered elsewhere in these specifications.

9.13 Sampling, testing and quality control

9.13.1 General

a) The Concessionaire shall carry out all sampling and testing in accordance with the relevant Indian Standards and/or International Standards and shall conduct such tests as called for by the Project Engineer and Executing Agency. Where no specific testing procedure is mentioned, the tests shall be carried out as per the prevalent accepted engineering practice to the directions of the Project Engineer and Executing Agency. Tests shall be done in the field and at a laboratory approved by the Project Engineer and the Concessionaire shall submit to the Project Engineer and Executing Agency, the test results in triplicate within three days after completion of a test. The Project Engineer and Executing Agency may, at his discretion, waive off some of the stipulations given for small and unimportant operations.

b) Material / work found unsuitable for acceptance, shall be removed and replaced by the Concessionaire. The work shall be redone as per specification requirements and to the satisfaction of the Project Engineer and Executing Agency.

c) Radiography and ultrasonic testing of welds shall be carried out by specialist agency only. In case, the Concessionaire does not have the required expertise, he shall engage specialist agency for this purpose.
An indicative programme of inspection and testing for raw materials, welds and dimensional tolerances for fabrication & erection of steel structures are given in Annexure - B. The Concessionaire shall draw-up a comprehensive programme for executing the works based on this indicative programme.

**Annexure - B**

**Inspection, testing and quality check list**

1 **Inspection & testing**

The Concessionaire shall carry out a comprehensive inspection and testing programme of inspection / testing on the basis of details given below. The testing of all the materials supplied by the Concessionaire shall be carried out by him. This is however, not intended to form a comprehensive programme as it is the Concessionaire’s responsibility to draw-up and carry out such a programme duly approved by the Project Engineer and Executing Agency. Such approval shall not relieve the Concessionaire of the responsibility about the correctness and adequacy of workmanship, materials etc.

1.1 **Raw material inspection**

1.1.1 **Steel**

i) **Conformity with specifications**

a) The conformity of the materials with the specification and the availability of the relevant test certificates shall be checked. Carbon equivalent value shall also be made available.

b) Plates above 25 mm thickness shall be subjected to ultrasonic test as per ASTM A435 or equivalent to check the presence of lamination.

ii) **Physical conditions:**

a) Steel shall not be pitted and should be free from scales and rust.

b) If the rolled sections and plates are bent or distorted, bend or distortion shall normally be removed by cold treatment etc.

c) Straightening under hot stage shall be resorted only under specific permission from the Project Engineer and Executing Agency.

d) If any rolling defects, viz. lamination, cracks etc. are discovered in the steel during the processing, it is to be rejected.
iii) **Storage**

a) Steel plates of different specifications shall be stacked separately.

b) Steel of IS:2062 (different grades) and IS:8500 quality shall be given distinctive identification mark.

c) Rolled sections shall be stacked profile-wise separately.

d) Steel sections shall be stacked over spacers supported on posts of about 50 cm. height above ground. Passages and space between the stacks shall be sufficient for rigging operations.

1.1.2 **Electrodes**

i) Electrodes for all welding shall be procured as envisaged in the welding procedure sheet predetermined before actual welding operation starts/

ii) Electrodes shall be properly stored dry as required by the IS Code or by the manufacturer.

iii) Electrodes shall bear the ISI or equivalent Certification mark.

iv) The approval for all the consumables for welding shall be specifically obtained beforehand.

1.1.3 **Nuts, bolts etc.**

i) The quality of these shall be as per relevant IS codes.

ii) They shall be stored properly according to grade, diameter and length. However, special bolts like HSFG shall be stored separately as per the relevant clause.

iii) Bolts of well known manufacturers are acceptable with manufacturer’s test certificates. However, in case the Concessionaire is not able to produce the test certificate, the bolts can be accepted only after satisfactory cold bend and flattening tests. For the purpose of these tests, the inspecting officer should select at random 3 specimens each for cold bend and flattening tests. For the purpose of these tests, the inspecting officer should select at random 3 specimens each for cold bend and flattening tests out of each consignment of 1000 Nos. or less and instruct the Concessionaire to carry out the tests in his presence. Cost of testing shall be borne by the Concessionaire.
1.1.4 Paints/primers

i) The relevant IS or equivalent mark on sealed tins shall be checked.

ii) A few tins shall be opened at random to check the condition of the paint. Paint from old stock and showing signs of solidification shall not be accepted.

1.1.5 Cement

i) The quality of cement shall conform to relevant IS code.

ii) Cement is to be stored in a place of easy access for proper inspection and identification. It should be placed in a weather tight building, so that dampness and loss due to other causes is minimum.

1.2 Welding procedure qualification

Welding procedure shall be established as per ASME Section IX or equivalent Indian Standards. Welding procedure, specifications shall be submitted by the Concessionaire for review and approval of the Executing Agency. Typical welding procedure data sheet is given in Proforma A.P-1.

1.3 Welders qualification test

Welders qualification test shall be as per ASTM Section IX or equivalent Indian Standards.

1.4 Inspection for tack assembly set up:

i) Bevel
ii) Gap
iii) Off-setting
iv) Shrinkage allowance
v) Fitment Sequence
vi) Principal overall size

1.5 Preheating:

Temperature control by Thermochalk or suitable equivalent method.

Inspection of main welds of principal components for columns, crane girders, framing beams, trusses, etc.

I) Fillet welds for:
i) Check size
ii) Macroetch examination of production test coupons for main fillet weld.
iii) 100% visual examination
iv) 100% dye penetration test/magnetic particle test - Major welds (including welds subjected to tension) like web to flange connection, splice plates, moment/shear connection.
v) 10% All other areas.

II) Butt welds :

a) Columns, Beams etc.

i) 100% Visual examination

ii) 100% Dye penetration test after back gouging shall be carried out. Final weld shall also be tested.

iii) Mechanical testing of production test coupons - Minimum one joint per column/built up beam and crane grinder etc. The Project Engineer and Executing Agency may reduce the frequency of this test, after getting consistently satisfactory results for initial 10 tests.

iv) 100% Radiography test on tension zone (bottom flange of the girder) welds and 10% spot Radiography on compression zone for minimum 300 mm length (top flange of the girder) welds of crane girder shall be carried out. Where Radiography test is not possible, ultrasonic test shall be carried out after grinding the surface wherever required with prior approval of the Project Engineer and Executing Agency.

v) All other butt welds and full penetration welds shall be subjected to 10% spot Radiographic test and for the balance ultrasonic test. Wherever Radiography is not possible, ultrasonic testing shall be carried out with prior approval of the Project Engineer and Executing Agency.

b) Dry ash silo :

i) Dye penetration test after back gouging and for all finished welds.

ii) 10% spot Radiography test on fabrication shop butt welds and 10% spot Radiography test on site erected butt joints shall be carried out where access is available.
c) In case of failure of any weld in spot radiography the percentage for retesting shall be doubled at that particular location.

1.6 Final inspection

i) Dimensional check as per fabrication check list detailed elsewhere.

ii) Marking for holes for fitments or connection and hole sizes.

iii) Erection mark

iv) Painting

a) Dressing and surface preparation.

b) Final painting including dry film thickness (DFT) by using Elcometer or any other approved method. In addition, the rate of application (coverage) as per manufacturer’s recommendation shall be checked.

1.7 Inspection during fabrication and erection

a) All structural components/members shall be checked for dimensional tolerance during fabrication and erection.

b) Tolerance on dimensions for fabrication of structures shall be according to IS:7215 and check list given under table A-1 to A-5. In case of any conflict between the provisions of IS:7215 and those mentioned under the table, the stipulation of the latter shall govern.

c) Tolerance on dimensions for erection of steel structures shall be according to IS:12843. Relevant portion of the same is given under Table A-6 for ready reference.

1.8 Welding tests on welds and weld defects

Mechanical testing of welds (destructive tests): Butt welds having one or more of the following defects are not acceptable.

i) Bend Test: No crack on root/face on being bent through 180 degree with mandrel of 41 where t is the thickness of plate.

ii) Tensile Test: Weld strength not less than parent metal’s strength.

1.8.1 Radiographic examination

Sections of welds that are shown by Radiography to have any of the following type of imperfections shall be judged unacceptable:

1) Any type of crack or zone of incomplete fusion or penetration.
2) Any elongated slag inclusion which has length greater than:

   i) 6 mm for \( t \) upto 20 mm
   ii) 8 mm for \( t \) from 20 mm to 32 mm
   iii) \( t \) = thickness of weld

3) Any group of slag inclusion in line that have an aggregate length greater than \( t \) in a length of 12\( t \), except when distance between the successive imperfections exceed 6\( L \) where \( L \) is length of longest imperfection in group.

4) Rounded indications in excess of that specified by the acceptance standard given in Appendix 4 of ASME section VIII Div. 1.

1.8.2 Ultrasonic examination

The welded joints will be tested by suitable combination of Angle and Normal beam probe techniques to ensure scanning of the entire cross-section of weldments.

Acceptance standard

All indications which produce a response greater than 20% of the reference level shall be investigated to the extent that operator can determine the shape, identify and location of all such reflectors and evaluate them in terms of the acceptance standards given in (a) and (b) below:

a) Discontinuities are unacceptable if the amplitude exceeds the reference level and discontinuities have lengths which exceed.

   i) 6 mm for \( t \) upto 20 mm inclusive
   ii) 8 mm for \( t \) from 20 mm to 50 mm inclusive
   iii) 20 mm for \( t \) over 50 mm

Where \( t \) is thickness of weld being examined. If a weld joins two members having different thickness at the weld, \( t \) is thinner of these two thickness.

b) Where discontinuities are interpreted to be cracks, lack of fusion, or incomplete penetration, they are unacceptable regardless of discontinuities or signal amplitude.

1.8.3 Visual examination:
Following defects are not allowed:

1. Unsatisfactory appearance
2. Incomplete weld
3. Molten metal flow
4. Pits
5. Surface crack, lack of penetration
6. Insufficient length
7. Surface defects exceeding 5% of weld seam area

1.8.4 **Dye penetration test:**

All surfaces to be examined shall be free of:

a) Relevant linear indications

b) Four or more rounded defects in a line separated by 1.5mm or less (edge to edge) except where the specification for the material establishes different requirements for acceptance so far as defects are concerned.

**Evaluation of indicators**

i) Linear indications are those indications in which the length is more than 3 times the width. Only indicators with major dimensions greater than 1.5 mm shall be considered relevant.

ii) Rounded indications or indications which are circular or elliptical with length less than 3 times the width.

iii) Any questionable or doubtful indications shall be tested to verify whether or not actual defects are present.

iv) Localised surface imperfections may occur from machining work surface conditions or an incomplete bond between base metal & cladding may produce similar indications which are relevant to the deletions of unacceptable discontinuities.

Sub section - C10: Technical specification for glass and glazing

10.1 Scope

The work in general shall consist of supplying and fixing all glass and glazing including all clips, putty, mastic cement, etc. wherever required.

10.2 Installation

10.2.1 General

The Concessionaire shall supply and install all glass and glazing as required for various doors, windows, sashes, ventilators and fixed louvers, miscellaneous glazing and partitions, as approved by the Executing Agency, having very high optical clarity, brighter appearance, uniform thickness, consistent product quality manufactured out of molten glass coming out of the furnace floats on molten tin, thus being formed into float glass. The glass shall be delivered to site in containers with the maker's name, guarantee, type of glass and thickness, or weight of glass attached to the outside of the containers. Glass cut to size shall be straight and free from chips, spalls or any other damage on any cut edge.

10.2.2 Materials

(a) Clear glass shall be flat drawn sheet glass and shall be atleast 4 mm thick conforming to IS:2835. Sheet glass for doors shall be minimum 5.5 mm thick.

(b) Wired glass shall be thick rolled glass with centrally embedded 24G wire mesh of Georgian type. This may be of clear or coloured glass as shown in drawings and shall conform to IS:5437.

(c) Composite double glazing shall be made of double glazing of two 6 mm thick sheet glass either both sheets of tinted glass or one glass tinted & other plain or both sheets of plain sheet glass. Both the glasses shall be separated by an air gap of 12 mm. The trapped air shall be kept dry by means of suitable desiccant. The sealing shall be under strict quality control. The composite glazing shall be procured as finished product from reputed manufactures. Toughen glass conforming to IS:2553 shall be used.

(d) Obscure glass shall have a cast surface on one side.

(e) Coloured and figured glass shall be as per the approved sample.

(f) In general, the putty shall conform to IS:410 latest edition and be of best quality from an approved manufacturer. It shall be brought to site in the manufacturer's original packing. Quick setting putty shall be used for windows and sashes except when glare reducing glass is used where it shall be of non-setting type.
(g) Neoprene gaskets with snap-fit glazing shall be fixed as per manufacturer's instructions and shall fit firmly against the glass to give a leak proof installation.

10.3 Glazing, setting and finish

All glazing clips, bolts, nuts, putty, mastic, cement, etc., shall be supplied by the Concessionaire.

All glass shall be thoroughly cleaned before placing in position. Each glass pane shall be held in place by special glazing clips of an approved type. Four glazing clips shall be provided per glass pane, except for large panes where six or more clips shall be used as instructed by the Project Engineer and Executing Agency. All holes that may be necessary for holding the clips, glazing beads and all other attachments shall be drilled by the Concessionaire.

Glass panes shall be set without springing, and shall be bedded in putty and back puttied, except where mouldings or gaskets are specified. Putty, mastic cement etc., shall be smoothly finished to a true even line. Obscure and figured glass shall be set with smooth side out.

After completion of glazing work, the Concessionaire shall remove all dirt, stains, putty, etc., clean the glass panes and leave the work in perfectly acceptable condition. All broken, cracked or damaged glass shall be replaced by new at the Concessionaire's own cost.

10.4 Acceptance criteria

(a) All installations shall be free from cracked, broken or damaged glass. Edges of large panes of thicker glass and heat absorbing glass shall be inspected carefully for chipped, cracked or unground edges.

(b) Glazing shall be carefully done to avoid direct contact with metal frames.

(c) All glass shall be embedded in mastic or fixed by neoprene gaskets to give a leak-proof installation.

(d) At completion the panes shall be free from dirt, stains, excess putty, etc., to the complete satisfaction of the Project Engineer and Executing Agency.

10.5 IS codes

Some of the important applicable Indian Codes for this section are listed below. Latest editions of these codes shall be followed:

IS:3548 Code of Practice for glazing in building.
IS:1083 Code of practice for fixing and glazing metal doors, windows and ventilators.
IS:419 Putty for use on window frames.

</tbody>
</table>
11.1 Scope

The work in general shall consist of supplying, erecting and installing of all MS doors, windows, ventilators, louvres, glazed partitions etc. as required with all materials, complete excluding supply of glass and glazing. Supplying and/or fixing of all door and window accessories and hardware are also included in the scope.

11.2 Installation

11.2.1 Materials

Steel sections used for fabrication of doors, windows, etc. shall be standard rolled steel sections specified in IS:1038 and IS:1361. Mild Steel sheets for frames, shutters, louver blades, etc. shall be of the gauge mentioned in this specification.

Hardwares and fixtures of the best quality from approved manufacturers only shall be used. The Concessionaire shall specifically state the particular manufacturer’s materials, proposes to use. All hardware and fixtures shall be able to withstand repeated use. Door closers shall conform to IS:3564 latest edition and shall be suitable for doors weighing 61-80 kg unless otherwise stated. Each closer shall be guaranteed against manufacturing defect for one year and any defect found within this period shall be rectified or the closer replaced free of charge. Concealed doors closers shall be either floor mounted or transform mounted suitable for installation with metal doors. They shall conform to the performance requirements and endurance test stated in Appendix A of IS 3564 (latest edition).

Aluminium sections for fabrication of doors, windows, partitions etc. shall be extruded section conforming to IS:1948 and 1949 or as manufactured by Indian Aluminium Company Ltd. or approved equivalent. The alloy used shall conform to IS designation HE-9-WP of IS:733. Heavy duty double acting floor springs where specified shall conform to IS:6315, shall be suitable for door shutters weighing upto 125 kg. shall be hydraulically regulated, shall be constructed of cast brass casting cover and shoe, gun metal piston player and all other parts of mild steel.

The Concessionaire shall submit samples of each type of hardware to the Project Engineer and Executing Agency. The approved samples shall be retained by the Project Engineer and Executing Agency for comparison of the bulk supply. The samples shall be returned to the Concessionaire towards the end for incorporation in the job.

The mastic for caulking shall be of best quality from a manufacturer approved by the Project Engineer and Executing Agency. In general the mastic for fixing of metal frames shall be as per IS:1081 latest edition and/or as approved by the Project Engineer and Executing Agency.

11.2.2 Fabrication

> Steel doors, windows, ventilators, louvers, etc.
(a) Door frames:

Frames shall be fabricated from 16 G sheets. They shall be mortised, reinforced, drilled and tapped for hinges, lock and bolt strikes. Where necessary, frames shall be reinforced for door closers. Welded construction with mitred corners shall be used. Rubber door silencers shall be furnished and for the striking jamb, Loose ‘T’ masonry anchors shall be provided. Frames shall finish flush with the floor and adjustable floor anchors shall be supplied. Frames shall be brought to site with the floor ties/weather bars installed in place.

(b) Double plate flush door shutter

Door shutters shall be 45 mm thick completely flush design and shall comprise of two outer sheets of 18G steel sheets rigidly connected and reinforced inside with continuous vertical 20 G stiffeners, spot welded in position at not more than 150mm centres. Both edges of doors shall be joined and reinforced to full height by steel channels placed immediately inside and welded to the door faces. The tops and bottoms of doors shall be reinforced horizontally by steel channels running to the full width of the door. Doors shall have proper level on lock stiles and rails to operate without bending and shall be reinforced at the corners to prevent sagging or twisting. Pairs of double doors shall have meeting stile edges bevelled or rebated. Wherever required the doors shall be sound deadened by filling the inside voids with mineral wool or other suitable approved materials.

Door shall be mortised, reinforced, drilled and tapped in the shop for hinges, locks and bolts. They shall also be reinforced for closers, push plates and other surface hardware where necessary.

Any drilling and tapping required on the surface shall be done at site. Wherever required provision shall be made for fixing glazing, vision panels, louvers, etc. Glazing mouldings shall be of 18 g steel as directed by the Project Engineer and Executing Agency. Louvre blades shall be V or Z shaped and made out of 16 G sheets.

(c) Single sheet door shutters

Single sheet doors shall be made from best quality 18 G mild steel sheets and shall present a flush surface on the outside. The inside shall be stiffened with a semitubular edge and central stiffening rail which shall support the lock and other furniture. The frames shall be made from best quality 16 G mild steel sheets.

Wherever required provision for fixing glass panels, louvers, etc. shall be made. Fabrication shall be as specified in 2.02.01 (b) “Double Flush Door Shutters”.

(d) Sliding doors

Sliding doors shall be either double plate or single plate construction as required and made out of 18 gauge steel sheets with adequate stiffeners.
The Concessionaire shall specify the weight of the door in his shop drawing and submit the manufacturer’s catalogue of the sliding gear he proposes to use. The Concessionaire shall make provisions where necessary for openings in the door for monorail beams. Doors shall close positively to exclude rain water from seeping in. Sliding doors shall withstand specified wind loads without buckling or jamming. The door shall slide freely under all ambient conditions.

(e) **Steel windows, sashes, ventilators, etc.**

These shall conform in all respects to IS:1038 and IS:1361 latest editions. The details as called for in the above codes shall be applicable for coupling mullions, transoms, weather bars, pivot arrangements for ventilators, etc.

All welds shall be flush butt welded to form a solid fused joint, so that all frames are square and flat.

Where composite unit openings are envisaged the individual windows units shall be joined together with requisite transom and mullions. All windows shall be outside glazed fixed with putty or metal glazing beads. Where aluminium glazing beads are specified they shall be extruded aluminium channel 9.5 mm x 9.5 mm x 1.6 mm (Indal section No.2209) aluminium beads shall be given one coat of zinc chromate primer before fixing to windows.

➢ **Welding**

The joints for steel doors, windows, ventilators, etc. shall be electrically flash butt welded joint at all corners and junctions to form a solid fuses right angle joint.

➢ **Fabrication of aluminium doors, windows, frames, etc.**

Extruded sections shall have a minimum 3 mm wall thickness. All sections shall be approved by the Project Engineer and Executing Agency before fabrication is taken up. Doors, windows, frames, mullions, transformers etc. shall be anodized in bath of sulphuric acid to provide a clear coating of minimum 10 micro-meter. The anodized materials shall then be sealed by immersing in boiling water for 15 minutes. A protective transparent coating shall be applied to the sections before shipment from the factory.

Fabrication drawings shall be submitted by the Concessionaire which shall also include the weights of the materials used and got approved from the Project Engineer and Executing Agency.

11.2.3 **Shop coat of paint**

The shop paint for steel doors, windows, etc. shall be best red oxide, zinc chromate primer paint from approved manufacturer conforming to IS:2074, latest edition. All surfaces shall be thoroughly cleaned of rust, grease, loose mill scales, etc. and given one coat of shop paint. Portions like mullions transoms, etc. which will be inaccessible after assembly of units shall be given an extra coat of paint before assembly.
11.2.4 Handling and storage of fabricated material

All metal doors, windows, etc. shall be packed and crated properly before despatch to ensure that there will be no damage to the fabricated materials. Loading into wagons and trucks shall be done with all care to ensure safe arrival of materials at site in an undamaged condition. All metal doors, windows, etc. shall be stored under cover and handled in a way to prevent damage or distortion. Special care shall be taken to prevent staining of aluminium products by rust, motor etc.

11.2.5 Assembly and erection at site

In general the fixing of steel doors, windows, ventilators, louvres, etc. shall conform to IS:1081 latest edition. The Concessionaire shall assemble and install all steel doors, windows, sashes, fixed metal louvres, etc. including transoms and mullions for composite units in respective places keeping proper lines and levels, and in an approved workman like manner to give a trouble free and leak proof installation. If required by the Project Engineer and Executing Agency, the installation shall be carried out under the supervision of the manufacturer’s staff.

After installation of steel doors, windows, etc., all abrasions to the shop-coat of paint shall be retouched and made good with the same quality of paint.

All coupling mullions, transoms, frames, etc. in contact with adjacent steel and other members shall be well bedded in mastic. The Concessionaire shall bring to site the mastic cement in original sealed containers of the manufacturer and shall apply it as per the manufacturer’s instructions.

Floor, shutters, partitions, hardware fixtures, etc. shall be fixed only after the major equipment has been installed in the rooms.

Wherever required, nylon cords of approved quality shall be supplied along with pivoted sashes. These shall be adequate length to terminate one metre from the floor. Loose ends of cords shall have a metal or plastic pull as approved by the Project Engineer and Executing Agency.

11.3 Acceptance criteria

11.3.1 For fabricated items

(a) Overall dimensions shall be within ± 0.5mm of the size.

(b) Mullions, transoms, etc. shall be in one length and permissible deviations from straightness shall be limited to plus minus 0.5 mm from the axis of the member.

(c) Door and window shutters shall operate without jamming. The clearance at head and jamb for door shutters shall not exceed 1.5mm. For double leafs the gap at the meeting stiles shall not be more than 1.5mm.
(d) Door leafs shall be undercut wherever required.

(e) Doors, windows, frames, etc. shall be on a true plane, free from warp or buckles.

(f) All welds shall be dressed flush on exposed and contact surfaces.

(g) Correctness of hardware and smoothness of operation of all shop installed hardware and fixture.

(h) Provisions for hardware and fixtures to be installed at site.

(i) Glazing beads shall be cut with mitred corners.

(j) Shop coats shall be properly applied.

(k) Exposed aluminium surface shall be free from scratches, stains and discolouration. Anodized surfaces shall present a uniform and pleasing look.

11.3.2 For installed items

(a) Installation shall be at the correct location, elevation and in general on a true vertical plane.

(b) All frames of external walls shall be mastic caulked to prevent leakage through the joint between frames and masonry.

(c) All openable sections shall operate smoothly without jamming.

(d) Locks, fasteners, etc. shall engaged positively. Keys shall be non-interchangeable.

(e) Cutting to concrete or masonry shall be made good and all abrasions to shop paint shall be touched up with a paint of the same quality as the shop paint.

(f) Aluminium doors, windows etc. shall be free scratches, stains or discolouration.

(g) It shall be the responsibility of the Concessionaire to see that the material is protected from mortar, paint, plaster, terrazzo framing members.

11.4 Information to be submitted

Before starting fabrication of any metal doors, windows, etc. the Concessionaire shall submit detailed fabrication drawings to the Project Engineer and Executing Agency for approval. The fabrications shall be started only after approval of the drawings.
11.5 IS codes

The important IS codes to be followed are listed below:

IS:1083 Steel doors, windows and ventilators.
IS:1361 Steel windows for industrial buildings.
IS:1451 Steel door frames.

**Sub section - C12: Technical specification for rolling steel shutters/grills**

12.1 **Scope**

This specification covers the design, supply of materials, fabrication, delivery and erection of rolling shutters grills with motor drives and/or manual operation during all accessories as hereinafter specified. All electrical work shall be in strict accordance with the latest Indian Electricity Rules.

12.2 **Installation**

12.2.1 **Components**

a) States for rolling shutters shall be made from tested bright, cold rolled, annealed M.S. strips, not less than 0.9 mm thick for shutters upto 3.5 m wide and not less than 1.24 mm thick for shutters 3.5 m wide and above, machine rolled at 75 mm rolling centres, interlocking with each other. The profile will be such as to prevent excessive deflection under specified wind load.

b) Rolling grills shall be constructed out of 6 mm dia. rods at 35 mm centres running horizontally flexibly connected with vertical links spaced not more than 200 mm centres. Alternatively, rolling grills shall be made from perforated slats of approved design, reinforced with 6 mm dia rods.

c) End locks shall be heavy type M.C.I./C.I. and shall be provided at each end of alternate slats.

d) Bottom bars shall be finished with two angles not less than 6 mm thick for external shutters. When shown on drawings, a flexible weather strip shall be applied to make tight contact with the floor.

e) Guide shall be of such depth as to retain the shutter under a wind pressure of 150 kg/sq.m. The minimum thickness of guide shall be 126.

f) Shafts shall be of steel pipes of sufficient size to carry the torsional load with a maximum deflection of 1/360th of span. Grease packed ball bearings or bushings shall be provided for smooth trouble-free operation.

g) Hoods shall be formed of not less than 20 gauge steel, suitably reinforced to prevent sag.

h) Locks shall be side belt and hasp or cylinder lock operable from one or both sides. Provision for securing hand chain with pad-lock, provision for removable handle for hand cranks etc. shall be made as desired by the Project Engineer and Executing Agency.

i) Power unit shall be suitable for 3 phase, 50 cycle, 400 volt A.C. Power supply and shall be either floor or wall mounted unit. The motors shall be of sufficient capacity to move the shutter in either direction at a speed of 0.3 metres per second. In addition to the gear motor, each standard power unit shall include a magnetic brake, reversing starter with built-in overload protection, a geared limit switch and one push button station located inside the building unless otherwise stated. It is desirable that the button bar or motor operated doors
shall be provided with a sensitive edge, electrically connected to stop the travel of the door on meeting an obstruction.
j) Operating chains shall be of tested quality, heavily galvanized and with all ends rounded to assure smooth operation and hand protection.
k) Reduction gears shall be of high strength grey cast iron, machine moulded from machine cut patterns.

12.2.2 Manually operated shutters/grills

Manually operated shutters shall be easily operable by one person. The speed of operation shall be about 0.3 metres per second.

In general, manually operated shutters shall be push-pull type for opening upto 9 sq. metre in area. Larger shutters shall be either chain and gear operated or crank and gear operated. The crank handle shall be removable. All shutters shall be lockable from one or both sides as desired by the Project Engineer and Executing Agency.

12.2.3 Power operated shutters/grill

These shall be operable from a push button station conveniently located beside the door or as shown on drawings. One emergency hand chain-crank operation shall also be provided for use in case of failure of the electrical system.

12.2.4 Shop coat

Shutters shall be painted with one coat of red lead or zinc chromate primer. Where specified, doors shall be galvanized and subsequently painted with one coat of zinc chromate for adhesion of field coat.

12.3 Acceptance criteria

12.3.1 Shop inspection

After completion the manufacture of different components of the rolling shutter, an arrangement for shop inspection by the Project Engineer and Executing Agency shall be made to check the conformity with approved shop drawings.

12.3.2 Field inspection

After installing the shutters, the Concessionaire shall test the performance of the shutter in the presence of the Project Engineer and Executing Agency. The doors shall be smoothly operable under all ambient conditions. All control and locking devices shall give fault-free performance.
12.3.3 Guarantee

The Concessionaire shall give one year’s guarantee for the successful operation of the shutters.

12.4 IS codes

IS:6248 Metal rolling shutters and rolling grills.

Section - WS1: Technical specifications for laying of pipes and fittings / specials

1. **Scope**

The work shall include providing of materials, all necessary plant and equipment, providing adequate engineering supervision and technical personnel, skilled and unskilled labour, etc. as required to carry out the entire work as indicated on the drawings and/or described herein subsequently and/or as directed by the Project Engineer and Executing Agency. The Concessionaire shall carry out all works meant within the intent of this specification even if not explicitly mentioned herein.

All works shall be executed to the satisfaction of the Project Engineer and Executing Agency.

2. **Applicable codes**

The laying of pipes and fittings/specials shall comply with all currently applicable statutes, regulations, standards and codes. In particular, the following standards, unless otherwise specified herein, shall be referred. In all cases, the latest revision of the standards/codes shall be referred to.

In the event of conflict between any of these Specifications and the Codes referred, such specifications shall be defined, prepared by the Concessionaire and submitted to the Project Engineer for approval. The decision of Project Engineer in such case shall be final and binding on the Concessionaire.

Any approval, instructions, permissions, checking, review, etc. whatsoever by the Project Engineer and Executing Agency, shall not relieve the Concessionaire of his responsibility and obligation regarding adequacy, correctness, completeness, timely completion, safety, strength, quality & workmanship etc.

The Concessionaire shall make his own surveying arrangements for locating the coordinates and positions of all work and establish the reduced levels (RLs) at these locations, based on two reference grid lines and one bench mark which will be furnished by the Executing Agency. If need be the Executing Agency reserves the right to have the Concessionaire re-verify the coordinates at no cost to Executing Agency. The Concessionaire has to provide at site, all the required survey instruments, along with qualified surveyors, to the satisfaction of the Project Engineer and Executing Agency so that the work can be carried out accurately and according to the specifications and drawings.

2.1 **Codes of practice**

All applicable standards, specifications, etc. and codes of practice shall be the latest editions, including all applicable official amendments and revisions. A complete set of all these documents shall generally be available at site, with the Concessionaire.

All work shall be carried out as per the stipulations contained in various sections of these specifications and the latest Indian Standards, Act, Codes and best practices.
In case of conflict between the stipulations contained in various sections of these specifications and stipulations of Indian Standard Codes, etc. the requirements of stipulations contained in various sections of these specifications shall prevail over that of Indian Standards, Codes, etc. Concessionaire is responsible to notify Executing Agency in writing well in advance of such conflicts prior to execution of the work.

Some of the applicable Indian Standards, Codes are referred to herein below:

(a) IS.783 - Code of practice for laying of concrete pipes
(b) I.S. 3114 - Code of practice for laying of cast iron pipes
(c) I.S. 3764 - Excavation work - code of safety
(d) I.S. 5822 - Code of practice for laying of electrically welded steel pipes for water supply
(e) I.S. 6530 - Code of practice for laying of asbestos cement pressure pipes
(f) I.S. 1726 - Specifications for Cast Iron Manhole covers & frames
(g) I.S. 5455 - Specifications for C.I. steps for manholes.
(h) I.S.4111(Part -1) - Code of practice for ancillary structures in sewerage system (manholes)

3. **Carting & handling**

Pipes and fittings/specials shall be transported to all the work sites at places along the alignment of pipe line as directed by Project Engineer and Executing Agency. Concessionaire shall be responsible for the safety of pipes and fittings/specials in transit, loading/unloading storage etc. Every care shall be exercised in handling pipes and fittings/specials to avoid possible damage. While unloading, the pipes and fittings/specials shall not be dropped down from the truck on to any hard surfaces. They should be unloaded on timber skids with steadying ropes or by any other approved means. Padding shall be provided between coated pipes, fittings/specials and timber skids to avoid damage to the coating. Suitable gaps between pipesSTACKS of pipe should be left at intervals in order to permit free access from one side to the other. In case of spigot & socket pipes care should be taken regarding orientation of pipes while unloading. As far as possible pipes shall be unloaded on one side of the trench only. The pipes shall be checked for any visible damage (such as broken edges, cracking & spalling of pipe etc.) while unloading and shall be sorted out for replacement. Any pipe which shows any damage to preclude it from being used shall be discarded. Dragging of pipes and fittings/specials along concrete and similar pavement with hard surfaces shall be prohibited.

4. **Storage**

4.1 Each stack of pipes shall contain only pipes of same class and size, with consignment or batch number marked on it with particulars of suppliers wherever possible. Storage shall be done on firm level and clean ground and wedges shall be provided at the bottom layer to keep the stack stable. The stack shall be in pyramid shape or the pipes laid lengthwise and crosswise in alternate layers. The pyramid stack shall be made for smaller diameter pipes for conserving space in
storing them. The height of the stack shall not exceed 1.5 m. Also necessary security arrangements should be provided to avoid these till the pipes are finally used.

4.2 Fittings/specials shall be stacked under cover and separated from pipes and with suitable security measures.

4.3 Rubber rings shall be stored in a clean & cool store away from windows, boiler, electrical equipment and petrol, oils or other chemicals. Particularly in the field where the rubber rings are being used it is desirable that they do not be left out on the ground in the sun or overnight under heavy frost or snow conditions.

5. Laying

5.1 General

The Concessionaire shall visit the site before tendering and get himself acquainted with site conditions and the regulations regarding the laying of pipes in congested areas, heavy traffic areas etc.

5.2 Excavation

Before excavating the trench the alignment of pipeline shall be approved by Project Engineer and Executing Agency. The excavation of trenches and pits for manholes/chambers shall be carried out in accordance with the specifications contained herein below and shall be done in such a manner that IT DOES NOT GET FAR AHEAD OF THE LAYING OPERATION as approved by Executing Agency.

After excavation of trenches, pipes shall not be lowered in position unless the dimensions of trenches and bedding work at the bottom of the trenches are-approved and measured by Project Engineer and Executing Agency. Pipes and fittings shall be carefully lowered in the trenches. Special arrangements such as cranes, tripods with chain pulley block etc. for lowering the pipes and fittings shall be made by Concessionaire at his own cost. In no case pipes shall be dropped. Slings of canvas or equally NON ABRASIVE MATERIAL of suitable width and strength or special attachment to fit the ends of pipes and fittings shall be used to lift and lower the coated pipes and fittings. The pipes and fittings shall be inspected for defects and, be struck with light hammer preferably while in suspended position to detect presence of any cracks. If doubt persists, further confirmation shall be done by pouring a little Paraffin on the inside of the pipe at the suspected spot and after doing vigilant investigation whether the Paraffin is leaking on to the external side of the pipe or not then only the non leaking pipe should be considered fit for use. Pipes and fittings damaged during lowering or aligning shall be replaced by Concessionaire at no extra cost.

To protect the persons from injury and to avoid any damage to property, adequate barricades, construction signs, red lanterns and guards, as required for smooth functioning of work and to avoid any minor or major accidents, shall be placed and maintained during the progress of the
construction work and until it is safe for the traffic to use the roadways. The relevant Indian Standards and the rules and regulations of local authorities in regard to safety provisions shall be observed.

Suitable fencing/barricades shall be provided along the sides of trenches and pits. The posts of fencing shall be of timber securely fixed in the ground not more than 3 m apart and they shall not be less than 75 mm. in diameter or less than 1.2 m. above the surface of the ground. There shall be two rails, one near the top of the posts and the other about 450 mm. above the ground and each shall be from 50 mm. to 70 mm. in diameter and sufficiently long to run from post to post to which they shall be bound with strong rope. The method of projecting rails beyond the posts and tying them together where they meet will not be allowed on any account. All along the edges of the excavated trenches a bund of earth about 1.2 m. high shall be formed where required by Project Engineer and Executing Agency (but due care shall be taken while stacking the excavated stuff to cause least inconvenience for day to day site activities) for further protection. The above work shall not be paid for separately and the Concessionaire shaft takes into account the costs of such works and quote accordingly.

Total quantity of water required for entire work including for testing- pipes and fittings at work site shall be arranged by Concessionaire at his own cost. Dragging of pipes and fittings along concrete and similar pavements with hard surfaces shall be prohibited.

The road metal and also the rubble packing obtained out of road surface excavations etc. shall first be stripped off for the whole width and entire length of the trench/pit and separately deposited in such place or places as may be determined by Project Engineer and Executing Agency. In case of the metal packing or "Khandkies" not being so deposited or being mixed up with excavated materials and not available for backfilling and making good the excavation, the cost of the new metal, packing or "Khandkies" required shall be charged to the Concessionaire.

The portions of trenches in stony or rocky ground are to be excavated all along to the entire length and for the full depth such that the bottom of the excavation shall not be higher at any point than the bottom of the concrete' bedding layer below the sewer pipe.

During excavation, large stones and rubble shall be separated and removed from the excavated soil and stacked separately. The material from excavation shall be deposited on either side of the trench leaving adequate clear distance from the edges of the trench and pit or as may be necessary to prevent the sides of the trench/pit to "cave-in" or at such a distance and in such a manner as to avoid covering fire hydrants, sluice valves, manhole covers etc., and so as to avoid abutting the wall or structure or causing inconvenience to the public and other service, organization or otherwise as Project Engineer and Executing Agency may direct.

Concessionaire also shall take into account while quoting his rates for possible additional excavations for trial pits of such sizes and depths that may be required to be undertaken by him as per the instructions of Project Engineer and Executing Agency for determining the locations of various existing underground service line such as water pipes, drains, sewers, gas pipe lines, electric and telephone cable etc. which may be met with. Concessionaire should also as per the instructions of Project Engineer and Executing Agency backfill and thoroughly compact all such
additional excavations and make the area as original after the purpose of locating is served. No additional payment will be considered by the Executing Agency on this account.

During the pendency of the contract the Concessionaire should take all due precautions for proper maintenance and protection against damage of all such service lines if met with during excavation, by means of shoring, strutting, planking over, padding- or otherwise as Project Engineer and Executing Agency may direct. Also all precautions shall be taken during excavation and laying operations to guard against possible damage to any existing structures. In case if any such damages have occurred then those shall be made good either by Concessionaire or by other agency, as Executing Agency may decide and wholly in either case at the expense of Concessionaire.

If the work for which the excavation has been made is not completed by the expected date of the setting of monsoon or the setting in of rain whichever is earlier, or before the day fixed by Project Engineer and Executing Agency for filling in any excavation on account of any festival or special occasion, Concessionaire shall backfill such excavation and consolidate the filling at his own expenses as directed by Project Engineer and Executing Agency and shall re-excavate when required at his own cost.

Project Engineer and Executing Agency may order portions of shoring to be left in the trenches at such places, where it is found absolutely necessary to do so as to avoid any damage which may be caused (because of pulling out shoring from the excavated trench/pit) to buildings, cables, gas mains, water mains, sewers etc. in close proximity of the excavation. Concessionaire shall be paid at the negotiated rate for the shoring left in the trenches / pit if directed by Project Engineer and Executing Agency. Concessionaire shall not claim, for any reasons whatsoever for the shoring which may have been left in position by him at his own discretion. Concessionaire shall not be paid for shoring left in the portions of the rakers, struts, or other timber cut off and not permanently left in the work.

Utmost care shall be taken to see that the width of the trench at the top of pipe is not more than that as specified. In case additional width is required it shall be provided only in the top portion from the ground level upto 300 mm. above the crown of pipe. If any extra width is provided in the area below this portion because of mistake on part of the Concessionaire, Concessionaire shall have to provide remedial measures in the form of lime concrete or rubble masonry or otherwise at the discussion and to the satisfaction of Project Engineer and Executing Agency. Concessionaire shall not be paid any additional for extra excavation as well as for the resulting remedial measures adopted to make up for the additionally done excavation. If rock is met with, it shall be removed to 15 cm. below the bottom of pipes and fittings / specials and the space resulting shall be refilled with granular materials and properly consolidated. No compensation will be paid to the Concessionaire on this account and financial implications for the same should be included by the Concessionaire in his rates. Bottom of trenches / pits shall be saturated with water and well rammed wherever Project Engineer and Executing Agency may consider it necessary to do so.

Wherever a socket or collar of pipe or fitting / special is to be accommodated a strip sufficient enough for this purpose is to be cut in the bottom of the trench or concrete bed to a depth of at least 75 mm. below the bed of the pipe so that the pipe may have a fair bearing on its shaft and
does not rest upon its socket. Such strip shall be of sufficient size in every respect to admit the free movements of hand holding necessary tools of the skilled worker, all around the socket in order to make the joint completely water tight and the strip shall be maintained clear until the joint has been approved by Project Engineer and Executing Agency.

All the pipes are to be laid perfectly true both in alignment and to the gradient specified.

When welding is to be carried out with the pipes and specials in the trench, additional excavation of not more than 60 cm. in depth and 90 cm. in length shall be made at joints in order to facilitate welding. The excess volume of this excavation should be brought to the acceptable level by making good with necessary fill material as directed by Project Engineer and Executing Agency. The charges on this account should be included in his rates by the Concessionaire.

The excess excavated material shall be carried away from site of works to a place up to a distance as directed by Project Engineer and Executing Agency. This shall be done immediately so as not to cause any inconvenience to the public or traffic.

5.3 **Dewatering**

During the excavation, if subsoil water or water mixed with day/slush- is met with Concessionaire shall have to provide necessary equipment and labourers for dewatering the trenches/pits by bailing out water or clay/slush; if pumping out subsoil water is found to be necessary, Concessionaire shall provide pumps in sufficient numbers/type for the same. In both the above cases the excavation shall be done to the required level and the pipes shall be laid to proper alignment and gradient. Concessionaire shall also make foolproof necessary arrangement for the disposal of drained water to nearby storm water drain or in a pit if allowed by Project Engineer and Executing Agency. In no case the water shall be allowed to spread indiscriminately over the adjoining area. Before discharging this water into public sewer/drain, Concessionaire shall take necessary permission from all the local authorities before implementing the draining arrangements.

5.4 **Special foundation in poor quality soil**

Where the bottom of the trench at subgrade is found to consist of material which is unstable to such a degree that in the opinion of Project Engineer and Executing Agency, it cannot be removed and replaced with an approved material thoroughly compacted in place to support the pipe properly, a suitable foundation for the pipes, consisting of piling, timbers or other materials, in accordance with relevant drawings and as instructed and approved by Project Engineer and Executing Agency shall be constructed.

When the work of constructing the pipe lines has to be carried out in soft underground strata, such as puddle etc. or in a reclaimed land, a good foundation shall be provided for the pipes and manholes. For the former, excavation in the trench shall be taken 75 mm. deeper than what is ordinarily required and for this depth the whole of the trench shall be covered over with M-150 bed concrete of the required width, reinforced with B.R.C. fabric No.9 or any other fabric-approved-by the Project Engineer and Executing Agency.
The fabric shall be suitably cut to the requirement and securely joined together with adequate laps which should not be less than 200 mm. The fabric in the pipe line must also be securely jointed together. The rates in both the cases shall be held to include all lapping, jointing and also any probable wastage.

5.5 Wooden shoring

Concessionaire shall suitably design polling boards, walling and struts to meet different soil conditions that might be encountered in excavating trenches/pits. The horizontal and vertical spacing of struts shall be such that not only the sides of trenches shall be prevented from collapse but also easy lowering of pipe in trenches shall be ensured without creating undue obstructions for the excavation of the work. Any inconvenience and/or delay that might be caused in lowering pipes in trenches as a result of adopting improper spacing of struts by Concessionaire shall be his sole responsibility. No part of shoring shall at any time be removed by Concessionaire without obtaining permission from Project Engineer and Executing Agency. While taking out shoring planks the hollows of any form must simultaneously be filled in with soft earth well watered & rammed with rammers.

Project Engineer and Executing Agency may order portions of shoring to be left in the trenches/pits at such places, where it is found absolutely necessary to do so as to avoid any damage which may be caused to the adjacent buildings, cables, gas mains, water mains, sewers etc. in close proximity of the excavation, by pulling out the shoring from the excavations. Concessionaire shall not claim, on any reason, whatsoever for the shoring which may have been left in by him at his own discretion.

5.6 Steel plate shoring

Where the subsoil conditions are expected to be of a soft and unstable character in trench/pit excavation the normal method of timbering may prove insufficient to avoid subsidence of the adjoining road surfaces and other services. In such circumstances Concessionaire will be required to use steel trench sheeting or sheet piling adequately supported by timber struts, walling etc., as per the instructions, manner and method directed by Project Engineer and Executing Agency. Concessionaire shall supply, pitch drive and subsequently remove trench sheeting or piling in accordance with other items of the specification.

5.7 Boning staves and side rails

In laying the pipes and fittings/specials the centre for each pipe line shall be marked by a peg. Concessionaire shall dig holes for and set up two posts (about 100 mm. x 100 mm. x 1800 mm.) at each junction of pipe lines at nearly equal distance from the peg and at sufficient distances there from to be well clear of all intended excavation, so arranged that a side rail when fixed at a certain level against the post shall cross the centre line of the manhole / chamber or pipe lines. The side rail shall not in any case be more than 30 m apart, intermediate rails shall be put up if directed by Project Engineer and Executing Agency.

Boning staves of 75 mm. x 50 mm size shall be prepared by Concessionaire in various lengths,
each length being of a certain whole number of metres and with a fixed tee-head and fixed intermediate cross pieces, each about 300 mm. long. The top-edge of the cross piece must be fixed below the top-edge of this tee-head at a distance equal to the outside diameter of the pipe or the thickness of the concrete bed to be laid as the case may be. The top of cross pieces shall indicate different levels such as excavation for pipe line, top of concrete bed, top of pipe etc. as the case may be.

The side rail of size 250 mm. x 40 mm. shall be screwed with the top edge resting against the level marks. The centre line of the pipe shall be marked on the rail and this mark shall denote also the meeting point of the centre lines of any converging pipes. A line drawn from the top edge of one rail to the top edge of the next rail shall be vertically parallel with the bed of the pipe and the depth of the bed of pipe at any intermediate point may be determined by letting down the selected boning staff until the tee head comes in the line of the sight from rail to rail.

The post and rails shall be perfectly square and planed smooth on all sides and edges. The rails shall be painted white on both sides, and the tee heads and cross piece of the boning staves shall be painted black.

For the pipes converging to a manhole / chamber at various levels, there shall be a rail fixed for every different level. When a rail comes within 0.60 M. of the surface of the ground, a higher sight rail shall be fixed for use with the rail over the next point.

The posts and rails shall be in no case be removed until the trench is excavated, the pipes are laid and Project Engineer and Executing Agency gives permission to proceed with the backfilling.

5.8 Encasing / being / hunching etc.

The pipes shall be provided with encasement / bedding / hunching etc. as specified in drawings.

5.9 Laying of pipes and fittings / specials

All precautions shall be taken during excavation and laying operations to guard against possible damage to any existing structure / pipe line of water, gas, etc. and excavation to proceed in accordance with the relevant of Clause of this specifications.

All the pipes are to be laid perfectly true both in alignment and to gradient specified In case of spigot and socket pipe the socket end of the pipe shall face upstream EXCEPT WHEN THE PIPE LINE RUNS UPHILL IN WHICH CASE THE SOCKET ENDS SHOULD FACE THE UPGRADE. The laying of pipes shall always proceed upgrade of a slope. After placing a pipe in the trench, the spigot end shall be centered in the socket and the pipe forced home and aligned to required gradient. The pipes shall be secured in place with approved backfill material tamped under it except at the socket. Pipes and fittings / specials which do not allow a sufficient and uniform space for joints shall be removed and replaced with pipes and fittings/ specials of proper dimensions to ensure such uniform space: Precaution shall be taken to prevent dirt from entering the jointing space. At times when pipe laying is not in progress, the open ends of pipe shall be closed by a watertight plug or other means approved by Project Engineer and Executing Agency. During the period that the plug is on, the Concessionaire shall take proper precautions.
against flotation of the pipe owing to entry of water into the trench: Wherever it is necessary to deflect pipe from a straight line, either in the vertical or horizontal plane, to avoid obstructions or where long radius curves are permitted, the deflection allowed at joints shall not exceed 2½°. In the case of pipes, with joint to be made with loose collars, the collars shall be slipped on before the next pipe is laid. The pipes shall be laid such that the marking on pipes appears at the top of the pipes.

The cutting of pipe for inserting valves, fittings or closure pieces /specials shall be done in a neat and workmanlike manner without damage to the pipe so as to leave a smooth end at right angles to the axis of the pipe. For this purpose, pipe cutting machine shall be used and skilled labourers only should be allowed to achieve this task.

5.10  Thrust blocks

Thrust blocks shall be provided as directed by Project Engineer and Executing Agency to counteract hydraulic thrust, at places wherever directed and as per relevant drawing.

Where the hydraulic thrust is in an upward direction, anchor blocks as per the relevant drawing shall be provided to which the pipes shall be secured with steel straps.

5.11  Jointing of pipes

Jointing for pipes and fittings / specials shall be done in accordance with: the relevant specifications depending on type of pipes being used.

5.12  Testing and commissioning

Testing and commissioning of pipes shall be done in accordance with the relevant specifications.

5.13  Backfilling

Trenches shall be backfilled with approved selected excavated material only after the successful testing of the pipe line. The tamping around the pipe shall be done by hand or other hand operated mechanical means. The water content of the soil shall be as near the optimum moisture content as possible. Filling of the trench shall be carried out simultaneously on both sides of the pipe in such a manner that the level of filling rises gradually and unequal pressure does not occur on the pipe. Back filling shall be done in layers not exceeding 30 cm. Each layer shall be consolidated by watering, ramming, care being taken not to damage to the pipe line. In case of mild steel pipes / specials, the spiders provided during assembly and welding shall be retained until the trench is refilled and consolidated. Where timbers are placed under the pipe line to aid alignment, these timbers shall be removed before backfilling.

5.14  Reinstatement of road / footpath

Reinstatement of road / footpath shall be done as per requirements of local authorities and the
relevant specifications after the completion of work.

5.15 Clearing of site

All surplus materials, and all tools and temporary structures shall be removed from the site as directed by Project Engineer and Executing Agency and the construction site left clean to the satisfaction of Project Engineer and Executing Agency.

6. Measurement

The measurements for excavation in trenches shall be done in following manner and will be paid accordingly.

(i) Length (L) As per the actual length of pipe and fittings / specials laid at work site.
(ii) Width (B) O.D. + 600 mm. only where O.D. is the outside dia. of pipes in mm.
(iii) Depth (D) Average depth of trench from ground level to invert of pipe and fittings.

Excavation of asphalt road and reinstatement of road shall be measured on per square metre basis and the length and width at top of trench shall be considered same as those mentioned for excavation of trench.

The rate for this item should be inclusive of all excess excavated material to be transported from site of work to a place upto a maximum distance of 5 km. as directed by Project Engineer and Executing Agency immediately after his instructions so as not to cause any inconvenience to the public or traffic.

In case the excavation is done in wet condition either by bailing out water or by resorting to pumping, the respective items shall be paid according to the items in schedule of quantities and rates. The measurement for these items shall be made as per the units for relevant item(s) in schedule of quantities and rates. However, Project Engineer and Executing Agency will decide on site the mode of dewatering and his decision shall be final and binding on Concessionaire.

Shoring (open/ close) if to be paid separately shall be measured on the square metre basis of the actual area of trenches shored.

The measurement for removal of excess excavated material upto a specified distance shall be as per the relevant item(s) in the Schedule of Quantities and Rates and shall be measured on cubic metre basis. In case of soil 30% deduction shall be done to take account for voids where as it will be 40% in case of rubble.

Measurement for pipes and fittings / specials shall be in accordance with the relevant clause(s) of
specification for particular type of pipes.

7. **Notes**

Fencing provided along the sides of trenches and pits shall not be paid for separately and Concessionaire shall take into account the costs of such works and quote accordingly.

In case of the road metal packing or dressed stones not being deposited as specified or being mixed up with excavated materials and not available for the reinstatement of road / pavement, the cost of the new metal packing or dressed stones required shall be charged to Concessionaire by Executing Agency.

Service lines if damaged during excavation shall be made good either by Concessionaire or by other agency as Executing Agency may decide and wholly in either case at the expense of Concessionaire.

Concessionaire shall not be paid any additional compensation for excess excavation over what is specified as well as for any remedial measures that are specified.

The excess excavated material shall be carried away from site of works as specified, failing which in view of public safety and traffic convenience at Concessionaire cost.

8. **Data Sheet – A**

- Hydrostatic Test Pressure at Work Site - 30 m.
- Leakage Test Pressure at Work Site - 30 m.
- Bedding - As per drawing
- Width of trench - O.D. + 600 mm. only where O.D is the outside dia. of pipes in mm

Section - WS2: Technical specifications for laying of jointing of cast iron pipes and fittings (cast iron)

1. Scope

This specification covers the requirements for collecting from stores / warehouses as suggested by the Executing Agency, transporting to work sites, laying, jointing and field testing of cast iron pipes and fittings for the water distribution and transmission Network.

2. Applicable codes

Various operations such as transporting to work sites, lowering in trenches, laying, jointing and field testing of cast iron pipes and fittings shall comply with all currently applicable standards. In particular, the following standards, unless otherwise specified herein, shall be referred. In all cases, the latest revision of the standards shall be referred to. In the event of conflict between any of these Specifications and the Codes referred, such specifications shall be defined, prepared by the Concessionaire and submitted to the Project Engineer for approval. The decision of Project Engineer in such case shall be final and binding on the Concessionaire.

   a) Cast Iron Pipes - LA Class - IS : 1536
   b) Specials (Tees, crosses, bends etc.) - IS : 1538
   c) Property connections & Fittings - IS: 1239 (Part I & II)
   d) Laying of C.I. pipes -IS: 3114
   e) Sluice Valves - IS : 780 and IS : 2906
   f) Butterfly Valves (Double flanged long body) - BS : 5155 / IS: 13095
3. Laying

For Clauses No.3.0 i.e. Carting and Handling, 4.0 i.e. Storage and 5.0 i.e. Laying - please refer Sub-Section WS-1 for "Technical Specifications for Laying of Pipes and Fittings / Specials" which are common for this item also.

4. Valves

4.1. General

i. Valves shall be as per internationally recognized standards. Flanges shall be machined on faces and edges and conform to ISO 7005, IS 6392 or BS 4504.

ii. Valves shall be double flanged type and the face shall be parallel to each other and flange face should be at right angles to the valve centerline. Back side of valve flanges shall be machined or spot faced for proper seating of the head and nut.

iii. Valve buried or installed in underground chamber, where access to a hand wheel would be impractical shall be operated by means of extension spindle and / or keys.

iv. Valve of diameter 450 mm. and above shall be provided with lifting eyes and shall have detachable bolted covers for inspection, cleaning and servicing.

v. Valve shall be suitable for frequent operation as well as operation after long periods of idleness in either open or closed position.

vi. The valve stem, thrust washers, screws, nuts and all other components exposed to the water shall be of a corrosion resistant grade of stainless steel.

vii. Valves shall be free from sharp projections.

4.2. Butterfly valves

(a) Butterfly valve shall be as per IS 13095 / BS 5155. Valve shall suitable for mounting in any position.
(b) The valve seat shall be secured to the valve body. When the valve is fully closed, a seal shall seat firmly so as to prevent leakage. The seat surfaces shall be machined smooth to provide a long life for the seal.

(c) The valve seal shall be replaceable and securely clamped to the edge of the disc by stainless steel seal retention members, or equivalent so as to prevent leakage and to hold the seal securely during operation. The seal retention member shall be securely clamped with stainless steel fasteners. All fasteners shall be set flush so as to offer the least resistance possible to the flow-through the valve.

(d) Valve shall be suitable for throttling purpose.

(e) All valve spindles and hand wheels shall be positioned to give good access for operational personnel.

(f) Valve of diameter 450 mm. and above shall be provided with enclosed gear arrangement for ease of operation. The operation gear shall be such that they can be opened and closed by one man against an unbalanced head 15% in excess of the maximum specified rating. Valve and any gearing shall be such as to permit manual operation in a reasonable time and not exceed a required rim pull of 400 N.

(g) All hand wheels shall be arranged to turn in a clockwise direction to close the valve, the direction of rotation for opening and closing being indicated on the hand wheels

4.3. Sluice valves

(a) Sluice valve shall conform to IS 780 and IS 2906 or relevant internationally recognized standards.

(b) They shall be of rising or non-rising spindle type depending on application. The valve shall be furnished with a bushing arrangement for replacement of packing without leakage. They shall also have renewable channel and shoe linings. The gap between the shoe and channel shall be limited to 1.5 mm.

(c) The gate face rings shall be screwed into the gate or alternatively securely pegged over the full circumference.

(d) Valves of 450 mm. and above shall be provided with thrust bearing arrangement for ease of operation.
(e) Valves of diameter 450 mm. and above shall be provided with enclosed gear arrangement for ease of operation. The operation gear of all valves shall be such that they can be opened and closed by one man against an unbalanced head 15% in excess of the maximum specified rating. Valve and any gearing shall be such as to permit manual operation in a reasonable time and not exceed a required rim pull of 400 N.

(f) All valves, spindles and hand wheels shall be positioned to give good access for operational personnel.

(g) All hand wheels shall be arranged to turn in a clockwise direction to close the valve, the direction to close the valve, the direction of rotation for opening and closing being indicated on the hand wheels.

4.4. **Non-return valve**

(a) The valve shall be suitable for mounting on a horizontal pipeline and flow direction shall be clearly embossed on the valve body.

(b) The valves shall possess high speed closing characteristics and be designed for minimum slam condition when closing.

(c) In case of multi door swing type check valve, the non-slam characteristic shall be achieved by providing suitable combination of door and hydraulic passages without any external damping arrangements or passages. The angle of sealing and door weight shall be designed to provide the most efficient working with least restriction to flow.

(d) Valve of diameter greater than 450 mm. shall be provided, in addition to others, feet and jacking screws. Hinge pins / shaft shall preferably be square in section to ensure positive location of flaps and provide for secure fixing.

4.5. **Air valves**

(a) The valve shall be capable of exhausting air form pipe work automatically when being filled. The air being released at a sufficiently high rate to prevent the restriction of the inflow rate. Similarly the valve shall be capable of ventilating pipe work automatically when being emptied, the air inflow rate being sufficiently high to prevent the development of a vacuum in the pipelines. The valve shall also automatically release air accumulating in pipe work during normal working conditions.

(b) Air valve shall be of the double orifice type with a large orifice for ventilation or exhaust of the pipeline and smaller orifice for automatic release of air under normal working pressure.
(c) Air valve shall be designed to prevent premature closure prior to all air having been discharged from the line. The orifice shall be positively sealed in the closed position but the float (ball) shall only be raised by the liquid and not by a mixture of air and liquid spray. The seating shall be designed to prevent the floats sticking after long periods in the closed position.

4.6. Pressure relief valves

1. Pressure relief valves shall be capable of relieving pressure in the system to prevent the system being pressurized in excess of a preset maximum allowable pressure. The valves shall be drop tight under normal operating conditions.

2. The valve operation shall be achieved by the interaction of the inlet pressure and an intermediate pressure produced by a pilot valve or relay system acting on the upper side of the main valves.

3. The pilot valve or relay system shall be actuated by a diaphragm connected to the inlet pressure on its underside and a constant pressure on its upper side derived either from weight or from a spring.

5. Jointing

5.1. Tyton joints

The rubber rings shall be stored in a cool dark, dry and dust free environment. The storage location shall not be exposed to direct sunlight or any heat radiating appliances. The rings shall not be allowed to come in contact with any fuels and shall be stored free of tension.

Rubber rings shall be clearly labeled in bundles to indicate the type of ring, the size of pipe which they are to be used, the manufacturer's name or trademark and the month and the year of the manufacture.

The rings shall comply with IS:5382 regarding their material finish, tolerance in dimensions and physical requirements. Rubber ring bundles from every lot shall carry with them manufacturer's test certificate showing the results of following tests:

[a] Hardness  
[b] Tensile Strength  
[c] Compression test  
[d] Oil immersion test  
[e] Water absorption test  
[f] Stretch test and visual examination
The test procedures, the scale of sampling and the criteria for acceptance shall be as per IS:5382 and IS:3400.

The rubber rings shall be such that they shall not show any signs of deterioration for any reasons during the contract period plus the defects liability period. Entire expenses associated with correcting defects in this regard including replacement of rubber rings shall be fully borne by the Concessionaire.

In jointing cast iron spigot and socket pipes and fittings with tyton flexible joints, the Concessionaire shall take into account the manufacturer's recommendations as to the methods and equipment to be used in assembling the joints, in particular the Concessionaire shall ensure that the spigot end of the pipe to be jointed is smooth and has been properly chamfered, that the rubber ring as per IS::5382 is correctly positioned in the socket and that the two pipes are accurately in line, before the joint is made. The rubber rings and any recommended lubricant shall be procured only through the reputed pipe supplier or as directed by the Project Engineer and Executing Agency.

5.2. Flanged joints

In case of flanged joints, the jointing material used between flanges of pipes and fittings shall be compressed fibre board or rubber conforming to IS:638 of thickness between 1.5 mm. to 3 mm. The fibre board shall be impregnated with chemically neutral mineral oil and shall have a smooth and hard surface. Its weight per sq.m. shall be not less than 112 g./mm. thickness. Each bolt shall be tightened a little at a time taking care not to tighten the bolt which is located immediately adjacent to the tightened bolt and the bolt which is located diametrically opposite each other should alternatively be tightened.

The practice of fully tightening the bolts one after another shall not be allowed. The bolts shall be of mild steel unless otherwise specified.

5.3. Lead caulking joint

The jointing shall be done with molten lead and spun yarn. Pig lead shall be of uniform quality, clean and free from any impurities and any foreign materials. It shall be of uniform softness capable of being easily caulked or driven. It shall conform to IS::782. Spun yarn shall be of clean hemp and of good quality. It shall conform to IS: 65S7. The quantity of lead and spun yarn to be used for jointing of different diameters of C.I. pipes and fittings shall be as per Table 1 of IS::3114.

Lead shall be heated in a melting pot kept in easy reach of the joint to be poured so that the molten metal will not be chilled in being carried from the melting pot to the joint and shall be brought to a proper temperature so that when stirred it will show a rapid change of colour. Before pouring, all scum shall be removed. Each joint shall be made with one continuous pour filling in the entire joint space with solid lead. Spongy or imperfectly filled joints shall thoroughly cleaned by heating/burning till all the contents of the imperfectly tilled lead in the joint are cleared. After clearing the joint it should be re-poured as per the original procedure.
The joint runner shall fit snugly against the face of the socket and a bund of clay should be made on outside of the pipe to form a pouring lip to provide for filling the joint flush with the face and to the top of the socket.

The jointing is done by first caulking in spun yarn, then filling the remainder of the joint space by running in molten lead, taking care that no dross enters the joint, and then thoroughly caulking the lead. The spun yarn shall be used to centre the spigot in the socket and to prevent the flow of molten lead into the bore of the pipe.

After the lead has been run into the joint the lead shall be thoroughly caulked. Caulking of joints shall be done after a convenient length of the pipes shall been laid and leaded. The leading ring shall first be removed and any lead outside the socket shall be removed with a flat chisel and then the joint caulked around three times with caulking tools of increasing thickness and hammer of 2 kg weight. Lead run joints shall be preferably finished 3 mm. behind the socket face. The joints shall not be covered till the pipe line has been tested under specified hydrostatic test pressure, though the rest of the pipe line should be covered up to prevent expansion and contraction due to variation in temperature.

5.4. Proposed jointing of C.T. pipes

It is proposed to use spigot and socket pipes with rubber ring tyton joints and flanged joints for valves and other appurtenances.

The pipeline shall be laid such that the socket ends should face the upstream on level ground. When the line runs uphill the socket end should face the upgrade.

Whenever valve or hydrant connection is to be made socket and flanged specials or T specials as shown in the drawings shall be used.

In case of rubber ring joints, the groove and the socket shall be thoroughly cleaned before inserting the rubber gasket. While inserting the gasket, it shall be made sure that it takes the proper direction and that it is correctly seated in the groove. After cleaning dirt or foreign materials from the plain end, lubricant shall be applied in accordance with the pipe manufacturer’s recommendations. The plain end of the pipe shall be pushed into the socket of the pipe and while pushing, the pipe shall be kept straight. If any deflections are to be made in the alignment, it may be made after the joint is assembled.

For joints between pipe and valve, socket and flanged specials shall be used. The gasket used between flanges of valves and pipe shall be compressed fibre board or natural / synthetic rubber (IS::63S) of thickness between 1.5 to 3.0 mm. The fibre board shall be impregnated with chemically neutral mineral oil and shall have a smooth and hard surface. Its weight per square meter shall be not less than 112 g/mm thickness. Each bolt should be tightened a little at a time taking care to tighten diametrically opposite bolts alternatively. The practice of fully tightening the bolts one after another is highly undesirable.
5.5. **Property connections**

A property connection should consist of following parts

(i) Brass ferrule
(ii) Communication pipes with couplings, bends, elbows, union etc. (Length as per drawings)
(iii) Cap at the end of the communication pipe near the plot boundary.

The plot Executing Agency is expected to construct and connect the remaining portion of property connections at plot boundary. The desired arrangement of property connection is shown in Drawing No.15-A-101.

5.6. **Connection at main**

Boring on water main should be done on top of main to reduce possible entry of silt into pipe and subsequently damaging of meters. A manual drilling and tapping machine should be used for this purpose. A bore shall be drilled and tapped on CI main and a ferrule shall be screwed directly into the bore. Upto 38 mm size of property connections, ferrules shall be used where as for higher size property connections, T connection shall be given. Ferrule shall be of gunmetal or brass as per IS: 2692. The ferrule should be so set in the main that the communication pipe leads off in line with the main before curving round right handed into its proper course as show in Drawing No. 15-A-101. G I. Pipes to be used as property connections shall confirm to IS: 1239. Class C. the pipe should be provided, external protection of bitumen coating with hession cloth wrapped over it. It should be provided with PVC sheathing wherever they are exposed such as in case of drain crossings.

The specials to be used at crossing of pipelines, T joints, 90 deg. bends and valve joints are shown in the Drawing No. 15-A-101.

5.7. **Testing**

After the pipes and specials are laid, jointed and the trench partially back filled except at the joints the stretch of pipe line as directed by Project Engineer and Executing Agency shall be subjected to pressure test and leakage test. Where any section of the rising main is provided with concrete thrust blocks or anchorages, the pressure test shall not be made until atleast five days have elapsed after the concrete was cast. If rapid hardening cement has been used in these blocks or anchorages, the test shall not be made until atleast two days have elapsed after concreting.

Each section of pipe line shall be slowly filled with water and all air shall be expelled from the pipe by tapping at points of highest elevation before the test is made and plugs inserted after the test have been completed. Specified pressure as per Data Sheet A, based on the elevation of the lowest point of the line or section under test and corrected to the elevation of the test gauge, shall be applied by means of a pump connected to the pipe as directed by Project Engineer and Executing Agency. The duration of test shall not be less than 5 minutes. Where the field test pressure is less than two-third the work test pressure, the period of test should be increased to
atleast 24 hours. If a drop in pressure occurs, the quantity of water added in order to re-establish the test pressure should be carefully measured. This should not exceed 0.1 litre/mm. dia. per km. of pipe line length per day for each 30 m. head of pressure applied. The exposed joints shall be carefully examined and all such joints showing visible leaks shall be rectified until it becomes fully water tight. Any cracked or defective pipes and fittings as a consequence of this pressure test shall be removed from site and replaced by acceptable quality of pipes by Concessionaire and the test shall be repeated to the satisfaction of Project Engineer and Executing Agency.

After the satisfactory completion of pressure test, the section of pipeline shall be subjected to leakage test at a pressure as specified in Data Sheet A. The duration of test shall be 2 hrs. No pipe installation shall be accepted until the leakage is less than the number of CUM./hr. as determined by the formula;

\[ qL = \frac{ND \sqrt{p}}{3.3} \]

where,

- \( qL \) = the allowable leakage in CUM./hr.
- \( N \) = number of joints in the length of the pipeline
- \( D \) = diameter in mm. and
- \( p \) = the average test pressure during the leakage test in kg./sq.cm.

Should any test of pipe laid disclose leakage greater than that specified above the defective joints shall be repaired by Concessionaire at no extra cost to the Executing Agency until the leakage is within the specified allowance.

Necessary equipment and water used for testing shall be arranged by Concessionaire at his own cost. Damage during testing shall be Concessionaire's responsibility and shall be rectified by him at no extra cost to the Executing Agency. Water used for testing shall be drained out from the pipe to safe location and should not be released in the excavated trenches.

After the tests mentioned above are completed to the satisfaction of Project Engineer and Executing Agency, the backfilling of trenches shall be done as per specification.

### 5.8 Disinfection of water mains

The mains intended for potable water supplies should be disinfected before commissioning them for use.

After pressure testing the main, it should be flushed with water with sufficient velocity to remove all dirt and other foreign materials. When this process has been completed the process of disinfection (using liquid chlorine, sodium or calcium hydrochloride) can proceed by one of the following methods.

### 5.9 Continuous feed

In this method, water from the distribution system or other approved source and the chlorine are
fed at a concentration of at least 20 to 50 mg./litre. A properly adjusted hydrochloride solution injected into the main with a hydro chlorinator, or liquid chlorine injected into the main through a solution feed chlorinator and booster pump shall be used. The residual chlorine should be checked at intervals to ensure that the proper level is maintained. Chlorine application should continue until the entire main is filled. The water should remain in the main for a minimum of 24 hours, during which time all valves, hydrants, etc. along the main should be operated to ensure their proper disinfection. Following the 24 hours period not less than 10 mg./l. residual chlorine should remain in the main.

5.10. Slug method

In this method a continuous flow of water is fed with a constant dose of chlorine but with rates proportioned to give a chlorine concentration of at least 300 mg./l. The chlorine is applied continuously for a period of time to provide a column of chlorinated water that will contact all interior surface of the main for a period of at least three hours. As the slug passes tees, crosses etc., valves must be properly operated to ensure their disinfection. This method shall be used principally for large diameter mains.

Regardless of the method used, it is necessary to make certain that back flow of the strong chlorine solution into the supplying line does not occur. The chlorinated water should be flushed to waste until the remaining water has a chlorine residual approximating to 0.2 mg./l. that throughout the rest of the system bacteriological tests should be taken and if the result fails to meet minimum standards, the disinfecting procedure must be repeated and the results again tested before placing the main in service.

6. Measurement

The measurement for pipe laying shall be on running metres of net length along the centre line of pipe as laid including specials. The length of pipes shall not include the portion of spigots within the sockets of fittings and pipes.

The rate for providing and laying of C.I. pipes shall be deemed to include the extra excavation required for ordinary bedding of pipes as per IS: 783 and also for sockets or flanges if any and cost of jointing material.

6.1. Procedure of measurements

i. Length (L): As per the actual length of pipe and fittings / specials laid at work site.

ii. Trench Width (B): For payment of excavation, the width of trench shall be considered as O. D. + 600 mm. only where O.D. is the outside diameter of the pipe in mm.

iii. Depth (D): Average depth of trench from ground level to invert of pipe and fittings.

7. Data sheet - A

7.1. Hydrostatic test pressure at work site - 30 m
7.2. Leakage test pressure at work site - 30 m.

7.3. Bedding - As per drawing

8. Notes

Fencing provided along the sides of trenches and pits shall not be paid for separately and Concessionaire shall take into account the costs of such works and quote accordingly. In case of the road metal packing or dressed stones not being deposited as specified or being mixed up with excavated materials and not available for the reinstatement of road / pavement, the cost of the new metal packing or dressed stones required shall be charged to Concessionaire by Executing Agency.

Service lines if damaged during excavation shall be made good either by Concessionaire or by other agency as Project Engineer and Executing Agency may decide and wholly in either case at the expense of Concessionaire.

Concessionaire shall not be paid any additional compensation for excess excavation over what is specified as well as for any remedial measures that are specified.

The excess excavated material shall be carried away from site of works as specified, failing which in view of public safety and traffic convenience Executing Agency / Project Engineer may carry out the work by any other agency at Concessionaire's risk and cost.

Portion of shoring left in the excavated trenches or pits shall be measured and paid separately, if instructed by Project Engineer and Executing Agency to do so.

Section G4.1: General mechanical specifications

1. Double entry split casing pumps

The pumping unit shall consist of a horizontal split-case, single stage and double suction impeller directly connected through a flexible coupling to a horizontal induction motor. The pump shall be designed such that the rotating element can be removed without disturbing the pipework or the pump motor. All rotating parts individually and in assembly shall be statically and dynamically balanced to prevent vibration through a range of normal and reverse speeds.

The pumps shall be designed to operate satisfactorily without detrimental surges, vibration noise, or dynamic imbalance over the required head range. The head-capacity curve of the pump shall have a continually rising head characteristic with decreasing capacity over the whole range of total head.

The Concessionaire shall guarantee that adequate required Net Positive Suction Head (NPSH) is available to ensure that pumps can operate without cavitation under the worst operating conditions. The required NPSH at duty point shall be at least 0.5 M less than the available NPSH at the lowest water level in the sump.

Each pump must be capable of running satisfactorily in parallel with 3 to 5 other sets in the system without throttling and by itself, without cavitation or overload under all operating conditions within the system resistance indicated.

The unit shall be designed to operate safely at the maximum speed attainable in the reverse direction of rotation due to water returning through the pump at times when the power supply to the motor is interrupted and the discharge valve fails to close.

Pumps shall run smooth without undue noise and vibration. The velocity of vibration shall be within the 4.5 mm / sec. Noise level shall be limited to 85 dBA at a distance of 1.86 m.

Automatic float type air valve with cock shall be fitted in the highest part of the casing to assist priming.

Small bore pipework shall be provided for gland water drainage. Gland water drainage shall be piped to the drainage channel.

All the pumps shall be supplied with machined pads to allow the fitting of portable vibration monitoring transducers.

The pump casing shall be of the double suction type. Either single or double volute type could be adopted, to produce smooth flow with gradual changes in velocity. Unbalanced, hydraulic, radial thrust acting upon rotating elements shall be kept minimum.

Flanges shall be machined on faces and edges and conform to ISO 7005, IS 6392 or BS 4574. Back faces of flanges shall, where necessary, be machined to ensure they are parallel to the front
faces and that flange bolts can be fitted flush to the flanges.

The pump casing shall be provided with removable and renewable wearing rings where there are close-running clearances between the impeller and the casing. Suitable tapped holes shall be provided for air vents and for drains. The casing shall be so constructed that the drains will unwater the entire casing. One tapped hole shall be provided in the discharge flange and the suction flange for connection of pressure gauges.

The casing stuffing box and gland shall be designed to be suitable for easy maintenance of the conventional gland packings.

The pump base, or the supporting bracket, shall be drilled in the shop for doweling to the baseplate at the site.

The impeller shall be the enclosed type and shall be fastened to the shaft in such a manner as to make it readily removable. The water passages of the impeller shall be hand finished to remove rough spots and excessive irregularities. Removable and renewable wearing rings shall be provided on the impeller where there are close running clearances between the impeller and the casing. Materials and hardness of the casing and impeller wearing rings shall be selected to ensure that they are not susceptible to galling and premature wear.

The shaft shall be provided with replaceable stainless steel sleeves with proper hardness where it passes through the stuffing boxes and water passages. Water deflectors shall be provided on the shaft to prevent water from passing along the shaft and entering the pump bearings.

A stationery guard shall be provided for the coupling conforming to all relevant safety codes and regulations. Guard shall be designed for easy installation and removal, complete with necessary support, accessories and fasteners.

The stuffing box shall be provided with a readily accessible soft packings of conventional type. The material of packing shall be of technically advanced and commercially available type.

The pump shaft shall be supported by two bearings of anti-friction type, one located on each side of the pump. Bush bearing will not be accepted. The bearings may be of the oil or grease lubricated, ball or roller bearing type. One bearing on the pump shall be of the thrust type, designed to withstand the unbalanced axial hydraulic thrust. Suitable fittings shall be furnished for the type of lubrication provided. Bearings shall have a minimum life of 40,000 hours of operation.

It is desired that bearings be furnished which do not require water for cooling. If the bearings are water cooled, the water shall be taken from the pump discharge and returned to the pump suction. Suitable cooling water supply piping and return drain piping shall be supplied, and a y-type strainer with blow off shall be provided in the cooling water supply piping.

Seals shall be provided to prevent loss of lubricant and entrance of moisture and dirt.
The pumping unit shall be provided with a structural / steel baseplate. The pump and motor may be mounted on a common baseplate or on separate baseplates. The baseplates shall be of sufficient size and rigidity to maintain the pump and motor in proper alignment and position. All contact surfaces between the pump and baseplate and between the motor and baseplate shall be machined. Means shall be provided for transmitting the entire load due to discharge shutoff pressure to the concrete structure. After the unit has been installed and properly aligned, the baseplates will be drilled and reamed for the dowels. The necessary dowels shall be furnished with the pumping unit.

2. **End Suction Pumps**

End suction pumps shall be horizontally mounted complete with drive motor on a common base plate. The pump / drive coupling shall be of the spacer type to facilitate removal of the pump rotating element and bearing housing without dismantling the pump casing, adjoining pipework or drive motor.

The bedplate shall be of substantial fabricated steel construction with floor fixing bolt holes ready drilled. All holding down bolts etc. shall be supplied with the units.

Impellers shall be provided with means to prevent abrasive matter reaching the glands and with fully shrouded impellers, to prevent the trapping of matter between the impeller vanes and the casing.

The speed of any pump (excluding non-clog pumps) shall not exceed 1,500 rpm.

Glands may be fitted with suitable mechanical seals or conventional soft packing. The gland arrangement shall be designed for ease of adjustment or removal of the seal or packing material. Shafts shall be sleeved around the area of the gland when soft pack glands are used.

Flushing facilities shall be provided for mechanical seals or packed glands, where pump fluid may be contaminated with abrasive material. Where soft packed glands are used, means shall be provided for collection of the gland leakage water, which shall be piped into the drainage system through adequately sized ports.

Lubrication arrangements shall be so designed that there is no contamination of the pumped fluid.

The pumps and associated pipework shall be, wherever possible, arranged so that air can be completely expelled during priming. Where this is not possible, facilities shall be provided for the removal of the trapped air. Adequate facilities shall be provided for drainage of the pumps for inspection purposes.

Tappings shall be provided at both the suction and discharge flanges for pressure gauge equipment.

3. **Submersible pumps**
Submersible pumps shall be of the totally submersible centrifugal or mixed flow type capable of operating below a 15m. head of water. The pumping unit shall be suitable for continuous operation, designed to meet the desired performance and capable of handling the pumped medium without undue wear and tear.

A built-in cooling system must allow the motor to operate continuously at its rated output regardless of whether the electric motor is submerged or not.

The motor shall be direct coupled to its pump and rated for continuous full load operation above or under water.

The insulation rating of the motor shall be Class F rated to run at Class B and supply rated output at deviations of up to ±5% of the rated frequency and voltage. The motor shall be to IP68 BS 5490.

The cable termination shall be water tight and provided with a cable sleeve and strain relief.

The motor shall have ball type bearings permanently greased and maintenance free.

The pump and motor shall be separated by two mechanical face seals. The lower seal shall rotate in the water medium and the upper seal shall rotate in an oil bath medium.

The pump shall have a non-overloading performance characteristic and its efficiency shall be high at the duty point and remain at a reasonably high level over the duty range of the pumping system.

Rotating assemblies of pumps shall be statically and dynamically balanced.

The pump wear rings shall be easily replaceable.

4. **Induction motor**

4.1 **Design Requirements**

The motors shall generally conform to IS:325 or relevant, equivalent internationally approved standards. Additionally the specific requirements mentioned in the following clauses shall also be met.

4.2 **Performance and Characteristics**

(a) Motors shall be capable of giving rated output without reduction in the expected life span when operated continuously under the following supply conditions:

(i) Variation in supply voltage ± 10%

(ii) Variation in supply frequency ± 5%

(iii) Combined voltage and frequency variation ± 10%
(b) Motors shall be suitable for full voltage direct-on-line starting.

(c) The power rating of the motor shall be the larger of the following:

(i) 115% of the power input to the pump at duty point.

(ii) Maximum power input while operating within maximum and minimum system resistance.

4.3 Insulations

(a) Any joints in the motor insulation such as at coil connections or between slot and winding sections, shall have strength equivalent to that of slot sections of the coil. The insulation shall be given tropical and fungicidal treatment for successful operation of the motor in hot, humid and tropical climate. The motors shall be provided with class F insulation with temperature rise limited to that of class B insulation.

(b) Motors shall be given power house treatment. This comprises an additional treatment to the winding over and above the normal specified treatment. After the coils are placed in slots and all connections have been made, the entire motor assembly shall be impregnated by completely submerging in suitable insulating compound or varnish followed by proper baking. At least three such submersions and bakings shall be applied to the assembly.

4.4 Constructions Features

(a) The motor construction shall be suitable for easy disassembly and reassembly. The enclosure shall be sturdy and shall permit easy removal of any part of the motor for inspection and repair.

(b) Motors weighing more than 25 kg. Shall be provided with eyebolts, lugs or other means to facilitate safe lifting.

(c) The rotor bars shall not be insulated in the slot portion between the iron core laminations for squirrel cage motors.

4.5 Terminal Box

(a) Terminal boxes shall be of weather proof construction designed for outdoor service. To eliminate entry to dust and water, gaskets of neoprene or approved equivalent shall be provided at cover joints and between box and motor frame. It shall be suitable for bottom entry of cables. It shall be capable of being turned through 360 degrees in steps of 90 degrees.

(b) The terminals shall be of the stud type with necessary plain washers, spring washers and check-nuts. They shall be designed for the current carrying capacity and shall ensure ample
phase to phase and phase to ground clearances. Suitable cable glands and cable lugs shall be supplied to match specified cables.

4.6 Accessories

Two independent earthing points shall be provided on opposite sides of the motor, for bolted connections. These earthing points shall be in addition to earthing stud provided in the terminal box.

4.7 H.V. Motors

a) Motors shall be capable of starting and accelerating the load with the applicable method of starting, without exceeding acceptable winding temperatures, when the supply voltage is 80% of the rated voltage.

b) Motors shall be capable of satisfactory operation at full load at a supply voltage of 80% of the rated voltage for 5 minutes, commencing from hot condition.

c) The locked rotor withstand time under hot conditions at 110% rated voltage shall be more than starting time at minimum permissible voltage by atleast two seconds or 15% of the accelerating time whichever is greater. The locked rotor current of motors shall not exceed 600% of full load current of motors which is inclusive of 20% tolerance.

d) Motors when started with the drive imposing its full starting torque under the specified supply voltage variations shall be capable of withstanding atleast two successive starts from cold condition and one start from hot condition without injurious heating of windings. The motors shall also be suitable for three equally spread starts per hour under the above referred supply conditions.

e) The three phases shall be segregated by metal barriers within both line and neutral terminal box.

f) The earthing pads shall be of non-corrodible metal, welded / brazed at two locations on opposite sides. The pad size shall be 75 x 65 x 25 mm. With two holes drilled at 40 mm. centers, tapped and provided with suitable bolts and washers for connecting the earthing strip.

g) At least six resistance type temperature detectors for the stator winding each having D.C. resistance of 100 ohms at 0 degrees Celsius, embedded in the stator winding at locations where highest temperatures may be expected, shall be provided. The material of the RTD’s shall be platinum.
h) Motors shall have space heaters suitable for 240 V single phase 50 Hz AC supply. These shall be placed in easily accessible position in the lower part of motor frame. Provision shall be made to measure temperature of bearing by inserting hand held temperature measuring device.

i) Motors shall have drain plugs so located that they will drain water, resulting from condensation or other causes from all pockets in the motor casing.

4.8 L.V. Motors

(a) Motors shall be suitable of starting and accelerating the load with the applicable method of starting, without exceeding acceptable winding temperatures, when the supply voltage is 85% of the rated motor voltage.

(b) The locked rotor current of the motor shall not exceed 600% of full load current (subject to tolerance as per the applicable standard).

(c) Motors shall be designed to withstand 120% of rated speed for two minutes without any mechanical damage, in either direction of rotation.

(d) Stator leads shall be brought to the terminal box as insulated cable through a suitable barrier and terminated in clamp type terminals.

5. Valves

5.1 General

(a) Valves shall be as per internationally recognised standards. Flanges shall be machined on faces and edges and conform to ISO 7005, IS 6392 or BS 4504.

(b) Valves shall be double flanged type and the face shall be parallel to each other and flange face should be at right angles to the valve centreline. Back side of valve flanges shall be machined or spot faced for proper seating of the head and nut.

(c) Valve buried or installed in underground chamber, where access to a handwheel would be impractical shall be operated by means of extension spindle and / or keys.

(d) Valve of diameter 450 mm. and above shall be provided with lifting eyes and shall have detachable bolted covers for inspection, cleaning and servicing.

(e) Valve shall be suitable for frequent operation as well as operation after long periods of idleness in either open or closed position.

(f) The valve stem, thrust washers, screws, nuts and all other components exposed to the water shall be of a corrosion resistant grade of stainless steel.
(g) Valves shall be free from sharp projections.

### 5.2 Butterfly Valve

(a) Butterfly valve shall be as per IS 13095 / BS 5155. Valve shall suitable for mounting in any position.

(b) The valve seat shall be secured to the valve body. When the valve is fully closed, a seal shall seat firmly so as to prevent leakage. The seat surfaces shall be machined smooth to provide a long life for the seal.

(c) The valve seal shall be replaceable and securely clamped to the edge of the disc by stainless steel seal retention members, or equivalent so as to prevent leakage and to hold the seal securely during operation. The seal retention member shall be securely clamped with stainless steel fasteners. All fasteners shall be set flush so as to offer the least resistance possible to the flow through the valve.

(d) Valve shall be suitable for throttling purpose.

(e) All valve spindles & handwheels shall be positioned to give good access for operational personnel.

(f) Valve of diameter 450 mm. and above shall be provided with enclosed gear arrangement for ease of operation. The operation gear shall be such that they can be opened and closed by one man against an unbalanced head 15% in excess of the maximum specified rating. Valve and any gearing shall be such as to permit manual operation in a reasonable time and not exceed a required rim pull of 400 N.

(g) All handwheels shall be arranged to turn in a clockwise direction to close the valve, the direction of rotation for opening and closing being indicated on the handwheels.

### 5.3 Sluice Valves

(a) Sluice valve shall conform to IS 780 and IS 2906 or relevant internationally recognised standards.

(b) They shall be of rising or non-rising spindle type depending on application. The valve shall be furnished with a bushing arrangement for replacement of packing without leakage. They shall also have renewable channel and shoe linings. The gap between the shoe and channel shall be limited to 1.5 mm.

(c) The gate face rings shall be screwed into the gate or alternatively securely pegged over the full circumference.

(d) Valves of 450 mm. and above shall be provided with thrust bearing arrangement for ease of operation.
(e) Valves of diameter 450 mm and above shall be provided with enclosed gear arrangement
for ease of operation. The operation gear of all valves shall be such that they can be opened
and closed by one man against an unbalanced head 15% in excess of the maximum
specified rating. Valve and any gearing shall be such as to permit manual operation in a
reasonable time and not exceed a required rim pull of 400 N.

(f) All valves, spindles and handwheels shall be positioned to give good access for operational
personnel.

(g) All handwheels shall be arranged to turn in a clockwise direction to close the valve, the
direction to close the valve, the direction of rotation for opening and closing being
indicated on the handwheels.

5.4 Non-Return Valve

(a) The valve shall be suitable for mounting on a horizontal pipeline and flow direction shall be
clearly embossed on the valve body.

(b) The valves shall possess high speed closing characteristics and be designed for minimum
slam condition when closing.

(c) In case of multidoor swing type check valve, the non-slam characteristic shall be achieved
by providing suitable combination of door and hydraulic passages without any external
damping arrangements or passages. The angle of sealing and door weight shall be designed
to provide the most efficient working with least restriction to flow.

(d) Valve of diameter greater than 450 mm. shall be provided, in addition to others, feet and
jacking screws. Hinge pins / shaft shall preferably be square in section to ensure positive
location of flaps and provide for secure fixing.

5.5 Air Valve

(a) The valve shall be capable of exhausting air form pipework automatically when being
filled. The air being released at a sufficiently high rate to prevent the restriction of the
inflow rate. Similarly the valve shall be capable of ventilating pipework automatically
when being emptied, the air inflow rate being sufficiently high to prevent the development
of a vacuum in the pipelines. The valve shall also automatically release air accumulating in
pipework during normal working conditions.

(b) Air valve shall be of the double orifice type with a large orifice for ventilation or exhaust of
the pipeline and smaller orifice for automatic release of air under normal working pressure.

(c) Air valve shall be designed to prevent premature closure prior to all air having been
discharged from the line. The orifice shall be positively sealed in the closed position but the
float (ball) shall only be raised by the liquid and not by a mixture of air and liquid spray.
The seatings shall be designed to prevent the floats sticking after long periods in the closed
5.6 Pressure Relief Valve

(a) Pressure relief valves shall be capable of relieving pressure in the system to prevent the system being pressurised in excess of a preset maximum allowable pressure. The valves shall be drop tight under normal operating conditions.

(b) The valve operation shall be achieved by the interaction of the inlet pressure and an intermediate pressure produced by a pilot valve or relay system acting on the upper side of the main valves.

(c) The pilot valve or relay system shall be actuated by a diaphragm connected to the inlet pressure on its underside and a constant pressure on its upper side derived either from weight or from a spring.

6. Electric Actuator

(a) All local controls shall be protected by a lockable cover.

(b) Each actuator shall be adequately sized to suit the application and be continuously rated to suit the modulating control required. The gearbox shall be oil or grease filled, and capable of installation in any position. All operating spindles, gears and headstocks shall be provided with adequate points for lubrication.

(c) The actuator shall be capable of producing not less than 1½ times the required valve torque and shall be suitable for at least 15 minutes continuous operation.

(d) The actuator starters shall be integrally housed with the actuator in robustly constructed and totally enclosed weatherproof housing. The motor starter shall be capable of starting the motor under the most severe conditions.

(e) The starter housing shall be fitted with contacts and terminals for power supply, remote control and remote positional indication, and shall also be fitted with internal heaters so as to provide protection against damage due to condensation. Heaters shall be suitable for single phase operation. The heaters shall be switched “ON” when the starters are “OFF” and shall be switched “OFF” when the starters are “ON”.

(f) Each starter shall be equipped as follows:

(i) 2 Nos. - Three phase magnetically operated line contactors with no-volt release and electrical and mechanical interlock.

(ii) 1 No. - Three phase terminal cut-out device.

(iii) 1 No. - Control circuit transformer fully protected by fuses on primary and secondary circuit.
(iv) 1 No. - Set of “Open”, “Close” and “Stop” buttons.

(v) 1 No. - Local - Off-remote switch with padlocking facilities.

(vi) 1 No. - Set of torque and limit switches for “Open” and “Close” positions.

(vii) Valve position indicator and handwheel for manual operation.

(ix) Reduction gear unit.

(g) Gearbox shall have a life of 1,00,000 hours, and be selected in accordance with AGMA recommendation.

7. Pipe Work

All pipes, fittings, bolts, nuts, jointing materials and appurtenances for piping required for execution of the Works shall be manufactured and erected in accordance with the erection plans, specifications and directives of the Project Engineer and Executing Agency. All pipework and fittings shall be to a class in excess of the maximum pressure attained in service including any surge pressure.

The pipework installation shall be so arranged to offer ease of dismantling and removal of pumps or other major items of equipment. Flanged adapter shall be included in the suction and delivery pipe work of all pumps as well as on delivery header for easy dismantling, and provision shall be made for a flexible joint arrangement to building structures. All loose flanges shall be secured to fixed flanges by suitable tie-bolts. All pipe work shall be adequately supported with purpose-made fittings. When passing through walls, pipe work shall incorporate a puddle flange or other suitable sealing device. Flange adapters and unions shall be supplied and fitted in pipe work runs, wherever necessary, to permit the simple disconnection of flanges, valves and equipment. The final outlet connection of the pipe work shall match the connecting point of the transmission main.

Flanged joints shall be made with minimum 3 mm thick full face, fabric reinforced rubber gaskets, pierced to take the bolts, and the face of all flanges shall be machined to give a true angle of 90° to the centre line of the pipe or fittings. All necessary supports, saddles, slings, fixing bolts and foundation bolts shall be supplied to support the pipe work and its associated equipment in an approved manner. Valves, meters and other devices mounted in the pipe work shall be supported independently of the pipes to which they are connected.

The whole of the jointing work and materials necessary to fix and connect the pipes, including adequate and efficient pipe support shall be included in the Contract. The Concessionaire shall be responsible for ensuring that the internal surface of all pipe work is thoroughly clean before and during erection and before commissioning. Cleaning shall include removal of all dirt, rust, scale and welding slag due to site welding. Before despatch from the manufacturer’s works, the ends of the pipes, branch pipes, etc., shall be suitably capped and covered to prevent any accumulation of
dirt or damage. This protection shall not be removed until immediately prior to connecting adjacent pipes, valves or pumps. All small bore pipes shall be blown through with compressed air before connection is made to instruments and other equipment. No point of passage of pipes through floors or walls shall be used as a point of support, except with the approval of the Project Engineer and Executing Agency.

Material of steel pipes and fittings shall conform to IS:2062. Fabrication and testing shall be in accordance with IS:3589 for pipes and IS:6392, ISO 7005 or P.S. 4804 for flanges.

All the underground buried mild steel piping shall be protected by the application of hot coal tar enamel and fibre glass wrapping. The coating shall consist of one coal tar primer coat, one coal tar enamel coat, wrapping of fibre glass and one more coat of enamel and then final wrap of enamel impregnated fibre glass.

8. **Hand operated travelling cranes**

Hand operated travelling cranes shall be manufactured in accordance with medium duty class 2.

The term crane shall be deemed to include also hoists, gantry, rails end stops, holding down bolts and all other items required for complete installation.

Sufficient slings, ropes, shackles, lifting beams and all other necessary equipment shall be supplied to handle all items of plant served by the crane. They shall be labelled or marked with their safe working load in accordance with the safety code and with the purpose, for which they are intended.

9. **Sluice Gate**

9.1 **Design Requirements and Construction Features**

(a) The construction of sluice gates shall be in accordance with the Specification and generally as per AWWA C 501 or IS:13349.

(b) The sluice gates shall be capable of performing the duties set in this Specification without undue wear or deterioration. They shall be constructed so that maintenance is kept to a minimum. All parts of sluice gate, including lifting mechanism components shall be designed for the heads specified with a minimum safety factor of five.

(c) All sluice gates shall be of the rising spindle type.

9.2 **Frame**

The frame shall be of ample section and cast in one piece. All surface forming joints and bearings shall be machined. The frame shall be of the flange back type and shall be machined on the rear face to bolt directly to the machined face of the wall thimble.
9.3 **Guide**

(a) Guide shall be bolted to the frame or cast integrally with it and shall be machined on all bearing and contact faces.

(b) The length of guide shall be such that it should support the gate upto the horizontal line of stem nut pocket.

(c) Arrangement shall be made to prevent lateral movement of bolted on guides. They shall be capable of taking the entire thrust produced by water pressure and wedging action. Wedges shall be attached securely to the guides at points where, in the closed position, they will make full contact with the wedging surfaces on the slides.

9.4 **Seating Faces**

(a) Seating faces shall be made of full width, solid section. They shall be secured firmly by means of counter sunk fixings in finished grooves in the frame and slide faces in such a way as to ensure that they will remain permanently in place, free from distortion and loosening during the life of the sluice gates.

(b) The faces shall be of ample section and finished smooth. The maximum clearance between the seating surfaces, with the slide in the closed position shall not exceed 0.10 mm.

9.5 **Wedging Devices**

Sluice gates shall be equipped with adjustable side, top and bottom wedging devices as required to provide contact between the slide and frame facing when the gate is in closed position. All faces shall be machined accurately to give maximum contact and wedging action. Wedges shall be fully adjustable with suitable adjusting screws and locknuts and so designed that they will remain in the fixed position after adjustment.

9.6 **Gate Slides**

(a) The slide shall be with strengthening ribs where required and a reinforced section to receive the seating faces.

(b) The slide shall have tongues on each side extending its full length, and the tongues shall be machined accurately on contact surfaces. Surfaces of the slide that come in contact with the seat facing and wedges shall be machined accurately. The maximum allowable clearances between the slide and the slide guide shall be 1.6 mm.

(c) An integrally cast stem nut pocket with reinforced ribs shall be provided above the horizontal centre line of the slide. The stem nut pocket shall be provided with drain.
9.7 **Stem Nut and Lift Nut**

Gate shall be provided with a lower fixed stem nut for connecting the stem to the slide and a revolving lift nut located in the lifting mechanism in the head stock. They shall be of ample design to endure the thrust developed during gate operation under maximum gate operating condition loads in opening and closing direction. The stem nut and slide shall be constructed to prevent turning of the stem nut in the pocket in the slide. The stem be threaded and keyed or threaded and pinned to the stem.

9.8 **Stem**

The threads of the stem shall be machined cut or rolled and of the square or acme type. The number of threads per inch shall be such as to work most effectively with the lift mechanism used. The top of the stem be provided with a stop collar.

9.9 **Stem Coupling**

The coupling shall be threaded and keyed or threaded and bolted, and shall be of greater strength than the stem.

9.10 **Stem Guides**

Stem guides shall be cast, with bushings and mounted on cast brackets. Guides shall be adjustable in two directions and shall be so constructed that when properly spaced they shall hold the stem in alignment. Number of stem guides shall be such that unsupported length of stem shall not exceed one hundred times its diameter.

9.11 **Lifting Mechanism**

(a) Sluice gate shall be operated through suitable lifting mechanism which shall incorporate suitable gearing, if required.

(b) Lifting mechanism shall be suitable for operation by one man under all conditions. Lifting mechanism shall incorporate a strong locking device suitable for use with a padlock or padlock and chain.

(c) The manual operation shall be of the handwheel or crank operated type and shall have a lift nut threaded to fit the operating stem. Crank shall be removable. Ball or roller thrust bearings shall be provided above and below the flange on the lift nut to take the load developed in opening and closing the gate with a torque of 14 kg-m. on the crank. Fittings shall be provided to lubricate gears and bearing.

(d) The design of the lift mechanism of the hand operated gates shall be such that the slide can
be operated with a torque of not more than 7 kg-m. on the operator after the slide is unseated from wedges based on the operating head. The maximum crank radius shall be 380 mm.

(e) All gears and bearings shall be enclosed in a cast iron housing with labyrinth seals. The lifting mechanism shall be with a cast iron pedestal, machined and drilled to receive the gear housing and suitable for bolting to the operating floor. The gates shall close with clockwise rotation of the crank. The direction of rotation to close the gates shall be indicated on the lift mechanism.

(f) A suitable means shall be provided for lubricating the stem threads directly adjacent to the lift nut. An inspection cover shall be provided to access the lift nut and gearing.

(g) Stem shall be provided with a GI pipe cover shall be fixed to the head stock.

9.12 Fasteners

All anchor bolts, assembly bolts, screw, nuts, etc. shall be of ample section to safety withstand the forces created by operation of the gate.

9.13 Wall Thimbles

(a) Wall thimbles shall be made of cast iron and shall be supplied along with the gate. The wall thimbles shall provide a rigid mounting, designed to prevent warping of the gate frame during installation.

(b) The cross section of the thimble shall have the shape of the letter ‘F’. The front, or mounting flange, shall be machined and shall be drilled and tapped to the same template used for its particular gate frame. The frame shall be attached to the thimble with bolts of studs. The depth of the wall thimbles shall not be less than 300 mm.

(c) To permit entrapped air to escape as the thimble is being encased in concrete, holes not lesser than 35 mm. diameter at more than 600 mm. span, shall be cast or drilled in each entrapment zone formed by the reinforcing ribs or the flange and water stop.

9.14 Lifting Lugs

Lifting lugs shall be provided for all gates.
Section - G5.1
General electrical specifications
Section G5.1: General electrical specifications

1. **Scope of works and responsibility of the concessionaire**

   The concessionaire is advised to peruse the document in full and understand the scope of work as detailed elsewhere in this document. He is / they are also advised to make himself / themselves aware of the site requirements and conditions before submission of his / their bid. Clarification, if any, required shall be made with the consultant before submission of bid.

   However, nothing shall absolve the concessionaire to carry out and complete the entire works including those minor / incidental works required for the completion of the work whether it is explicitly brought out in this document or not.

   The Concessionaire shall make appropriate arrangement for power supply provisions during Construction Period. All power and lighting circuits shall be constructed with due regard for personnel safety and shall comply with recognized codes of practice and local regulations. All circuits shall be fitted with earth leakage systems.

   This specification is a general specification and the applicability of various component requirements shall be as per actual requirements from site to site basis

2. **Interpretation**

   All the technical terms referred in this document shall have the interpretation as per the relevant Indian standard code / Indian Electricity Rules / Indian Electricity Act etc., In case on any doubt in any of the meanings / interpretations, the tenderer shall get the same clarified from the owner prior to submission of bid.

3. **Electrical’s license**

   The electrical works shall be carried out by persons holding valid competency certificate issued / recognised by the Licensing Board of the locality / State in which the works is to be done. The Concessionaire holding valid Licence / Authorisation from the Licensing Board of the locality / State for carrying out the installation work of such nature and voltage grade.

4. **Design philosophy**

   All equipment offered by the Concessionaire shall offer the following features:-

   - Safety to personnel and equipment during operation and maintenance.
   - Reliability of Services.
   - Ease of maintenance.
   - Facility for ready addition of future loads.
   - Convenience of operation.
• Maximum Inter-changeability of equipment.
• Minimum fire risk.

5. Codes and Standards

Whether explicitly mentioned in this specification document or not, all the engineering, systems, equipment, materials and works being provided by the Concessionaire for this project shall conform to the requirements of the respective latest editions / amendments of the Indian Standards Specifications. In particular cases where relevant Indian Standards are not available, other International Codes and Standards may be accepted, subject to Executing Agency’s specific approval.

The design and the installation shall be in accordance with established and sound engineering practices, standard specifications and must conform to the statutory regulations applicable.

The equipment and installation shall conform to (but not be limited to) the following (Latest versions/editions).

• Indian Electricity Act, 1910
• Indian Electricity Rules, 1956
• The Factory Act, 1948

In the event of conflict between any of these Specifications and the Codes referred, such specifications shall be defined, prepared by the Concessionaire and submitted to the Project Engineer for approval. The decision of Project Engineer in such case shall be final and binding on the Concessionaire.

6. Electrical system

Unless and until specified, otherwise the complete electrical system shall be suitable to work satisfactorily with the following system parameters

<table>
<thead>
<tr>
<th>System Voltage (High Voltage)</th>
<th>11 kV (E) 3 wire 50 Hz AC system of supply and subject to permissible variations as per IE Rules</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Voltage (Medium Voltage)</td>
<td>415 Volts, 3 phase, 4 Wire AC system of supply subject to permissible variations as per IE rules</td>
</tr>
<tr>
<td>System Voltage (Low Voltage)</td>
<td>240 Volts Single phase 3 wire AC system of supply subject to permissible variations as per IE rules</td>
</tr>
<tr>
<td>Frequency</td>
<td>50 Hz and subject to permissible variations as per IE rules</td>

<td>Maximum altitude above mean sea level (Meters)</td>
<td>1000</td>
</tr>
<tr>
<td>Operating Environment</td>
<td>Moderately hot and humid tropical climate conducive to rust &amp; fungus growth.</td>
</tr>
</tbody>
</table>

8. **Drawings and data**

The concessionaire shall furnish the following drawings and data as part of the work:

i. General arrangement showing plan, elevation and typical section views.

ii. Foundation plan showing location of fixing channels, floor openings etc.

iii. Schematic wiring drawings for each breaker.

iv. Technical literature on the equipment offered.

v. Make/Model No. of various major electrical equipment

The Concessionaire shall also furnish the following drawings for each major equipment such as HV panels, Transformers, MV panels, APFCR Panel, Street lighting Poles etc., after the award of contract.

(i) Overall outline dimensions and general arrangement including plan, front elevations, clearances required in front and back etc.,

(ii) Schematic control diagrams to cover controls, protection, interlocks, switch instruments, space heaters, etc., for each type of module.

(iii) Itemized bill of material for each module, listing all devices mounted and cable glands, indicating all type, rating quantity and special notes, if any.

(iv) Detailed internal wiring diagram of each type of module, including terminal block number, ferrule numbers and the external cable connection designations.

(v) Inter panel interconnection wiring diagram including terminal numbers and ferrule numbers.

9. **The energy measurement point:**

(i) The "point of supply" of the utility connections for measuring the electrical energy consumption when the Facilities are running on utility power.
(ii) The Concessionaire shall also install meters and gauges at the DG Sets to measure the total number of energy units (in kWh) consumed from the DG Sets in each month of the O&M Period.

(iii) If the Concessionaire sets up a Power Plant at the Site, then the Concessionaire shall install meters at the Power Plant to measure the total number of energy units (in kWh) generated from the Power Plant in each month of the O&M Period.

(iv) All the energy recording meters shall be in conformance with the required class of accuracy and type as mandated by the utility rules and regulations.

10. Specific project requirements for electrical equipment

10.1. 11 KV Ring Main Unit (RMU)

❖ Scope

This specification describes the minimum requirement for design, manufacture, inspection and testing before despatch, packing and delivery F.O.R. (Destination) of SF6 insulated RMUs complete with other accessories and auxiliaries equipments and mandatory spares, described herein and required for their satisfactory operation.

The objective of the RMUs is for extremely small construction width, compact, maintenance free, independent of climate, easy installation, operational reliability, safe and easy to operate, minimum construction cost, minimum site work and minimum space requirement.

The RMUs shall conform in all respects to high standards of Engineering design, workmanship and latest revisions of relevant standards at the time of offer.

The type of the 11 KV circuit breaker shall be VCB. Insulating medium for load break isolators, Earth switch, 11 KV Buses and other associated equipment’s should be SF6 gas.

❖ General

The insulation / dielectric media inside the stainless steel welded tank should be SF6 gas. The RMU should be of extensible type on both sides with provision of attaching /connecting with SNAP FIT arrangement without external bus bars additional load break switches and circuit breakers in future whenever required.

The RMU shall be for a nominal voltage of 12 KV for 11 kV RMU using SF6 gas as insulating and Vacuum as arc quenching medium. The RMU and combination shall be tropicalized and outdoor metal enclosed type. The RMU metal parts shall be of high thickness, high tensile steel which must be grit /short blasted, thermally sprayed with Zinc alloy, phosphate or should follow the 7 tank pre-treatment process and be subsequently painted with polyurethane based powder
paint. The overall paint layer thickness shall be not less than 80 microns.

Relevant IE rules for clearances, safety and operation inside the enclosure shall be applicable. The enclosure shall be IP54 and type tested from recognized laboratories by National Accreditation Board of Laboratories (NABL). All live parts except for the cable connections in the cable compartments shall be insulated with SF6 gas.

The SF6 gas tank shall be made of TIG welded stainless steel, to have the best weld quality. The gas cubicle shall be metal enclosed with stainless steel of minimum 2 mm thickness and should be provided with a pressure relief arrangement away from operator.

The gas tank shall be of completely welded construction. The connection of different welded sections of gas tank by gasket and bolts, to form a RMU chamber is not acceptable.

Both the load break switches and the tee off circuit breaker shall be suitable for motorization in future. The cable box of isolators and circuit breakers both should be of front access type. The side and rear access cable box are not preferred as they require greater space for cable connection and maintenance at site. Any accidental over pressure inside the sealed chamber shall be limited by the opening of a pressure-limiting device in the rear-bottom part of the enclosure. Gas will be released to the rear of the switchboard away from the operator and should be directed towards the bottom, into the trench to ensure safety of the operating personnel and the pedestrians / civilians. All the manual operations should be carried out on the front of the switchboard.

The entire units of RMU shall be enclosed in a single compact metal clad, outdoor enclosure suitable for all weather conditions. The switchgear/steel gas tank shall be filled with SF6 as per IEC/IS Standards relative pressure to ensure the insulation and breaking functions. The steel gas tank must be sealed for life and shall meet the “Sealed pressure system” criteria in accordance with the IEC 298 standard. The RMU must be a system for which no handling of gas is required throughout the 20 years of service life.

The RMU shall have a design such that in the event of an internal arc fault, the operator shall be safe. This should be in accordance with IEC 298 and relevant Test certificates shall be submitted during design and detailed Engineering stage.

**The RMU shall be tested for an minimum internal arc rating of 20 kA for 1 Sec.**

Suitable temperature rise test on the RMU shall be carried out & test reports shall be submitted during design and detailed Engineering stage. Each switchboard shall be identified by an appropriately sized label, which clearly indicates the functional units and their electrical characteristics devices is visible to the operator on the front of the switchboard and operations are visible as well.

The entire system shall be totally encapsulated. There shall be no access to exposed conductors. In accordance with the standards in effect, the switchboards shall be designed so as to prevent access to all live parts during operation without the use of tools.
The entire 11 KV RMU are insulated by inert gas (SF6) suitable for operating voltage up to 12 KV respectively. The 11 KV circuit breakers must be VCB breaker. **It is necessary to fit an absorption material in the tank to absorb the moisture from the SF6 gas.** The SF6 insulating medium shall be constantly monitored via a temperature compensating gas pressure indicator offering a indication at different temperature ranges, like -25, 0, 20, 40, 60 deg centigrade, having distinctive RED and GREEN zones for safe operation.

**Sulphur Hex fluoride Gas (SF6 GAS)**

The SF6 gas shall comply with IEC 376, 376A and 376B and shall be suitable in all respects for use in 11 KV and 22 KV RMUs under the operating conditions. The SF6 shall be tested for purity, dew point air hydrolysable fluorides and water content as per IEC 376, 376A and 376B.

**Standards**

Unless otherwise specified elsewhere in this Specification, the RMU, Switchboard (Switchgear), Load break isolators, Instrument Transformers and other associated accessories shall conform to the latest revisions and amendments thereof to the following standards.

- IEC 60 298/IEC 62 271-200/IS 12729:1988 - General requirement for Metal enclosed switchgear
- IEC60129/IEC62271-102/IS 9921 - Alternating current disconnector’s (Load break isolators) and earthing switch
- IEC 62 271-1/IEC 60694 - Panel design, SF6/Vacuum Circuit Breakers
- IEC 376 - Filling of SF6 gas in RMU.
- IEC 60273/IS :2099- Dimension of Indoor & Outdoor post insulators with voltage> 1000 Volts.
- IEC 60529/IS 13947(Part-1) - Degree of protection provided by enclosures for low voltage switchgear and control gear.
- Indian Electricity Rules/Bills

Equipment meeting with the requirements of any other authoritative standards, which ensures equal or better quality than the standard mentioned above shall also be acceptable. If the equipment’s, offered by the Concessionaire conform to other standards, salient points of difference between the standards adopted and the specific standards shall be clearly brought out in relevant schedule. In case of any difference between provisions of these standards and provisions of this specification, the provisions contained in this specification shall prevail. One copy of such standards with authentic English Translations shall be furnished along with the offer.(Hard copy)
• Specific requirements in RMU

The RMUs going to be installed in the field network, will be hooked with SCADA through RTUs and hence, RMUs used shall be compatible with SCADA RMU outdoor metal clad enclosure.

The RMU enclosure must be a metallic, it shall follows an industrialized process of manufacturing. The RMU and combination shall be tropicalized and outdoor metal enclosed type. The RMU metal parts shall be of high thickness, high tensile steel which must be grit/short blasted, thermally sprayed with Zinc alloy, phosphate or should follow the 7 tank pre-treatment process and be subsequently painted with polyurethane based powder paint. The overall paint layer thickness shall be not less than 80 microns.

The rating of enclosure shall be suitable for operation on three phase, three wire, 11 KV, 50 cycles, A.C. System with short-time current rating of 20 kA for 3 seconds with RMU Panels. The enclosure should have two access doors one for the operation and relay monitoring and other for the cable access. Both the doors should have the locking facility.

• Take OFF terminal units for future automation:

The RMU should be provided with necessary take off terminal units for future automations, located in the front recesses / LV cubical of the RMU.

• Isolators (Load Break Type)

The load break isolators for Incoming and Outgoing supply must be provided. These should be fully insulated by SF6 gas. The load break isolators shall consist of 630 Amp fault making/load breaking spring assisted ring switches, each with integral fault making earth switches. The switch shall be naturally interlocked to prevent the main and earth switch being switched ‘ON’ at the same time. The selection of the main and earth switch is made by a lever on the facia, which is allowed to move only if the main or earth switch is in the off position. The load break isolators should have the facility for future remote operation. Each load break switch shall be of the triple pole, integral earthing arrangement.

The isolating distance between the OFF and the ON position in the isolator should be more than 80 mm, so as to have enough isolating distance for ensuring safety during DC injection for Cable testing.

• Earthing of Isolators and breakers (earth switch)

Necessary arrangements are provided at Load break isolators / Distribution Transformer Breaker for selecting Earth position. Mechanical interlocking systems shall prevent the RMU function from being operated from the ‘ON’ to ‘Earth’ on position without going through the ‘OFF’ position.

• Tee Off breaker (Vacuum)
The VCB breaker for the controlling of Transformer must be provided inside welded stainless steel SF6 gas tank with the outdoor metal clad enclosure. The VCB circuit breaker must be a spring assisted three positions with integral fault making earth switch. The selection of the main/earth switch lever on the facia, which is allowed to move only if the main or earth switches is in the off position.

The manual operation of the circuit breaker shall not have an effect on the trip spring. This should only be discharged under a fault (electrical) trip; the following manual reset operation should recharge the trip spring and reset the circuit breaker mechanism in the main off position.

The circuit breaker shall be fitted with a mechanical flag, which shall operate in the event of a fault (electrical) trip occurring. The ‘tripped’ flag should be an unambiguous colour differing from any other flag or mimic. Both the circuit breaker and ring switches are operated by the same unidirectional handle.

The protection on the circuit breaker shall comprise of the following components:

- 3 class X protection CT’s,
- a low burden trip coil and
- a self-powered (No external DC or AC source required) IDMT protection relays (Numeric/Microprocessor based) 3 x over current and earth fault element shall be Definite Time type relay. The protection system should be suitable for protecting transformers of rated power from 250 KVA onwards. The relay should be housed within a pilot cable box accessible.

- **Bushings**

The units are fitted with the standardized bushings that comply with IEC standards. All the bushings are the same height from the ground and are protected by a cable cover.

- **Cable boxes**

All the cable boxes shall be air insulated suitable for dry type cable terminations and should have front access only. Side and rear cable entry / access should be avoided, so not to have extra space at site for cable connection and cable testing. The cable boxes at each of the two ring switches should be suitable for accepting HV cables of sizes 3C x 240 sq.mm and circuit breaker cable suitable up to 3C x 300 sq.mm.

The cable boxes for an isolator in it’s standard design should have sufficient space for connecting two cables per phase.

- **Cable testing facility**

It shall be possible to test the cable after opening the cable boxes. The cable boxes should open only after operation of the earth switch. Thus ensuring the earthing of the cables prior to
performing the cable testing with DC injection.

- **Voltage indicator lamps and phase comparators**

  The RMU shall be equipped with a voltage indication to indicate whether or not there is voltage on the cable. There should be a facility to check the synchronization of phases with the use of external device. It shall be possible for the each of the function of the RMU to be equipped with a permanent voltage indication as per IEC 601958 to indicate whether or not there is voltage on the cables.

- **Extensible**

  Each RMU shall have the provision for extension by load break isolators / breakers in future, with suitable accessories and necessary Bus Bar. The equipment shall be well designed to avoid any kind of extension / trunking chamber for connecting and housing extensible Busbars. Extensible isolators and circuit breakers shall be individually housed in separate SF6 gas enclosures. Multiple devices inside single gas tank / enclosure will not be acceptable. In case of extensible circuit breakers, the Breaker should be capable of necessary short circuit operations as per IEC at 20 KA, and the Breaker should have a rated current carrying capacity of 200 A.

- **Wiring & Terminals**

  The wiring should be of high standard and should be able to withstand the tropical weather conditions. All the wiring and terminals (including take off terminals for future automation, DC, Control wiring), Spare terminals shall be provided by the Concessionaire. The wiring cable must be standard single-core non-sheathed, Core marking (ferrules), stripped with non-notching tools and fitted with end sleeves, marked in accordance with the circuit diagram with printed adhesive marking strips. The wiring should be of high standard and should be able to withstand the tropical weather conditions. All wiring shall be provided with single core multi strand copper conductor wires with PVC insulation.

  The wiring shall be carried out using multi-strand copper conductor super flexible PVC insulated wires of 650/1100 V Grade for AC Power, DC Control and CT circuits. Suitable colored wires shall be used for phase identification and interlocking type ferrules shall be provided at both ends of the wires for wire identification. Terminal should be suitably protected to eliminate sulphating. Connections and terminal should be able to withstand vibrations. The terminal blocks should be stud type for controls and disconnecting link type terminals for CT leads with suitable spring washer and lock nuts.

  Flexible wires shall be used for wiring of devices on moving parts such as swinging Panels (Switch Gear) or panel doors. Panel wiring shall be securely supported, neatly arranged readily accessible and connected to equipment terminals, terminal blocks and wiring gutters. The cables shall be uniformly bunched and tied by means of PVC belts and carried in a PVC carrying trough. The position of PVC carrying trough and wires should not give any hindrance for fixing or removing relay casing, switches etc., Wire termination shall be made with solder less crimping type of tinned copper lugs. Core identification plastic ferrules marked to correspond with panel
wiring diagram shall be fitted with both ends of each wire.

Ferrules shall fit tightly on the wire when disconnected. The wire number shown on the wiring shall be in accordance with the IS. 375. All wires directly connected to trip circuits of breaker or devices shall be distinguished by addition of a red color unlettered ferrule. Inter-connections to adjacent Panels (Switch Gear) shall be brought out to a separate set of Terminal blocks located near the slots or holes to be provided at the top portion of the panel. Arrangements shall be made for easy connections to adjacent Panels (Switch Gear) at site and wires for this purpose shall be provided and bunched inside the panel. The bus wire shall run at the top of the panel. Terminal block with isolating links should be provided for bus wire. At least 10% of total terminals shall be provided as spare for further connections. Wiring shall be done for all the contacts available in the relay and other equipment and brought out to the terminal blocks for spare contacts. Color code for wiring is preferable in the following colours.

(a) Voltage supply Red, Yellow, Blue for phase and Black for Neutral
(b) CT circuits similar to the above
(c) DC circuits Grey for both positive and negative
(d) 250 V AC circuits Black for both phase and neutral
(e) Earthing Green

The wiring shall be in accordance to the wiring diagram for proper functioning of the connected equipment. Terminal blocks shall not be less than 650 V grade and shall be piece-molded type with insulation barriers. The terminal shall hold the wires in the tight position by bolts and nuts with lock washers. The terminal blocks shall be arranged in vertical formation at an inclined angle with sufficient space between terminal blocks for easy wiring. The terminals are to be marked with the terminal number in accordance with the circuit diagram and terminal diagram. The terminals should not have any function designation and are of the tension spring and plug-in type.

- **Earthing**

The RMU outdoor metal clad, Switch Gear, Load break isolators, Vacuum circuit breakers shall be equipped with an earth bus securely fixed along the base of the RMU. The size of the earth bus shall be made as per IEC/IS standards Necessary terminal clamps and connectors shall be included in the scope of supply.

All metal parts of the switchgear which do not belong to main circuit and which can collect electric charges causing dangerous effect shall be connected to the earthing conductor made of **copper** having CS area of minimum 75 sq.mm. Each end of conductor shall be terminated by M12/equivalent quality and type of terminal for connection to earth system installation. Earth conductor location shall not obstruct access to cable terminations.

The following items are to be connected to the main earth conductor by rigid or **copper** conductors having a minimum cross section of 75 sq.mm.
(a) Earthing switches
(b) Cable sheath or screen
(c) Capacitors used in voltage control devices, if any.

The metallic cases of the relays, instruments and other panel mounted Equipment shall be connected to the earth bus by independent copper wires of size shall be made of IEC/IS standards. The colour code of earthing wire shall be green.

Earthing wires shall be connected on the terminals with suitable clamp connectors and soldering shall not be permitted.

- **Accessories**

The following spares and accessories shall be ensured along with the main equipment’s

1) Charging lever for operating load break isolators & circuit breaker of each RMU.
2) The pressure gauges indications – 1 numbers
3) Provision shall be made for padlocking the load break switches/ Circuit breaker, and the earthing switches in either open or closed position with lock & master key.

- **Testing of equipment & Accessories**

Provision for testing CTs, Relays, Breakers and Cables shall be made available. The supplier shall provide procedure and schedule for Periodical & Annual testing of equipments, relays, etc.

- **Tests:**

  - **Type test**

    The Concessionaire should, after award of contract during design detailed engineering, submit copies of all Type test certificate of their make in full shape as confirming to relevant ISI/IEC of latest issue obtained from a International/National Govt. Lab/Recognized laboratory along with quality plan, inspection plan as per applicable Indian standards.

  - **Acceptance and Routine tests**

    All acceptance and routine tests as stipulated in the latest IEC/ IS shall be carried out by the supplier in the presence of owner’s representative. The supplier shall give at least 7 days advance intimation to the owner to enable them to depute their representative for witnessing the tests. The partial discharge shall be carried out as routine test on each completely assembled RMU gas tank and not on a sample basis. As this test checks and guarantees for the high insulation level and thus the complete life of switchgear.

  - **Additional tests**
The Executing Agency reserves the right for carrying out any other tests of a reasonable nature at the works of the supplier/laboratory or at any other recognized laboratory/research institute in addition to the above mentioned type, acceptance and routine tests at the cost of the Executing Agency to satisfy that the material complies with the intent of this specification.

- **Pre-commissioning tests**

  All the pre-commissioning tests will be carried out in the presence of the Project Engineer and Executing Agency and necessary drawing manual and periodical test tools shall be arranged to be supplied. During the above tests the Concessionaire’s representative should be present till the RMUs are put in to service.

- **Inspection:**

  The owner may carry out the inspection at any stage of manufacture. The supplier shall grant free access to owner representative at a reasonable time when the work is in progress. Inspection and acceptance of any equipment under this specification by the owner shall not relieve the supplier of his obligation of furnishing equipment in accordance with the specification and shall not prevent subsequent rejection if the equipment is found to be defective.

  The supplier shall keep the owner in advance, about the manufacturing programme so that arrangement can be made for inspection. The owner reserves the right to insist for witnessing the acceptance/routine testing of the bought out items. The owner has rights to inspect the supplier’s premises for each consignment for type & routine test. No material shall be dispatched from its point of manufacture unless the material has been satisfactorily inspected and tested / unless the same is waived by the owner in writing.

  - **Quality Assurance Plan:**

    The Concessionaire shall invariably furnish following information during Design and detail engineering stage

    (i) Statement giving list of important raw materials including but not limited to:

        (a) Contact material
        (b) Insulation
        (c) Sealing material
        (d) Contactor, limit switches, etc. in control cabinet.

    Name of sub-suppliers for the raw materials, list of standards according to which the raw materials are tested, list of test normally carried out on raw materials in presence of Concessionaire’s representative, copies of test certificates.
(ii) Information and copies of test certificates as in (i) above in respect of bought out accessories

(iii) List of areas in manufacturing process, where stage inspections are normally carried out for quality control and details of such tests and inspections.

(iv) Special features provided in the equipment to make it maintenance free.

(v) List of testing equipment available with the Concessionaire for final testing of RMUs and associated combinations vis-à-vis, the type, special, acceptance and routine tests specified in the relevant standards. These limitations shall be very clearly brought out in the relevant schedule i.e. schedule of deviations from specified test requirements. The supplier shall, within 15 days from the date of receipt of Purchase Order submit following information to the owner.

(vi) List of raw materials as well bought out accessories and the names of sub-suppliers selected from those furnished during Design and Detailed Engineering stage.

(vii) Necessary test certificates of the raw material and bought out accessories.

(viii) Quality Assurance Plan (QAP) withhold points for owner inspection. The quality assurance plan and hold points shall be discussed between the owner and supplier before the QAP is finalized.

The supplier shall submit the routine test certificates of bought out items and raw material, at the time of routine testing of the fully assembled breaker.

- Training

The supplier shall give rigorous training to the engineers & staff at the site for 2 days in attending trouble shooting and maintenance.

**SCADA Connectivity:** Specific requirement for SCADA connectivity following requirement shall be fulfilled:

1. FPI shall be provided per isolator
2. **DC control supply system should be 24 V DC.**
3. Battery charger to cater load of minimum 10 motorized operation cycles (CLOSE / OPEN) in absence of battery.
4. Battery to cater load of minimum 10 motorized operation cycles (CLOSE-OPEN) in absence of battery charger. **The battery backup should be minimum of 2Hrs**
5. Availability of MCB’s for battery charger supply, RMU Motor supply & FRTU supply (Minimum 2 Amp circuit for future use of FRTU).
6. Individual control circuit of isolator/CB/BC to have point of isolation/protection.
7. Individual motor circuit of isolator/CB/BC to have point of isolation/protection.
8. RMU shall have minimum protection of IP 54 with gland plate & knock outs. Provision for control cable entry should preferably be from Right/Left top through LV cable box & shall be independent of HV isolator/CB/BC status. It should be vermin proof.
9. Control cable gland plate shall be independent of power cable gland plate.
10. A point of earthing for control cables shall be electrically isolated from power cable earthing.
11. Ambient temperature of 50 degree C max. Allowable temperature rise of battery & battery charger above ambient 40 degree C.
12. Local/Remote switch shall be provided on all the isolator & breaker panels for selection of controls
13. CT & PT terminals for all the circuit breakers only.

Following is the list of I/O requirements for RMU modules. Please note that all DI & DO should be potential free contacts.

a) List of potential free contacts for Isolator (Terminals shall be provided):

**Digital Indications**

1. Isolator ON
2. Isolator OFF
3. Isolator Earth switch Status (ON/OFF)
4. FPI Operated
5. LOCAL/REMOTE switch position

**List of commands**

1. Isolator Close
2. Isolator Open
3. FPI reset

b) List of potential free contacts for Circuit Breaker / Bus coupler (Terminals shall be provided):

**Digital Indications**

1. Circuit Breaker ON
2. Circuit Breaker OFF
3. Auto trip
4. LOCAL/REMOTE switch position
List of commands

1. CB Close
2. CB Open

Requirement for Multifunction Meters (MFMs):

1. Terminals shall be provided for CT and PT connections.
2. Space may be provided for MFM mounting inside control panel.

c) List of potential free signals for AUXILIARY:

Digital indications

1. RMU Battery charger fail
2. Battery Low indication
3. SF6 low

Documentation and drawings

All drawings shall conform to relevant International Standards Organization (ISO) Specification.

The Concessionaire shall submit after award of contract during design and detailed engineering stage, dimensional general arrangement drawings of the equipment’s, illustrative and descriptive literature in triplicate for various items in the RMUs, which are all essentially required for future automation.

i) Schematic diagram of the RMU panel
ii) Instruction manuals
iii) Catalogues of spares recommended with drawing to indicate each items of spares
iv) List of spares and special tools recommended by the supplier.
v) Copies of Type Test Certificates as per latest IS/IEC.
vi) Drawings of equipment’s, relays, control wiring circuit, etc.
vii) Foundation drawings of RMU.
viii) Dimensional drawings of each material used for item vii.
ix) Actual single line diagram of RMU/RMUs with or without Extra combinations shall be made displayed on the front portion of the RMU so as to carry out the operations easily.

The following should be supplied to along with the initial supply of the equipment’s ordered.
Two copies of printed and bound volumes of operation, maintenance and erection manuals in English along with the copies of approved drawings and type test reports etc.

- **Nameplate**

Each RMU and its associated equipment’s shall be provided with a nameplate legible and indelibly marked with at least the following information.

(a) Name of manufacturer  
(b) Type, design and serial number  
(c) Rated voltage and current  
(d) Rated frequency  
(e) Rated symmetrical breaking capacity  
(f) Rated making capacity  
(g) Rated short time current and its duration  
(h) Purchase Order number and date  
(i) Month and Year of supply  
(j) Rated lighting impulse withstand voltage  
(k) Feeder name (Incoming and Outgoing), DTs Structure name, 11000 Volts Dangers etc.

**Note:** Recognized abbreviations may be used to express the above and auxiliary supply shall be stated either on the circuit breaker name plate or any other acceptable position.

- **Fault Passage Indicators (FPI):**

These shall facilitate quick detection of faulty section of line. The fault indication may be based on monitoring fault current flow through the device. The unit should be self-contained requiring no auxiliary power supply. The FPI shall be integral part of RMU. The FPI shall have **LCD/LED display**, automatic reset facility. The sensors to be bushing mounted. **FPI shall be provided per Isolator**

- **Tropicalisation**

Due regard should be given to the climatic conditions under which the equipment is to work. Ambient temperature normally varies between 20 °C and 32 °C, although direct sun temperature may reach 50 °C. The climate is humid and rapid variations occur, relative humidity between 60% and 90% being frequently recorded, but these values generally correspond to the lower ambient temperatures. The equipment should also be designed to prevent ingress of vermin, accidental contact with live parts and to minimize the ingress of dust and dirt. The use of materials, which may be liable to attack by termites and other insects, should be avoided.

- **Motorization**

All the functions within the RMU i.e. Isolators / Breakers should be suitable for motor drive
mechanism and closing coil making it suitable to make it ON from remote.

Control Supply and Auxiliaries: Following Auxiliaries has to be considered:

(i) Shunt trip coil – 24VDC for Isolators and Breakers
(ii) Closing Coil – 24VDC
(iii) 6NO+6NC – Potential free auxiliary contacts for breakers / isolator
(iv) Auxiliary supply should be – 24 V DC
(v) Local / Remote switch for breaker and Isolators

- Metering

Separate Metering Module consisting of bus connected PT’s and metering CT’s to be provided for VCB function along with Provision of installing Multifunction meter to be provided. The PT’s and CT’s provided shall made up of epoxy cast resin with an Accuracy class of 0.5. The CT ratio shall be as per transformer Rating. The metering is required only in breaker functions.

10.1.1. Guaranteed Technical particulars for RMU

The Concessionaire shall submit the Guaranteed Technical particular for RMU during design and detailed Engineering stage.

**10.2. 11 kV Metal enclosed switchgear**

**Applicable standards**

The switchgear and its components shall conform to the latest applicable standards specified below. In the event of conflict between any of these Specifications and the Cddes referred, such specifications shall be defined, prepared by the Concessionaire and submitted to the Project Engineer for approval. The decision of Project Engineer in such case shall be final and binding on the Concessionaire.

| IS : 13118     | Circuit Breakers                     |
| IS : 3427     | Metal enclosed switchgear             |
| IS : 2705     | Current Transformers                  |
| IS : 3156     | Voltage Transformers                  |
| IS : 5576, 11353 | Arrangement for switchgear, bus bars, main connections and auxiliary wiring |
| IS : 2544     | Bus bar support insulators            |
Features of construction

(a) The switchgear shall be outdoor, metal enclosed with separate compartments for

(i) Circuit breaker
(ii) Control, metering and relaying devices
(iii) Busbars
(iv) Instrument transformers
(vi) Power cable terminations

(a) Adjacent switchgear cubicles shall be provided with side sheets on either side to ensure complete isolation. The bottom of the switchgear shall be fully covered by sheet steel.

(b) Separate removable gland plates shall be provided for power and control cables. The gland plate for the power cables shall be of non-magnetic material.

(c) All sheet steel work shall be thoroughly cleaned of rust, scale, oil, grease, dirt, and sward by pickling, emulsion, cleaning etc. The sheet steel shall be phosphated and then painted with two coats of zinc rich primer paint. After application of the primer, two coats of finishing synthetic enamel paint over baked / stoved shall be applied.

(d) The circuit breaker shall be fully draw out type. The circuit breaker shall have distinct service and test positions. In the test position, the circuit breakers shall be capable of being tested for operation without energising the power circuits. Four normally open auxiliary contacts shall be provided for each of the service and test limit position switches.

(e) The test position should preferably be obtained without the need to disconnect normal control connections and use of extension cords for testing.
(f) The switchgear shall fully house the breaker both in the service position as well as in the test position.

(g) The current transformers shall be mounted on the fixed portion of the switchgear and not on the breaker truck.

(h) The cable compartment shall house all power cable connections along with associated cable terminations. Wherever zero sequence current transformers are provided for earth fault protection, these shall also be located inside the cable compartment.

(i) Each switchgear cubicle shall be fitted with a label in the front and rear of the cubicle. Each switchgear shall also be fitted with label indicating the switchgear designation, rating and duty. Each relay, instrument, switch, fuse and other devices shall be provided with separate labels.

### Safety interlocks and features

(a) Withdrawal or engagement of circuit breakers or disconnecting switch shall not be possible unless it is in the open position.

(b) Operation of circuit breaker or disconnecting switch shall not be possible unless it is fully in service position, or in test position or in fully drawn-out.

(c) Operation of a disconnecting switch shall not be possible unless the associated circuit breaker is open.

(d) Circuit breaker cubicles shall be provided with safety shutters operated automatically by the movement of the circuit breaker carriage to cover the exposed live parts when the breaker is withdrawn.

(e) Caution name plate with inscription ‘Caution- Live Terminals’ shall be provided at all points, where the terminals are likely to remain live and isolation is possible only at remote end, e.g. incoming terminals of main disconnecting switch.

(f) A draw-out with breaker of given rating shall be prevented from engaging with stationery element of higher rating.

### Main Bus Bars

(a) Busbars shall be fully insulated by encapsulation in epoxy resin, with mould caps protecting all joints.

(b) Busbars shall be supported on insulators capable of withstanding dynamic stresses due to short circuit.
(c) Busbars shall be of electrolytic aluminium conductor of hard drawn and high conductivity.

- **Circuit Breakers:**
  
  (a) **Auxiliary contacts:**
  Auxiliary switch mounted on the fix portion of the breaker and directly operated from the breaker operating mechanism shall be provided and shall have minimum 6 ‘NO’ and 6 ‘NC’ potential free contacts for Purchaser’s use. Any auxiliary relays required for contact multiplication for other requirements shall be provided. The contacts shall be rated for 10 amps, 240 V A.C and 1 Amp. (Inductive breaking), 110 V D.C. The above auxiliary switches shall not operate when the breaker is withdrawn to test position and operated.

  (b) **Spring operated mechanism:**
  The operating mechanism shall be complete with motor, opening and closing springs, limit switches for automatic charging and all necessary accessories. Facility for manual charging of the closing spring shall be provided. The operating mechanism shall be trip-free and non-pumping electrically. An anti-pumping relay to achieve electrical anti-pumping feature shall be provided even if the breaker has provision for anti-pumping by mechanical arrangement.

- **Earthing:**
  
  (a) An earthing bus shall be provided at the bottom and extend throughout the length of the switchgear. It shall be bolted / welded to the framework of each unit and each breaker earthing bus.

  (b) All non-current carrying metalwork of the switchgear shall be effectively bonded to the earth bus. Hinged doors shall be earthed through flexible earthing braid.

  (c) Positive earthing of the circuit breaker frame shall be maintained both in service and test position.

- **Annunciators:**
  
  (a) Facia annunciators, suitable for operation on 24 V DC shall be provided. Facia annunciators shall be:

    i. Equipped with ‘Sound Cancel’, ‘Acknowled’ and ‘Reset’ push buttons common to annunciators on all switchgear aligned together and a ‘Lamp Test’ push button for each annunciator on individual panels;

    ii. Provided with two lamps connected in parallel on each facia window with series resistors;

    iii. Suitable for normally open indicating contacts of either ‘hand’ or ‘self’ reset type;
iv. Suitable for annunciating subsequent faults with the specified sequence, immediately after acknowledging the previous fault;

v. Facia window of minimum size of 35 mm. x 50 mm;

vi. Designed for an operating sequence indicated below:

### Switchgear accessories and wiring

(a) Switchgear shall be supplied completely wired internally upto equipment and terminal blocks and ready for external cable connections at the terminal blocks. Inner panel wiring between cubicles of same switchgear shall be provided.

(b) All auxiliary wiring shall be carried out with 650 volts grade, single core, stranded copper conductor with PVC insulation. The sizes of wire shall not be less than 1.5 sq.mm.

(c) Terminal blocks shall be of stud type, 650 volts, 10 amps, rated complete with insulated barriers.

(d) All spare contacts and terminals of cubicle mounted equipment and devices shall be wired to terminal blocks.

(e) Accuracy class for indicating instruments shall be 1.0. Instruments shall be 110 mm. Square with 240° scale for flush mounting with only flanges projecting.

(f) Ammeters, voltmeters, shall be of moving iron type. The accuracy class shall be 1.0. The range shall be indicated on the drawing / data sheets. Digital microprocessor based power monitor shall be provided to monitor all electrical parameters, such as KVA, KW with resettable maximum demand recorder and indicator, KVAR, KWH, KVARH, Power Factor PF, Frequency, Voltage current etc. The power monitor shall operate off a PT secondary of 110 volts, suitable for operation on 3-phase, 3-wire system and to measure unbalanced loads.

(g) Relays shall be suitable for flush mounting with only flanges projecting.
All protective relays shall be in draw-out cases with built-in test facilities. Necessary test plugs shall be supplied loose. All auxiliary relays and timers shall be supplied loose. All auxiliary relays & timers shall be supplied in non-draw-out cases. Externally operated hand reset flow indicators shall be provided on all relays and timers. Timers shall be of electromagnetic or electronic type only.

Control and instrument switches shall be rotary type provided with inscription plates clearly marked to show operating position and suitable for semi-flush mounting with only switch front plate and operating handle projecting out.

Breaker control switches shall be pistol grip black and selector switches shall be oval or knob and black. Breaker control switches shall be three-position spring return to neutral type. Instrument selector switches shall be of the maintained stay-put type. Contacts of the switches shall be spring assisted and contact faces shall be with rivets of pure silver. The contact ratings shall be adequate to meet the requirements of circuit capacity in which they are used.

All push buttons shall have two normally open and two normally closed contacts unless specified otherwise. The contacts shall be able to make and carry 5 A at 110V DC and shall be capable of breaking 1 A inductive load at 110V DC. They shall be provided with inscription plates engraved with their functions.

Indicating lamps shall be panel mounting type with series resistors. The wattage of lamps shall be 5 to 10 watts.

Space heaters of adequate capacity shall be provided inside each panel. They shall be suitable for 240V, 1 pH, 50 Hz supply. They shall be complete with HRC fuses, isolating switches and thermostat to cut off heater at 45°C.

Each switchgear panel shall be provided with 240 Volts, 1 phase, 50 Hz, 5 amps, 3 pin receptacle with switch located in a convenient position.

An interior illuminating lamp together with operating door switch and protective fuse shall be provided.

Provision shall be made for receiving, distribution, isolating and fusing of auxiliary D.C. and A.C. supplies for controls, space heating, etc. The fuse ratings shall be so chosen as to ensure selective clearance of sub circuit faults.

Fuses shall be HRC cartridge type mounted on plug in type fuse base.
(r) The D.C. and A.C. auxiliary supply shall be distributed inside the switchgear with necessary isolating arrangements at the point of entry and with sub-circuit fuses as required.

- **Instrument transformers**

(a) The CTS shall withstand momentary and short time current ratings of the associated switchgear. CTS and PTS shall be of the cast resin type and completely encapsulated.

(b) The core balance CTS shall be suitable for the respective outgoing feeders and shall be suitably supported.

(c) PTS shall be single phase, draw out type. PTS shall be provided with fuses on both primary and secondary sides, except those terminals that are required to be connected to earth. These shall have an isolating link. Fuses on primary side shall have rupturing capacity equal to the switchgear rating.

- **Cable termination**

(a) Necessary number of cable glands shall be supplied for terminating auxiliary power and control cables. Glands shall be of heavy-duty brass castings, machine finished and complete with check nut, washers, neoprene compression ring.

(b) Cable lugs for all power and control cable connections shall be supplied. The lugs shall be tinned copper / aluminium depending on cable conductor and of solder less crimping type.

(c) All necessary materials required for terminating the power cables such as tapes, filters, binding wires, armour clamps, brass glands etc., shall be supplied.

- **Drawings and data**

  a) **The Concessionaire shall furnish the following drawings & data during design and detailed engineering stage:**

    - General arrangement showing plan, elevation and typical section views.
    - Foundation plan showing location of fixing channels, floor openings etc.
    - Schematic wiring drawings for each breaker.
    - Technical literature on the breakers offered.
    - Bill of material listing equipment designation, make type, rating etc., of various equipment mounted on switchgear panel.

  b) **The Concessionaire shall furnish the following drawings for each panel & switchgear after the award of contract.**
• Overall outline dimensions & general arrangement including plan, front elevations, clearances required in front and back, details of bus duct connections, if any.
• Schematic control diagrams to cover controls, protection, interlocks, instruments, space heaters, etc., for each type of module.
• Itemized bill of material for each module, listing all devices mounted and cable glands, indicating all type, rating quantity and special notes, if any.
• Detailed internal wiring diagram of each type of module, including terminal block number, ferrule numbers and the external cable connection designations.
• Inter panel interconnection wiring diagram including terminal numbers and ferrule numbers.

### 10.3. 11 kV XLPE Power cables

#### 10.3.1. Scope

The specification covers design, manufacture, shop testing, packing and delivery of 11 kV multi core, cross-linked polyethylene insulated power cables suitable for effectively earthed neutral system.

#### 10.3.2. Standards

Unless otherwise specified elsewhere in this specification, the rating as well as performance and testing of the HT XLPE power cables shall conform to the latest revisions available at the time of placement of order of all the relevant standards as listed in, but not limited to table below

<table>
<thead>
<tr>
<th>Standard</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS: 8130 – 1984</td>
<td>Conductors for insulated electric cables and flexible cords.</td>
</tr>
<tr>
<td>IS :7098 (Part 2) – 1985</td>
<td>XLPE PVC sheathed cable for working voltages from 3.3 kV up to and including 33 kV.</td>
</tr>
<tr>
<td>IS: 5831 – 1984</td>
<td>PVC insulation and sheath of electric cables.</td>
</tr>
<tr>
<td>IS: 3975 – 1988</td>
<td>Mild steel wires, formed wires and Tapes for armouring of cables.</td>
</tr>
</tbody>
</table>

#### 10.3.3. General constructional requirements

The HT multi core power cables shall normally be with stranded compacted H2/H4 grade aluminium conductor as per IS: 8130 - 1984, provided with conductor screening (of extruded semi-conducting cross link material) and shall be insulated with XLPE of natural colour.
Identification of cores shall be by colour, as per provision of clause 13.1 of IS: 7098 (Part 2) - 1985. The insulation (XLPE) screening shall be provided consisting of extruded semi-conducting cross link material in combination with a metallic layer of copper tapes. Three such screened cores shall be laid up together with fillers and/or binder tapes where necessary and provided with extruded inner sheathing of heat resistant PVC conforming to type ST-2 of IS: 5831- 1984. Maximum continuous operating temperature shall be 90 deg C under normal operation and 250 deg C under short circuit condition Armouring shall be provided consisting
of single galvanized round steel wires (In case of Single core cable armouring shall be of Non-magnetic material) conforming to IS:3975 - 1988 (amended upto date) and over the armouring a tough outer sheath of PVC compound shall be extruded. The PVC compound for the outer sheath shall conform to type ST-2 of IS: 5831 - 1984 (amended upto date). The colour of the outer sheath shall be black. The cable shall be manufactured strictly conforming to IS:7098 (Part 2) – 1985 amended upto date and shall bear ISI mark.

10.3.4. Sequential marking of length of cable

Non-erasable Sequential Marking of length shall be provided by embossing on outer sheath of the cable for each meter length. The quality of insulation should be good and insulation should not be deteriorated when exposed to the climatic conditions.

10.3.5. Discharge free construction:

Inner conductor shielding, XLPE insulation and outer core shielding shall be extruded in one operation by special process (viz. Triple Extrusion Process) to ensure that the insulation is free from contamination and voids and perfect bonding of inner and outer shielding with insulation is achieved.

10.3.6. Continuous A.C. Current carrying capacity:

Continuous a.c. current capacity shall be as per Table given below.

<table>
<thead>
<tr>
<th>Conductor sizes in sq.mm.</th>
<th>Continuous a.c. current capacity in Amps. at maximum conductor temp. of 90 deg.C.</th>
</tr>
</thead>
<tbody>
<tr>

<td>355</td>
</tr>
<tr>
<td>400 sq mm</td>
<td>405</td>
</tr>
<tr>
<td>500 sq mm</td>
<td>450</td>
</tr>
</tbody>
</table>

10.3.7. Short circuit current

Short circuit current of 11 kV XLPE cable shall be as per Table given below.

<table>
<thead>
<tr>
<th>Duration of Short Circuit in sec</th>
<th>Area of Al. Conductor</th>
<th>Short circuit current in kA</th>
</tr>
</thead>
<tbody>

10.3.8. **Routine tests**

All the Routine tests as per IS: 7098 (Part 2) - 1985 amended upto date shall be carried out on each delivery length of cable. The result should be given in test report. Partial discharge test must be carried out in a fully screened test cell. It is, therefore, essential that the manufacturer should have the appropriate type of facility to conduct this test, which is routine test.

10.3.9. **Acceptance tests**

All Acceptance tests as per IS: 7098 (Part 2) - 1985 as modified upto date including the optional test as per clause no 18.4 and Flammability Test shall be carried out on sample taken from the delivery lot.

10.3.10. **Packing and marking:**

- **Identification marks on cable:**

  The following particulars shall be properly legible embossed on the cable sheath at the intervals of not exceeding one meter throughout the length of the cable. The cables with poor and illegible embossing shall be liable for rejection.

  a) Manufactures name and/or Trade name.
  b) Voltage grade.
  c) Year of manufacture.
  d) Successive Length.
  e) Size of cable
  f) ISI mark

The cable shall be supplied in continuous standard length of 250 running meters with plus or minus 5% tolerance wound on non-returnable wooden drum of good quality and non-standard lengths not less than 100 meters upto 5% of the ordered quantity shall be accepted. Alternately, cable can be supplied wound on non-returnable steel drum without any extra cost to the purchaser. Packing and marking shall be as per Clause No. 21 of IS: 7098 (Part 2) - 1985 amended up to date.
10.4. Transformers

10.4.1. Applicable standards

The power and auxiliary transformers shall conform to the latest applicable standards specified below. In the event of conflict between any of these Specifications and the Codes referred, such specifications shall be defined, prepared by the Concessionaire and submitted to the Project Engineer for approval. The decision of Project Engineer and Executing Agency in such case shall be final and binding on the Concessionaire.

10.4.2. Features of construction

(a) The transformer shall be designed for adequate capacity with 100% stand by transformer.

(b) The transformer tank shall be made from high-grade plate steel, suitably reinforced by means of stiffeners made of structural steel sections. All seams, flanges, lifting lugs, braces and other parts attached to the tank shall be welded. The interior of the tank shall be cleaned by shot blasting and painted with two coats of heat resistant and oil insoluble paint. Adequately sized manholes shall be provided for easy inspection and maintenance. All joints which may have to be opened from time to time in the course of operation shall be of a design to permit them to be made easily oil tight in reassembly. Steel bolts and nuts exposed to atmosphere, shall be galvanised. The tank cover shall be suitably sloped so that it does not retain rainwater.

(c) Lifting lugs and eyebolts shall be so located that a safe clearance is obtained between sling and transformer bushings, without the use of a spreader.

(d) Transformer of rating above 500 KVA shall be equipped with detachable or separately mounted radiator banks. Transformers of rating 500 KVA and below shall be provided with fixed type radiators.

(e) When transformers are provided with separately mounted radiators, flexible joints shall be provided on the main oil pipes connecting the transformer tank to the radiator banks.
reduce vibration and facilitate erection and dismantling. The interconnecting pipes shall be provided with drain plug and air release vents.

(f) The transformer tank, radiators and conservator shall be designed taking into account the loss of thickness due to shot blasting.

(g) The transformer core shall be constructed from high grade, non-ageing, cold rolled, grain oriented, silicon steel laminations coated with insulation varnish. The steel laminations shall be of “core” type.

(h) Each lamination shall be coated with insulation, which is unaffected by the temperature attained by the transformer during service.

(i) Core lamination shall be annealed and burrs removed after cutting. Cut edges shall be insulated.

(j) The framework and clamping arrangements of core and coil shall be securely earthed inside the tank by copper strap connection to the tank.

(k) Windings shall be of suitably insulated copper wire or copper strip. The windings shall be fully shrunk under vacuum before assembly.

(l) High voltage end windings shall be suitably braced to withstand short circuit stresses and stresses set up by surges.

(m) All taps shall be provided on the HV winding.

(n) The core and coil assembly shall be dried out and impregnated under vacuum.

(o) Cable boxes shall have sufficient space for segregating the cable cores and to give adequate clearance in air between bare conductors at the terminals. Cable boxes shall be complete with necessary cable lugs and armour grips.

(p) All auxiliary wiring from current transformers, winding temperature indicators, etc., shall be marshalled to a separate weatherproof and vermin proof marshalling box with an independent access cover.

(q) The marshalling box shall be complete with necessary cable glands and cable lugs. The marshalling box and components shall comply with the requirements specified for control cabinets indicated elsewhere in this specification.
10.4.3. Performance requirements:

(a) Transformers shall operate without injurious heating at the rated KVA at any voltage within \( \pm 10 \) percent of the rated voltage of that particular tap.

(b) Transformers shall be capable of delivering the rated current at a voltage equal to 105 percent of the rated voltage without exceeding the limiting temperature rise.

(c) Transformer for two or more limits of voltage or frequency or both shall deliver its rated KVA under all the rated conditions of voltage or frequency or both; provided an increase in voltage is not accompanied by a decrease in frequency.

(d) Transformers shall operate below the knee of the saturation curve at 110 percent voltage to preclude ferro-resonance and non-linear oscillations.

(e) Transformers shall be capable of operation continuously, in accordance with the applicable standard loading guide at their rated KVA and at any of the specified voltage ratios. Under these conditions, no limitations by terminal bushings, on-load tap changers or other auxiliary equipment shall apply.

(f) The neutral terminal of windings with star connection shall be designed for the highest over current that can flow through this winding.

(g) The transformers shall be designed with particular attention to the suppression of harmonic voltage, especially the third and fifth, so as to eliminate wave form distortion and any possibility of high frequency disturbances reaching a magnitude as to cause interference with communication circuits.

(h) The Project Engineer’s Representative reserves the right to reject the transformer if the same does not meet the specification requirement subject to tolerances as per IS: 2062. The rejected transformers shall be replaced by transformers complying with the requirements to this specification at the Concessionaire’s cost.

(i) If the commissioning of the project is likely to be delayed by the rejection of a transformer, as mentioned under h) above, the Project Engineer and Executing Agency’s Representative reserves the right to accept the rejected transformer until the replacement transformer is made available. Transporting the rejected and replacement transformers as well as installation and commissioning of both the transformers shall be at Concessionaire’s cost.

10.4.4. On Load Tap Changing Gear for transformer:
(a) The OLTC gear shall be designed to complete successfully tap changes for the maximum current to which transformer can be loaded, i.e. 150% of the rated current. Devices shall be incorporated to prevent tap change when the through current is in excess of the safe current that the tap changer can handle. The OLTC gear shall withstand through fault currents without injury.

(b) When a tap change has been commenced it shall be completed independently of the operation of the control relays and switches. Necessary safeguard shall be provided to allow for failure of auxiliary power supply or any other contingency, which may result in the tap changer movement not being completed once it is commenced.

(c) Oil in compartments, which contain the making and breaking contacts of the OLTC shall not mix with oil in other compartments of the OLTC or with transformer oil. Gases released from these compartments shall be conveyed by a pipe to a separate oil conservator or to a segregated compartment within the main transformer conservator. A Buchholz relay shall be installed in the above pipe. The conservator shall be provided with a prismatic oil level gauge.

(d) Oil, in compartments of OLTC which do not contain the make and break contacts, shall be maintained under conservator head by valved pipe connections. Any gas leaving these compartments shall pass through the Buchholz relay before entering the conservator.

(e) Oil filled compartments shall be provided with filling plug, drain valve with plug, air release vent, oil sampling device, inspection opening with gasketed and bolted cover with lifting handles.

(f) OLTC driving mechanism and its associated control equipment (Local) shall be mounted in an outdoor, weatherproof cabinet with IP 55 protection, which shall include:

- Driving motor (415V, 3-phase, 50 Hz, AC squirrel cage).
- Motor starting contactor with thermal overload relays, isolating switch and HRC fuses.
- Control switch: Raise / off / lower (spring return to normal type).
- Remote / local selector switch (maintained contact type).
- Mechanical tap position indicator showing rated tap voltage against each position and resettable maximum and minimum indicators.
- Limit switches to prevent motor over-travel in either direction and final mechanical stops.
- Brake or clutch to permit only one tap change at a time on manual operation.
- Emergency manual operating device (hand crank or head wheel).
- A five-digit operation counter.
Electricity interlocked reversing contactors (preferably also mechanically interlocked).

- 240V, 50 Hz, AC space heater with switch and HRC fuses.
- Interior lighting fixture with lamp door switch and HRC fuses.
- Gasketted and hinged door with locking arrangement.
- Terminal blocks, internal wiring, earthing terminals and cable glands for power and control cables.
- Necessary relays, contactors, current transformers etc.

(g) Control Requirements for OLTC:

The following electrical control features shall be provided:

- Positive completion of load current transfer, once a tap change has been initiated, without stopping on any intermediate position, even in case of failure of external power supply.
- Only one tap change from each tap change impulse even if the control switches or push button is maintained in the operated position.
- Cut-off of electrical control when manual control is resorted to cut-off of a counter impulse for a reverse tap change until the mechanism comes to rest and resets the circuits for a fresh operation.
- Cut-off of electrical control when it tends to operate the tap beyond its extreme position.

(h) Automatic Control of OLTC:

Automatic OLTC control shall include the following items:

- Voltage setting device
- Voltage sensing and voltage regulating devices
- Line drop compensator with adjustable R and X elements
- Timer 5-25 seconds for delaying the operation of the tap changer in the first step for every tap change operation
- Adjustable dead band for voltage variation

(i) OLTC panel:

The OLTC remote control equipment shall be suitable for 24 V DC supply and shall be housed in an indoor sheet steel cubicle to be located in a remote control room. The OLTC control panel shall comprise of rigid welded structural frames made of structural steel section or of pressed and formed cold rolled steel and frame enclosures, doors and partitions shall be of cold rolled steel of thickness 2 mm. Stiffeners shall be provided wherever necessary. All doors, removable covers and plate shall be gasketed all around
with neoprene gaskets. Panel shall be dust, weather and vermin proof providing degree of protection of IP 54, colour of finish shade for interior and exterior shall be glassy white and light grey semi glossy shade 631 of IS-5 respectively. Earthing bus shall be of 25 x 6 mm copper.

The panel shall consist of:

(i) Control Switch : Raise / Off / Lower (spring return to normal type)

(ii) Auto / manual selector switch (maintained contact type)

(iii) Tap position indicator

(iv) Facia type alarm annunciators with “accept” and “lamp test” facilities
   - Supply failure
   - Drive motor auto tripped
   - Tap change delayed

(v) Necessary auxiliary relays

(vi) Lamp indications for:
   - Tap change in progress
   - Lower limit reached
   - Upper limit reached

(vii) Cable glands for power and control cables

(viii) 240 V rated panel space heater with ON-OFF switch

(ix) Fluorescent type interior lighting fixture with lamp and door switch

(x) HRC fuses

(xi) Terminal blocks

(xii) Internal wiring

(xiii) Earthing terminal

10.4.5. Fittings and accessories:
The following fittings and accessories shall be provided with transformer:

(a) Inspection manhole in the cover

(b) Lifting lugs for both the transformer and the core

(c) Two earthing terminals on opposite ends of the transformer tank

(d) Name plate, rating plate and diagram plate

(e) Detachable radiator banks, complete with top and bottom shut-off valves, air release plug, drain valve and lifting lugs, suitably located thermometer pockets for measuring inlet and outlet oil temperature and one grounding terminal for connection of grounding conductor. Fins of the radiators shall not have sharp edges but shall be rounded shape.

(f) Conservator, complete with filling plug, sump and drain valve, and a shut-off valve on the pipe connection between transformer tank and conservator, to permit removal of the conservator. The conservator shall be designed to maintain an oil seal through a temperature range of 100 degree C.

(g) Oil level indicator with minimum marking.

(h) Weather proof dehydrating breather with activated alumina or silicagel as the dehydrating agent.

(i) Magnetic type oil level gauge with low oil level alarm contact, mounted on the conservators with waterproof and dustproof terminal box.

(j) Gas detector relays with separate alarm and trip contacts complete with shut-off valves.

(k) Separate drain valve, oil sampling valve with plug and top filter valve shall be provided on the tank.

(l) Explosion vent with diaphragm for relieving pressure inside the transformer. The device shall be rain proof after operation. For transformers of 500 KVA and above an equaliser pipe connecting the pressure relief device to the conservator shall be supplied.

(m) Separately mounted, water proof and dustproof marshalling box housing the oil temperature indicator and winding temperature indicator with alarm and trip contacts and marshalling facilities for electrical devices mounted on transformer.

(n) For transformers rated 500 KVA and above, adequate number of air vents for reliving trapped air during oil filling and during maintenance.

(o) Thermometer pockets and sensing element mounted on the transformer tank cover for measuring top oil temperature.
(p) Four jacking pads for lifting the transformer with jacks.

(q) Pulling eyes and skids for the movement of the transformers.

(r) Bi-directional wheels for movement of the transformers.

(s) Accessories for clamping the wheel mounted transformer to the foundation in order to withstand earthquake forces with a seismic acceleration of 0.2 g.

(t) Noise level of transformers shall be less than 80 dB.

(u) Transformer shall be supplied complete with insulating oil required for first filling plus 10% excess oil.

10.4.6. Drawings and data

The following drawings shall be submitted for the Executing Agency’s approval:

(a) General outline drawing with binding dimensions and weights shall be submitted during design and detailed engineering stage.

(b) General outline drawings showing plan, front elevation, and side elevation, with all fittings and accessories, locating dimensions of cable entries, earthing terminals, foundation / floor fixing details, jacking pads and weights of the following:

- OLTC (Local and Remote) cabinets
- Marshalling box
- Cable boxes
- Disconnecting chambers

(c) Cable junction box details, mounting details, make and type number, current and voltage rating, creep age distances and principal characteristics.

(d) Rating and diagram plates

(e) OLTC cabinets: schematic circuit diagram and actual detailed wiring diagram giving terminal numbers within 5 months of award of Contract.

(f) Marshalling box terminal connections wiring diagram.

### 10.5. MV Panel Board / Switch Board construction

All MV and LV panel boards / switch boards, unless and mentioned otherwise, shall meet the following requirements.

**Type** : Floor mounting, free standing, single front, fully compartmentalized, totally enclosed, dust & vermin proof, modular in construction & fully extensible on either sides

**Conforming to** : IEC 60439

**Construction** :
- 2.00 mm thick for frames and other load bearing members
- 1.6 mm thick for doors and partitions
- 3.0 mm for gland plates & of non-metallic construction for termination of single core armoured cables

**Form of separation** : Form 3 B

**Bus bar configuration, MOC, busbar supports, busbar insulation, busbar compartments, cable alley and feeder compartments** :
- TPN bus bars with 50% neutral for all applications not involving harmonic loads and with 100% neutral for loads with harmonics.
- Risers (vertical busbars) shall have a continuous current rating at least 125% of combined feeder ratings of the particular vertical section.
- Completely enclosed busbar compartment running horizontally at the top / bottom as per actual panel configuration
- Completely enclosed compartments for vertical busbars.
- Individual feeder modules in multi-tier modular formation.
- Vertical cable alleys with removable gland plates at the bottom/ top
- Busbar supports- Non-hygrosopic / SMC/ DMC supports with anti-tracking design and strength to withstand the dynamic forces during short circuit current of appropriate value
- Busbar insulation – 1.1 kV grade Heat shrinkable colour coded
- Busbar connections- by using cadmium plated high tensile hardware

**Bus bar MOC and sizing** :
- MOC – High conductivity, high strength Aluminium alloy complying to requirements of Grade E 91E of IS 5082 (or) E.C
| Grade Copper |  
|---|---|
| ➢ All bus bars to be dimensioned considering the maximum permissible rise in temperature of 50 Degrees over ambient temperature under normal operating conditions. |

| Earth Bus |  
|---|---|
| ➢ Continuous Aluminium strip of adequate cross section to carry the fault current to be run inside each shipping section. |
| ➢ All compartment doors to be provided with insulated earth continuity conductors / jumper wires |

| Panel Height, Door and Shipping Sections |  
|---|---|
| ➢ Panel height shall generally not exceed 2100 mm including the bottom mounting channel. |
| ➢ The operating handle of the switchgear at the top most tier shall be not more than 1800 mm from FFL. |
| ➢ The operating handle of the switchgear at the lower most tier shall be not less than 300 mm from FFL |
| ➢ Panel doors (Front) – Hinged |
| ➢ Panel doors (rear) – Bolted |
| ➢ Bus bar chamber and cable chamber doors – Bolted |
| ➢ Gaskets – Continuous type of neoprene |
| ➢ Locks – Each compartment shall be with interlock to ensure that the doors do not open with switch ON. Interlock defeat also required to be provided |
| ➢ All switchgear compartments to be suitable for LOTO arrangement. |
| ➢ The panel shall generally be made in sections not exceeding 2.50 mtrs long for ease of handling and movement inside panel rooms. |

| Degree of Protection |  
|---|---|
| ➢ IP 42 for indoor panels |
| ➢ IP 54 for panels meant for use in dusty and humid operating environment |
| ➢ IP 65 for outdoor panels |

| Finish |  
|---|---|
| ➢ Powder coat finished as per IS 3618. |

| Cable Termination |  
|---|---|
| ➢ From top / bottom as per data sheet. |
| ➢ Shall be suitable for terminating the number of cable runs and the type of cable as per SLD / data sheet. |

| Wiring |  
|---|---|
| ➢ All control wiring (Other than CT circuit) to be done using 1.5 Sq.mm PVC insulated wires |
| ➢ All CT wiring shall be not less than 2.5 Sq.mm PVC insulated wires |

| Meters |  
|---|---|
| ➢ All MFM's / Ammeters / Voltmeters and other meters as called for in the SLD shall be suitable for flush mounting type on panel compartment doors and shall be digital versions with RS 485 communication feature. |

| Relays |  
|---|---|
| ➢ Shall be as per SLD / data sheet |
| **Control Supply** | ➢ Shall be derived using 415 / 110 V AC control transformer and with MCB protection on both primary and secondary side of the control transformer. |
| **Space Heaters** | ➢ All bus bar compartments shall be provided with space heater to prevent moisture condensation and maintain cubicle temperature 5 degree C above the ambient. The space heaters shall be located suitably and shall be controlled through thermostats with suitable setting with MCB. |
| **Indication lamps** | ➢ LED cluster type. The lamps shall have red, green, amber, Blue and white caps as applicable made out of temperature resistant prismatic glass. The lamp holders and caps shall be guaranteed for continuous operation of lamps without any damage. |
| **Control switches / Push button actuators** | ➢ Control and instrument selector switches shall be rotary type provided with escutcheon plates clearly marked to show operating position and suitable for semi-flush mounting with only the switch joint plate and operating handle projecting out. The connection shall be from the back. |
| **Legend plates / name plates / warning boards** | ➢ Each compartment of the PANEL / MDB / PDB / MCC/ PMCC shall be provided with a nameplate engraved with its designation. The nameplates shall be rear engraved perspex with white letters on black background. The name plate shall also indicate the rating of the switchgear, the equipment fed and its rated power (in kw or hp) ➢ Metallic nameplate shall be provided on any one side of the panel / switch board duly indicating as a minimum the name of the panel vendor, the P.O No. & date, the month & year of installation, ➢ Warning stickers with danger signage & text in trilingual (English / Hindi and Local language) red letters on white background shall be provided at appropriate locations. |
| **Mimic display** | ➢ The panel front facia shall be provided with mimic key SLD (either red painted or with red sticker) |

### 10.5.1. Control and switchgear specifications

- All control gear and switchgear shall be ROHS compliant
- All control and switchgear, unless and mentioned otherwise, shall meet the following requirements.

| **ACB** | ➢ EDO type |
| **Pole configuration** | ➢ As per equipment requirement |
| **Breaking Capacity** | ➢ As per system requirements |
| **Protection type** | ➢ O/L, S/C and E/F |
Accessories : UV, Earth Fault and Shunt release (two of the accessories as per data sheet)

Auxiliary contacts : 2 NO and 2 NC minimum

MCCB : Panel internal mounted with door mounted rotary handle operated type

Pole configuration : As per equipment requirement

Breaking Capacity : As per system requirements

Protection type : Thermal magnetic up to 250 Amps Microprocessor based for ratings 250 Amps and above

Cable termination : All MCCBs for terminating cables above 35 Sq.mm shall be with spreader links

Accessories : UV, Earth Fault & Shunt release (two of the accessories as per data sheet)

Auxiliary contacts : 2 NO and 2 NC minimum

MCCB : DIN rail mounted with dolly handle operated type

Pole configuration : As per requirement at individual facility

Breaking Capacity : As per requirement at individual facility

Protection : O/L & S/C

Cable termination : All MCBs for terminating cables above 16 Sq.mm shall be with spreader links

Fault Level : 10 kA for MCBs rated more than 25 Amps

Motor starter component rating : Based on Type-2 co-ordination charts

Motor starter type : Upto and including 10 HP – DOL

Above 10 HP and upto and including 30 HP – Star Delta starting

Above 30 HP and upto and including 50 HP – Soft start

Above 50 HP – VFD

Additional protection : Current sensing type single phase and phase reversal protection

Metering and CT : For motors upto 10 HP CT shall be provided in the centre phase complete with ammeter. For motors above 10 HP CT shall be provided in all three phases complete with ammeter and ammeter selector switch

Cable termination : All terminations for cables above 16 Sq.mm shall be with spreader links

Note: Apart from the above guidelines, the concessionaire shall consider VFD for various applications irrespective of their rating wherever the process/application warrants provision of such variable speed requirements.

10.5.2. Soft starters for LV motors

The soft starters shall comply with the requirements of IEC 60034, 60947 and IS 325 including those standards referred to therein.
Constructional and performance features

Motor soft starters shall be switched or electronic type.

Soft starter panel shall be indoor, metal clad with separate metal enclosed compartments for

a) control, metering and current transformers for differential protection, if specified
b) shorting (bypass) arrangement
c) bus bars
d) power cable terminations
e) push buttons with indicating lamps.

Soft starter shall achieve smooth starting by torque control for gradual acceleration of the drive thus preventing jerks and extending the life of equipment.

Starting current shall be limited to 2.5 to 3 times the rated current of the motor. The soft starter manufacturer shall co-ordinate with motor manufacturer for this purpose.

Separate removable gland plates shall be provided for power and control cables.

Each cubicle shall be fitted with a label in the front and rear of the cubicle, indicating the panel designation, rating and duty. Each relay, instrument, switch, fuse and other devices shall be provided with separate labels.

Necessary wiring diagram shall be provided considering starting interlock, trip circuit, starting and running mode signal.

It shall be possible to manually start the motor locally from the starter panel or in Auto mode through PLC.

10.5.3. Variable Frequency Drives (VFD)

AC induction motor in clear water pumping station for rural distribution shall be coupled with a Frequency drive of rating commensurate with the rated motor.

The Frequency drives shall be of Current Source Inverter Pulse Width Modulated (CSIPWM) with GTO/IGBT/IGCT/SGCT/DTC technologies or later version, which performs precise speed and torque control of standard squirrel cage motors with optimum efficiency. Each drive must have a soft starting feature and a by pass arrangement for DOL starting of motors. All frequency drives shall be suitable for data connectivity with PLC/SCADA system and shall have Ethernet TCP/IP suitable communication 99 port and protocol. The drives must be easily programmable. The drives shall be provided with surge protection, programmable lockable code. The Frequency drive shall have following characteristics:

- Accurate open loop torque control
- Torque step rise time typically less than 5 ms
- Speed control inaccuracy typically 0.1% to 0.5% of nominal speed
- 150% overload capacity for 60 second
- Total Harmonic distortion shall comply with the provisions of IEEE 519. Necessary metering, self-diagnostic arrangement (including display and alarm facilities) shall be provided for local/remote monitoring.

- Technical Parameters

  - Main connection
    - Voltage: 3 phase, 415 +/- 10% permitted tolerance
    - Frequency: 45 to 65 Hz, maximum rate of change 17%/s
    - Imbalance: Max. +/- 3% of nominal phase to phase input voltage
    - Fundamental Power factor: 0.97 (at nominal load)

  - Motor connection
    - Voltage: 3 phase, from 0 to applied incoming supply voltage, 3-phase symmetrical
    - Output Frequency: 0 to 250 Hz
    - Frequency Resolution: 0.01 Hz

  - Continuous Current: 1.0 * I2N(normal use)

  - Short Term Overload
    - Capacity (1min./10min)
    - I2max = 1.1 * I2N

  - Field Weakening point: 8 to 300 Hz

  - Acceleration Time: 0 to 1800 sec

  - Deceleration Time: 0 to 1800 sec

  - Efficiency: Min. 97% at nominal power level

  - Environment limits
    - Ambient temperature: 0 to 45 deg. Cent.

  - General Standard Control Connections or as per Process Requirement
    - 3 programmable differential analogue inputs (1 voltage signal, 2 current signals)
    - 7 programmable digital inputs
    - 2 programmables analogues outputs (current signal)
    - 3 programmable digital outputs (from C relays)
    - Power Torque Speed value must be configurable to the ethernet tcp/ip port for their remote data acquisition in PLC/SCADA. Optional analogue and digital extension modules can be added as well as a wide range of field bus adapters.

  - Protection
    - Over current
    - Short circuit at start-up
    - Input phase loss
- Output phase loss
- Motor overload
- Earth fault
- Overvoltage
- Undervoltage
- Over temperature
- Motor stall

- Application macros

The features a selection of built-in, pre-programmed application macros for configuration of inputs, outputs, signal processing and other parameters. It shall have interfacing facilities to communicate data to SCADA system. These include:

- FACTORY SETTING for basic industrial applications
- HAND/AUTO CONTROL for local and remote operation
- PID CONTROL for closed loop processes
- TORQUE CONTROL for process where torque control is required.
- SEQUENTIAL CONTROL for processes where torque control is required.
- USER MACRO 1 and 2 for user’s own parameter setting
- Comprehensive testing and diagnostic function

- Tests

- Each unit of Variable frequency drive shall be tested at the manufacturer’s work with the motor they have been assigned to work for at the STP(s)/FSTP(s)
- Test result must satisfy the efficiencies on various loads and at different frequency levels against their quoted values.

10.6. 1.1 kV XLPE cable

10.6.1. Scope

This part of the specification covers the requirements of design, manufacture, inspection, testing and supply at site of 1.1 kV grade XLPE power and control cables.

10.6.2. Standards

The 1.1 kV grade Power & Control Cables conform to the requirements of the latest Indian Standard Specifications including but not limited to the following:

<table>

</tbody>
</table>

10.6.3. General construction

The cables shall be suitable for laying in trays, trenches, ducts, conduits and buried underground installation with uncontrolled backfill and possibility of flooding by water. These shall have following constructional features.

All power and control cables for use on low voltage system shall be heavy of 1100 V grade with aluminium / copper conductor, XLPE insulated, PVC inner sheathed, armoured and overall PVC sheathed.

The construction of the conductors shall be SOLID for aluminium conductor cables up to 10 mm sq. and for copper conductor cables up to 2.5 mm sq. For cables above 10 mm sq. and for copper cables above 2.5 mm sq. the conductor shall be STRANDED. Conductors of nominal cross sectional area less than 10 sq.mm shall be circular only. Conductors of nominal cross...
section area 16 sq.mm and above may be circular or sector shaped.

The core insulation shall be with XLPE applied over the conductor by extrusion and shall conform to the IS 7098. Control cables having 6 cores & above shall be identified with prominent & indelible numerals on the outer surface of the insulation. Colour of the numbers shall be white with a spacing of maximum 500 mm between two consecutive numbers.

The inner sheath shall be applied over the laid-up cores by extrusion and shall be of PVC conforming to the requirements of type ST 2 PVC compound per IS 5831. The extruded inner sheath shall be of uniform thickness of size not less than 0.5 mm up to 16 sq.mm, 0.8 mm from 25 sq.mm upto 120 sq.mm and 1.0 mm above 120 sq.mm conductor size. Taped inner sheath shall also be acceptable.

For multi core cables, the armouring shall be by single round galvanized steel wires where the calculated diameter below armouring does not exceed 13 mm and galvanized steel strips where this dimension is greater than 13 mm. Requirement and methods of tests for armour material and uniformity of galvanization shall be as per IS 3975 and IS 2611.

The outer sheath for the cables shall be applied by extrusion and shall be of PVC compound and conforming to the requirements of type ST 2 compound per IS 5831. To protect the cables against rodent and termite attack, suitable chemicals shall be added into the PVC compound of the outer sheath.

The dimensions of the insulation, armour and outer sheath materials shall be governed by values given in IS 1554 (Part I).

10.6.4. Packing

The cables shall be supplied in standard drum lengths duly wound on non-returnable wooden drums.

Vendor shall ensure that the bending radii of cables are not less than 12 times their overall diameters when wound on drums. Both ends of the cables shall be sealed.

Following information shall be printed on the flange of each cable drum.
   a) Type
   b) Size
   c) Voltage grade
   d) Length in meters
   e) ISI Mark
   f) Gross weight
   g) Direction of rolling

10.7. Specification for power / lighting distribution boards
10.7.1. Scope

This part of the specification covers the requirements of design, manufacture, assembly, inspection, testing and delivery at site of Power/ Lighting Distribution Boards / Panels.

10.7.2. Standards

The Power / Lighting Distribution Boards shall conform to the requirements of the latest Indian Standard Specifications including but not limited to the following:

- **IS 13947**: Low Voltage Switchgear and Control gear
- **IS 11353**: Guide for Uniform System of marking and identification of conductors and apparatus
- **IS 2705**: Current Transformers
- **IS 8623**: Low voltage switchgear and control gear assemblies
- **IS 4237**: General requirements for switchgear and Control gear for voltages not exceeding 1000 V
- **IS 13032**: Miniature air-break circuit breakers for voltages not exceeding 1000 V
- **IS 13947**: Switches, disconnectors, air break Switch (Part 3) disconnectors and fuse combination units
- **IS 13703**: LV Fuses for voltages not exceeding 1000 V ac or 1500 V dc Part 1 General requirements
- **IS 1248**: Direct acting electrical instruments
- **IS 722**: AC Electricity Meters

10.7.3. Construction & component specification

The boards shall be sheet steel enclosed on all sides and shall be dust and vermin proof, providing a degree of protection equivalent to IP 54. The sheet steel used shall be 14/16 Gauge CRCA.

The distribution boards shall be provided with hinged doors for access to components. Doors shall be provided with gasket all around with neoprene gaskets.

The Power Distribution Boards (PDBs) / Lighting DB, shall be suitable for wall mounting. Cable entries to these boards for incoming as well as outgoing cables shall be from the Top. The bus bars of Power Distribution Boards (PDBs) / Lighting DB shall be of electrical grade Copper of adequate size. These shall be supported on SMC/ DMC/ Epoxy non-hygroscopic supports at suitable intervals to withstand the thermal and dynamic stresses developed due to short circuit current of 10KA for Power DBs & Lighting DB.

Internal Earth bus of adequate size of copper flat shall be provided extending through the entire length of the boards

10.7.4. Earth Leakage Circuit Breakers (ELCBs)
The ELCBs shall be designed to operate within 30 milliseconds to provide effective protection against electrocution risks and fires caused by earth leakage faults of 30 mA and above. All parts of the switching mechanism shall be of non-corroding self-lubricating material thus providing consistent and trouble free services. These shall have short circuit withstand capacity of 10 KA.

10.7.5. Miniature Circuit Breakers

These shall be hand operated type. The miniature circuit breaker shall incorporate thermal overload and magnetic short circuit tripping devices. These shall have short circuit withstand capacity of 10 KA.

Provide positive ‘ON’ locking devices for miniature circuit breakers supplying power to corridor lights, night lights and other circuits requiring continuous supply.

Provide a neatly typed directory on each panel, listing the locations of devices and equipment served by each circuit, mounted on the inside of the front cover in a frame with hard transparent shield.

10.7.6. Internal wiring

The boards/panels shall be supplied completely wired, ready for the external connections at the terminal blocks. Wiring shall be carried out with 1100V grade PVC insulated, stranded copper conductor of adequate size (min. 2.5 mm sq.) Identification ferrules shall be provided to correspond with wiring diagrams. All wiring shall be terminated on terminal block. Terminals of Power Distribution Boards / Lighting DB shall covered terminals.

10.7.7. Painting

Sheet metal work of the Boards / Panels shall undergo a thorough surface treatment comprising rust removal, degreasing, pickling and phosphating prior to painting. The pre-treated boards/panels shall be painted/ Powder coated with two coats of suitable primer and finished with two coats of Power coated of approved shade as per IS-5.

10.8. Specification for cable carrier / cable containment system and accessories

10.8.1. Scope

This part of the specification covers the requirements of design, manufacture, assembly, inspection, testing and delivery at site of cable carrier / cable containment system with accessories.

10.8.2. Standards
The Cable carrier system with accessories shall conform to the requirements of the latest Indian Standard Specifications including but not limited to the following:

<table>
<thead>
<tr>
<th>IS</th>
<th>Description</th>

</tr>
<tr>
<td>1663</td>
<td>Method for tensile testing of steel sheet &amp; strip of thickness 0.5 mm to 3 mm</td>
</tr>
</tbody>
</table>

10.8.3. Construction

Cable carries, fittings and accessories shall be fabricated out of rolled Mild Steel sheets free from flaws such as laminations, rolling marks, pitting etc. conforming relevant codes.

Minimum thickness of Mild Steel sheets used for fabrication of cable carries and fittings shall be 1.60 mm up to 450 mm wide trays and 2.0 mm above 450 mm wide trays. The thickness of side coupler plates shall be minimum 3 mm.

All accessories like bends, reducers, tees, crosses coupler plates, etc., shall be pre-fabricated and not fabricated at site.

Structural supports shall be made out of Mild steel with hot dip galvanized of adequate size and load carrying capacity.

Structural supports shall be located appropriately and the distance between any two supports shall not be more than 1500 mm.

In RCC trenches, the cable carriers shall be of cantilever construction and erected with anchor fasteners / insert plate with adequate load carrying capacity. Fittings like bends, reducers, tees, crosses, etc. accessories like side coupler plates etc. and hardware GI bolts, nuts, springs, washers as may be required shall be treated as part of the supply item.

In masonry brick work the cable carrier support shall be grouted adequately with appropriate supports using cement mortar.

In vertical sections the cable carriers shall be of ladder / perforated construction with one or multi tiers complete with matching fittings like bends, reducers, tees, crosses etc., accessories like side coupler plat etc. and hardware GI bolts, nuts, springs, washers, etc. as may be required.

The standard length of each size and type of cable tray / ladder shall be not more than 2.5 metre.
10.8.4. **Support system for cable carriers**

The support system shall be fabricated from standard structural steel members. The cable carriers and support system shall be hot dip galvanized.

10.8.5. **Galvanizing**

Galvanising of steel components and accessories shall conform to relevant code. The galvanising shall be uniform, clean, smooth, continuous and free from spots. Should the galvanizing of the samples be found defective, the entire batch steel shall have to be re-galvanised at Concessionaire's cost after pickling.

The amount of zinc deposit over threaded portion of bolts, nuts, screws and washers shall be as per relevant codes. The removal of extra zinc on threaded portion of components shall be carefully done to ensure that the threads have the required zinc coating on them.

The hot dip galvanized thickness shall not be less than 80 micron thickness.
Section – G5.2
Technical specification for Diesel generator set
Section G5.2: Technical specification for Diesel generator set

1. **General**

   1.1 **Scope of work**

   This specification covers the technical requirements and essential particulars for the Design, manufacture, supply, inspection, testing and commissioning of adequate size of Diesel Generator systems as covered in the specification documents and drawings. The Concessionaire shall demonstrate that the DG set satisfies the requirements of the specification and applicable codes.

2. **Diesel Generator**

   2.1 **Applicable codes and standards**

   2.1.1 The DG set shall conform to the latest editions of the codes and standards listed under Clause 2.1.2 below & other applicable standards. Nothing in this specification shall be construed to relieve the Concessionaire of this responsibility.

   2.1.2 The applicable Indian standards and codes shall be followed wherever applicable for the DG set. In all cases, the latest revision of the standards shall be referred to. In the event of conflict between any of these Specifications and the Codes referred, such specifications shall be defined, prepared by the Concessionaire and submitted to the Project Engineer for approval. The decision of Project Engineer in such case shall be final and binding on the Concessionaire. The following standards, unless otherwise specified herein, shall be referred to.

3. **Construction & component specification**

3.1 **Diesel Engine**

3.1.1 The diesel engines shall be approved make, suitable for Prime power rating, direct injection, four stroke, multi cylinder, water cooled through base mounted radiator, turbo charged, water cooled type operating, acoustic enclosure & capable of developing requisite BHP rating to drive the Alternator.

3.1.2 The engine shall be designed to operate at 50° C ambient temperature without any derating factor.

3.1.3 The engine & the governing system shall conform to class-A1 governing as per BS 5514 and shall be suitable for Prime power rating generating application. The unit shall be suitable for operation on High Speed Diesel Oil without any modifications.

3.1.4 The governing system of the engine shall be of the microprocessor based electronic type suitable to control frequency variation within +/-4% for a sudden load change up to 70% The governor shall ensure that the speed of the set is regulated within 1% of the nominal speed under normal operating conditions.

3.1.5 The engine shall be electric start and shall be suitable for battery assisted manual / auto / SCADA system starting. The design shall ensure that the starter will be automatically released when the engine picks up speed beyond 60% of the rated speed.
3.1.6 All moving parts of the engine and other associated equipment shall be provided with guards to prevent accidental contact. The guard shall be designed to facilitate easy removal and reinstallation.

3.1.7 The engine fitments shall include but not be limited to the following:

i) Flexible coupling and flywheel with guard
ii) Air inlet system with Dry type air filter with clogged condition indicator & turbo charger
iii) Fuel system complete with Fuel Pump, flexible hoses, primary & secondary fuel filters with service indicator and manual priming pump.
iv) Exhaust system with dry manifold and residential silencer.
v) Lube oil system with gear type oil pump, oil cooler, filter and crank case heater.
vi) Cooling system with engine coolant belt, fan, guard, radiator & low coolant level switch.

vii) 24V D.C. Starter and battery charging alternator with auto cut off.
viii) Acoustic enclosure suitable for outdoor operation.

4. Alternator

4.1 The Alternator shall be industrial type, 1500 RPM, 415V, 3 Phase, neutral, 50Hz, adequate size of DG set in KVA, 0.8PF, star connected, IP-23, horizontal foot mounted, continuous duty suitable for prime power alternator, double bearing, self-excited, self-regulated, brushless excitation machine with exciter and automatic voltage regulator (AVR). The exciter shall be rotating diode type and Class 'H' insulated. The exciter shall be capable of forcing the field for 3 seconds (or duration as specified in the data sheet) in the event of short circuit fault at generator terminal. The exciter should be capable of building up voltage from residual magnetism, protection against low speed operation & high motor starting capability. The rectifier shall have in built protection for over voltage and rate of rise of voltage. The generator shall have on line greasing facility with grease nipple & relief device. All other parameters shall be as specified in the data sheet and conforming to codes and standards specified in the data sheet or relevant standards.

4.2 Continuous damper winding fitted on each pole.

4.3 Thermistor for Hot spot detection with control unit for mounting in the control panel.

4.4 Terminal box with separately mounted adopter box having bus bars and flexible wiring between Alternator terminals and adopter box drawn in PVC covered metallic flexible conduit. The adopter box shall be suitable for terminating adequate size of 2 runs x 3½ core XLPE armoured Aluminium cable.
The Alternator shall further meet the following specification.

The alternator shall conform to IS 4722 / BS standards.

The alternator shall be suitable for 20% over speed for two minutes.

The alternator terminal voltage for any load variation should be maintained within +/-2%.

The transient and steady state frequency variation should be limited to +/-4% for sudden load variation up to 70%. The generator TVD for sudden load variation of 100% shall not be more than 15%.

Both ends of each phase winding shall be brought to the terminal box.

The alternator shall be capable of carrying 50% overload for a duration of one minute and 10% overload for one hour in 12 hours operation.

The alternator shall withstand a 3 phase short circuit at the terminals for a period of 3 seconds.

The total harmonic distortion shall not exceed 3% and the design shall permit up to 30% unbalance between phases while in operation.

The efficiency shall preferably not be less than 93% in the normal operating range of 50% to 100% loading.

5. **Acoustic enclosure**

5.1 The acoustic enclosure shall be of free standing, floor-mounting type integral with the DG set.

5.2 The enclosure shall be provided with rugged heavy-duty structural steel base frame with chequered plate flooring on which the DG set is to be mounted. The enclosure shall be prefabricated factory-built and modular in construction.

5.3 The enclosure shall consist of acoustically treated panels housed in rugged steel frames, which shall be bolted together to form the body of the enclosure.

5.4 Hinged doors shall be provided, on either side, which shall also be acoustically treated, thereby providing easy access to the DG set while minimizing the operating space requirements.

5.5 The construction of the acoustic enclosure shall be such that with both the acoustic doors open on the either side, full access is available to the engine and alternator.

5.6 Fresh air inlet into the system a parallel baffle air inlet silencer shall be provided. Additionally, to augment the fresh air inlet requirements, a forced air ventilation duct with associated silencer shall be provided above the alternator.

5.7 For hot air discharge, an acoustic discharge plenum shall be provided in front of the engine radiator, for discharge of hot air into the surroundings through a parallel baffle air outlet silencer. The enclosure shall have suitable openings in the roof module for exhaust piping.

5.8 The acoustic panels shall be filled with a special grade high-density mineral wool retained on the inside by perforated GI sheets specially designed for optimum sound attenuation.

5.9 The outer surface of the Acoustic Panels shall be fabricated of performed 16 G
corrugated CRCA sheet steel.

5.10 All structural members such as angles / channels used in the construction of the enclosure frame.

5.11 All materials used for Acoustic Enclosure shall be fire resistant / fire retardant grade.

5.12 The sheet steel treatment shall consist of degreasing, de-rusting and phosphating followed by two coats of zinc chromate primer, followed by two coats of Zinpholite surface for superior corrosion resistance and two coats of finish paint.

5.13 For effective Acoustic sealing, necessary gasket material shall be provided.

5.14 All hardware and fittings used shall be passivated with zinc.

5.15 With the above Enclosure, the sound pressure levels when measured at a distance of 1 meter outside the Acoustic Enclosure shall be confirming to the CPCB / Tamilnadu state Pollution control Board regulation.

5.16 It shall be ensured that at least 1000 mm (min.) clear space is available all around the Acoustic Enclosure to ensure free airflow for the Gen-set as required and to facilitate accessibility for generator operation and routine maintenance.

5.17 The enclosure shall be provided with suction fans to ensure that the adequate cooling and combustion air is made available to the engine and the temperature within the enclosure is limited to 5° C above ambient.

5.18 The fan shall be designed with sufficient static to draw the requisite quality of air from the duct provided for this purpose. Calculations shall be furnished to prove the adequacy of the ventilation system offered. The suction fans shall start automatically when the temperature in the enclosure reaches 40°C and shall continue to run for 5 to 10 minutes after the load is disconnected. A temperature controller shall be provided for this purpose housed in sheet steel enclosure.

5.19 Two light points controlled by a switch complete with 36W fluorescent Luminaries and lamps shall be provided. Provision shall also be made for fixing a heat detector inside the acoustic enclosure, which will be connected to the central fire alarm panel.

5.20 Necessary openings shall be made for the entry of power cable and control cables, fuel piping, exhaust piping, air inlet pipe etc.
5.21 With the installation of the acoustic enclosure, there shall not be any de-rating of the DG set. The maximum temperature of oil and water shall not exceed the limits prescribed by the manufacturer of the engine. The DG set shall give rated output continuously.

5.22 The ventilation system shall be designed to provide an adequate air volume whenever the DG set is in operation.

5.23 The ventilation fan shall be of the axial flow type designed to handle the static pressure estimated based on the inlet air duct size and length.

6. **Instrument / Control Panel**

6.1 Instrument / Control Panel shall have the Equipment’s / Instruments but not limited to the following

   a) Auto Start / Stop control
   b) Local / Remote / SCADA control
   c) MCCB / ACB for power control
   d) MCB for Control wiring
   e) Lube oil pressure
   f) Coolant temperature
   g) Low Coolant Level
   h) High Coolant Temperature
   i) Over Speed
   j) Engine start / stop key switch.
   k) D.C Voltage.
   l) Engine RPM
   m) Operating Hours Meter
   n) Over / Under Voltage
   o) Over Current
   p) Safety cutouts for low lube oil pressure high coolant temperature, over speed, emergency stop, low coolant level and fail to start
   q) Indications for the above safety cutouts
   r) Alternator Voltage and Amperage of all 3 phases
   s) Wiring harness using temperature resistant insulation and flexible copper conductor wires. The wiring should be clamped at regular intervals and terminated using lugs.
   t) Stainless steel flexible for engine exhaust
   u) Stop solenoid.
   v) Panel illuminating lights
   w) Emergency stop
x) DG set controller with RS 485 Communication / Equivalent port to communicate to SCADA system (supplied by others) to control / monitor critical and essential system.

7. **Accessories**

7.1 The following accessories shall be supplied with the DG set

a) Common base frame for the Engine and Alternator
b) Anti-vibration mounts of reputed make in requisite quantity
c) Protective guards for all rotating parts
d) 18 G galvanized sheet steel trays beneath the engine, day tank and overflow collection tank to collect the oil leakage

8. **Batteries**

8.1 The batteries shall be of heavy duty, high performance & rated for continuous duty.

8.2 Each battery shall be rated 24 V. The number and AH capacity shall be selected to suit the engine requirements.

8.3 Battery shall be suitable for six successive starting attempts each of 10 seconds duration with a gap of 5 seconds between successive starts.

8.4 The battery shall be supplied complete with electrolyte and accessories. The accessories shall include battery stand, battery leads with terminal ends, acrylic top cover and inter battery connectors. First charging of the batteries shall be included.

9. **Control cabling**

9.1 The cables shall comply with all currently applicable Indian Standards & IEC standards and the following specific standards and codes:

9.2 Copper/Aluminium control cables - PVC / XLPE insulated, PVC sheathed 650/1100V grade as per IS: 1554-I & IS: 7098 - I. Overall shielding if required with Aluminium Mylar tape with 100% coverage & 25% overlap on laid up cores for static noise reduction.

9.3 Flexible, chord cables and wiring cables - PVC insulated & sheathed upto 1100V as per IS: 694, single and multi core.

9.4 Coaxial cables - RG and UR series as specified and as per MIL-C-17 / Bs: 2316 / IS
5068/ Is 11967 and suitable for 50/75/100/125 ohms

9.5 Signal cables as per BS:5308, DIN VDE 0815 & 816, IS: 1554, IEC: 189

9.6 Conductor shall be stranded / solid, circular / shaped - electrical grade aluminium / copper as per IS: 8130 and IEC: 60228 / BS: 6360.

9.7 Cable Insulation as per IS: 5831 / IS: 7098 and BS: 6746 / BS: 5467 / IEC: 60502

9.8 Inner sheath & outer sheath shall be PVC / HR PVC / PVC FRLS / PVC FR as per ST 1 / ST 2 / IEC 754 Part1 / IEC 60332 Part I & III / IEEE-383 / ASTM 2843 & 2863, EIL Specs etc.

9.9 Armouring shall be G.S round wire / Flat strip or Aluminium wire / Flat strip over the inner sheath as per IS 3975

10. Receipt of material at site

All material loading, unloading, transportation, (shifting and storage, safe keeping) etc., is under the scope of DG vendor.

11. Testing, commissioning, training and approvals

Testing and commissioning shall be carried out based on the specifications, data sheets, BOQ and the latest requirements of the various statutory authorities.

After installation as per the final approved drawing, the site testing shall be carried out by the vendor as specified before commissioning the DG set system. After testing the entire system to the satisfaction of the Executing Agency and their represents.

A thorough training of the operation and maintenance procedures etc as required or necessary shall be given by the vendor to the Executing Agency’s representatives with appropriate write-ups and manuals / catalogues as reference for a minimum period of three months after handing over.

The documents / drawings required for obtaining the approval / sanction from the Electrical inspector, State Electricity board, State regulatory authority, Factory inspector, Pollution control board, Regulatory authority, and any other statutory agency appointed for the purpose by the state / central / municipal / local bodies shall be prepared by the DG set supplier.

12. Guarantee

The performance figures specified shall be guaranteed within the tolerance specified or as permitted by relevant standards. In case of failure of equipment to meet the guaranteed
performance, the Executing Agency reserves the right to reject the equipment. However, the Executing Agency also reserves the right to use the rejected equipment until new equipment meeting the guaranteed performance requirements is supplied by the vendor at no extra cost. If any equipment supplied by the vendor fails at site during erection, commissioning or service (within guarantee period), the vendor shall repair and put back into successful operation the failed equipment within the time frame and procedure of repair agreed with the Executing Agency depending on nature of failure at no extra cost to the purchaser. The guarantee period shall be as specified in the commercial terms and conditions.

13. **Bar chart / Network**

The Concessionaire to indicate following schedules:
- Manufacturing, Inspection & Testing at works
- Shipping
- Pre - commissioning / testing
- Commissioning
- Service kits with all filters and other consumables
- List of recommended spares for three years satisfactory operation.

14. **Documentation and drawing requirements:**

The following documents, drawings etc shall be submitted by the Concessionaire:

Data sheet / Compliance and guaranteed particulars statement.

DG layout plan showing all dimensions, including operational and maintenance clearances with sections as required. The plan should also indicate ventilation requirement, civil foundations, loading data, wall openings, etc. & generator earthing requirement.

Schematic diagram of control panel with accessories like AVR, AMF, and auxiliary power distribution details etc., along with cable schedule.

Terminal box drawing, literature, write-ups, description of DG set excitation system, voltage regulator, governor, & other auxiliaries, catalogues / brochures etc.

Component list with rating & ranges of all items

Single line diagram for the whole system - control and power

Technical specification sheet with brochures / catalogues and operational details for:

- DG sets
- Acoustic enclosure or Room sound proofing
o Detailed specification sheet for all auxiliary components giving material specifications, make/model, capacity, ratings etc.

15. Testing

The following tests shall be carried out at the manufacturer’s works and the test results submitted to the Executing Agency. The Executing Agency reserves the right to inspect the above tests or waive the inspection.

- Tests on engine
  - Engine starting time
  - 4 hour running at full load followed by 1 hour running at 110 % of load
  - Fuel consumption test:
    - One hour running at 100% load
    - One hour running at 75% load
    - One hour running at 50% load

- Testing arrangement
  - Arrangement for loading DG by: Vendor
  - Fuel charges for site testing by: Vendor

- Shop tests
  - All the tests required by the manufactures practice or by applicable standard during the manufacture stage.
  - Performance tests on the assembled diesel generator set. (With Voltage regulator)
  - Check of fuel consumption at different loads.
  - Measurement of Generator Winding Temperature after stabilized condition at 10 % overload.
  - Measurement of cooling water temperature of engine at 10% overload as above
  - Measurement of vibration
  - Measurement of sound level at 1 Meter Level and 10 Meter distance
  - Functional tests on fuel transfer pump.
  - Dielectric and insulation tests
  - Routine test on voltage regulator
  - Hydrostatic Pressure test on both fuel tanks (at 2 Bars)
  - Simulation of all protection
  - Simulation of mains failure and mains return
  - Load tests at 0.8 Power Factor
    - 2 Hour at 100 % rated load
- 1 Hour at 110 % rated load
- 1 Hour at 75 % rated load.
- 1 Hour at 50 % rated load.
  - Starting tests to show time of starting and load acceptance

16. **Inspection, operation, maintenance Manuals**

The supplier shall submit along with the delivery and/or on commissioning - as applicable, the Type & Routine test certificates / Guarantee certificates, etc.

17. **Make of DG set**
The concessionaire to decide and get approval from the Executing Agency

18. **Guaranteed technical particulars for DG SET**

**Note**
19. Earthing and lightning protection

19.1 General

The metallic body / enclosure of all electrical equipment shall be earthed with a minimum of 2 distinct earth connections of adequate size earth conductors.

Earthing shall be in conformation with IS 3043

19.2 Earth station

   o Pipe electrode earthing

   Earth electrode shall be of minimum 40 mm dia class “B” GI Pipe 3.0 m long with tapered bottom and with 12 mm dia holes at 75 mm c/c on all sides for bottom 2.0 m with top watering arrangement.

   o Plate electrode

   600 x 600 x 6 mm GI plates with 25 mm dia watering pipe with funnel buried at a depth of 2.5 m forms earth electrode. Earthing strip is directly brought to chamber/disconnecting link in protective pipe.

   Earth electrode shall be back filled with alternate layers of charcoal and salt are provided through out height of electrode with overall 300 mm cover

19.3 Inspection chamber

Brick masonry chamber of size 450 x 450 x 450 mm with heavy duty cast iron cover and frame with top at ground level are provided for watering arrangement.

19.4 Soil treatment
In case of rocky soil or hard murrum, soil resistance is very high. Hence, for getting lower resistivity values, the Concessionaire shall carry out artificial soil treatment to achieve the required level of lower resistance as per IS.

The earth resistance shall not exceed 1.0 ohms in any case. The Concessionaire shall provide additional earth pits to get the desired earth resistance value of 1.0 ohm.

19.5 Lightning protection

Lightning protection shall be in confirmation with IS/IEC : 62305.

The lightning protection to the buildings shall be effected by use of conventional vertical lightning air termination or horizontal faraday cage or by a combination of both. G.I tapes / strips or aluminium circular conductor shall be laid on all parapet walls and as down conductors.

Conventional spike type lightning arrestor shall be mounted at the highest point of the building and a supporting pole shall be used to achieve the desired height and angle of coverage.

The down conductors shall be brought down from parapet / terrace level to ground level duly ensuring that adequate side flashing distance is maintained between the down conductor and other metallic pipes, if any, running parallel from terrace to ground.

A Test and disconnecting link box shall be provided at a height of 1.0 mtr from G and the down conductor shall be terminated onto this link. Beyond this link 25 x 6 mm GI strip shall be run up to earth station.

Earth station for lightning protection system shall of 600 x 600 x 6 mm GI plate earthing.

19.6 Inspection and testing

The consultant and the representative of the Owner shall have free access to vendor’s works to inspect, expedite and witness shop tests. Any materials or works found to be defective or which does not meet the requirements of this specification will be rejected and shall be replaced at supplier’s cost. Purchaser reserves the right to carry out stage wise inspection.

All routine tests shall be carried out on the electrical equipment as per relevant Indian Standard Specifications. The delivery of the electrical equipment / electrical items shall be accompanied with copies of such routine test certificates clearly mentioning reference to the P.O No., Line item No. of P.O, quantity as per P.O, quantity inspected and passed, Governing IS for testing, test results and details of test equipment with their calibration details.
Section - G5.3
Erection, testing and commissioning
Section G5.3: Erection, testing and commissioning

1. Equipment installation, testing and commissioning

1.1 Installation of equipment

a) In accordance with the specific installation instructions, as shown in the Concessionaire’s drawings or as directed by the Executing Agency, the Concessionaire shall unload, erect, install, wire, test and place into use of all electrical equipment included in the contract. Equipment shall be installed in a neat, workmanlike manner so that it is level, plumb, square and properly aligned and oriented.

b) The Concessionaire shall furnish all supervision, labour, tools, equipment, rigging materials and incidental materials such as bolts, wedges, anchors, concrete inserts etc. required to completely install, test and adjust the equipment.

c) Drawings, instructions and recommendations shall be correctly followed in handling, settling, testing and commissioning of all equipment and care shall be exercised in handling to avoid distortion to stationary structures, the marring of finish, or damaging of delicate instruments or other electrical parts.

d) The Concessionaire shall erect and commission the equipment as per the instructions of the Executing Agency and shall extend all co-operation to him.

e) In case of any doubt / query as to correct interpretation of drawings or instructions, necessary clarification shall be obtained from the Executing Agency. The Concessionaire shall be held responsible for any damage to the equipment consequent to not following instructions correctly.

f) The Concessionaire shall move all equipment into the respective buildings through regular doors or floors openings provided specifically for the equipment. The Concessionaire shall make his own arrangement for lifting of equipment.

g) Where assemblies are supplied in more than one section, the Concessionaire shall make all necessary mechanical and electrical connections between sections including the connections between bus bars / wires. The Concessionaire shall also carry out the adjustments/alignments necessary for proper operation of the circuit breakers. All insulators and bushings shall be protected against damage during installation. Insulators or business chipped, cracked or damaged due to negligence or carelessness shall be replaced by the Concessionaire at his own expenses.
h) The Concessionaire shall take utmost care in handling instruments, relays and other delicate mechanisms. Wherever the instruments or relays are supplied separately, they shall be mounted only after the associated control panels have been erected and aligned. The blocking material/mechanism employed for the safe transit of the instruments and relays shall be removed after ensuring that the panels have been completely installed and no further movement of the same would be necessary. Any damage to relays and instruments shall be immediately reported to the Executing Agency.

i) Care shall be taken during handling on insulating oil to prevent ingress of moisture or foreign matter. In the testing, circulation, filtering, or otherwise handling of oil, rubber hose shall not be used. Circulation and filtering of oil, the heating of oil by regulated short-circuit current during drying runs and sampling and testing of oil shall be in accordance with the latest Code of Practice IS:10028 (Part II) shall be carried out.

j) Inspection, storage, installation, testing and commissioning of transformers shall be in accordance with the latest Indian Standard Code of Practice IS:10028. All commissioning tests as applicable, vide Appendix B of IS:10028 (Part II) shall be carried out.

k) Switchgear, relay and control panels shall be installed in accordance with the latest Indian Standard Code of Practice IS:10118. The switchgear panels shall be installed on finished surface or concrete or steel sills. The Concessionaire shall be required to install and align any channel sills which form part of the foundations. Tape or compound shall be applied where called for. The base of outdoor type units shall be sealed in approved manner to prevent ingress of moisture.

l) After installation of all power and control wiring, the Concessionaire shall perform operating tests on all switchgear and panels to verify the proper operation of switchgear/panels and the correctness of the interconnections between various items of equipment. This shall be done by applying normal AC or DC voltage to the circuits and operating the equipment. Megger tests for insulation, polarity installation tests shall be carried out by the Concessionaire who shall also make all necessary for proper functioning of the equipment.

m) Installation and testing of the battery and battery chargers shall be done in strict compliance with the applicable standards. Each cell shall be inspected for breakage and condition of cover seals as soon as received at site. The battery shall be set up on racks as soon as possible after receipt, utilizing lifting devices. The cells shall not be lifted by terminals. Contact surface of the battery terminals and inter cell connectors shall be cleaned, coated with protective grease and assembled. Each connection shall be properly tightened. Each cell shall be tested with an hydrometer and thermometer and the results logged. A freshening charge, if required, shall be added. When handed over to the Executing
Agency, the battery shall be fully charged and the electrolyte shall be at the full level of the specified specific gravity.

n) Equipment furnished with finished coats of paint shall be touched up by the Concessionaire if their surface is spoiled or marred while handling.

o) Foundation work and grouting-in of fixing bolts or channels for all transformer, switchgear, motors and control panels will be carried out by the Concessionaire.

1.1.1 Installation work for earthing and lightning protection system.

- The Concessionaire shall install aluminium / copper / steel conductors, braids, etc. required for the system and individual equipment earthing. All work such as cutting, bending, supporting, painting/coating, drilling, brazing/soldering/welding, clamping, bolting and connecting onto structures, equipment frames, terminals, rails or other devices shall be in the Concessionaire’s scope of work. All incidental hardware and consumables such as fixing cleats/clamps, anchor fasteners, lugs, bolts, nuts, washing, bituminous.

- The quantities, sizes, materials of earthing conductors and electrodes to be installed as per requirement. Routes of the conductors and locations of electrodes shall be as shown on the project drawings.

- The work of embedment of earthing conductor in RCC floors / walls along with provision of earth plate inserts / pads / earth risers shall be done by the Concessionaire when the floors are cast or during construction of walls. The Concessionaire’s scope of installation shall include laying the conductors in position with 50 mm concrete cover, making welded connections to inserts/pad/risers above the floor near the equipment. The embedded conductors shall be connected to reinforcing rods wherever necessary.

- If the tap connections (earthing leads) from the floor embedded main earthing grid to the equipment are more than 500 mm long then the same shall be embedded in floor by the Concessionaire where required, together with associated civil work such as excavation / chasing, concreting and surfacing, if not already done in the civil work. The concrete cover over the conductor shall not be less than 50 mm.

- Installation of earth conductors in outdoor areas, buried in ground, shall include excavation of earth upto 600 mm deep 450 mm wide, laying of conductors at 600 mm depth, brazing / welding as required, of main grid conductor joints as well as risers of length 500 mm above ground at required locations and then backfiring material to be placed over buried conductor shall be free from stones and other harmful mixtures. Backfill shall be placed in layers of 150 mm, uniformly spread along the ditch and tampered utilizing pneumatic
tampers or other approved means. If the excavated soil is found unsuitable for backfilling, the Concessionaire shall arrange for suitable material from outside.

- Installation of earth connection leads to equipment and risers on steel structures / walls shall include laying the conductors, welding / cleating at specified intervals, welding / brazing to the main earth grid risers, bolting at equipment terminals and coating welded / brazed joints by bitumen paint. Galvanized conductors shall be touched up with zinc rich paint where holes are drilled at site for bolting to equipment / structure.

- Electrodes shall be installed (a) directly in earth, or (b) in constructed earth pits and connected to main buried earth grid. The scope of work shall include excavation, construction of the earth pits including all materials required for construction of earth pits, placing the rod and fixing test links on those pipe / rod / plate electrodes in test pits and connecting to main earth conductors.

- Installation of lightning conductors on the roofs of buildings shall include laying, anchoring, fastening and cleating of horizontal conductors, grouting of vertical rods wherever necessary, laying fastening / cleating / welding of the down comers on the walls / columns of the building and connection to the test links to be provided above ground level.

- Installation of the test links shall include mounting of the same at specified height on wall / column by suitable brackets and connections of the test link to the earth electrode.

- Whenever main earthing conductor crosses cable trenches, they shall be buried below the trench floor.

- Suitable earth risers shall be provided above finished floor/ground level. If the equipment is not available at the time of laying of the main earth conductors, the minimum length of such riser inside the building shall be 200 mm and outdoors shall be 500 mm above ground level. The risers to be provided will be marked in project drawings.

- Earth leads and risers between equipment earthing terminal and the earthing grid shall follow as direct and short a path as possible.

- Wherever earthing conductors passes through walls galvanized iron sleeves shall be provided for the passage of earthing conductor. The pipe ends shall be sealed by the Concessionaire by suitable water proof compound.

1.1.2 Earthing connections

- All connections in the main earth conductors buried in earth/concrete and connection between main earthing conductor and earth leads shall be of welded type.
o Connection between earth leads and earthing terminal provided on the equipment shall be bolted type.
o All bimetallic connections shall be treated with suitable compound to prevent moisture ingressation.
o Metallic conduits and pipes shall be connected to the earthing system.
o Lightning protection system down conductors shall not be connected to other earthing conductors above ground level. Also no intermediate earthing connection shall be made to lightning arrester and transformer earthing leads which shall be directly connected to plate electrode.

1.1.3 Earth electrodes

o Electrodes shall as far practicable, be embedded below permanent moisture level.
o Test pits with concrete covers shall be provided for periodic testing of earth resistance. Installation of plate electrodes in test pits shall be suitable for watering. The necessary materials required for installation work shall also include civil work such as excavation and connection to main earth grid.
o Earth pits shall be treated with salt and charcoal.
o Soil, salt and charcoal placed around the electrode shall be finely graded, free from stones and other harmful mixtures. Backfill shall be placed in layers of 250 mm thick uniformly spread and compacted. If excavated soil is found unsuitable for backfilling, the Concessionaire shall arrange for a suitable soil from outside.

1.1.4 Lightning protection system

o The lightning protection of air termination rods and/or horizontal air termination conductors shall be fixed in such a way that they remain in their installed position even during severe weather conditions. The necessary accessories such as cleats, clamps, welding materials, bolts, nuts shall be supplied by the Concessionaire.
o Air termination system shall be connected to earthing system by down conductors. The down conductors shall follow a direct path to earth. There shall not be any sharp bends, turns and kinks in the down conductors.
o All joints in the down conductors shall be of welded type. All metallic structures within 2 metres of down conductors shall be bonded to lightening protection system.
o Every down conductor shall be provided with a ‘test link’ at about 1000 mm above ground level housed in a suitable G.I. enclosure made of adequate thickness steel sheet and hot-dip galvanised. The test joint shall be directly connected to the earthing system electrode.
o The lightning protection system shall not be in direct contact with underground metallic service ducts, cables, cable conduits and metal enclosures of electrical equipment. However, all metal projections, railings, vents, tanks, etc. above the roof shall be bonded together to form a part of roof grid.
1.2 Installation of cable racks and trays

a) Lines and grade for trays may be measured from building steel and finished floor elevations. Changes in line or grade, or the addition of offsets by means of cutting standard tray sections and inserting additional tray fittings to match with the existing arrangement shall be considered as a normal part of the work.

b) Where embedded steel inserts in concrete floors/walls for welding the supports for cable racks/trays are not available, Concessionaire shall provide suitable anchor fasteners at no extra cost.

c) Cable shall be clamped to the cable trays at regular intervals.

d) Flexible metallic conduits shall be used for termination of connection to equipment such as motors, limit switches and other apparatus.

1.3 Installation of cables

a) The Concessionaire shall install, test and commission the cables specified in the specification in accordance with drawings & instructions issued by the Executing Agency representative. Cables shall be laid directly buried in earth, on cable racks, in built-up trenches, on cable trays and supports, in conduits and ducts or bare on walls, ceiling etc. as per drawings. Concessionaire’s scope of work includes unloading, laying, fixing, jointing, bending and termination of the cables. The Concessionaire shall also supply the necessary materials and equipment required for jointing and termination of the cables.

b) All apparatus, connections and cable work shall be designed and arranged to minimise risk of fire and any damage which might be caused in the event of fire. Wherever cables pass through floor or wall openings or other partitions, suitable bushes of an approved type shall be supplied and put into position by the Concessionaire.

c) Standard cable grips and reels shall be utilised for cable pulling. If unduly difficult pulling occurs, the Concessionaire shall check the pull required and suspend pulling until further procedure has been approved by the Executing Agency. The maximum pull tension shall not exceed the recommended value for the cable measured by the tension dynamometer. In general, any lubricant that does not injure the overall covering and does not set up undesirable conditions of electrostatic stress or electrostatic charge may be used to assist in the pulling of insulated cables in conduits and ducts.

d) After pulling the cable, the Concessionaire shall record cable identification with date pulled neatly with waterproof ink in linen tags. Identification tags shall be attached securely to each end of cable with non-corrosive wire. The said wire must be non-ferrous material on single conductor power cable. Tags shall further be attached at intervals on long runs of cables on cable trays and in pull boxes. Cables and joint markers and RCC warning covers shall be provided wherever required. All cables shall be allocated a unique number which shall be fixed to each end of the cable using
corrosion resistant label. Cable of different categories shall be tagged with the following
subscripts and three digit number.
- HV power          HV-P _____
- LV power          P _____
- Control           C _____
- Instrumentation I _____
- Protection        PR_____
- Telecommunication T_______

e) Sharp bending and kinking of cables shall be avoided. The bending radii for various
types of cables shall not be less than those specified below:
- KV XLPE multicore armoured cables: 15 times the overall dia of the cable
- 650 / 1100 V PVC insulated armoured cables: 12 times the overall dia of the cable

If shorter radius appears necessary, no bend shall be made until clearance and
instructions have been received from the Executing Agency.

f) Power, control and instrumentation cables shall be laid in separate cable racks / rays.

g) Where groups of HV, LV and control cables are to be laid along the same route, suitable
barriers to segregate them physically shall be provided.

h) Cables of different categories shall be installed so as to maintain satisfactory clearances
for safety and in order to reduce the possibility of electrical interference. The following
table gives the distances in mm that shall be maintained between the different categories
/voltage grade of cable.

<table>

i) Where cables cross roads and water, oil, gas or sewage pipes, the cables shall be laid in
reinforced spun concrete or steel pipes. For road crossings the pipe for the cables shall
be buried at not less than one metre depth.

j) Cables laid in ground shall be laid on a 50 mm riddled earth bed. The cables shall then
be covered on top and at their sides with riddled earth of depth of about 150 mm. This is
then gently filled up to a depth of about 100 mm above the top of uppermost cable to
provide bedding for the protective cable covers which are placed centrally over the
cables. The protective cable covers for LV cables may be of earthenware and for HV
cables of reinforced concrete. The RCC covers shall have one hole at each end, to tie
them to each other with GI wires to prevent displacement. The trench is then backfilled
with the excavated soil and well rammed in successive layer of not more than 300 mm
depth, with the trenches being watered to improve consolidation wherever necessary. To
allow for subsidence, it is advisable to allow a crown of earth not less than 50 mm in the
centre and tapering towards the sides of the trench.

k) In each cable run some extra length shall be kept at a suitable point to enable one or two
straight through joints to be made, should the cable develop a fault at a latter date.

l) Cables on cable racks, on cable trays and conduits shall be formed to avoid bearing
against edges of trays, racks, conduits or their supports upon entering or leaving trays,
racks or conduits. Cables shall be racked or laid directly into cantilevered cable trays
where practicable, but in some cases it may be necessary that cables are pulled or
threaded into trays. To facilitate visual tracing, cables in tray shall be laid only in single
layers and unnecessary crossing of cables shall be avoided. Cables on trays shall finally
be clamped in an approved manner.

m) Cable splices will not be permitted except where permitted by the Executing Agency.
Splices shall be made by Concessionaire for each type of wire or cable in accordance
with the instructions issued by cable manufacturer’s and the Executing Agency. Before
splicing, insulated cables shall have conductor insulation stepped and bound or pencilled
for recommended distance back from splices to provide a long leakage path. After
splicing, insulation equal to that on the spliced conductors shall be applied at each
splice.

n) Jointing of cables shall be in accordance with relevant Indian Standard Code of Practice.
Materials and tools required for cable jointing work, including cold setting bituminous
compound shall be supplied by the Concessionaire. Cables shall be firmly clamped on
either side of a straight through joint at a distance of not more than 300 mm away from
the joints. Identification tags shall be provided at each joint at all cable terminations.

o) At cable terminal points where the conductor and cable insulation will be terminated,
termination shall be made in neat, workmanlike and approved manner by men
specialised in this class of work.

p) Control cable termination shall be made in accordance with wiring diagrams, using
colour codes established by the Executing Agency for the various control circuit, by
code marked wiring diagram.

q) When control cables are to be fanned out and cabled together with cord, the
Concessionaire shall make connections to terminal blocks, and test the equipment for
proper operation before cables are cabled together. If there is any question as to the
proper connection, the Concessionaire shall make a temporary connection with
sufficient length of cables so that the cable can be switched to another terminal without
splicing. After correct connections are established through operating the equipment,
cables shall be cut to their correct lengths, connected to terminals in the specified
manner, and corded together where necessary to hold them in place in a workmanlike manner.

r) Cable seals shall be examined to ascertain if they are intact and that cable ends are not damaged. If the seals are found to be broken the cable ends shall not be jointed until after due examination and testing by the Executing Agency. Before jointing is commenced, insulation resistance of both sections of cables to be jointed shall be checked by megger.

s) After installation and alignment of motors, the Concessionaire shall complete the conduit installation, including a section of flexible conduit between motor terminal box and trench/tray. The Concessionaire shall install and connect the power, control and heater supply cables as per equipment manufacturer’s drawings, if any.

t) For directly buried underground cables, Concessionaire shall install galvanised cast iron cable markers over ground, at all bends, loops, joints, crossing points and at every 25 meters interval on straight runs. The cable markers shall be anchored in the ground to a depth of minimum 500 mm. The cable markers for L.T. cables & HT cables shall be distinctly different in shape and marked as L.T. Cables and HT Cables as the case may be by 30 mm size letters.

1.4 Lighting system installation

This covers the requirements of installation of the following :-

a) Lighting fixtures complete with lamps and accessories
b) Main Lighting distribution board
c) Lighting panels
d) Receptacles and lighting control switches
e) Point wiring
f) Street lighting poles and flood light towers
g) Multicore cables for street and boundary lighting
h) Maintaining equipment/materials during storage and being responsible for the equipment/material until they are handed over to the Executing Agency.
i) Installation, testing and commissioning shall be carried out in accordance with the drawings and as stipulated in this specification.

1.4.1 Applicable standards

Electrical wiring installations (system voltage exceeding 650 V) : IS:732

Code of practice for interior illumination (Part-1) : IS:3646/BS:8206

Code of practice for street lighting installation : IS:1944
1.4.2 Lighting fixtures

a) The installation of lighting fixtures shall be based on the mounting arrangement shown in the drawings enclosed. Installation shall include all materials required to mount the fixtures in the manner as shown in the drawings. Installation of lighting fixtures shall include installation of control gear box wherever applicable.

b) Installation of receptacles and switches shall be carried out suitably as per the lighting layout drawings prepared by Concessionaire and approved by Executing Agency. Switch shall be mounted in flush with the front cover plate. Supply and installation of necessary hardware shall be included in the scope for installation of receptacles/switches.

c) Lighting distribution boards shall be installed at the location indicated in the layout drawings prepared by Concessionaire and approved by Executing Agency. Installation rates quoted for installation of lighting distribution boards shall include supply and installation of base channels, foundation bolts, etc.

d) Outdoor lighting distribution boards shall be installed on a concrete plinth. The top of plinth shall be 100 mm (min.) above the ground level. Construction of concrete plinth shall be included in the installation of outdoor lighting distribution board. Installation cost of lighting distribution board shall include installation of earthing conductor from LDB to the nearest earthing grid.

1.4.3 Point wiring

- Supply and installation of conduit point wiring

  - The point wiring shall include supply of necessary materials for the conduit wiring such as galvanised rigid steel conduit, galvanised M.S. fixing saddles with spacer plates, nylon/fibre plugs, galvanised M.S. fixing screws, 12 SWG galvanised steel earthing wire, PVC insulated copper or aluminium conductor wires, control switches and pulling, termination of the earthing/PVC insulated wires as required, installation of control switches, drilling holes in brick walls/RCC roof slabs for taking the wiring conduits and refinishing any other works/material necessary for making point wiring complete in all respects.
• Wires used for conduit point wiring of lighting fixtures/ceiling fans and receptacles shall be 1100 V grade, PVC insulated, single core, stranded copper conductor wires of sizes not less than 1.5 sq.mm and 2.5 sq.mm respectively. Wires shall conform to IS:694 and shall bear the ISI mark.

• Concessionaire shall take into consideration necessary galvanised MS fixing clamps when the wiring conduits are to be supported from steel roof truss/structural members.

➤ **Point wiring shall also include/hold good for the following:**

• Supply and installation of lighting control switches and switchboxes complete with fixing accessories.

• Drilling holes in brick/RCC wall & roof for taking cable or conduit, sealing and refinishing with cement plaster.

• Testing, commissioning and handing over the lighting system in commercial working condition.

➤ **Outdoor Lighting (Street and Flood Lighting)**

The following shall be deemed to be included as part of the installation work for outdoor lighting point wiring.

• Installation of multicore/single core cables between LDB and junction box mounted on street light pole/flood lighting tower, from junction box to metal enclosed control gear box.

• Supply and installation of crimping type cable lugs, double compression type cable glands at each junction box and fixture, termination and testing and commissioning of cables.

• Concessionaire’s scope shall also include excavation and preparation for buried cables. Supply and installation of route markers, supply and installation of HDPE pipes for road crossing shall also be included.

• Supply and installation of necessary cleating arrangement for cabling on flood light poles.
• Concessionaire shall provide necessary foundation for erecting street light pole/flood light tower and install the same. Concessionaire shall prepare foundation drawings with necessary details to Executing Agency for approval.

• Concessionaire shall plan and cut the cables in such a way that there is no wastage and no cable jointing is required in any run. However, should any joint become necessary, the same shall be provided by the Concessionaire and joint marker shall also be provided at no extra cost.

• Earthing of street light pole/flood light tower, lighting fixtures, control gear boxes, junction boxes, etc. are also included in the scope of installation. Concessionaire shall earth street light pole/flood light poles and junction box with 25 x 3 mm G.S. flat tap off from the 25 x 3 mm M.S. flat earthing grid along the street lighting included in the scope. The Concessionaire shall interconnect earthing grid to plant main earthing grid at first and last pole of each feeder circuit and at one intermediate pole.

➢ Installation of lighting poles & towers for outdoor lighting (Street and flood lighting)

• Work includes supply and installation of street light poles and flood light towers including associated junction boxes with fuses, links and terminals for junction boxes and junction boxes near each flood light fixtures.

• All street light poles and towers shall be painted with two coats of red oxide oil primer followed by two coats of aluminium alkyd paint.

➢ Installation of Lighting Distribution Board, Lighting Panels (AC & DC), 240 V, AC 1-Phase Distribution Boards

Installation of above items shall include necessary foundation channels, bolts/nuts, etc. for grouting lighting distribution boards, iron brackets/grouting brackets, bolts/nuts for wall/column mounted panels and associated civil works.

1.5 Point wiring

1.5.1 Wiring

a) Wiring shall be carried out strictly as per project drawings and technical specification. All exposed conduit wiring shall have provision for easy inspection. Exposed wiring when run along wall shall be as near the ceiling as possible. Where cable wiring is specified cable shall be cleated on to the wall as close to the ceiling as possible. In all types of wiring due consideration shall be given for neatness and appearance.
b) Wherever DC emergency lighting is provided, emergency lighting wires shall run in a separate conduit. Colour of the wires used shall be as follows; white for positive, black for negative.

c) Wherever lighting system has three phase distribution, separate conduits shall be used for different phases. For easy identification of phases and neutral wires, the following colour wires shall be used.

(i) R - Phase - Red  
(ii) Y - Phase - Yellow  
(iii) B - Phase - Blue  
(iv) Neutral - Black

d) There shall be a circuit breaker or a linked switch on each live conductor of supply mains at the point of entry. The wiring throughout the installation shall be such that there is no break in neutral wire in the form of switch or fuse unit.

e) Conductors not arranged for connection to the same system or supply different phases of the same supply, shall be kept apart throughout their entire run.

f) Receptacles and lighting fittings in general shall be fed from different circuits. Five amps receptacles for toilet or small rooms can be fed from the lighting circuit with proper isolating arrangement.

g) Each final sub-circuit from a lighting panel shall be controlled by a single pole switch connected to the live conductor.

h) For long conduit wiring runs, inspection/pull boxes shall be provided at intervals not exceeding 10 m. Such facilities shall also be provided at conduit bends.

1.5.2 General practices

a) All receptacles and switches to be installed in offices and control rooms shall be flush mounted within the wall and those in other areas shall be wall or column mounted.

b) Ceiling roses shall not embody fuse terminals as an integral part. For voltages exceeding 250 volts, a ceiling rose or any similar attachment shall not be used.

c) A socket outlet shall not embody fuse terminals as an integral part of it. The switch controlling the socket outlet shall be on the live side of the line.

d) All exposed metal parts of the plug, when the plug is in complete engagement with the socket outlet, shall be in effective electrical connection with the earthing pin.

1.5.3 Earthing
a) Exposed conduits and fittings shall be earthed by 12 SWG GI wires run along the length of the conduit and secured by means of suitable clamps efficiently fastened to conduit tip. To achieve perfect electrical continuity, the conduits shall be bonded effectively on either end of a coupling and other joints. In case of concealed wiring 1.5 / 2.5 sq.mm PVC insulated wire inside the conduit shall be used for earthing.

b) Conduits shall be earthed at the ends adjacent to switch boards at which they originate or otherwise at the earth clip, clamp or gland, in effective electrical contact with the conduit.

c) For outdoor lighting poles the earthing conductor shall be terminated upto the junction box on the pole and 12 SWG wire shall be taken up to the pole fitting.

1.6 Pre-Commissioning checks and commissioning

All checks and tests shall be as per the Manufacturer’s drawing manuals, relevant codes of installation and commissioning check lists as given below :-

a) Among other commissioning tests, the following shall be carried out at site after completion of installation. Concessionaire shall ensure to use calibrated test equipment having valid calibration test certificates from standard laboratories traceable to National Standards / International Standards. All tests to be carried out in the presence of Executing Agency.

(i) For Transformers

Dielectric strength of transformer oil. Operation of all protective equipment, voltage/turns ratio at all taps, winding resistance at all taps, vector group test, phase sequence test, buchholz relay operation (alarm and trip), OLTC control indicating and alarm circuits, lightning arrestor installation, test the bushing oil for dielectric strength.

(ii) For Switchgear

Power frequency high voltage test, operation tests.

(iii) For Relays

Check internal wiring, relay settings.

Satisfactory operation over their whole operating range by secondary injection. Check the minimum pick up voltage of D.C. coils, megger all terminals to body and AC to DC terminals.

(iv) Relay and Control Panel

Switch development, check on relays, check on metres, functional checking of all
control circuit, e.g. closing, tripping, control, interlock, supervision, and alarm circuits including proper functioning of the component equipment.

(v) **Circuit breakers**

Manual operation of breakers, power closing/opening operation manually and electrically, breaker closing and tripping time, trip free and anti pumping operation, control wiring for correctness of connections, continuity and IR value, electrical and mechanical interlocks, all functional checks on CTS, checks on spring charging motor.

(vi) **Battery**

Special gravity test, cell voltage check, capacity test as per IS, Initial charging cycle.

(vii) **Battery charger & D.C. Distribution Board**

Functional check of auxiliary devices such as alarms, indicating etc., measurement of voltage regulation.

(viii) **Voltage transformers**

Polarity test, ratio test on all cores, oil level and leakages, ‘Insulation resistance test’, earthing connection.

(ix) **Current Transformer**

Megger between windings and winding terminal to body, polarity test, capacitance and tan delta test.

(x) **Cables**

- All new cables shall be tested for its insulation strength before terminating / jointing. After terminating / jointing is completed of all L.V. (i.e. 650/1100V) cable shall be tested by 1000V megger. All H.T. Cables (i.e. 11 KV) shall be tested by 2500 V motor operated megger.

- Cable core shall be tested for

  - Continuity
  - Absence of cross phasing
  - Insulation resistance to earth
  - Insulation resistance between conductors

(xi) **Earthing and Lightning Protection System**
The Concessionaire shall ensure the continuity of all conductors and joints. The Executing Agency may ask for earth continuity tests earth resistance measurements and other tests which in his opinion are necessary to prove that the system is in accordance with design, specification, code of practice and electricity rules. Earth resistance value should be not greater than one (1) ohm.

(xii) Lighting System

Before putting complete system into service, commissioning tests stipulated in applicable standards and code of practice shall be carried out by the Concessionaire in the presence of the Executing Agency covering all lighting system equipment.

(xiii) The Concessionaire shall carry out insulation resistance tests by megger of following rating:

- Control circuits upto 220 V : 500 V megger
- Power circuits upto 1.1 KV : 1000 V megger

1.7 Safety procedure and practice

Following safety procedure and practice should be provided by concessionaire in switchgear room/sub-station as per latest edition of I.S. 5216.

a) Rubber matting

(i) In front of 11 KV switchgear.
(ii) In front of 415 V switchgear and other panel in switchgear room.

b) Shock treatment charts

(i) One chart near 11 KV switchgear room
(ii) One chart near 415 V switchgear room

c) Caution/Danger Board

(i) 11 KV switchgear
(ii) 11 KV capacitor panel
(iii) 415 V switchgear
(iv) Transformer near H.T. cable box
(v) All power Distribution Board

d) Fire Safety

The requirement of hand appliance in switchgear room, electrical equipment room shall be
Section - G5.4
Instrumentation Works
Section G5.4: Instrumentation Works

1. General

The Concessionaire is required to adopt the latest technology with compatible automation system having fully automatic process control. The “Plant Control Configuration” to be provided by the Concessionaire as part of Basic engineering package. ON LINE to monitor and control the plant from a single location. The data collected through online monitoring shall be made available via the internet to authorities & officials in Executing agency, {NATIONAL/STATE LEVEL AGENCY IF ANY}\(^{161}\), CPCB, SPCB, ULB and Project Engineer.

2. General requirements

This part covers the general requirements for the design, supply, installation, inspection and testing of the instrumentation and automation solution proposed for flow measurement, monitoring of water quality and control of plant.

3. Reference Standards

Unless otherwise approved, instrumentation shall comply with relevant quality standards test procedures and codes of practice collectively referred to as Reference Standards including those listed below in accordance with the requirements detailed elsewhere in this specification. IEC 60381-1:1982 Analogue signals for process control systems.

4. Specification for direct current signals:

- IS 15953 : 2011
- ISA-5.1-2009
- IEC 62443
- IEC 61346
- IEC 60870-6- all parts
- IEC 61131-3 industrial control programming standard advancements
- IEC 61850 all parts ranging from 1 - 10
- IEC 61850-10:2012 - Conformance testing 118
- IEC TR 61850-90-3:2016 - Using IEC 61850 for condition monitoring diagnosis and analysis + IEC TR 61850-90 all parts

o Installation works shall comply with all relevant local Indian Regulations including the Code of Practice for Electrical Wiring Installations – IS 732.

8. Basic Features

Each instrumentation system shall be designed, manufactured and installed to achieve the following basic requirements:

o To maintain the highest standards of availability, reliability and accuracy and to give clear warnings of any deterioration in performance
o To suit the abilities of the staff who will:
  (i) Use the systems
  (ii) Service the systems
o To measure, indicate, process, store and control the relevant parameters, as specified
o To give clear warnings of dangerous and other abnormal conditions and to initiate plant safety procedures, shutdowns and corrective measures as specified to assure the safety of
‘operations and maintenance’ personnel and that of the plant and to store and collate the data, as required

- To derive, present and utilize, as required, such additional data to facilitate:
  
  1. The most efficient operation of the plant
  2. The routine maintenance of the plant

9. **Design requirements for instrumentation and control systems (I&C)**

The instrumentation, control and automation installations shall fully comply with design standards, regulations and the material and workmanship requirements of the Specification. The instrumentation control and automation systems shall comply with the relevant Indian Standards being practiced as per the industry norms. All consumable items and spare parts shall be readily available within India.

All equipment and materials incorporated in the system shall be selected, designed and rated to operate under the defined performance duties and specified site conditions and to maintain a high level of operational reliability. The instrumentation control and monitoring system equipment and materials shall have an operational life of not less than 15 years.

Unless otherwise specified, all functions shall be transmitted electrically and all analogue signal transmission systems shall be in accordance with IEC 60381-1:1982 or equivalent and shall use a signal of 4mA to 20mA dc. Where possible, measuring systems shall be designed so that any necessary power supply is taken from the appropriate instrument panel. Transmitting devices shall have integral indicators to monitor the output signal or connections suitable for use with a portable test meter, and shall be capable of meeting the requirements specified in the appropriate part of IEC 60770-1:1999 or equivalent. Equipment mounted in enclosures shall be suitable for continuous operation at the maximum internal temperature possible in service, due account being taken of internally-generated heat and heat dissipated by other plant. All components shall be rated adequately and circuits shall be designed so that change of component characteristics within the manufacturers’ tolerances shall not affect the performance of plant. All equipment shall be designed to operate without forced (or fan) cooling.

All measuring instruments shall have zero and span adjustment. Instruments not mounted in panels shall be supplied complete with all brackets, stands, supporting steelwork and weatherproof enclosures (separate from the instrument cases) necessary for securing them in their working positions and affording complete protection at all times including periods of servicing, adjustment, calibration and maintenance. The installation arrangements for meters measuring conductivity, pH, dissolved oxygen, chlorine residual and ionic concentration shall include a sample bench and other facilities for operating portable test meters. Each installation shall incorporate a valve and pipework for obtaining a sample representative of the fluid at the position of the permanent meter, tundish and drain. If the measuring and sampling points are remote from each other, the test and sample facilities shall be provided at both points. Sample transport times shall be minimized by provision of a bypass and drain with control and isolating valves and a local flow meter to enable the correct sample flow to be adjusted. An automatic portable sampler shall be provided for collecting and transporting the samples from the sampling locations to the laboratory.
10. **Instrument Design Criteria**

The design criteria to be applied to instrumentation system shall be as follows:

- Instrumentation & Control (I&C) systems shall be selected, designed, manufactured, installed, tested and rated to operate under the defined performance duties and specified site conditions and to maintain a high level of operational reliability. Instruments mounted in field and on panels shall be suitable for continuous real time operation. All electronic components shall be adequately rated and circuits shall be designed so that change of component characteristics shall not affect the plant operation. All I&C equipment shall be new, of proven design, reputed make and have data logging facility. Unless otherwise specified, all instruments shall be tropicalized. The outdoor equipment shall be designed to withstand tropical rain and shall be suitable for the worst environmental operating conditions. Wherever necessary space heaters, heat dissipaters, dust and weather proof cabinets shall be provided. Instruments offered shall be complete with all the necessary mounting accessories & safety features.
- No custom made hybrid type integrated circuits shall be used in any circuit in instrumentation and control equipment.
- Instruments and loggers provided shall be able to carry out continuous real time monitoring and logging of selected water quality parameters.
- All instrumentation shall be suitable for continuous real time operation and be powered through the UPS.
- The signal/data from all field mounted instruments and skid mounted instruments shall be transmitted to the PLC through hardwired 4-20 mA / 0-10V DC linear having two/four wire system in the respective STP/FSTP/pumping stations/LS for local monitoring, control and automation.
- The signal/data transmission from RTUs to central control room shall be GPRS/GSM based and preferably supported with alternate land based fibre communication link. After a power failure, when power supply resumes, the instruments and associated equipment shall start working automatically.
- Unless otherwise specified, the normal working range of all indicating instruments shall be between 25% and 80% of the full scale range.
- The field instruments i.e. the instruments mounted outside the control panel shall be mounted at a convenient height of approximately 1.2 m above grade platform.
- Unless otherwise stated, field mounted electrical and electronic instruments shall be weatherproof to IP-65 or better.
- The instruments shall be designed to work at the ambient conditions of temperature, humidity, and contamination that may prevail at site. The instruments shall be given enough protection against corrosion. All wetted parts of instrument sensors shall be non – corrosive and suitable for use within sewerage environment.
The performance of all instruments shall be unaffected for the ±10% variation in supply voltage and ±5% variation in frequency simultaneously.

Unless otherwise specified, double compression glands shall be used for glanding the cable in field instruments and instrument control panel.

All digital outputs shall be volt free.

All probe type analyzers should be IP68 rated.

All displays shall be of the digital type with no moving parts and should utilize back lit liquid crystal diode LCD/ LED technology.

Instrumentation shall utilize solid state electronic technology and avoid the use where practical of any moving parts.

Minimum maintenance requirements. The instruments selected shall be rugged and not require any consumables / filling solutions. Systems should be able to work with minimum power requirements.

Lockable enclosure shall be provided for all the field mounted instruments.

All the instruments and cabinets shall have tag plates / name plates permanently attached to them.

All instruments to be used or installed within a corrosive sewerage environment shall be explosion proof and intrinsically safe.

The data obtained from the online quality monitoring system shall be conveyed back via suitable communications protocol, to web servers hosted by a service provider. The service provider shall have the data storage capacity for next 15 years.

Unless otherwise specified, all continuous online monitoring instruments shall be plug and play type.

Instrumentation system shall be provided to monitor the following parameters as required

- Online Continuous Dissolved Oxygen Measuring System
- Ultrasonic Level Measurement
- Ultrasonic Differential Level Measurement
- Flow Measurement Instrument at Parshall Flume
- Gas Flowmeter (Thermal Mass Flow Measurement System)
- Pressure Transmitter
- Continuous Online Total Suspended Solids Analyzer
- Continuous Online pH Measuring System
- Online Residual Chlorine Measuring System
- Conductivity Meter
- Ammonia Analyzer
- Alkalinity Analyzer
- Indicative BOD Analyzer
- Indicative COD Analyzer
- Indicative TOC Analyzer
- Measurement of CO₂, CH₄ and H₂S Gas Concentration
11. **Online Instruments**

The online measurement at Inlet and outlet for continuous monitoring of the raw and treated sewage/faecal sludge/septage characteristics are specified below. However Concessionaire shall provide additional instruments to support their design.

- At the Inlet Point and the Outlet Point –
  - Electro-Magnetic Flow Meter/ Ultrasonic Open Channel Flow Measurement
  - Continuous Online pH Measuring System
  - Continuous Online Total Suspended Solids Analyzer
  - Indicative TOC Analyzer
  - Total Phosphorus
  - Total Nitrogen Analyzer
  - Online Residual Chlorine Measuring System

Online instrument system shall have the ranges in accordance with CPCB “Guidelines for continuous monitoring for Effluents” and CPHEEO.

12. **Laboratory – Laboratory instruments and sampling system**

The laboratory shall be housed within the administrative building and shall be equipped with instruments, equipment, chemicals and other infrastructure that is necessary to perform the routine analysis for the parameters as detailed in “Table 2”. The equipment shall be supplied with all the accessories that are necessary to make the equipment functional for analyzing parameters and generating daily reports. In addition to these, Concessionaire shall also provide necessary chemicals, glassware and reagents required for sample testing in the laboratory along with calibration standards / solutions for calibrating the instruments.

The quality of the sewage/faecal sludge/septage entering, passing and leaving the treatment plant shall be monitored via online monitoring equipment as well as manual sampling systems and tested daily, at least from the following parameters:

<table>
<thead>
<tr>
<th>Sl. No</th>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>BOD</td>
</tr>
<tr>
<td>2</td>
<td>pH</td>
</tr>
</tbody>
</table>
Two portable samplers shall be provided to collect composite samples for monitoring from Inlet chamber for raw sewage/faecal sludge/septage and at outlet of STP(s)/FSTP(s).

The laboratory shall have the equipment, storage space and chemicals for all the chemical and bacteriological routine analyses. The area of laboratory shall be sufficient with sufficient length of working platforms and adequate no. of sinks. Area of laboratory shall be defined by Concessionaire as per the requirement of the Concession Agreement. At least the following equipment and all required laboratory chemicals / reagents given in Table 3 are to be provided by the Concessionaire within the scope of work and have to be replenished by him till the end of the O&M Period.

All lab based test instruments results shall be stored automatically and transferred to the PLC as well as web servers on real time basis for control and report applications.

13. **Online Instruments Specifications**
13.1. Flow measuring system

A. Electromagnetic flowmeter

Flow meters shall operate on the electromagnetic induction principle and shall consist of a measuring sensor and measuring transmitter complying with ISO 6817:1997. Measuring sensors shall have a full bore stainless steel metering tube and non-conductive, abrasion-resistant lining to suit the fluid being metered. The lining of material can be of polyurethane. No rubber lining will be allowed. The flow meter shall have flanged connection. Measuring sensors shall have factory sealed power and signal cables. Unless otherwise specified, the cable lengths shall be sufficient to permit termination external to the chamber, either at a junction box or at the measuring transmitter. Remote flow indicator cum integrator shall be provided on the control panel.

Measuring sensors installed within a chamber shall be suitable for indefinite submersion under a head of water equal to the chamber depth or 3 meters whichever is the greater. Measuring sensors shall be installed on a steel cradle or concrete plinth with upstream and downstream straight pipe lengths not less than those recommended by the manufacturer. When fitted in lined non-metallic or internally-coated pipe work, measuring sensors shall have an earthing electrode or corrosion resistant earthing rings. To ensure full electromagnetic compatibility the flow tube flanges and transmitter housing shall be connected earth.

Measuring sensors shall be bonded by tinned copper braid links at each end to the adjacent pipe work to ensure a good connection between the body and the metered liquid. Measuring sensors installed in a cathodic protected pipeline shall have isolation and bonding in accordance with the recommendations of the manufacturer. The measuring transmitter shall provide a precise current input to the field winding of the measuring sensor and shall convert the resultant signal from the electrodes to analogue and pulse outputs in accordance with IEC 60381-1:1982. The signal processing facilities of the converter shall ensure that the output signals are unaffected by interfering voltages, stratified flow, changes in fluid electrical conductivity within the limit stated, non-homogeneity of the fluid and the presence of ferrous particles. The zero and output signals shall be unaffected by partly-fouled electrodes.

The following measuring transmitter features shall be provided as a minimum:

- Measuring transmitter features:
  - Pulsed D.C. field excitation
  - Scaled pulse output for integration counter drive
  - Capability of bi-directional measurement with differing forward and reverse ranges and with local and remote indication of flow reversal
  - Contact operation at a programmable measured value
• Integral display of flow and integrated quantity
• Galvanic isolation between each output circuit and between the electrode circuit and output circuit
• Output circuit isolation from earth within the instrument but suitable for earthing at any point in the external circuit
• Key entry for basic parameters
• Commissioning and re-scaling to require no special programming knowledge
• Adjustable low flow cut-off

• Self-diagnosis
  • Continuously adjustable velocity and flow range settings
  • Terminals accommodated in a compartment separate from electronic components
  • Outputs including: analogue - 4-20mA
  • Pulse - two programmable outputs
  • Alarms - two outputs programmable for high/low
  • Flow, polarity, forward/reverse, instrument fault, liquid sensing fault condition including partially empty pipe

❖ Technical specifications

  o Measuring Principal : Electromagnetic
  o Type : Pulsed DC
  o Application : H2S laden atmosphere and other poisonous gases, Corrosive Waste Water Environment
  o Safety : Explosion Proof or Intrinsically Safe
  o Metering Tube : SS 304
  o Sensor Housing : SS 304 fully welded
  o Connection / Junction Box : SS 304
  o Lining Material : PTFE/Polyurethane
  o Range : As per site requirement
  o Accuracy : ± 0.5% of flow rate at maximum mean velocity of 1.5 to 3.0 m/sec
  o Electrode Type : Flush or bullet nose as recommended by the manufacturer
  o Earthing Ring/Electrode Material: Type 316 stainless steel
  o Protection Category
    a.) Sensor : IP-68
    b.) Transmitter / Controller : IP-65
  o Transmitter / Controller Type : Microprocessor Based
  o Display : Indicating and totalizing
    a.) Indicator : Digital 16-character display
    b.) Totalizer : Digital 16-character display
  o Mounting : Pipe, wall, panel
o Diagnostic : Inbuilt
o Power Supply : 230 V AC ± 10%, 50 Hz
o Analog Output : Isolated 4 – 20mA / 0-10VDC output based on the flow rate
o Zero & Span : Field Adjustable
o Turndown Ratio : Minimum of 10 to 1 when flow velocity at minimum flow is at least 0.3 metres per second
o Zero Stability Feature : Required to eliminate the need to stop flow to check zero alignment
o Pressure Loss : Very Low
o Removable Electrodes : Required
o Flange Material : Carbon steel, Epoxy Coated
o Empty Pipe Detection : Inbuilt
o Operating Temperature : 0 to 50°C
o Temperature Compensation: Inbuilt temperature sensors for automatic compensation for changes in air temperature
o Communication Protocol : Open Protocol like MODBUS, PROFIBUS, etc.

13.2. Level measuring system

13.2.1. Ultrasonic level meters

Ultrasonic level measuring devices applied for liquid level measurement shall comprise of level sensor / transducer, level transmitter, digital level indicator / remote indicator, control unit and any other items required to complete the level measuring system.

The transducer shall be suitable for flange or bracket mounting as required. To reduce the effect of sewage/faecal sludge/septage turbulence in wet wells / tanks, averaging facility should be provided in the transmitter unit for providing steady readings.

The design and application of the ultrasonic level measuring system shall take into account the vessel / sump / wet well / channel construction, the material, size, shape, environment, process fluid or material, the presence of foam, granules, size etc.

In case of ultrasonic level sensor, the installation shall avoid any degradation of instrument performance due to spurious reflections, absorption, sound velocity variations, sensor detection area, temperature fluctuations, specific gravity changes and condensation. For applications where spurious reflections are unavoidable the control unit shall be provided with facilities for spurious reflection rejection. If turbulence exists, shielding, stilling tubes or other measures shall be provided to avoid effects on the measurement.

❖ Technical specifications

o Measuring Principal : Ultrasonic
o Application: H₂S laden atmosphere and other poisonous gases, corrosive Waste Water Environment
o Safety: Explosion Proof or Intrinsically Safe
o Range: As required at site
o Accuracy: ± 0.25% of measured value or better
o Resolution: 2mm or 0.2 percent of range, whichever is greater
o Blanking Distance: As short as 0.3 meters
o Beam Angle: 12 degrees or less
o Temperature compensation: Integral
o Mounting
  a.) Sensor: Flange or bracket
  b.) Transmitter / Controller: Wall, Panel, Pole
o Protection Category
  a.) Sensor: IP-68
  b.) Transmitter / Controller: IP-66 (NEMA 4X)
o Transmitter / Controller Type: Microprocessor Based
o Diagnostic: Inbuilt
o Display: LCD with LED backlighting 130
o Power Supply: 230 V AC ± 10%, 50 Hz
o Analog Output: Isolated 4 – 20mA
o Relay Contacts: Minimum of 3 SPDT contacts
o Zero & Span: Field Adjustable
o Operating Temperature: 0 to 50°C
o Communication Protocol: Open Protocol like MODBUS, PROFIBUS, etc.
o Sensor Cable: Integral to sensor
o Cable Length: As per site requirement

13.2.2. Ultrasonic differential level measurement

The ultrasonic type differential level measuring system shall consist of ultrasonic type level sensors on upstream and downstream of screens, differential level computer / transmitter and indicator. The flow computer / transmitter shall be microprocessor based and shall have facility for programming (i.e. adjustment of set points) while the sensor shall be capable of adjustable datum setting facilities.

The differential level control shall be done by two ultrasonic sensors, one before and one after the screen to sense the differential level through the screen and give a signal to the control to start the screens operation as soon as a preset differential level is reached. After receiving the level signal the control shall start and operate the screen as long as the preset level difference appears.

- Technical specifications
Measuring Principal: Ultrasonic
Application: H2S laden atmosphere and other poisonous gases,
Corrosive Waste Water Environment
Safety: Explosion Proof or Intrinsically Safe
Range: As required at site
Accuracy: ± 0.25% of measured value or better
Resolution: 2mm or 0.2 percent of range, whichever is greater
Blanking Distance: As short as 0.3 meters
Beam Angle: 12 degrees or less
Temperature compensation: Inbuilt
Mounting
a.) Sensor: Flange or bracket
b.) Transmitter / Controller: Wall, Panel, Pole
Protection Category
a.) Sensor: IP-68
b.) Transmitter / Controller: IP-66 (NEMA 4X)
Transmitter / Controller Type: Microprocessor Based
Diagnostic: Inbuilt
Display: LCD with LED backlighting
Power Supply: 230 V AC ± 10%, 50 Hz
Analog Output: Isolated 4 – 20mA
Relay Contacts: Minimum of 3 SPDT contacts
Zero & Span: Field Adjustable
Operating Temperature: 0 to 50°C
Communication Protocol: Open Protocol like MODBUS, PROFIBUS, etc.
Sensor Cable: Integral to sensor
Cable Length: As per site requirement

13.3. Pressure measuring system – pressure transmitter

Pressure measuring system shall measure pressure and transmit signal proportional to pressure.

The system shall consist of a combined pressure transducer and transmitter, digital panel indicator, connecting pipe work, diaphragm seal and valves. Pressure measuring system shall be rugged in construction and shall be capable for withstanding surge pressures likely to occur in the monitored system. Pressure transmitters shall have over range protection up to 1.5 times the maximum line pressure and shall be capable of withstanding full line pressure on any side with the other side vented to atmosphere without damage or effect on the calibration. No plastic material shall be used in their construction. Internal parts shall be of stainless steel, bronze or approved corrosion-resistant material. Where necessary, a special diaphragm shall be used to segregate the corrosive fluid media. In ammonia applications, the diaphragm shall be in stainless steel. In chlorine applications, the diaphragm shall be in silver or tantalum. In Sulphur dioxide
applications, the diaphragm shall be in tantalum.

The zero and span of a pressure transmitter shall not change by more than ±0.1% of the span per °C change in ambient temperature. After application for 10 minutes of pressure at 130% of maximum pressure, the change in zero and span shall not exceed ±0.1% of the span. Pressure transmitters shall be protected to BS EN 60529:1992, IP 65 standard or higher. For transmitters installed in locations liable to flooding or underwater applications, they shall be to IP 68 standard and shall operate up to a maximum submergence of 20 meters of water.

Note: Explosion proof and intrinsically safe transmitters/instruments are required only for instruments/sensor/limit switches/solenoid valves located in the hazardous areas and not for instruments/sensor/limit switches/solenoid valves located in Safe Areas.

Instruments in hazardous area installation shall be intrinsically safe and in case of instruments where intrinsically safe option is unavailable, explosion proof shall be provided

Technical specifications

- Parts: Transmitter and communicator
- Type: Electronic variable capacitance; two-wire transmitter
- Application: H₂S laden atmosphere and other poisonous gases, Corrosive Waste Water Environment
- Safety: Explosion Proof or Intrinsically Safe
- Range: As required at site
- Accuracy: ± 0.25% of span or better
- Humidity: 0 to 100% relative humidity
- Damping: Fluid or electronic type with adjustment
- Indicator: LCD with LED backlighting
- Materials: Wetted parts including process flanges and drain / vent valves, Type 316 stainless steel otherwise specified
- Wetted O-Rings: Glass filled TFE, graphite filled PTFE, or Viton, unless otherwise specified
- Fill Fluid: Silicone
- Output: 4 – 20mA DC output proportional to the pressure range
- Mounting: Pipe or wall as specified. Provide stainless steel brackets with stainless steel bolts
- Housing: Modular with separate compartments for electronics and field wiring termination. Epoxy coated aluminium, unless otherwise specified
- Power Supply: 230 V AC ± 10%, 50 Hz
- Operating Temperature: 0 to 50°C
- Communication Protocol: Open Protocol like MODBUS, PROFIBUS, etc.
13.4. **Dissolved oxygen measuring system - DO analyzer**

DO analyzers shall be installed to continually record the dissolved oxygen level at every grid within each aeration basin. The primary sensing device used for the dissolved oxygen level measurement, shall be a sensing probe mounted within the aeration basin and connected to a controller for displaying and transmitting the results.

- **Technical specifications**
  - Measuring Principal: Optical
  - Application: H₂S laden atmosphere and other poisonous gases, Corrosive Waste Water Environment
  - Safety: Explosion Proof or Intrinsically Safe
  - Range: 0 to 20.0 ppm, 0 to 20.0 mg/L
  - Accuracy: ± 0.5% or better
  - Repeatability: ±0.5% of span
  - Sensitivity: ±0.5% of span
  - Pressure Limit: 4 - 6 bar
  - Temperature Indication: Inbuilt
  - Calibration Method: Air Calibration: One point, 100% water saturated air;
    Sample Calibration: Comparison to standard instrument, or comparison to Winkler Titration method
  - Cleaning: Air Blast Unit. Probe should be able to function with cleaning unit attached to it
  - Mounting
    a.) Sensor: Inside aeration basin at each grid
    b.) Transmitter / Controller: Wall, Panel, Pole
  - Protection Category
    a.) Sensor: IP-68 for Sensor
    b.) Transmitter / Controller: IP-66 (NEMA 4X)
  - Transmitter / Controller Type: Microprocessor Based
  - Diagnostic: Inbuilt
  - Display: LCD with LED backlighting
  - Power Supply: 230 V AC ± 10%, 50 Hz
  - Analog Output: Isolated 4 – 20mA
  - Relay Contacts: Minimum of 2 SPDT contacts 133
  - Operating Temperature: 0 to 50°C
  - Communication Protocol: Open Protocol like MODBUS, PROFIBUS, etc.
  - Sensor Cable: Integral to sensor
  - Cable Length: As per site requirement
13.5. Total Suspended Solids Measuring System - TSS Analyzer

- **Technical specifications**
  
  - Measuring Principal: Optical
  - Application: H₂S laden atmosphere and other poisonous gases, Corrosive Waste Water Environment
  - Safety: Explosion Proof or Intrinsically Safe
  - Range: 0 – 50 mg/l, 0 - 1000 mg/l, 0 – 5000 mg/l
  - Accuracy: <5% of reading or better
  - Pressure Limit: 6 bar
  - Flow Rate: Maximum 3m per second
  - Temperature Indication: Inbuilt
  - Calibration Method: Single point or two point
  - Cleaning: Inbuilt
  - Mounting
    a.) Sensor: Inside pipe / channel / tank
    b.) Transmitter / Controller: Wall, Panel, Pole
  - Protection Category
    a.) Sensor: IP-68 for Sensor
    b.) Transmitter / Controller: IP-66 (NEMA 4X)
  - Transmitter / Controller Type: Microprocessor Based
  - Diagnostic: Inbuilt
  - Display: LCD with LED backlighting
  - Power Supply: 230 V AC ± 10%, 50 Hz
  - Analog Output: Isolated 4 – 20mA
  - Relay Contacts: Minimum of 2 SPDT contacts
  - Operating Temperature: 0 to 50°C
  - Communication Protocol: Open Protocol like MODBUS, PROFIBUS, etc.
  - Sensor Cable: Integral to sensor
  - Cable Length: As per site requirement
  - pH Measuring System – pH Analyzer

13.6. pH measuring system- pH Analyzer

- **Technical specifications**
  
  - Measuring Principal: Combination / Differential Electrode
  - Application: H₂S laden atmosphere and other poisonous gases, Corrosive Waste Water Environment
  - Safety: Explosion Proof or Intrinsically Safe
  - Range: 0 - 12 pH
Accuracy : ±0.02 pH or better  
Repeatability : ±0.05 pH  
Sensitivity : ±0.01 pH  
Pressure Limit : 4 - 6 bar  
Flow Rate : Maximum 3m per second  
Temperature Indication : Inbuilt  
Temperature Compensation : Inbuilt automatic temperature compensation  
Temperature Accuracy : ±0.5 °C  
Calibration Method : Two point automatic, one point automatic, two point manual, one point manual  
Mounting  
  a.) Sensor : Inside pipe / channel / tank  
  b.) Transmitter / Controller : Wall, Panel, Pole  
Protection Category  
  For Transmitter / Controller : IP-66 (NEMA 4X)  
Transmitter / Controller Type : Microprocessor Based  
Diagnostic : Inbuilt  
Display : LCD with LED backlighting  
Power Supply : 230 V AC ± 10%, 50 Hz  
Analog Output : Isolated 4 – 20mA  
Relay Contacts : Minimum of 2 SPDT contacts  
Operating Temperature : 0 to 50°C  
Communication Protocol : Open Protocol like MODBUS, PROFIBUS, etc.  
Sensor Cable : Integral to sensor  
Cable Length : As per site requirement

13.7. Residual Chlorine Measuring System – Residual Chlorine Analyzer

- Technical specifications
  - Measuring Principal : Amperometric or DPD Colorimetric  
  - Application : H₂S laden atmosphere and other poisonous gases, Corrosive Waste Water Environment  
  - Safety : Explosion Proof or Intrinsically Safe  
  - Range : 0 – 10 ppm  
  - Accuracy : ±3% of the reference test or better  
  - Resolution : 0.001 ppm  
  - Repeatability : 30 ppb or 3%, whichever is greater  
  - pH : Automatic  
  - Temperature Compensation : Inbuilt temperature sensor  
  - Temperature Indication : Inbuilt
- Pressure Limit: 0.5 bar
- Flow Rate: Maximum 50 L/hour
- Calibration Method: 1-point or 2-point calibration
- Mounting: Wall, Panel
- Protection Category
  - a.) Sensor: IP-65
  - b.) Transmitter / Controller: IP-66 (NEMA 4X)
- Transmitter / Controller Type: Microprocessor Based
- Diagnostic: Inbuilt
- Display: LCD with LED backlighting
- Power Supply: 230 V AC ± 10%, 50 Hz
- Analog Output: Isolated 4–20 mA
- Relay Contacts: Minimum of 2 SPDT contacts
- Operating Temperature: 0 to 50°C
- Communication Protocol: Open Protocol like MODBUS, PROFIBUS, etc.
- Sensor Cable: Integral to sensor
- Cable Length: As per site requirement

13.8. Conductivity Measurement – Conductivity Analyzer

- Technical specifications
  - Application: H₂S laden atmosphere and other poisonous gases, Corrosive Waste Water Environment
  - Safety: Explosion Proof or Intrinsically Safe
  - Range: 0 - 1000 μS/cm
  - Accuracy: ±0.5% or better
  - Temperature Compensation: Inbuilt
  - Temperature Indication: Inbuilt
  - Pressure Limit: 6.9 bar
  - Flow Rate: Maximum 3m per second
  - Mounting
    - a.) Sensor: Inside pipe / channel / tank
    - b.) Transmitter / Controller: Wall, Panel, Pole
  - Protection Category
  - For Transmitter / Controller: IP-66 (NEMA 4X)
  - Transmitter / Controller Type: Microprocessor Based
  - Diagnostic: Inbuilt
  - Display: LCD with LED backlighting
  - Power Supply: 230 V AC ± 10%, 50 Hz
  - Analog Output: Isolated 4 – 20mA
  - Relay Contacts: Minimum of 2 SPDT contacts
Operating Temperature : 0 to 50°C
Communication Protocol : Open Protocol like MODBUS, PROFIBUS, etc.
Sensor Cable : Integral to sensor
Cable Length : As per site requirement

13.9. Ammonia Measurement - Ammonia Analyzer

Technical specifications

Application : H₂S laden atmosphere and other poisonous gases, Corrosive Waste Water Environment
Safety : Explosion Proof or Intrinsically Safe
Range : 0 – 5 mg/l, 0 - 50 mg/l
Accuracy : 3% ±1mg/l or better
Repeatability : 2% ±1mg/l or better
Flow Rate : Maximum 20 L/h
Cleaning : Automatic
Mounting
a.) Analyzer : Wall, Panel
b.) Transmitter / Controller : Wall, Panel, Pole
Protection Category
a.) Analyzer : IP-55 or better
b.) Transmitter / Controller : IP-66 or better
Transmitter / Controller Type : Microprocessor Based
Diagnostic : Inbuilt
Display : LCD with LED backlighting
Power Supply : 230 V AC ± 10%, 50 Hz
Analog Output : Isolated 4 – 20mA
Relay Contacts : Minimum of 2 SPDT contacts
Operating Temperature : 0 to 50°C
Communication Protocol : Open Protocol like MODBUS, PROFIBUS, etc.
Cable Length : As per site requirement

13.10. Alkalinity Measurement – Alkalinity Analyzer

Technical specifications

Application : H₂S laden atmosphere and other poisonous gases, Corrosive Waste Water Environment
Safety : Explosion Proof or Intrinsically Safe
Range : 0 – 500 mg/l
Accuracy : ±5% of reading or ±1.0 mg/L, whichever is greater
o Repeatability: ±3% of reading or ±0.6 mg/L, whichever is greater
o Pressure Limit: 2 bar
o Flow Rate: Maximum 2 L/m
o Mounting: Wall, Panel
o Protection Category: IP-66 (NEMA 4X)
o Power Supply: 230 V AC ± 10%, 50 Hz
o Analog Output: Isolated 4 – 20mA
o Relay Contacts: Minimum of 2 SPDT contacts
o Operating Temperature: 0 to 50°C
o Communication Protocol: Open Protocol like MODBUS, PROFIBUS, etc.

13.11. Total Nitrogen Measurement – Total Nitrogen Analyzer

❖ Technical specifications

o Measuring Principle: UV Absorption
o Application: H₂S laden atmosphere and other poisonous gases, Corrosive Waste Water Environment
o Safety: Explosion Proof or Intrinsically Safe
o Range: 0 – 30 mg/l, 0 - 80 mg/l
o Accuracy: ± 3% of mean + 0.5 mg/l
o Resolution: 0.1 mg/L
o Pressure Limit: 0.5 bar
o Cleaning: Automatic
o Mounting
  a.) Sensor: Inside pipe / channel / tank
  b.) Transmitter / Controller: Wall, Panel, Pole
o Protection Category
  a.) Sensor: IP-68
  b.) Transmitter / Controller: IP-66 (NEMA 4X)
  c.) Transmitter / Controller Type: Microprocessor Based
  d.) Diagnostic: Inbuilt
  e.) Display: LCD with LED backlitting
  f.) Power Supply: 230 V AC ± 10%, 50 Hz
  g.) Analog Output: Isolated 4 – 20 mA
  h.) Relay Contacts: Minimum of 2 SPDT contacts
  i.) Operating Temperature: 0 to 50°C
  j.) Communication Protocol: Open Protocol like MODBUS, PROFIBUS, etc.
  k.) Sensor Cable: Integral to sensor
  l.) Cable Length: As per site requirement

13.12. BOD Measurement – Indicative BOD Analyzer
Technical specifications

- Measuring Principle: UV Absorption
- Application: H₂S laden atmosphere and other poisonous gases,
- Corrosive Waste Water Environment
- Safety: Explosion Proof or Intrinsically Safe
- Range: 0 – 50 mg/l, 0 - 500 mg/l
- Accuracy: ± 5% or better
- Compensation: 550 nm
- Sample pH: 4.5 to 9 pH
- Pressure Limit: 0.5 bar
- Cleaning: Automatic 138
- Mounting
  - a.) Sensor: Inside pipe / channel / tank
  - b.) Transmitter / Controller: Wall, Panel, Pole
- Protection Category
  - a.) Sensor: IP-68
  - b.) Transmitter / Controller: IP-66 (NEMA 4X)
- Transmitter / Controller Type: Microprocessor Based
- Diagnostic: Inbuilt
- Display: LCD with LED backlighting
- Power Supply: 230 V AC ± 10%, 50 Hz
- Analog Output: Isolated 4 – 20mA
- Relay Contacts: Minimum of 2 SPDT contacts
- Operating Temperature: 0 to 50°C
- Communication Protocol: Open Protocol like MODBUS, PROFIBUS, etc.
- Sensor Cable: Integral to sensor
- Cable Length: As per site requirement

13.13. COD Measurement – Indicative COD Analyzer

- Measuring Principle: UV Absorption
- Application: H₂S laden atmosphere and other poisonous gases,
- Corrosive Waste Water Environment
- Safety: Explosion Proof or Intrinsically Safe
- Range: 0 – 250 mg/l, 0 - 1000 mg/l
- Accuracy: ± 5% or better
- Compensation: 550 nm
- Sample pH: 4.5 to 9 pH
- Pressure Limit: 0.5 bar
- Cleaning: Automatic
- Mounting
  a.) Sensor: Inside pipe / channel / tank
  b.) Transmitter / Controller: Wall, Panel, Pole
- Protection Category
  a.) Sensor: IP-55 or better
  b.) Transmitter / Controller: IP-55 or better
- Transmitter / Controller Type: Microprocessor Based
- Diagnostic: Inbuilt
- Display: LCD with LED backlighting
- Power Supply: 230 V AC ± 10%, 50 Hz
- Analog Output: Isolated 4 – 20mA
- Relay Contacts: Minimum of 2 SPDT contacts
- Operating Temperature: 0 to 50°C
- Communication Protocol: Open Protocol like MODBUS, PROFIBUS, etc.
- Sensor Cable: Integral to sensor
- Cable Length: As per site requirement

### 13.14. TOC Measurement – Indicative TOC Analyzer

- **Technical specifications**
  - Measuring Principle: UV Absorption / UV Pursulphate
  - Application: H₂S laden atmosphere and other poisonous gases,
  - Corrosive Waste Water Environment
  - Safety: Explosion Proof or Intrinsically Safe
  - Range: 0 - 1000 mg/l
  - Accuracy: ± 5% or better
  - Compensation: 550 nm
  - Sample pH: 4.5 to 9 pH
  - Pressure Limit: 0.5 bar
  - Mounting
    a.) Sensor: Inside pipe / channel / tank
    b.) Transmitter / Controller: Wall, Panel, Pole
  - Protection Category
    a.) Sensor: IP-55 or better
    b.) Transmitter / Controller: IP-55 or better
  - Transmitter / Controller Type: Microprocessor Based
  - Diagnostic: Inbuilt
14. Surge Protection Devices

Surge protection devices (SPDs) shall be suitable for withstanding the surge arising out of high energy static discharge / lighting strikes and protect the instrument to which it is connected against damage. SPDs shall provide protection through the use of quick acting semiconductors like Tranzorb, zener diodes, varistors and an automatic disconnect and reset circuit. SPDs shall be passive and shall require negligible power for operation. During the occurrence of a surge it shall clamp on the allowable voltage and pass the excess voltage to the ground. The SPD shall be self resetting to minimize the down time of the measurement loop.

SPDs shall be provided to protect devices transmitting and receiving analogue and digital signals derived from field devices located outdoors.

The surge protection device shall be rated for surge rating of 10kA.

15. Cabinets for field instruments

Wall mounted cabinets shall be provided for enclosing transducer unit and associated accessories which are mounted outside the main control panel. The cabinet shall be of die-cast aluminium; field provided not less than IP-65 protection and shall be lockable. The cabinet shall have facilities for earthing. A steel plate shall be provided inside the cabinet for mounting instrument and accessories.

16. Panel Details

16.1. Cabinet / Enclosure for Instruments

Enclosures shall be any form of board, cabinet, panel, desk, box or case used to protect, contain or group instrumentation, telemetry or control equipment. Cabinets shall be fabricated from cold rolled steel with powder coating sheet of minimum 2 mm thick and shall be suitable for wall mounting or pedestal mounting as required. A steel plate/pipe, as per the requirement, shall be provided in the cabinet for mounting the instrument and accessories. The cabinet shall be properly painted from inside and outside and shall have built in locking facility. The cabinet shall also be earthed properly. All equipment in or on enclosures shall be arranged logically and, as far as possible, symmetrically, with projections kept to a minimum. Each enclosure shall be designed on ergonomic principles and shall permit in-situ and safe access for any normal adjustment,
maintenance and servicing. The tops of plant-mounted enclosures shall be sloped downwards from front to rear.

The minimum degree of protection shall be IP 54 for indoor locations and enclosures for use outside buildings or in places where splashing may occur shall have a minimum rating of protection to BS EN 60529:1992, IP 65 and have tops which project sufficiently to protect the vertical faces of the enclosure and any component mounted thereon from splashing, inclement weather and direct sunlight. Also, when enclosures for use outside buildings are located where exposure to direct sunlight will give rise to high top-panel surface temperatures such that the internal temperature rises above the manufacturer’s recommendation (normally 40°C), the enclosure shall include a sun shield fitted to the top of the enclosure and should have sufficient air ventilation for heat dissipation.

Fixing arrangements for surface-mounting enclosures shall be external to the enclosure and shall ensure that the rear face of the enclosure is not in contact with the surface to which it is fixed.

Enclosures shall have hinged access doors, fitted with recessed lockable handles. Doors shall be of rigid construction and provided with close-fitting flexible seals in recesses to prevent the ingress of liquids, moisture, dust and vermin. Hinges shall be of the lift-off pattern and one hinge shall engage before the other for ease of fitting. Wherever necessary, removable access covers secured by quick-release fasteners shall be provided to ensure ease of maintenance for all installed apparatus. Mounting plates, brackets and racks shall be provided for all other internal equipment which shall be hinged or otherwise arranged with quick-release fasteners or captive screws to give quick and easy access to equipment, securing screws, terminals and wiring.

Enclosures for two or more devices with electrical circuits shall have gland plates and terminal blocks as specified elsewhere. Each enclosure shall be designed for the safe testing and servicing of equipment with the power on. Each part which may be live under any circumstances shall be so covered or shielded as to prevent inadvertent contact.

16.2. Panel Design and Construction

Unless otherwise specified, all instrument panels, instrument cubicles, control panels, control consoles and desks, associated equipment and terminal racks, telemetry and electronic equipment racks and the like shall be free-standing, floor-mounted units and shall conform to the requirements of this part and will hereafter be referred to as panels. The design and dimensions of control consoles and desks shall be determined according to their intended function but shall be in accordance with the requirements of the Specification drawings. The height shall not exceed 1400mm above the finished floor level.

Unless otherwise specified as per the approved Design and Drawings, the height of panels shall be not greater than 2130mm overall (excluding lifting devices) above finished floor level. Front-of-panel instruments and controls shall be mounted so that the height of their centers above the floor shall be generally between 1800mm and 900mm for indicators, 1400mm and 900mm for recorders and process controllers, 2000mm and 750mm for alarm facias and signal lamps and 1500mm and 750mm for manual controls. Controls, switches and push-buttons shall be positioned below or adjacent to any associated reading instrument. Panels for use in locations
such as pumping stations and machinery rooms shall have anti-vibration mountings. The clearance between the extremities of apparatus mounted on the internal walls shall allow safe and unobstructed access to all terminals and to parts requiring maintenance. Panel layout drawings shall normally include a list of all instruments, accessories and components contained therein. If the drawings have insufficient space for the list, a separate schedule of instruments, accessories and components shall be provided and the panel drawing shall contain a cross reference to the contents list and an indication of the panel location of each item on the list.

16.3. Panels - major

Panels shall be constructed generally as specified in the preceding clause and as shown in the Specification drawings. Panel material shall be prime-quality, cold-rolled and annealed mild steel or zinc-coated mild steel sheet, suitably braced and stiffened as necessary with flat bar or angle to form a rigid structure.

Panel fronts shall be flat and free from bow or ripple. Exterior corners and edges shall be rounded or welded and ground to give a smooth overall appearance. Flanged edges shall be straight and smooth. Materials shall be chosen with due regard to the panel size, number of cut-outs, instrument weight and position of centre of gravity and method of fabrication, with the following:

- minimum thicknesses
  - Instrument bearing surfaces, gland plates and pneumatic distribution plates: 3mm
  - Internal mounting plates: 3mm
  - Doors, covers and filler panels: 2mm

No design involving the use of externally-visible assembly or fixing bolts and screws nor any design resulting in dust or water-collecting crevices will be accepted. Stiffeners and supporting frameworks shall be provided where necessary inside panels. Framework shall be hinged or fixed, suitable for the installation of instruments, components and internal equipment for which it is provided and located to give easy access to adjacent equipment.

When a panel is constructed in sections, the sections shall be designed for ease of assembly during installation and, in any case, shall not exceed 2 m in length. All necessary nuts, bolts, washers and the like shall be supplied and included in the same shipment as the relevant sections. Sections exceeding 1 m in length shall be provided with double doors. Unless otherwise shown in the Specification drawings, each panel shall be mounted on a self-draining base frame fabricated from 150 mm deep, steel channel section which shall be drilled or provided with clamps for bolting to the floor. The base frame shall be set back from the panel front face to give a toe space of not less than 25mm. The outside of the base frame shall be covered with an approved kicking strip.

Ceiling and other filler panels shall be fabricated from sheet steel and adequately stiffened. Each section shall have 50 mm returned edges along all four sides and shall be braced to the main steelwork of the panel. A chequered plate floor shall be provided inside and above the level of the base frame, having openings suitable for the bottom entry of cables when applicable. Sufficient
removable undrilled gland plates, in sections convenient for handling, shall be fitted close to the appropriate terminal blocks and not less than 230 mm above the panel floor or not less than 230 mm below the panel top. The gland plates shall have removable side covers giving access to both sides of the gland plate and ensuring vermin-proof and dust-proof construction. Gland plates of a surface-mounted enclosure may form a part of the base or top. Panels containing pneumatic or other instruments using a fluid as the transmission medium shall have distribution plates with bulkhead unions for the termination of internal and external pipework.

All doors shall open outwards and all doors in one panel assembly shall use the same lock and key combination. Panel design shall ensure adequate ventilation and air circulation without permitting the entry of vermin or dust. Panels installed in control rooms or other clean condition areas shall have louvres to allow air circulation. Temporary closures shall be provided to prevent the entry of dust and vermin during transit and installation. After commissioning has been completed, all entries except air-circulation louvres shall be sealed.

No equipment other than front-of-panel items shall be mounted on panel wall surfaces. If electrical and non-electrical instruments are mounted in the same panel, the panel shall be subdivided internally to separate the electrical and non-electrical sections. All connections shall be arranged to ensure that no accidental damage to cabling or electrical components can occur in the event of failure of any non-electrical component or connection. Provision shall be made for safe and easy handling during transit and installation. If lifting eyes are provided, they shall be reversible and panel tops shall be reinforced where necessary.

Where equipment is specified to be installed at a future date, space shall be allocated, and cutouts with removable masking plates, brackets, supports, wiring, terminals and piping and the like shall be provided. Panels shall be finish-coated at the place of manufacture before commencing the installation of apparatus and other fittings.

16.4. Panels - Minor

Panels for installation on the Plant which contain relatively few items of equipment, or where so specified elsewhere, shall be provided as minor panels and shall be constructed generally as specified in the preceding clause and comply with this Clause. Panels shall be fabricated from sheet steel or other approved material less than 2.5mm thick suitably braced to form a robust and rigid structure. Exterior corners and edges shall be rounded to give a smooth overall appearance and assembly bolts, screws or rivets shall not be visible on the front face.

The design shall be such as to ensure adequate ventilation and air circulation where required, without permitting the entry of vermin. Openings for cables shall be made vermin-proof. Doors shall be hinged and shall be provided with close-fitting flexible seals in recesses to prevent the ingress of liquids, moisture, dust and vermin. Unless otherwise specified, panels shall be suitable for floor mounting and shall not exceed 2130mm in height. Where surface mounted panels are provided, the fixing shall prevent the ingress of moisture and the rear of the enclosure shall be not less than 10mm from the wall.

Lifting eyebolts shall be removed and replaced with bolts after installation. Panels shall be
extensible, and symmetrically arranged as far as possible with projections kept to a minimum. Where two or more panels are fitted together, they shall form a flush-fronted continuous panel of uniform height. Front door and top cover dimensions shall match. Instruments, relays, and control devices shall be mounted at a height not more than 2000mm and not less than 300mm from floor level.

The arrangement of equipment within each enclosure shall be such as to permit easy access for installation and maintenance. No instruments, relays or other components shall be mounted on rear access doors or removable covers.

16.5. Panels - composite

In situations where space limitations preclude the use of separate instrumentation, control and automation (ICA) and switchgear panels and with prior approval of the consultant ICA equipment may be combined within a single enclosure subject to the following conditions:

Enclosure

- The observance of all other clauses herein relating to enclosures, mounting boards and minor panels.
- The written assurance of each supplier of ICA equipment that the proximity of the switchgear will have no detrimental effect on the life or performance of any ICA component.
- The total segregation of ICA equipment and switchgear including the glanding and termination facilities.
- The absence of any voltage exceeding 250V ac or 50V dc from any compartment containing ICA equipment.
- The use of the full height of the panel (excluding the busbar chamber and cable space) for any ICA equipment compartment.

16.6. Panels - Glass Reinforced Plastic (GRP)

Any panel required to be installed outside buildings shall be manufactured from double-skin, resin-bonded fibreglass, with a totally encapsulated infill of rigid weatherproof and ‘boil proof’ plywood to BS 1203:2001 between the two skins to provide a rigid and vandal-proof enclosure.

The environmental rating shall be IP 65 or better.

For any application in a non-temperate climate or where so specified elsewhere, the roof section shall be sloping and have a totally-encapsulated infill of end-grain balsa instead of plywood. Box section steel shall be encapsulated into door edges and door frames. Door locks, handles and hinges shall be of a high tensile strength, non-corroding alloy with stainless steel pins and through fixing bolts. Large plane surfaces shall have adequate reinforcing to ensure rigidity.

The doors shall be complete with latching handles and locks. All door catches and locks shall latch onto steel-reinforced surfaces. Threaded studs shall be incorporated into the design of the
panel for the mounting of sub frames within the panel. Any panel drilled to provide fixings for internal equipment will not be accepted. Each cubicle shall be provided with a floor or deck with a removable gland plate for cable entry.

The laminate material shall have flame-retardant characteristics in compliance with BS 476 Class 2, and shall retain ‘stability, integrity and insulation’ for 30 minutes. Colour-impregnated gel coats backed by coloured resin shall be used to ensure maintenance free and ‘colour-fast’ finishes. The internal finish colour shall be white. The fronts of externally-visible instruments and windows shall be of glass. An air-gap of 100mm shall be provided between the top surface of the panel and its protective canopy. All internal equipment shall be mounted on supports built into the fiberglass structure. Fixing bolts through the skin will not be accepted.

16.7.  Panel protection

Adequate facilities for isolation and protection by miniature circuit breaker or fuse for each instrumentation and control circuit and sub-circuit shall be provided and shall be so arranged that any interruption causes minimum disruption of plant, operates the appropriate alarm and cannot result in any unsafe operating condition. All fuses shall be of the cartridge pattern and main fuses shall be of the high rupturing capacity type. Fuse and solid-link carriers and bases shall be of plastic-moulded insulating material as per best industry practices. Ceramic materials will not be accepted. Live connections shall be efficiently shrouded and it shall be possible to change fuses with power on without danger of contact with live metal. The fuses shall be rated to give maximum protection to the equipment in circuit and the rating shall be permanently inscribed on the fuse label and on the fuse carrier.

Unless necessary for the protection of particular equipment, miniature circuit breakers used for individual circuits in a panel or control desk shall not trip on over-voltage or under-voltage. Bases for solid links shall not be interchangeable with those for fuses. Fuses and links in the same circuit shall be mounted opposite each other in separate adjacent rows and shall not alternate in the same row. At least 10% and not less than two unallocated miniature circuit breakers or fuses and links shall be provided in each panel distribution board. Miniature circuit breakers and fuses of similar size and rating shall be of the same make and type. At least 10%, and not less than two, spare fuses and links of each rating shall be provided and fitted in clips inside the panel.

Each instrument requiring a power supply shall be individually wired and protected so that, in the event of a failure in one circuit, the remainder is unaffected. Power supply circuits shall be of sufficient rating that any protective device may operate without reducing the voltage at the terminals of any other component to an unacceptable level. Remote alarms shall be operated on failure of the electrical supply to a panel or to any internal sub-circuit. Clearly identifiable, switched socket outlets of 15A minimum rating to comply with IS 4615, supplied at the main cabinet operating voltages shall be fitted within the panel at the rate of one for each operating voltage per meter of panel length; for a panel whose length is less than one meter, one switched socket outlet for each main operating voltage shall be provided. Suitable socket outlets for portable tools and hand lamps shall be provided as specified elsewhere.

16.8.  Panel isolation
Clearly-labelled isolating circuit breakers shall be provided for each incoming power supply. Switches shall be of the quick make-and-break type with spring-loaded contacts that close fully without requiring full operation of the handle. The handle and cover shall be interlocked so that the handle cannot be operated when the cover is open and the cover cannot be opened unless the switch is in the ‘off’ position. The ‘on’ and ‘off’ positions of each switch shall be indicated clearly.

Circuit breakers for panel power supplies shall be mounted near an access point and in positions where they may be operated easily from a standing position. Plug-in isolating links or devices of an approved type shall be provided in any circuit that may still be alive when the power supply isolators are in the ‘off’ position, as, for example, in circuits controlling equipment whose power supply is independent of the panel. Such links or devices shall be properly screened and, if not incorporated in or adjacent to their associated outgoing terminals, shall be labelled with suitable warning notices. Any item of panel equipment to which panel internal wiring is connected with a plug and socket instead of terminals shall be wired in flexible cable of adequate rating between the ‘free’ plug and a socket mounted adjacent to the device. The power supply connector shall be a socket.

16.9. Panel terminal blocks

External wiring for panel power supplies shall be terminated on the appropriate isolator. Signal cables from strain gauges, analyzers, resistance thermometers, re-transmitting slide wires and thermocouples may be terminated at their appropriate instruments. A terminal block shall be provided as the interface between the corresponding conductors of each internal and external wire and each internal and external connection except those listed above. The terminal blocks shall be mounted vertically where possible and not nearer than 230mm to the floor or less than 230mm from an incoming cable gland.

Terminal block rows shall be spaced apart by not less than 150mm and arranged to permit convenient access to wires and terminals and to enable ferrule numbers to be read without difficulty. Other circuits shall be grouped on the terminal blocks according to the classification given in the clause for ‘Panel internal wiring’ which shall be clearly marked along the corresponding section of each terminal board. Groups of different voltages on the same board shall be separated by insulated barriers.

All connections shall be made from the front of terminal blocks and no live metal shall be exposed at the back. All terminal blocks shall be of the type which clamps the wire securely and without damage between two plates by means of a captive screw and which permits removal of any terminal without disturbance to adjacent terminals. Pinch-screw type terminal blocks will not be accepted. Terminal mouldings shall be in melamine to ISO 2112:1990, polyamide or equivalent. Terminal rails shall be hot-dip galvanized. Current bars between the two connection points of each terminal block shall be of copper or brass with tin/lead alloy plating. All steel parts shall be zinc-plated and passivated with a yellow chromate layer.

Terminal blocks for input and output analogue signals and for circuits containing volt-free
contacts internal or external to the cabinet shall be of the Klippon type SAKC or equivalent which permit the connection of a test millimeter or continuity meter without disconnecting any wiring.

Terminal blocks for power supplies for equipment external to the panel shall permit the isolation of the item of external equipment without affecting the operation of any other circuit within or outside the panel.

No more than one core of external cables or one internal wire shall be connected to any terminal. If terminal blocks are used as common points for two or more circuits, individual terminals with the appropriate number of permanent cross-connections shall be provided. The lengths of exposed cable cores shall be sufficient to reach any terminal in the appropriate row or rows. The cores shall be formed into a neat loom and a separate loom shall be provided for each cable.

Identification ferrules as specified in the clause for ‘Panel wiring identification and termination’ shall be fitted on each core of all external cables and on each internal wire. The size of the terminals shall be appropriate to the size and rating of the cable cores which will be connected to them but shall not be smaller than Klippon type SAK2.5 or equivalent.

Each row of terminal blocks shall contain at least 25% spare terminals over the number required for terminating all cores of external cables in that row. Unless otherwise specified or shown in the Specification drawings, each external cable shall contain at least 20% spare circuits, with a minimum of one spare circuit. Terminal blocks shall be numbered consecutively in a sequence different from that used for identifying wiring. The terminal numbers, voltage grouping and terminal board layout shall correspond precisely with wiring diagrams so that quick and accurate identification of wiring can be made. All the terminal boards shall be provided with covers of transparent insulating material that does not sustain combustion and shall be sectionalized where possible to give access to groups of terminals without uncovering all boards. Terminals which may be live when the panel is isolated from its main supplies shall be suitably labelled to minimize the risk of accidental contact.

16.10. Panel internal wiring

Panel circuits shall be segregated into the following categories:

- **Group 1: Power control and very-high-level signal wiring (above 50V):**
  - AC power supplies
  - DC power supplies
  - DC current signals above 50mA (such as CT circuits)
  - AC voltage and control signals above 50V (such as PT circuits)

- **Group 2: High-level signal wiring (6V to 50V dc):**
  - Signals from conventional electronic transmitters and controllers (such as 4mA to 20mA)
- Circuits to alarm enunciators and other solid-state devices (excluding those in categories 2.1, 2.5, 3.1, 3.2 and 3.3)
- Digital signals
- Emergency shut-down and tripping circuits
- On / Off control circuits
- Intrinsically safe circuits
- Speech-frequency circuits

- **Group 3: Low-level signal wiring (5V dc and below):**
  - Signals from thermocouples
  - Signals from resistance thermometers and re-transmitting slide-wires
  - Signals from analytical equipment and strain gauges

*For Group 3 wiring, internal connections to the instruments shall be made by one of the following methods:*
- The twisted, screened conductors of the external cable shall be led direct to their appropriate instruments via ducting systems installed for this purpose during construction of the panel.
- The conductors of the external cables shall be terminated on terminals segregated from all other categories and the connections to the appropriate instruments shall be made using twisted pairs with individual screening installed for this purpose during construction of the panel.

Internal wiring for all circuits in Group 2 except those sharing a common connection shall be multi-stranded, twisted pair, 0.75mm² minimum copper conductors with HPDE or PVC insulated cable of adequate grade and rating in accordance with BS 6004:2000. Wiring for circuits in other Groups or sharing a common connection shall be run in stranded, 1.0mm² minimum copper conductors with 250V grade, PVC-insulated cable of adequate grade and rating. Wiring sheath colours shall be black for AC circuits, and grey for DC circuits (excluding thermocouple circuits) and blue for Group 2.6 circuits. Circuits supplied at 240V, between 240V and 110V dc shall also be physically segregated from each other and from other circuits. Access to wiring and components of circuits having voltages exceeding 240V shall not be possible unless and until the circuit has been isolated.

Separate ducts, trunking, cable looms, tray work and the like shall be provided within the panel for each category with at least 150mm between parallel paths of Group 1 and those of any other Group. Intrinsically-safe circuits and their terminals shall be segregated from other circuits and terminals. All wiring shall be neatly and securely fixed by insulated cleats, bunched and secured by approved plastic strapping or run in approved insulated wiring trunking or non-corrodible flexible tubing. Not more than 75% of the capacity of trunking, ducts, looming, or tubing shall be used. Insulated earth wiring shall be so arranged that access to any equipment or connection point or the removal of any item of equipment is unimpeded. Wiring for future equipment shall be secured and terminated on terminal blocks. Lacing for wiring looms shall be of rot-proof cord or
plastic strips. Inter-section wiring in multi-section cabinets shall be via a terminal block in each section.

16.11. Panel wiring identification and termination

Identification ferrules shall be fitted at both ends of each wire. The numbers or letters used shall correspond with the appropriate wiring diagram. The ferrules shall be of plastic insulating material with permanent black characters on a colour-coded background for numbers and on a white background for letters, unaffected by oil or water. They shall be so arranged that they can be read logically from left to right when viewed normally. The system of wire identification shall be such that wires in the same circuit on opposite sides of a terminal shall have the same reference, and this system shall be continued through all external cabling. Terminal ferrules (spade, tongue, crimped connections) shall be provided on each conductor.

16.12. Panel earthing

A continuous copper earth bar of not less than 25mm % 6mm cross section shall run the full length of each panel and shall be securely fixed and bonded electrically to the main frame. The cable gland-plates and the earth bar shall be provided with suitable brass terminals of not less than 6mm diameter for connecting the metal cladding or armouring of all incoming and outgoing cables to the station earthing system.

A second continuous copper earth bar of not less than 25mm % 6mm cross section, electrically isolated from the steelwork of the panel and metal cladding and armouring of cables, shall be provided for earthing the signal earth connection of each instrumentation and control device and the screen(s) of each instrument cable not earthed elsewhere to the station instrumentation earth plate. The earth bar shall have sufficient brass terminals as specified above for each instrumentation and control device and the screen of every shielded cable plus 25% spare terminals. In multi-section panels, each earth bar shall be electrically bonded to the corresponding bars in the adjacent section(s). Instrumentation and instrument cable screen earthing shall comply with BS 6739: 1986, Section 10, unless otherwise stated in this clause.

16.13. Panel Heating

Each panel shall have one or more thermostatically-controlled tubular or ribbed panel heaters to prevent condensation and assist ventilation and which shall be adequate for ambient temperatures down to 5°C. The heater rating shall not exceed 0.2W/Sq.mm and the surface temperature of any part which could be contacted accidentally shall not exceed 60°C. Heaters shall be so situated that no deterioration can be caused to any equipment or wiring in the panel. The heating circuits shall be switched and fused independently of the instrumentation and control equipment and manually controlled by an enclosed switch mounted in an accessible position within the panel. Thermostats shall be mounted remote from the heaters and other sources of heat and shall be fully adjustable over a range of not less than 0°C to 50°C. Thermostats shall cut out each heater when the internal temperature of the panel exceeds a preset value; differential thermostats shall be used to maintain the panel internal temperature at a pre-set value above the external ambient temperature. If the permanent power supply is not available at the time of installation of the panel and condensation
is detected, a temporary power supply shall be connected to the panel of sufficient rating to operate the heaters.

Each panel shall be adequately illuminated internally, as evenly and as free from dazzle as possible, by fixed fluorescent lighting controlled from totally-enclosed light switches and by totally-enclosed door-operated switches positioned so as not to interfere with access. There shall also be one installed inspection lamp per three meters of panel length or part thereof with adequate flexible connection cable to reach any point in the panel. The control switch for an inspection lamp shall form part of the lamp assembly. Lighting circuits shall be fused independently of any instrumentation and control circuit and designed to allow lamps to be replaced safely and shall be fed from a distribution board and circuit breaker connected on the live side of the main panel ac supply circuit breaker.

16.15. Panel ventilation

Each panel shall be provided with ventilation fans as required to ensure that equipment within the panel is maintained within manufacturer’s recommendations, with due regard to the environment in which the panel will be mounted. Fans shall be controlled by a suitably labeled enclosed switch mounted internally in an accessible position. Fans shall be mounted with their axes horizontal and shall be arranged to draw clean air into the panel. Air entries shall have filters which can be renewed from outside the panel and shall be designed to prevent the entry of rain, spray, injurious fluids, sand or dust.

16.16. Panel piping and tubing

Panels containing equipment using a supply of compressed air shall have a common air pressure reducing station with duplicate pressure-reducing valves and filters. The pressure reducing station shall also include isolating valves upstream and downstream of each filter/reducing-valve set, pressure-relief valve, pressure indicator and low-pressure alarm unit for the low-pressure header and a pressure indicator for the high-pressure pipework. The pressure-reducing station components shall be mounted in a clear space inside the panel, supported on a suitable framework between the lower horizontal row of instruments and the main low-pressure header. All piping, fittings and valves downstream of the pressure-reducing station shall be of brass, copper or plastic. PTFE tape shall not be used downstream of the main filters. The low pressure header shall be brass and shall be near the panel floor with drain valves and tundishes piped to a drain. Branch air headers shall be of brass (15mm diameter minimum) and shall run vertically from the header to the instrument. The low pressure header and each branch shall have a 6mm minimum, non-ferrous shut-off valve for each instrument requiring an air supply and a compression coupling for each air-purge connection. At least 10% spare connections for possible future instruments shall be provided in each panel section. Any header dismantled before shipment shall have brass unions or flanges at each panel-section junction. Panel-mounted instruments shall be piped to bulkhead fittings on a gland plate during assembly at the manufacturer’s works. Piping shall be colour-coded in accordance with Recommended Practice ISA-RP 7.2 issued by the Instrument Society of America and shall be segregated from wiring so that any leakage is
harmless. Each panel-mounted pressure gauge shall have a stainless steel flush-mounted shut-off
die and fine-regulating valve mounted vertically below. A drip tray shall be provided below each row
of gauges. Exhaust and de-pressurizing pipework shall be routed out of the panel.

16.17. Panel labels

Labels shall be provided for every panel to describe the duty or otherwise identify the panel and
its sections and every instrument, component and item of equipment mounted internally and
externally. Where applicable, front-of-panel labels shall be as shown in the Specification
drawings. Each label shall be permanently secured to the surface near the item to which it refers.
Externally-fitted labels shall be of perspex or other approved transparent plastic, with letters and
numbers rear-engraved and filled with black. The rear surface of each perspex label shall be
finished with a coat of paint of the same colour as the panel external finish. Instrument duty labels
fitted externally shall be below the item to which they refer. Embossed tape or similar adhesive
labels will not be approved.

Laminated materials or rear-engraved and filled plastic shall be used for internally-fitted labels,
which shall be white with engraved black letters. Labels conforming to the requirements of the
preceding paragraphs or other approved means shall be provided:

- Labels
  - To describe or identify circuits or circuit components
  - To identify DC polarity
  - To warn or remind about dangerous or potentially-dangerous circumstances
  - Wherever elsewhere specified

Unless otherwise specified, all engraving shall be in plain block letters, 4mm high. The
minimum practicable number of different sizes shall be used. Manufacturers’ nameplates
shall not be fitted on panel external surfaces.

16.18. Panel finish

For control and instrument panels, desks and cubicles a hard, smooth, durable finish, free of
blemishes, shall be provided. Before painting, all external welds and any rough areas shall be
smoothed, and all surfaces shall be thoroughly cleaned and free from scale, contaminates
corrosion or grease. If rust-proof or Zintec steel has not been used in the construction, the panel
shall be treated with a passivating agent such as phosphoric acid. All internal surfaces shall have
a minimum of three coats of paint of which the first shall be an approved antirusting priming coat
and the final coat shall be opaque gloss white enamel. All external surfaces shall have not less
than five coats of paint of which the first shall be an approved etch priming coat, and the second
and third suitable undercoats, all of which shall be rubbed smooth when dry before application of
the next coat. The undercoats shall be easily distinguished in shade or colour from the priming
and finishing coats. The two final coats shall be of stove enamel paint, gloss or semi-matt finish,
to a colour and finish. Stoving shall be carried out in accordance with the recommendation of the
paint manufacturer. The overall dry film thickness (DFT) shall be between 85 and 120 microns.
Nuts, bolts, washers and other fixing devices which may have to be removed for transit or maintenance purposes shall be galvanized or otherwise finished to an approved standard. A 500ml tin of matching touch-up paint shall be provided and packed with each panel.

17. **Electrical Indicators and Integrators**

Indicators for use with analogue signal-transmission systems shall comply with BS 89:1990 or equivalent and have an accuracy class index of 1.0. Indicator movements shall be critically damped (dead-beat). Indicators for use on more than one circuit shall have rotary switches to select the circuit, with engraved plates to show the circuit selected. Indicators shall have circular scales or shall be of the vertical edgewise type and shall be designed to avoid parallax error.

Scales shall be clearly marked in SI units and shall comply with BS 3693:1992 or equivalent. All instruments mounted on one panel or board, or in adjacent groupings, shall have similar styles of figures and letters. Dials shall be white with black scales and lettering not subject to fading.

The material for scales shall be such that no peeling or discolouration will take place with age under any environmental conditions. Major scale marks and numerals shall be of the same size and thickness and shall be separated by not more than twenty-five minor marks. Pointers shall taper to the width of the scale marks. Integrators shall be of the multi-digit cyclometer type. Integrators operating in conjunction with an electromagnetic or ultrasonic flow meter shall use the pulse output from the flow transmitter. Any integrator operating from a device without a pulse output shall have an integral or separate current-to-pulse converter with sufficient adjustment of the pulse rate to avoid the use of any multiplying factor except in integer power of 10. Each integrator shall incorporate an adjustable limiter whereby any input below a pre-set value is inoperative. Unless otherwise specified, integrators shall have a minimum of eight digits with a decimal point where applicable.

17.1. **Alarm System**

Alarms shall be initiated by the opening or closing of volt-free contacts which shall remain unchanged throughout the periods in which the alarm conditions exit. Alarm circuits shall be capable of conversion from open-healthy to open-alarm or vice versa by a simple modification after installation requiring no additional parts or special equipment. Each alarm shall initiate the operation of both visual and audible devices. The sound intensity of each audible device shall be suitable for the maximum sound level of its environment.

Audible devices in the same room or area shall have distinguishable sounds and adjustable sound levels.

18. **Matrix Type Alarm Annunciators**

The alarm annunciator shall be microprocessor based, modular, split type unit with alarm windows mounted on the front door and electronic modules inside the panel. The weather protection class for alarm annunciator shall be IP-54 of IS 13947, Part-I. Each alarm shall initiate a visible and audible indication of the specified condition. Unless otherwise specified, alarm
indicators shall be grouped together in annunciator units each having at least 20% spare ways. Alarm indicator lamps (Cluster LED type) shall have transparent screens engraved with appropriate legends as approved in the Designs and Drawings. The legend area of each indication shall not exceed 40mm high and 75mm wide. When any alarm condition occurs, a condition device common to an alarm annunciator system shall sound and the appropriate indicator shall flash on and off. The flashing rate shall not be less than 2 Hz and shall not exceed 5 Hz. On pressing an accept pushbutton, the audible device shall be silenced and the flashing light shall become steady. The alarm indicator shall remain illuminated until the alarm condition ceases and a reset pushbutton has been operated.

The operation or acceptance of one alarm shall not inhibit the operation of the audible device or the flashing of the appropriate alarm indicator if a further alarm condition occurs.

At unmanned locations alarms operated on two or more annunciators shall require acceptance at each annunciator. Alarms shall be accepted automatically and the appropriate audible device silenced after an adjustable period of 1 to 5 minutes.

An integral ‘test’ pushbutton shall be provided to illuminate each lamp in the appropriate group and to operate the audible device but shall not cause a spurious alarm condition on any other annunciator.

Alarm circuitry shall be arranged so that spurious or transient alarm states persisting for less than 0.5 seconds do not initiate any action.

Alarm annunciator / indicator legends or labels shall be arranged with three lines of text as follows:

- Top Line: Location; example: sludge blanket level
- Middle line: parameter; Level
- Bottom line: status. High

19. **Push-Buttons and Indicator Lights**

Push-buttons in control circuits shall have shrouds, guards or other suitable means for preventing inadvertent operation. Status-indicator lights shall be of the high-intensity LED type. Indicator lights shall be of a design which allows easy LED replacement from the front. Indicator lights shall be easily visible above the ambient light level when viewed from within an included angle of 120 degrees. LEDs shall be chosen to ensure clear discrimination between the energized and de-energized states and to ensure an average working life of not less than 3000 hours. A ‘lamp test’ push-button shall be provided for each group of indicator lights. The colours of push-buttons and indicator lights on instrument panels shall be as follows:

- INDICATOR LIGHTS ON INSTRUMENT PANELS
  - Start or on (energize) - Green
  - Stop or off (de-energize) - Red
o Open valve - Black*
  o Close valve - Black*
  o Accept - Black
  o Lamp test - Black
  o Reset - Black
  o Motor running (energized) - Red
  o Motor stopped (de-energized) - Green
  o Valve open - Red
  o Valve closed - Green
  o Urgent alarm - Red
  o Non-urgent alarm - Yellow
  o Plant healthy or ready for use - White

*Panel-mounted push-buttons for valve operation shall be coloured black, or as per the approved Design and Drawings, with the duty clearly defined by legend on an associated label.

20. Analogue Signal Transmission

Unless otherwise specified, analogue signal-transmission systems shall be in accordance with BS EN 60546-1:1993 and shall use a signal of 4mA to 20mA DC. Transmitting devices shall have integral indicators to monitor the output signal or connections suitable for use with a portable test meter. Transmitters shall be capable of meeting the requirements laid down in the appropriate part of IEC 60770-1:1999.

21. Analogue Process Controllers

Analogue controllers shall use solid-state components and shall have outputs containing three terms with negligible interaction. The controller fascia shall have measured value, set value and output indication, manual set-value and output controls, auto/manual switch for control mode and remote-local transfer switch for set-value control. Manual control stations shall have measured value and set-value indication, local/remote switch and control available lamp indicator. Each controller shall have the means to restrict its output signal to a predetermined, fully adjustable band so that the regulating device is not moved to unsafe positions. The adjustment of these safe operating limits shall be by means of accessible, clearly marked, internal components. A continuously adjustable proportional band of not less than 5 to 500% shall be provided. Integral and derivative action times shall be adjustable over ranges which shall not be narrower than 6 seconds to 25 minutes and 0-to 10 minutes respectively. If the integral or derivative action times' adjustments are in steps, the ratio of successive steps shall not exceed 2. The controls used to set the P, I and D values may be at the front of the instrument or mounted internally in an accessible position.

Each controller shall be designed so that in the event of failure, it shall be possible to plug a portable manual station into the controller case and to control the regulating device manually.

Controller design shall ensure automatic procedure-less, bump less transfer whenever the
instrument is switched from "auto" to "manual" or vice versa. Controller action shall be adjustable from direct to reverse and vice versa by the operation of an internal switch. Analogue process controllers shall be capable of meeting the requirements laid down in the appropriate part of BS EN 60546-1:1993.
Section G5.5
SCADA (Online Monitoring System)
for STP(s)/FSTP(s) and LS/ PS
Section G5.5: SCADA (Online Monitoring System) for STP(s)/FSTP(s) and LS/PS

1. General

One of the key requirements forming part of Operation and Maintenance requirement of STP(s)/FSTP(s), LS/PS, and I&D is REAL TIME ONLINE MONITORING of various data & details by authorities & officials in Executing agency, {NATIONAL/STATE LEVEL AGENCY IF ANY}, CPCB, SPCB, ULB and Project Engineer.

In order to facilitate this requirement, the concessionaire shall design and implement an SCADA concept based ONLINE MONITORING SYSTEM for real time monitoring of various parameters of the STP(s)/FSTP(s) and LS/PS including mechanical equipment (pumps, motors, valves, etc.), process instruments and power network.

The SCADA based REAL TIME ON LINE MONITORING SYSTEM (hereinafter referred to as RTOLMS) should be such that it has feature as per generic requirements to enable transmission of real time data of all the monitored parameters over Internet networks, leased and phone lines, wireless communication etc., or a mix of these as appropriate and as feasible at the respective site(s). The indicative list of such parameters which are to be logged and monitored / communicated on line are given in the table below.

Typical parameter and relayed to control monitoring station

Note: For flow measurement at I&D, the Concessionaire is free adopt any available flow measuring instruments with compatibility for online monitoring
2. **System architecture**

The schematic representation of the required RTOLMS architecture to be provided by the Concessionaire as part of Basic engineering package to meet the KPI requirements as per schedule 1 and 11.

3. **Scope of work**

The scope of work, as a minimum shall include,

- Supply, installation, testing and commissioning of all necessary Hardware and Software for RTOLMS System including LAN switches, Modems, UPS, central work station, HMIs, data / fibre cabling between various sensing devices to the PLCs in the respective STP(s)/FSTP(s), and LS / PS
- Supply, installation, testing and commissioning at STP(s)/FSTP(s), and LS & PS of all necessary isolating and interface modules and RTUs, potential free auxiliary NO/NC contacts etc., required for making the existing / new Electrical power system components compatible for monitoring the voltage, current, PF, kVA, KWh, KVAh, pump ON/OFF status etc., besides interfacing of data on levels, pressure, flow rate and various other parameters of raw water and treated water.
- Supply, installation, testing and commissioning of all Networking Equipments (Router, firewall etc.) for the central unit at STP(s)/FSTP(s).
- Interface / Integration of PLC & RTU of STP(s)/FSTP(s), and LS & PS with RTOLMS System.
- Integration of Field Instruments Hardware with RTOLMS System.
- Testing, Erection & Commissioning of supplied system.

4. **Features Required in RTOLMS System**

RTOLMS system will have many extra features and the proposed system should support multiple PLC/ RTU Protocol like Modbus, Profibus, DNP (Serial/TCPIP), OPC etc.

4.1. **System components**

The system shall consist of a modular controller (including control, I/O, and communications functions) and software modules that facilitate open systems connections.

The system shall include a full complement of modular supporting equipment (including mounting racks, power supplies, termination strips, equipment enclosures, prefabricated cables, furniture, etc.), all of which shall be designed to simplify construction.

4.2. **Open Communications**
The control system shall be open to enable easy integration with OPC (OLE for Process Control) [where OLE stands for Object Linking and Embedding (OLE)] server so as to collect the data from the remote housing station.

4.3. **Reliability and redundancy**

The system must be designed for maximum reliability and minimal downtime and work satisfactorily under harsh and dusty ambient conditions. This should be achieved through a fault-tolerant design with minimal common cause failures and state-of-the-art redundancy schemes. The main system should offer 100% redundancy for both hardware and software. The offered system shall offer highest possible MTBF within the service period of 15 + years.

4.8. **Power Supply**

Redundant power supplies shall be available for card rack mounting to form as an integral part of the system. The module rack must provide two individual power supply buses that to be driven by two independent power sources for high availability placed in the rack in current sharing mode. Each module shall be capable of using power from any of the two buses.

4.9. **Enclosures**

The racks shall be mounted in an industrial enclosure with a front & rear -access design, with all frequently accessed items (such as modules, connectors, status indicators, switches, and termination assemblies) located in the front of the enclosure. For maximum flexibility, the enclosures shall be modular, with the ability to be stacked, joined side to side, or joined back to back. To provide the degree of environmental security required, enclosures shall be available in sealed and vented versions.

Enclosure shall be i) for Indoor IP 44 and ii) for Outdoor IP 65

4.10. **Input / Output Devices**

Input/output Modules shall be intelligent I/O modules. Each module should be able to communicate with the CPU in a dedicated fashion without requirement of any additional interfacing hardware so as to reduce the common cause of the Failure. Each module should have its own microprocessor to execute its input/output function, maintain its configured data, and
perform module diagnostics.

All process I/O shall be electrically isolated from both computer common and communications common. Isolation shall meet be min 1500 VAC requirements. Modules shall automatically determine their physical address and report this information to the controller. No range jumpers or user-configurable physical address jumpers should be necessary.

All configurable data shall be set via software, with no hardware jumpers used. Configurable data should include channel tag.

All the I/O modules shall have max 8 channels for the Analog and 16 channels for the Digital modules. Special modules like Counter inputs shall monitor dry contact pulses with an input resolution of one HZ minimum. More numbers per channel may be accepted if the overall reliability factor of MTBF within the service period of 15 + years is achieved.

4.11. Field Termination for I/O Modules

Each I/O module’s field signals shall be wired into the system such that an I/O module can be removed at any time without disturbing the field wiring.

The field wiring should be separate from the I/O module(s). The extension from the module(s) shall be accomplished via a marshalled I/O cable assembly. This assembly should be a multi-conductor cable that attaches to the module rack (and the back of the I/O module) on one end and a finished termination end.

The marshalled termination assemblies shall be DIN rail-mounted PCB-based fixtures that include terminal blocks and two receptacles for accepting the interconnect cable plug. These receptacles must be female to eliminate the possibility of power from the terminal block being exposed on pins.

5. Detailed functional Specification of RTOLMS System Components

5.1. Data Acquisition

The RTOLMS system shall perform data acquisition from PLC of all treatment plants, all LS / PS and field equipment. PLC is to be located at each location of the treatment plant and LS/PS. PLC communications with central system shall utilize the Open protocol like Modbus, Profibus and Ethernet TCP/IP.

5.2. Data Exchange

The RTOLMS systems shall be able to exchange various types of data with the other application software using ActiveX Data Objects (ADO) or Dynamic Data Exchange (DDE).
5.3. **Data Processing**

a) Analog data

Analog data processing shall be performed according to the requirements listed below.

- Conversion to measurable Units as required by ULB / {NATIONAL/STATE LEVEL AGENCY IF ANY}
- Reasonability limits checking
- Limit monitoring

b) Digital/Status Input Data

The following status input data types shall be accommodated as a minimum: Two-state points: The following pairs of state names shall be provided:

1. Open/Closed
2. Tripped/Closed
3. Alarm/Normal
4. On/Off
5. Auto/Manual
6. Remote/Local

c) Calculated Data

It shall be possible to define the calculations on real-time data and historical data, periodically and on request. The results shall be incorporated into the database as calculated data available for display & report generation.

The user shall be able to define calculated analog values using database points as the arguments and mathematical functions as the operations. Functions such as addition, subtraction, multiplication, division, maximum value, minimum value, average, count, square root, exponentiation, trigonometric functions, logarithms and other statistical functions shall be provided.

The RTOLMS system shall be capable of analyzing the open/closed status of switching devices, such as Motor, PUMP etc. The configuration shall be updated whenever a switching device status change is detected.

5.4. **Sequence-Of-Events Recording**

The Sequence-of-events (SOE) data shall be collected by the RTOLMS system from PLCs. The description of each event shall include the database description name, device state, the date, and
the time (to the nearest millisecond) of each event.

5.5. **Information Storage and Retrieval**

Information Storage and Retrieval (ISR) system shall collect and store analog data (telemetered and calculated) periodically at every 5 minute (configurable) and status data by exception. Associated quality codes shall be included. It shall be possible to perform calculations on the stored data, and the results of these calculations shall be collected and stored. Other information such as alarms, events, SOE and reports shall also be stored. The data shall be stored on hard disc with date tag on daily basis for easy retrieval. Subsequently, the data shall be retrieved for analysis, display, trending, and report generation.

5.6. **Extensive Use of Standard**

The RTOLMS Software should be such that it uses an extensive use of standards, achieved by a corporate commitment to comply with all standards that are recognized on the RTOLMS market, and in particular:

- Intel (or compatible) based hardware;
- Operating system options of WNT 4.0, Windows 2000 or Windows 2003;
- Uses Microsoft Foundation Class (MFC) Object Oriented Database;
- Developed with Microsoft Developer’s Studio;
- Installed using Microsoft Install Shield utilities;
- Component Based Architecture;
- Interfaced using Active X controls (OCX);
- TCP/IP for Local and Wide Area Networks (LAN & WAN);
- Web-enabled Operator Consoles;
- Control Center Application Programming Interface (CCAPI) Initiatives

5.7. **System Sizing & Extensibility**

The hardware and software openness of RTOLMS allows the Executing Agency / concessionaire to smoothly upgrade the proposed system with great facilities. Common upgrading needs include (but not limited to) the following items:

- Additional measurement points (analog and digital);
- Additional protocol-compliant IEDs;
- Additional protocol-compliant PLCs;
- Additional operator consoles;
- Additional printers;
5.8. **Graphical User Interface (GUI)**

The GUI shall operate within a window environment, the system shall use displays which mimic the existing control panels so that the operators working in conventional control room environment are comfortable while working on the new system. Concessionaire shall develop control panel display generally similar to the one existing in conventional control room.

The GUI shall allow the personnel to monitor and control the equipment through the control panel displays and Tabular displays. The control panel displays shall be dynamically updated for measurands, device positions, annunciations. To have better visibility of control panels, it shall be possible to iconise each control panel separately. Operator shall select that icon to zoom/view that panel display & carry out operations such as alarm annunciation accept/reset, device close/open operations etc.

5.9. **Trending**

Trend displays shall enable the user to select real-time and historical data for trending on graphical displays and for tabular displays. It shall be possible to take print of these trends.

5.10. **Alarms**

Alarms are conditions that require user notification when detected. Audio, visual alarm shall be generated for all such conditions. It shall be possible to accept & reset all trip & non-trip alarm annunciation appearing on control panel facia from control panel display itself. Alarm annunciation on control panel shall have following characteristics:

<table>
<thead>
<tr>
<th>Condition</th>
<th>Facia</th>
<th>Sound</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alarm initiation by relay contact</td>
<td>Flashing Glow</td>
<td>On</td>
</tr>
<tr>
<td>Accept PB pressed</td>
<td>Steady Glow</td>
<td>Off</td>
</tr>
<tr>
<td>Reset</td>
<td>Off (if relay contact is reset)</td>
<td>Steady Glow (if relay contact is not reset)</td>
</tr>
</tbody>
</table>

Other alarm conditions shall be acknowledged from respective alarm list displays. Other alarm conditions shall include, but not be limited to the following:

- (a) Telemetered or calculated value limit violations
- (b) Un-commanded changes of a power system device state
- (c) Data source communication errors resulting in loss of data
- (d) SCADA hardware and software element failures.

The standard products for advanced alarm management shall also be provided. Regardless of the alarm management technique used, all alarm messages shall be recorded with time & date tag on auxiliary memory for review and printing on demand by the user.
Displays shall highlight alarm condition using a combination of colour, intensity, inverse video and blinking. Alarm messages shall be a single line of text describing the alarm that has occurred with date & time of occurrence.

5.11. Events

Events are conditions or actions that shall be recorded by the SCADA system but do not require user action. Events shall be recorded in the form of an event message. The event message format shall be similar to the alarm message format. Events shall include but not be limited to the following:

Values returning to normal from a limit violation State Device status change on manual operation.

5.12. Hardcopy Printing of Display

A means shall be provided to produce a copy of a display. The display printout shall be initiated from user friendly push buttons/pull down menus. The options for printing mode shall include at least selection for orientation, background colour, page size, colour or black & white print and print preview. It shall also be possible to print selected portions of display and direct printing on any of the connected printer.

5.13. Report Generation

The user shall be able to schedule periodic reports generation, direct a report to a display, print a report, and archive a report. Hardcopy report formats shall be handed over to Concessionaire for generation of report formats in the system. It shall also be possible to define and generate the additional user configurable reports. The generation and printing of any report shall not effect normal scanning of data from PLC. The report scheduling display shall enable entry of the following parameters, with default values provided where appropriate:

(a) Report name
(b) Report destination (printer or archiving device)
(c) Time the system should produce the report.

5.14. RTOLMS System Access Security

A mechanism for defining and controlling user access to the SCADA system shall be provided.

5.15. Alarm Summary Displays
Displays that list or summarize all unacknowledged and acknowledged alarms shall be provided. The user shall be able to select between viewing alarms in chronological and reverse chronological order. The default shall be most recent alarms. The summary shall separate acknowledged and unacknowledged alarms. To facilitate identification of unacknowledged messages the time field shall blink or entire row shall blink. It shall be possible to sort alarms by user defined text, date, time.

5.16. **Event Summary Displays**

Event summary displays shall list the most recent events. The user shall be able to select between viewing events in chronological and reverse chronological order. The user shall be provided with a convenient and efficient means of selecting an event summary display. It shall be possible to sort events by user defined text, date, time.

5.17. **Operating Information Summaries**

The operating information summaries defined below shall be provided. Summary items will be listed in reverse chronological order with the most recent item shown on the first page. The user shall have the ability to sort summary items by device.

5.18. **Abnormal Summary**

The summary display shall list devices and values that are found to be abnormal, i.e., are not in their normal state. Telemetered, calculated, and manually entered status and data values shall be included.

5.19. **Out-Of-Scan Summary**

The out-of-scan summary display shall list device status and data values that are not currently being processed by the system.

5.20. **Alarm Inhibit Summary**

This display shall list devices and data values for which the user has suspended alarm processing.

5.21. **Tag Summary**

This display shall list and describe all active device tags.

5.22. **Help Displays**

Help displays shall be provided to aid the user in interpreting displayed information and to guide the user through a data entry or control procedure.

5.23. **Alarm Beeper Services**
The Alarm Beeper service audibly notifies the operator of recent alarms by playing a wave file. Wave files can be used to distinguish between Alarm priorities. All the Windows’ .wav files or customized wav files can be used.

5.24.  *Alarm Pager Services*

The Alarm Pager service allows the user to configure the system to issue various pages in response to specified alarms.
Section G5.6
Inspection and testing at manufacturer’s works
Section G5.6 : Inspection and testing at manufacturer’s works

All inspection and testing shall be carried out in accordance with the Specification and in absence of Specification relevant Indian Standard or internationally approved equivalent standard. After award of contract, Concessionaire shall furnish QA plan, which will be mutually discussed with the Executing Agency and finalized QA plan shall include test, and incoming supply of raw materials and bought out items, stage inspections and tests on finished products at manufacturer's works / appropriate testing station. QA plan shall clearly indicate tests which are intended to be witnessed by the Concessionaire alone and those by both Concessionaire and Project Engineer and Executing Agency.

The Concessionaire shall carry out wherever practical, at the place of manufacture tests of the Plant / Equipment.

The Executing Agency shall be entitled to attend the aforesaid inspection and / or tests by his own duly authorized and designated representatives.

The Executing Agency and his duly authorized representative shall have access to the Concessionaire's premises at all suitable times to inspect and examine the material and workmanship of the mechanical and electrical plant and equipment during its manufacture there. If part of the plant and equipment is being manufactured on other premises, the Concessionaire shall obtain permission for the Executing Agency or his duly authorized representative, to inspect as if the plant and equipment was manufactured on the Concessionaires own premises. Testing (including testing for chemical analysis and physical properties) shall be carried out by the Concessionaire and certificates submitted to the Executing Agency who will have the right to witness or inspect the above mentioned inspection / testing at any stage desired by him. Where inspection or testing is to be carried out at a sub-contractor's works, a representative of the Concessionaire shall be present.

The procedure for the testing and inspection to be carried out during or following the manufacture of the materials to ensure the quality and workmanship of the materials and to further ensure that they conform to the Contract is whatever place they are specified shall be as described below.

The Concessionaire shall give the Executing Agency at least 21 clear days’ notice in writing of the date and the place at which any plant or equipment will be ready for inspection/testing as provided in the Contract. The Executing Agency or his duly authorized representative shall thereupon at his discretion notify the Concessionaire of his intention either to release such part of the plant and equipment upon receipt of works test certificates or of his intention to inspect. The Executing Agency shall then give notice in writing to the Concessionaire, and attend at the place so named the said plant and equipment which will be ready for inspection and/or testing. As and when any plant shall have passed the tests referred to in this section, the Executing Agency shall issue to the Concessionaire a notification to that effect.

The Concessionaire shall forward to the Executing Agency duly certified copies of the test certificates and characteristics performance curves for all equipment.

662
If the Executing Agency fails to attend the inspection and/or test, or if it is agreed between the parties that the Executing Agency shall not do so, then the Concessionaire may proceed with the inspection and/or test in the absence of the Executing Agency and provide the Executing Agency with a certified report of the results thereof as mentioned above.

If any materials or any part of the works fails to pass any inspection / test, the Concessionaire shall either rectify or replace such materials or part of the works and shall repeat the inspection and/or test upon giving a notice as mentioned above. Any fault or shortcoming found during any inspection or test shall be rectified to the satisfaction of the Executing Agency before proceeding with further inspection.

Where the plant and equipment is a composite unit of several individual pieces manufactured in different places, it shall be assembled and tested as one complete working unit, at the maker's works or at site as mutually agreed by the Executing Agency and Concessionaire.

Neither the execution of an inspection test of materials or any part of the works, nor the attendance by the Executing Agency, nor the issue of any test certificate shall release the Concessionaire from any other responsibilities under the Contract.

The test equipment, meters, instruments etc., used for testing shall be calibrated at recognized test laboratories at regular intervals and valid certificates shall be made available to the Executing Agency's at the time of testing. The calibrating instrument used as standards shall be traceable to National / International standards. Calibration certificates or test instruments shall be produced from a recognized Laboratory for the Executing Agency's consent in advance of testing and if necessary instruments shall be recalibrated or substituted before the commencement of the test.

Items of plant or control systems not covered by standards shall be tested in accordance with the details and program agreed between the Executing Agency and Concessionaire.

Tests shall also be carried out such that due consideration is given to the Site conditions under which the equipment is required to function. The test certificates shall give all details of such tests.

The Concessionaire shall establish and submit a detailed procedure for the Inspection of materials or any part of the works to the Executing Agency for approval within the date indicated in the Programme Details. The detailed procedure shall indicate or specify, without limitation, the following:

i) Applicable code, standard and regulations
ii) Fabrication sequence flow chart indicating tests and inspection points
iii) Detailed tests and inspection method, indicating tests and inspection points
iv) Acceptance criteria
v) Test report forms and required code certificates and data records
vi) Method of sampling, if any sampling test to be conducted
vii) Concessionaire's or Executing Agency's witness points.
The Concessionaire shall not pack for shipment any part of the Plant until he has obtained from the Executing Agency or his authorized representative his written approval to the release of such part for shipment after any tests required by the Contract have been completed to the Executing Agency's satisfaction.
Part-C
Testing and Commissioning
Part C
Testing and Commissioning

Requirements Inspection and Testing During Construction

1.1 General

Inspection and testing of all Facilities shall be carried out in accordance with the relevant Indian Standard or internationally approved equivalent standard. QA plan shall clearly indicate tests which are intended to be witnessed by the Concessionaire alone and those by Concessionaire and Project Engineer.

Inspection and tests schedule shall be as follows;

(i) Manufacturer tests
(ii) Acceptance Inspection / Quantity checking
(iii) Install /Site Inspection
(iv) Site Acceptance Test
(v) Tests on Completion
(vi) Process Wet Tests (by Raw Sewage/Faecal Sludge/Septage)
(vii) Operation Test (Tests After Installation)

The Concessionaire shall establish and submit a detailed procedure for the inspection of materials or any part of the Facilities to the Project Engineer and Executing Agency for approval within the date indicated in the Programme Details. The detailed procedure shall indicate or specify, without limitation, the following:

- Applicable code, standard, and regulations.
- Fabrication sequence flow chart indicating tests and inspection points.
- Detailed tests and inspection method, indicating the measuring apparatus to be used, items to be measured, calculation formula, etc.
- Acceptance criteria.
- Test report forms and required code certificates and data records.
- Method of sampling, if any sampling test to be conducted.
- Concessionaire’s or Project Engineer’s witness points.

The witness testing shall be carried out for all the Mechanical, Electrical, Instrumentation, PLC, SCADA and Associated Equipment.

1.2 Testing on Construction Completion
For all the subject Facilities, prior to the commencement of Trial Operations on respective Construction Completion the Concessionaire shall submit the following to the Executing Agency:

(1) As-Built Drawings
(2) Operation and Maintenance Manuals
(3) Site test results

The initial charges of oil, grease, generator fuel / oil, chemical, disposal of cake, etc. necessary for Trial Operation shall be borne by the Concessionaire.

a) Manual Commissioning Tests

Manual commissioning tests shall be such preliminary trials, tests and retests on subject Facilities prior to subject Facilities COD respectively, in order to demonstrate that the subject Facilities as a whole are ready to undergo the manual operation tests and that these will take place with a minimum of interruption.

b) Manual Operation Tests

When the manual commissioning tests have been completed so that the subject Facilities have been demonstrated to the satisfaction of the Project Engineer and Executing Agency, the Concessionaire shall commence the manual operation tests.

These tests shall demonstrate the correct operation of the subject Facilities whilst using the minimum quantity of automatic control and monitoring equipment. Such equipment shall be at least that required for the maintenance of safety and for the normal mode of operation of such Facilities.

The subject Facilities will be required to demonstrate satisfactory operation at all design flow rates.

c) Automatic Commissioning Tests

The Automatic Commissioning Tests shall be such preliminary trials, tests and retests on subject Facilities in order to demonstrate that the subject Facilities as a whole are ready to undergo the tests of completion and that these will take place with a minimum of interruption.

1.3 Dry Test Requirements
As a minimum requirement the following dry tests shall be carried out as a general requirement:

1. A general inspection to check for correct assembly and quality of workmanship
2. A check on the presence of lubricant, cooling medium, electrolyte, etc.
3. A check on adequacy and security of Facilities fixing arrangements.
4. A general check to ensure that all covers, access ladders, water proofing, guard railings etc. are in place.
5. A check on damp-proofing, rust-proofing and vermin-proofing and particularly the sealing of apertures between building structures, chambers etc. and the outside.

a) Civil and Building Works

As a minimum requirement, check for the presence of foreign bodies in pipe work and structures shall be carried out on the civil and building works.

b) Mechanical Works

As a minimum requirement, preliminary running checks as far is permitted by circumstances in order to ensure smooth operation of Facilities shall be carried out on the mechanical systems.

c) Electrical Works

As a minimum requirement the following dry tests shall be carried out on the electrical systems:

a. Check phasing and polarity.
b. Carry out point to point check on cables.
c. Check on security of cable terminations.
d. Check on completeness and adequacy of earthing systems.
e. Check setting on protection relays, sizes of fuses and motor overload settings.
f. Carry out checks on cabling systems in accordance with the requirements of the relevant standards.
g. Check operation of main circuit breakers by secondary injection methods.
h. Check rotational direction of Plant.
i. Check instrument loop integrity, functionality and calibration.
j. Check operation of standby generator installation and mains / generator changeover procedures; a 4 hour load test (using the normal load of the Works) shall be carried out on the generator when the load is available.
k. Check plant functionality.
l. Check functionality of the central MMI and its power supply.
1.4 Process plant item / equipment

All process plant items / equipment shall be tested to ensure they meet the requirements for quality of workmanship, construction and performance as laid down in the Concession Agreement.

1.4.1 Hydraulic Wet Test Requirements

Hydraulic wet tests shall be carried out on completion of dry tests.

Clear water shall be used for hydraulic wet tests. The purpose of the tests is to prove the hydraulic performance of the Works. In order to demonstrate this, the Concessionaire shall ensure that each part of the Works is hydraulically loaded to its rated throughput for a period of at least four hours.

In order to ensure a sufficient supply of water to carry out these tests the Concessionaire shall provide all required facilities, including but not limited to any temporary facilities that may be required for storage and recycle of clear water or facilities for the disposal of the water off Site in an approved manner.

The following tests inter alia shall be carried out:

(i) Pressure testing of all piped systems laid direct in ground in accordance with the relevant standards.
(ii) Fill all structures and check for leaks.
(iii) Filling of all storage vessels to check for leaks and distortion.
(iv) Running of all pumped systems in order to check for.
(v) Correct functionality.
(vi) Absence of leaks.
(vii) Correct running temperatures.
(viii) Smoothness of running and the absence of undue vibration or stress.
(ix) Check drive running currents.
(x) Carry out calibration of instruments where appropriate.
(xi) Carry out valve operation, diversions etc. to fully hydraulically load each process element (or where there is a requirement to withstand an over load), overload each process element.
(xii) Demonstrate correct functionality of electrical, control and instrumentation systems.

1.4.2 Process Wet Tests (with Raw Sewage/Faecal Sludge/Septage)

On approval by the Project Engineer the Concessionaire shall carry out process wet tests.
Raw Sewage/Faecal Sludge/Septage shall be used as the primary feed stock for process wet tests. These tests shall be carried out to demonstrate the process performance of the Works. In order to demonstrate this, the Concessionaire shall ensure that each part of the Works is loaded to its rated throughput (including a period of overload if required in order to demonstrate compliance with the Project Engineer’s Requirements) for a continuous stable operating period of not less than 48 hours.

The Concessionaire shall provide all required facilities for the disposal off Site in an approved manner. The following tests inter alia shall be carried out:

(i) Check for leaks on vessels, structures, pumps and pipework.
(ii) Running of all pumped systems in order to check for.
    • Correct functionality.
    • Absence of leaks.
    • Correct running temperatures.
    • Smoothness of running and the absence of undue vibration or stress.
    • Check drive running currents where the solution pumped is different from that pumped during hydraulic wet tests.
(iii) Carry out calibration of instruments.
(iv) Carry out valve operation, diversions etc. to fully hydraulically load each process element (or where there is a requirement to withstand an over load), overload each process element.
(v) Demonstrate correct functionality of electrical, control and instrumentation systems not checked during dry or hydraulic wet tests or which may have changed as a result of the different operating conditions now prevailing.

On completion of the tests on the various parts of the works the Concessionaire shall run all subject Facilities as a whole in order to demonstrate the full functionality and performance of the subject Facilities at various throughput rates for a continuous period as specified in Concession Agreement.

1.5 Trial Operations

The Trial Operations shall be used to prove the operation of the subject Facilities are in compliance with the KPIs at varying flows and with varying Influent Standards.

1) The quality of Treated Effluent produced
2) Guaranteed Energy Consumption
3) Quality of Digested Sludge
4) The quality of Treated Water produced
Raw Sewage/Faecal Sludge/Septage shall be used as the main feed stock for Trial Operations. These tests shall be carried out to demonstrate the process performance of the Facilities. In order to demonstrate this, the Concessionaire shall ensure that each part of the Facilities are loaded to rated throughput.

The following tests, inter alia, shall be carried out:

1. Check for leaks on vessels, structures, pumps and pipe work.
2. Running of all pumped systems in order to check for:
   - Correct functionality.
   - Absence of leaks.
   - Smoothness of running and the absence of undue vibration or stress.
   - Check drive running currents where the solution pumped is different from that pumped during hydraulic wet tests.
3. Carry out calibration of instruments.
4. Carry out valve operation, diversions etc. to fully hydraulically load each process element (or where there is a requirement to withstand an overload), overload each process element.
5. Demonstrate correct functionality of electrical, control and instrumentation systems not checked during dry or hydraulic wet tests or which may have changed as a result of the different operating conditions now prevailing.

1.6 Trial Operation & minimum performance standards test record

The Concessionaire shall maintain two copies of Trial Operation test reports for documentation of the following information on daily basis.
- Print outs of data logs from SCADA system.
- Samples collected for assessment the quality of Treated Effluent
- Samples collected for assessment the quality of Treated Water
- Electricity consumption.
- Stabilized Digested Sludge characteristics

Log sheets required for noting down readings / results of various tests shall be prepared.
PART D
Specifications for Operation and Maintenance
Part D : Specifications for Operation and Maintenance

1.1. General

The Facilities and Associated Infrastructure shall run 24 hours every day and 365 days each year continuously under normal operation.

1.2. The O&M manual

The Concessionaire shall submit an O&M Manual as per the Concession Agreement before COD. The O&M of the Facilities and Associated Infrastructure shall be done as per the approved O&M Manual, any approved updations to it as agreed by the Executing Agency and the EHS Plan.

1.3. Guidelines of operations

1.3.1. Inventory control

Throughout the O&M Period, the Concessionaire shall provide and maintain tools and spare parts in accordance with the Concession Agreement.

The current stock levels shall be updated on-line by monitoring signals of the SCADA system (e.g. level of chemical tanks). All delivery of spare parts and consumables shall be recorded as appropriate.

The Concessionaire shall carry out inventory checks every six months. The inventory checks shall be scheduled to avoid disturbance to the O&M.

1.3.2. Chemicals, Dangerous Goods and Hazardous Materials

The Concessionaire shall provide and maintain storage of chemicals, dangerous goods and hazardous materials required for the O&M. Dangerous goods include any of the goods or substances to which the Dangerous Goods Ordinance applies.

1.4. Guidelines for Maintenance

The Concessionaire shall carry out corrective and preventive maintenance of the Facilities and Associated Infrastructure in accordance with the Design and Drawings, O&M Manual, Scheduled Maintenance Programme and EHS Plan to ensure the facilities and equipment perform to the specific standards.

The maintenance of all civil structures shall be done for a period of 15 years as per the frequency as per CPWD maintenance manual 2012 as approved by Executing Agency.

1.5. Maintenance Management
A Computerized Maintenance Management System (CMMS) shall include functions for the creation and upkeep of work orders and maintenance records. The database shall include the following information:

- Preventive maintenance programmes of systems, equipment, building and infrastructure of the Facility, which are used to generate work orders for preventive maintenance automatically;
- Logs of system or equipment fault / breakdown and automatic generation of work orders for corrective maintenance;
- Date of inspection / maintenance (preventive or corrective) carried out;
- Names and positions of Concessionaire’s staff carried out the inspection / maintenance;
- Logs of manual alterations of any operations records, etc;
- Details of inspection / maintenance carried out including:
  - Causes of maintenance
  - Maintenance procedures
  - Special gears / equipment used
  - Spare parts used
  - Equipment / parts replaced
  - Any follow-up actions / recommendations (e.g. change of operational procedures, etc.)

The CMMS shall have functions to organise, sort and filter the maintenance records in the database as required and perform statistical analysis and generate reports for performance monitoring. The CMMS database shall be archived on a monthly basis. One electronic copy of the entire database shall be stored on the Site for retrieval as necessary.

1.5.1. Calibration of Instruments and Measuring Equipment

The Concessionaire shall maintain accuracy and reliability of all measurement facilities throughout the O&M Period to enable correct and effective monitoring and control of the Facilities and Associated Infrastructure.

The Concessionaire shall be responsible for the calibration and re-calibration as necessary of all measurement facilities. All calibration work shall be carried out so as not to delay or disrupt the O&M. Calibration frequency shall not be less than that recommended by the manufacturers of the instruments or measuring equipment and in any case no longer than 12-month intervals.

1.5.2. Tools and Spare Parts

During the O&M Period, the Concessionaire shall provide and maintain tools and spare parts in accordance with the Concession Agreement.
The storage of special tools and inventory of spare parts shall be recorded and monitored.

At the expiry of the O&M Period, the Concessionaire shall handover to the Executing Agency all special tools and spare parts in accordance with the Concession Agreement. The stock level of spare parts shall be sufficient for 1 year operation from the end of the Concession Term.

1.6. Records and Reporting

1.6.1. Archiving of SCADA and CMMS Data

The Concessionaire shall maintain all operation and maintenance records, including SCADA, throughout the O&M Period in a safe and secure manner. Any amendment to the records shall only be made in accordance with proper checking and authorization procedures, which shall be included as part of the O&M Manual.

The Project Engineer shall be allowed to check the above mentioned data and records described at any time.

As far as possible, all records shall be kept electronically utilizing the Concessionaire’s computer facilities with backup security. If the computer facilities fail, then appropriate paper records shall be produced and filed.

1.6.2. Site Diary

The Concessionaire shall maintain a Site Diary which shall include, as a minimum, the following information on a daily basis:

- Date and weather;
- Operation hours;
- Labour on the Site;
- Flow and quality records of influent and effluent;
- Disposal records of treatment by-products;
- Accidents and incidents;
- Instructions to the Concessionaire;
- Comments by the Concessionaire;
- Complaints received and action taken;
- Authorized visitors to the Site;

The Site Diary shall be checked and signed by authorized personnel of the Concessionaire in accordance with the O&M Manual.

The Concessionaire shall keep appropriate records of all personnel employed at the Site. These records shall be available for inspection by the Project Engineer at any time.
1.6.3. **Safety and Health Records**

The Concessionaire shall keep records on all safety and health matters as per the requirements of the Concession Agreement, O&M Plan and the EHS Plan and update such records daily for inspection by the Project Engineer.

1.6.4. **Daily report**

The Concessionaire shall provide details in the form of daily reports, of operational data and information in relation to the O&M of the Facilities to the Executing Agency in a systematic and concise manner, which shall include the following. The frequency of testing must as per the Table: Testing Methodology and Frequency

- Availability of the Facilities
- Characteristics of the Treated Effluent and deviations from the KPIs, if any
- Characteristics of the Digested Sludge and deviations from the KPIs, if any

1.6.5. **Monthly Report**

The Concessionaire shall provide details in the form of monthly reports, of operational data and information in relation to the O&M of the Facilities to the Executing Agency in a systematic and concise manner. Monthly reports shall be submitted to the Executing Agency by the 7th day of the subsequent month and shall include the following:

- Availability of the Facilities
- Characteristics of the Treated Effluent and deviations from the KPIs, if any
- Characteristics of the Digested Sludge and deviations from the KPIs, if any
- Summary of energy consumption (fuel and electricity) of the Facility;
- Quantities of chemicals, reagents, fuel and spare parts consumed;
- Stock level of chemicals, reagents, fuel and spare parts;
- Programme showing the scheduled maintenance (including planned and ongoing) work in the following month.

1.6.6. **Quarterly Report**

The Concessionaire shall provide details in the form of monthly reports, of operational data and information in relation to the O&M of the Facilities to the Executing Agency in a systematic and concise manner. Quarterly reports shall be submitted to the Executing Agency within 7 days of end of a quarter and shall include the following:

- Availability of the Facilities
- Characteristics of the Treated Effluent and deviations from the KPIs, if any
- Characteristics of the Digested Sludge and deviations from the KPIs, if any
- Summary of energy consumption (fuel and electricity) of the Facility;
o Quantities of chemicals, reagents, fuel and spare parts consumed;
o Stock level of chemicals, reagents, fuel and spare parts;
Programme showing the scheduled maintenance (including planned and ongoing) work in the following quarter.

1.6.7. Annual Report

The Concessionaire shall submit Annual Reports to the Executing Agency within 30 days of end of the year and the report shall include the following:

o Summaries of quantities and characteristics of Sewage/Faecal Sludge/Septage received and treated at the STP(s)/FSTP(s) during the reporting year;
o Overall performance of the STP(s)/FSTP(s) with highlights on non-compliance with KPIs as reported in each quarter;
o Summary of expiry dates for licences, permits and certificates for the O&M;
o Summary of major equipment breakdown, repair, overhaul, renewal, replacement, modification, performance tests, condition surveys carried out;
o Summary of incidents related to safety and health, environmental issues, security and complaints;
o Scheduled maintenance, overhaul, renewal, replacement, modification of major plant and equipment, Performance Tests and Condition Surveys in the forthcoming 12 months;
o List of Changes ordered by the Executing Agency, with details and status;

1.6.8. Monthly Environmental Monitoring Report

The Concessionaire shall submit Monthly Environmental Monitoring Reports to the Executing Agency providing overview of compliance with EHS Plan.

1.6.9. Testing Methodology and Frequency

The raw sewage/faecal sludge/septage and treated effluent shall be tested and checked for compliance with KPIs as defined below.

<table>
<thead>
<tr>
<th>Parameters to be measured</th>
<th>Frequency</th>
<th>Methodology</th>
</tr>
</thead>
<tbody>
<tr>
<td>Raw sewage / faecal sludge / septage and treated effluent (pH, TOC based BOD &amp; COD, TSS, TP, TN and Residual Chloride)</td>
<td>It should be every 2 hours</td>
<td>Analysing the average of periodical values at every 5 minutes (configurable) and status data by exception of respective online instruments/analyzers</td>
</tr>
<tr>
<td>Raw sewage / faecal sludge / septage and treated effluent (pH, BOD, TSS, COD, TP, TN and Fecal Coliform)</td>
<td>One composite sample a day</td>
<td>24-hour composite be collected and analysed. These samples shall be stored in a refrigerator at a temperature between 1°C and 4°C. The sample shall not be allowed to freeze.</td>
</tr>
<tr>
<td>Raw sewage / faecal sludge /</td>
<td>One Composite</td>
<td>The sample shall be tested in National</td>
</tr>
</tbody>
</table>

<tr>
<td>septage and treated effluent (pH, BOD, TSS, COD, TP, TN and Fecal Coliform)</td>
<td>sample of a day every month</td>
<td>Accreditation Board for Testing and Calibration Laboratories (NABL) accredited laboratory recognised by CPCB and SPCB.</td>
</tr>
<tr>
<td>Digested/dewatered Sludge</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Outlet Concentration of dewatered sludge, and volatile suspended solids</td>
<td>At time of disposal</td>
<td>Seven samples of sludge shall be collected at the time of disposal and analyzed for Outlet concentration of dewatered sludge, and volatile suspended solids. The geometric mean of the Outlet concentration of dewatered sludge, and volatile suspended solids of these seven samples shall not exceed the prescribed standards/ limits as mentioned in the KPI.</td>
</tr>
<tr>
<td>Fecal coliform, Salmonella, viruses and helminth egg</td>
<td>At time of disposal</td>
<td>Seven samples of sludge shall be collected at the time of disposal and analyzed for faecal coliforms. The geometric mean of the these seven samples shall not exceed the fecal coliform limits.</td>
</tr>
<tr>
<td>Outlet Concentration of dewatered sludge, Fecal coliform, Salmonella, viruses, helminth egg and volatile suspended solids.</td>
<td>Once in month</td>
<td>The Outlet Concentration of dewatered sludge, volatile suspended solids, and fecal coliform of any one sample every month shall be tested in National Accreditation Board for Testing and Calibration Laboratories (NABL) accredited laboratory recognised by CPCB and SPCB</td>
</tr>
</tbody>
</table>

### 1.6.10 Staffing

For all operation and maintenance works, the Concessionaire shall provide skilled staff which has adequate qualifications and sufficient experience of similar works.

The Concessionaire shall appoint an overall Facilities Manager to be responsible for managing the Operation of the Facilities. The detailed staffing schedule shall be approved by Executing Agency. No staff / labour below the age of 18 years shall be employed. The Concessionaire shall make appropriate arrangements for maintenance of items like road work, buildings, horticulture, patrolling and maintenance of civil structures, vehicle operations and other activities defined to fulfill its obligations under O&M Contract.
PART E
Electrical Load List
**Part E : Electrical Load List**

List of Electrical Drives

This information requested for each proposed STP(s)/FSTP(s), and PS and LS is to consider the Bidders load calculations for Transformer Sizing Calculation and for communication to the Electricity Board and for assessment of Emergency Load requirement. The Bidders shall include any particular additional equipment anticipated for the running of the facilities. The bidders shall fill in the requisite information as per the technology considered.

DISCLAIMER

The information contained in this RFP or any other information provided to the Bidders, whether verbally or in writing or in any other form, by or on behalf of the [EXECUTING AGENCY] or (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY)¹ and its employees or advisors is provided to the Bidders on the terms and conditions set out in this RFP and such other terms and conditions subject to which such information is provided.

This RFP is not an agreement and further it is neither an offer nor an invitation by the [EXECUTING AGENCY] to the Bidders or any other Person. The purpose of this RFP is to provide the Bidders with information that may be useful to them in the preparation and submission of their Bids.

This RFP includes statements which reflect various assumptions and assessments arrived at by the [EXECUTING AGENCY], (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY) and their advisors for the Project. Such assumptions, assessments and statements do not purport to contain all the information that the Bidders may require. The information contained in this RFP may not be appropriate for all Persons and it is not possible for the [EXECUTING AGENCY], (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY) and their employees or advisors to consider the investment objectives, financial situation and particular needs of each Person who reads this RFP. The assumptions, assessments, statements and information contained in this RFP may not be complete, accurate, adequate or correct. Each Bidder should therefore conduct its own investigations and analysis and should check the accuracy, adequacy, correctness, reliability and completeness of the assumptions, assessments, statements and information contained in this RFP.

The information provided in this RFP to the Bidders is on a wide range of matters, some of which may depend upon interpretation of the law. The information given is not intended to be an exhaustive account of statutory requirements and should not be regarded as a complete or authoritative statement of the law. The [EXECUTING AGENCY], (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY) and their employees and advisors accept no responsibility for the accuracy or otherwise for any interpretation or opinion on laws expressed in this RFP.

The issue of this RFP does not imply that the [EXECUTING AGENCY] is bound to qualify any Bidder or to award the Project to any Bidder. The [EXECUTING AGENCY] reserves the right to reject all or any of the Bids without assigning any reasons whatsoever.

¹ Delete if not applicable.
GLOSSARY

In this RFP, unless the context otherwise requires, capitalised terms shall have the meaning given to them in the table below. Capitalised terms not defined below shall have the meaning given to them in the Concession Agreement.

<table>

<td>means a bid consisting of the Qualification Proposal and the Financial Proposal submitted by a Bidder for qualification and award of the Project, and <strong>Bids</strong> mean collectively, all the bids for the Project.</td>
</tr>
<tr>
<td><strong>Bid Due Date</strong></td>
<td>means the last date for submission of the Bids specified in the Bid Schedule, as may be extended from time to time in accordance with Clause 19.</td>
</tr>
<tr>
<td><strong>Bid Price Sheet</strong></td>
<td>means the sheet provided on the e-Procurement Portal, in which the Bidders shall quote for the [LOCATION] STP and/or FSTP and its Associated Infrastructure, the: (a) <strong>Bid Project Cost</strong> (including all Taxes); (b) [LOCATION] Facilities <strong>O&amp;M Charges</strong> for the first month after COD for the STP and the Associated Infrastructure (including all Taxes); (c) Guaranteed Energy Consumption for the O&amp;M Period for the STP and for the Associated infrastructures; and (d) [LOCATION] Facilities <strong>Land Requirement</strong>, as required based on which the Bid Price will be calculated.</td>
</tr>
<tr>
<td><strong>Bid Process</strong></td>
<td>means the single-stage bidding process, with two sub-stages, undertaken by [EXECUTING AGENCY] to award the Project to the Selected Bidder on the terms and conditions set out in this RFP. The Bid Process has commenced with the issuance of this RFP and will end on the date that the Concession Agreement is executed with the Special Purpose Vehicle incorporated by the Selected Bidder for the Project.</td>
</tr>
<tr>
<td><strong>Bid Project Cost</strong></td>
<td>means the cost of construction of the [LOCATION] Facilities, any power plant proposed to be set up by the Bidder, as quoted</td>
</tr>
</tbody>
</table>

² For Bank Funded Projects
by a Bidder in its Bid, which must include the interest during construction, Taxes and all other pre-operative expenses in relation to the [LOCATION] Facilities and the power plant, if any.

| **Bid Schedule** | means the schedule of the Bid Process set out in Clause 2.14, as may be amended from time to time. |
| **Bid Security** | means a bid security that must be submitted by a Bidder along with its Bid in accordance with Clause 15. |
| **Bidder** | means an interested entity or a Consortium of entities as described in Clause 3.1(a) which submits a Bid to [EXECUTING AGENCY] in accordance with this RFP and includes each Member when the Bidder is a Consortium, and Bidders shall be construed accordingly. |
| **BOD** | means biochemical oxygen demand. |
| **Capital** | means, in respect of the SPV that is incorporated by the Selected Bidder to act as the Concessionaire, the total capital of such SPV that will be raised by the issuance of equity shares, preference shares and convertible instruments. |
| **Clause** | means a clause of this RFP. |
| **COD Certificate** | means the certificate issued or deemed to be issued by [EXECUTING AGENCY] upon successful completion of the Trial Operations of the [LOCATION] Facilities, in accordance with the Concession Agreement. |
| **Commercial Operations Date or COD** | means the date on which the COD Certificate is issued or deemed to be issued to the Concessionaire in accordance with the Concession Agreement. |
| **Companies Act** | means the (Indian) Companies Act, 1956 or the (Indian) Companies Act, 2013, as amended from time to time, as the context may require. |
| **Company** | means a company incorporated under the Companies Act or a foreign company incorporated under the relevant statute of its
**Concession Agreement**

means the tripartite concession agreement to be executed between (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY), [EXECUTING AGENCY] and the Concessionaire. A draft of the Concession Agreement is attached to this RFP.

**Concessionaire**

means the Special Purpose Vehicle incorporated by the Selected Bidder to implement the Project.

**Conflict of Interest**

has the meaning ascribed to it in Clause 3.3.

**Consortium**

means any combination of Companies that have formed a consortium for the purpose of submitting a Bid and to implement the Project if such consortium is declared the Selected Bidder.

**Construction Completion Date**

means, with respect to the [LOCATION] Facility, the date on which the Construction Completion Certificate is issued or deemed to be issued to the Concessionaire and with respect to [LOCATION] Facility in accordance with the Concession Agreement and the reference to Construction Completion Date shall be construed accordingly.

**Construction Period**

means the period from the Effective Date until the Construction Completion Date.

**Control**

means, with respect to a Person:

(a) the ownership, directly or indirectly, of more than 50% of the voting shares of such Person; or

(b) the power, directly or indirectly, to direct or influence the management and policies of such Person by operation of law, contract or otherwise,

and the term Controlled and Controlling shall be construed accordingly.

**Effective Date**

means the date on which all the Conditions Precedent have been satisfied by [EXECUTING AGENCY], (NAME OF THE

jurisdiction.

</tr>
<tr>
<td>Trial Operations</td>
<td>means the operation of the [LOCATION] Facilities on a trial basis for 3 months post the Construction Completion Date in accordance with the Concession Agreement.</td>
</tr>
</tbody>
</table>
SECTION I
INTRODUCTION

1. BACKGROUND

1.1 (Brief about the genesis of the project).

1.2 The Government of India has received loan (Loan number: IBRD--_____) and credit (Credit number: IDA------) (hereafter jointly or separately called “loan”) from the International Bank for Reconstruction and Development (IBRD) and International Development Association (IDA) (hereafter interchangeably called “the Bank”) of the U.S. dollar amount one Billion under the -----------------------(Name of the loan). The loan will be used in various currencies toward the cost of the Project ------------------(name of the project/scheme). The Borrower intends to apply a portion of the proceeds of this loan to eligible payments under the contract for which this RFP is issued.  

1.3 The [EXECUTING AGENCY] ([EXECUTING AGENCY]), hereinafter referred to as the [EXECUTING AGENCY], is a statutory body constituted under ________, and has the power to ________. With a view to implement the -------------------(Name of the project/scheme), the [EXECUTING AGENCY] in association with the (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY) , has decided to undertake the development, operation and maintenance of STP and/or FSTP, with a proposed capacity of [STP CAPACITY IN MLD] STP and their Associated Infrastructure at [LOCATION], on a PPP basis, through a hybrid annuity model. While the [EXECUTING AGENCY] will be the principal executing agency and bidding authority for the Project, (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY) will be responsible for making payments to the Concessionaire.

1.4 The objectives that (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY) and [EXECUTING AGENCY] wish to achieve through the Project are to:

(a) intercept raw sewage flowing into the (name of water body/source) and divert the raw sewage to the [LOCATION] STP;

(b) treatment of the raw sewage and/or septage/faecal sludge at the [LOCATION] STP;

(c) implement viable technologies and international best practices for development, operation and maintenance of the [LOCATION] Facilities; and

(d) demonstrate large scale private sector participation and mobilization of private sector investment to further the national aim of ------------------(insert the aim of any).

For Bank Funded Projects only. If the funding is from any other Multilateral agency this clause and reference in the definition may be suitably modified.

These lines may be replaced suitably to reflect the nature of project such as I &D works or sewerage networks.
1.5 The main features of the Project are set out below:

(a) The [EXECUTING AGENCY] will provide such part of the Site as required by the Concessionaire to develop the [LOCATION] Facilities and implement the Project based on the [LOCATION] Facilities Land Requirement quoted by the Selected Bidder, free of all encumbrances and encroachments, and along with all necessary rights of way.

(b) The Concessionaire will be required to design, finance, construct and complete the [LOCATION] Facilities on or prior to the Scheduled Construction Completion Date, in accordance with the Concession Agreement.

(c) The [EXECUTING AGENCY] will provide, operate and maintain the Supporting Infrastructure for the [LOCATION] STP, to enable the Concessionaire to operate the [LOCATION] STP in accordance with the Concession Agreement.

(d) In order to meet its power consumption requirements for the [LOCATION] Facilities, the Concessionaire [shall/may]\(^8\) construct and operate a biogas power plant at the [LOCATION] STP Site, to utilise the biogas generated from the treatment of raw sewage at the [LOCATION] STP to produce clean energy. The Concessionaire may also set up a rooftop solar project at the [LOCATION] STP Site to meet its power consumption requirements.

(e) On and from the COD and until the Expiry Date, the Concessionaire will be required to operate and maintain the [LOCATION] Facilities in accordance with the Concession Agreement, such that the [LOCATION] Facilities meet the key performance indicators specified in the Concession Agreement.

(f) Upon the expiry of the O&M Period, the [LOCATION] Facilities and any power plant set up by the Concessionaire, will be transferred to the [EXECUTING AGENCY] after the rectification of any defects or deficiencies, in accordance with the Concession Agreement.

(g) The construction, operation and maintenance of the [LOCATION] Facilities must be in accordance with Applicable Laws, Applicable Permits and other requirements specified in the Concession Agreement.

(h) Prior to the Effective Date, (NAME OF THE STATE/NATIONAL LEVEL AGENCY IF ANY) will appoint a Project Engineer to assist the [EXECUTING AGENCY] in supervising the construction, operation and maintenance of the [LOCATION] Facilities. The Project Engineer shall support the [EXECUTING AGENCY] in monitoring compliance with the key performance indicators to be specified in the Concession Agreement. (NAME OF THE STATE/NATIONAL LEVEL AGENCY IF ANY) will

---

\(^8\) Construction of biogas power plant compulsory in case of STP capacity > 40 MLD
solely bear the costs of the Project Engineer.

(i) The Concessionaire shall operate the [LOCATION] Facilities at its risk for the term of the Concession Agreement.

(j) 40% of the [LOCATION] Facilities Bid Project Cost will be reimbursed to the Concessionaire during the Construction Period, which will be linked to completion and certification of the works corresponding to specified [LOCATION] Facilities Payment Milestones (refer clause 9.3 of Concession Agreement)

(k) From the COD, the [LOCATION] Facilities Capex Annuity (along with interest) and the [LOCATION] Facilities O&M Charges will be paid on a quarterly basis to the Concessionaire. Additionally, the Concessionaire will also be reimbursed on a quarterly basis for the [LOCATION] Facilities Power Charges at actuals (subject to a cap of the [LOCATION] Facilities Power Charges based on the Guaranteed Energy Consumption) for power consumed for O&M of the Facilities. If the Concessionaire consumes more power for O&M of the Facility than the Guaranteed Energy Consumption in any given quarter, it will be liable to pay damages to the [EXECUTING AGENCY] in accordance with the Concession Agreement.

(l) The [NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY] will set up a revolving escrow account for the Project, and all Payment Milestone (linked construction payments, Capex Annuities (along with interest), [LOCATION] Facilities O&M Charges and the [LOCATION] Facilities Power Charges will be paid to the Concessionaire through this escrow account. From the Effective Date and until the Construction Completion Date, [NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY] will ensure that the escrow account is funded with an amount equivalent to the construction payments due to the Concessionaire for the next 2 [LOCATION] Facilities Payment Milestones. From the COD and at all times thereafter until the expiry or termination of the Concession Agreement, [NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY] shall keep the escrow account funded with the Capex Annuities (along with interest), the [LOCATION] Facilities O&M Charges and the estimated [LOCATION] Facilities Power Charges (based on the Guaranteed Energy Consumption) for the [LOCATION] Facilities for the subsequent 2 years.

(m) Subject to early termination, the Concession Agreement shall be valid until the Expiry Date.

1.6 The [EXECUTING AGENCY] is now inviting interested natural persons, Companies, other private entities and State-owned entities to submit Bids to implement the Project.

1.7 The bidding will be conducted through the International Competitive Bidding (ICB) procedures specified in the World Bank’s Guidelines: Procurement of Goods, Works and Non-consulting
Services under IBRD Loans and IDA Credits& Grants, January 2011, revised July 2014 (Guidelines) and is open to all Bidders from eligible source countries as defined in the Guidelines.9

1.8 This RFP follows the General Procurement Notice for ---------------(name of the scheme/project if any) that was published on United Nations Development Business online Page 17 of 92 on March 30, 2011 and updated on January 31, 2014.10

1.9 The Selected Bidder is required to incorporate a Special Purpose Vehicle to implement the Project and such Special Purpose Vehicle will be required to execute the Concession Agreement with the [EXECUTING AGENCY] and (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY) in the format attached to this RFP.

1.10 The statements and explanations contained in this RFP are intended to provide the Bidders with an understanding of the subject matter of this RFP and the Project. Such statements and explanations should not be construed or interpreted as limiting in any way or manner:

   (a) the scope of the rights and obligations of the Concessionaire, which will be set out definitively in the Concession Agreement; or

   (b) the [EXECUTING AGENCY]’s right to alter, amend, change, supplement or clarify the rights and obligations of the Concessionaire or the terms and conditions that will be set out in the Concession Agreement, in accordance with this RFP.

   Consequently, any omissions, conflicts or contradictions between this RFP and the Concession Agreement are to be noted, interpreted and applied appropriately to give effect to this intent. (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY) and the [EXECUTING AGENCY] will not entertain any claims on account of such omissions, conflicts or contradictions.

---

2. BRIEF DESCRIPTION OF THE BID PROCESS

2.1 The [EXECUTING AGENCY] has adopted a single-stage Bid Process for declaration of the Selected Bidder for award of the Project, which is divided into 2 sub-stages.

2.2 The Bidders shall download the RFP from the e-Procurement Portal [web address for TENDER PORTAL]. A complete set of bidding documents will be available on the e-Procurement Portal in the ‘Active Tenders” section and will be available only until the specified time on the Bid Due Date. The [EXECUTING AGENCY] is not responsible for the completeness of the RFP, if it is not downloaded directly from the e-Procurement Portal complete with Addenda, if issued and uploaded on the e-Procurement Portal by the bid inviting authority.

---

9 For Bank Funded Projects
10 For Bank Funded Projects
2.3 Each Bidder is required to submit a single Bid, which should consist of 2 parts: (a) the Qualification Proposal; and (b) the Financial Proposal.

2.4 Evaluation stages

The evaluation of the Bids will be carried out in 2 sub-stages:

(a) The first sub-stage will involve qualification of the Bidders based on the evaluation of their Qualification Proposals to determine compliance with the Eligibility Criteria and the Qualification Criteria in accordance with Clause 3 and 4. Only those Bidders who are found to meet the Eligibility Criteria and the Qualification Criteria will be qualified for the next sub-stage.

(b) The second sub-stage will involve evaluation of the Financial Proposals of those Bidders whose Qualification Proposals meet the requirements set out in Clause 3 and 4, to identify the Selected Bidder for the Project.

2.5 Bid parameter

Each Bidder will be required to quote in the Bid Price Sheet, for the [LOCATION] Facilities, the following 4 components (on the basis of net present value): (a) the [LOCATION] Facilities Bid Project Cost (including all Taxes); (b) the [LOCATION] Facilities O&M Charges for the first month after COD (including all Taxes); (c) the Guaranteed Energy Consumption for the O&M Period; and (d) the [LOCATION] Facilities Land Requirement.

For the purposes of calculation of the 'Guaranteed Energy Consumption' of the [LOCATION] Facilities, each Bidder will be required to quote in its Bid Price Sheet the maximum number of units of power (in kWh) per MLD which it expects the Concessionaire to consume to treat the varying volumes (expressed in MLD) and BOD of sewage and faecal sludge, as specified in the format of the Bid Price Sheet for the [LOCATION] Facilities. Based on the number of units of power per MLD quoted by a Bidder for the varying volumes and BOD of sewage, the average number of units (in kWh) that the Concessionaire is expected to consume per MLD of sewage and/or faecal sludge treated at the [LOCATION] STP will be calculated using the formula specified in the Bid Price Sheet (such average, the [LOCATION] Average Guaranteed Energy Consumption). The [LOCATION] Facilities’ Average Guaranteed Energy Consumption will be used to calculate the [LOCATION] Facilities Power Charges of a Bidder in accordance with the Bid Price Sheet.

Bidder shall carefully quote the [LOCATION] Facilities Land Requirement in the Financial Proposal. No additional Land shall be ordinarily allocated to the Concessionaire beyond the quoted Land in the Financial Proposal for the Construction of the Project. However, under unavoidable circumstances and in the interest of the Project, the [EXECUTING AGENCY] based on availability, may consider allocating additional land for the construction of the Project upon the request of the Concessionaire and such allocation shall be subject to the payment of a
sum equivalent to one hundred and fifty percentage of the [LOCATION] Facilities Land Rate, for each additional acres of Land and part thereof. If the additional land requirement changes position of the Selected Bidder/Concessionaire vis-a-vis the Second Preferred Bidder, then the Concessionaire shall pay to [EXECUTING AGENCY], a sum of equivalent to (a) one hundred and fifty percentage of the [LOCATION] Facilities Land Rate for each additional acres of Land and part thereof; OR (b) the difference between [LOCATION] Facilities Bid Price of Second Preferred Bidder and the revised [LOCATION] Facilities Bid Price of the Selected Bidder; whichever is higher.

Based on the components quoted by the Bidders in the Bid Price Sheet for the [LOCATION] Facilities, the [LOCATION] Facilities Bid Price, will be calculated as per the formula in the Bid Price Sheet.

The only criterion for evaluation and comparison of Financial Proposals will be the [LOCATION] Facilities Bid Price.

2.6 The Bidder shall quote the [LOCATION] Facilities Bid Project Cost in INR i.e., Indian National Rupees. However, for any inputs required by the Bidder from outside India during the Construction Period, the Bidder may specify in its [Financial Proposal] the percentage of the Bid Project Cost that it would want to receive in a foreign currency. Payments for such inputs required from outside India may be quoted in up to 3 foreign currencies using RBI selling (exchange) rate prevailing 28 days prior to the Bid Due Date. It is clarified that the aggregate construction payments due to the Concessionaire during the Construction Period shall not exceed 40% of the Bid Project Cost, as quoted by the Selected Bidder in Rupees and adjusted for inflation under the Concession Agreement, on account of a percentage of the Bid Project Cost being paid to the Concessionaire in foreign currencies.\footnote{\textsuperscript{11}}

2.7 Subject to Clause 7.1(e), the Preferred Bidder shall be the one which: (a) meets the Qualification Criteria and the Eligibility Criteria; and (b) quotes the lowest [LOCATION] Facilities Bid Price. Generally, the Preferred Bidder shall be the Selected Bidder for the Project. If the Preferred Bidder withdraws its Bid or is not selected for any reason, then the [EXECUTING AGENCY] may, in its discretion, select the Second Preferred Bidder as the Selected Bidder or annul the Bid Process.

2.8 Bidders are required to submit the Bid Security along with their Bids as per Clause 15. The Bidders shall provide the Bid Security in the form of a bank guarantee issued by a Scheduled Bank in India or by a foreign bank listed with the Reserve Bank of India or a guarantee issued by a Public Financial Institution, and payable at [LOCATION] in favour of "[EXECUTING AGENCY]" represented by the Project Manager, Urban Works Unit 2\textsuperscript{nd}, in the format set out at Annexure 11. The original Bid Security must be submitted to [EXECUTING AGENCY] at the

\footnote{\textsuperscript{11} For Bank Funded Projects and International Projects}
address mentioned in Clause 24.11 below before the date/time of opening of the Bids (Qualification Proposals), either by registered/speed post/courier or by hand, failing which the Bid will be declared non-responsive. A scanned copy of the Bid Security must be uploaded by the Bidders on the e-Procurement Portal along with their Bids.

2.9 All Bids are required to be prepared and submitted electronically in accordance with the terms of this RFP on or before the Bid Due Date.

2.10 The Bidders may inspect the Site and carry out, at their own cost, such inspections as may be required to submit their respective Bids at any time prior to the date specified in the Bid Schedule. The [EXECUTING AGENCY] shall facilitate such site visits provided that the Bidder gives the [EXECUTING AGENCY] at least 3 days' prior written notice of its intention to visit the Site.

2.11 It will be assumed that the Bidders have accounted for all relevant factors, including technical data, status and condition of the Supporting Infrastructure, the Site conditions, climate, weather conditions, availability of power (including the requirement of any power back-up), water and other utilities for construction and/ or operations and maintenance of the [LOCATION] Facilities, access to the Site, handling and storage of materials, Applicable Laws and Applicable Permits while submitting their Bids. The Bidders will be deemed to have full knowledge of the Project, including the scope of activities required to be undertaken by the Bidders to undertake the Project.

2.12 e-Procurement

(a) The Bid Process will be conducted by way of e-tendering. In order to participate in the Bid Process, a Bidder must procure a digital signature certificate (class II or III) and register on the e-Procurement Portal using its digital signature. A digital signature certificate may be procured from a registered certifying authority as stipulated by Controller of Certifying Authorities, GoI.

(b) In case of a Consortium, the Bidder must register with the e-Procurement Portal in the name of the Lead Member, using the digital signature certificate issued in the name of the authorized signatory of the Lead Member.

(c) The Bidders must: (i) upload a soft copy/scanned copy of their Qualification Proposal, including a copy of the Bid Security on the e-Procurement Portal in PDF format; and (ii) populate the Bid Price Sheet provided on the e-Procurement Portal, before the specified time on the Bid Due Date. Upon submitting the Qualification Proposals and the Financial Proposals on the e-Procurement Portal, the Bidders must affix their digital signature both to the Qualification Proposals and the Financial Proposals.

(d) The Bidders are encouraged to visit the e-Procurement Portal to acquaint themselves with the process of submitting their Bids online.
(e) For the purposes of determining the cut-off time for submission of queries and Bids, the central server time displayed on the clock on the e-Procurement Portal will be followed by the Bidders and the [EXECUTING AGENCY].

2.13 Any queries or requests for additional information relating to this RFP should be submitted by the Bidder on the e-Procurement Portal on or before the specified time and date mentioned in the Bid Schedule.

2.14 [EXECUTING AGENCY] shall endeavour to adhere to the following schedule for the Bid Process:

SECTION II
ELIGIBILITY AND QUALIFICATION CRITERIA

3. ELIGIBILITY OF BIDDERS

3.1 Nature of Bidder

(a) A Bidder may be a natural person, a Company registered under the Companies Act or an equivalent law outside India, or any other private entity or State-owned entity, acting in its individual capacity or as a Consortium. The term Bidder used in this RFP shall apply to both a single entity as well as a Consortium.

However, Bidders that are Government-owned enterprises or institutions in India may participate only if they can establish that they (i) are legally and financially autonomous (ii) operate under commercial law, and (iii) are not dependent agencies of (NAME OF THE STATE/NATIONAL LEVEL AGENCY IF ANY) or [EXECUTING AGENCY].

To be eligible, a government-owned enterprise or institution shall establish to [EXECUTING AGENCY] Bank’s satisfaction, through all relevant documents, including its Charter and other information [EXECUTING AGENCY] Bank may request, that it: (i) is a legal entity separate from the government (ii) does not currently receive substantial subsidies or budget support; (iii) operates like any commercial enterprise, and, inter alia, is not obliged to pass on its surplus to the government, can acquire rights and liabilities, borrow funds and be liable for repayment of its debts, and can be declared bankrupt; and (iv) is not bidding for a contract to be awarded by the department or agency of the government which under their applicable laws or regulations is the reporting or supervisory authority of the enterprise or has the ability to exercise influence or control over the enterprise or institution.

(b) Eligible Countries

(i) In accordance with paragraph 1.10 of the Guidelines, the Bank permits firms and individuals from all countries to offer goods, works and services for Bank-financed projects. As an exception, firms of a country or goods manufactured in a country may be excluded if:

(A) Paragraph 1.10 (a)(i): as a matter of law or official regulation, India prohibits commercial relations with that country, provided that the Bank is satisfied that such exclusion does not preclude effective competition for the services required under the Project; or

(B) Paragraph 1.10 (a)(ii): by an act of compliance with a decision of the

12 For Bank Funded Projects and International Projects
United Nations Security Council taken under Chapter VII of the Charter of the United Nations, India prohibits any import of goods from that country or any payments to persons or entities in that country.

(ii) For the information of Bidders, at the present time, firms, goods and services from the following countries are excluded from this bidding:

   (A) With reference to paragraph 1.10(a)(i) of the Guidelines: none

   (B) With reference to paragraph 1.10(a)(ii) of the Guidelines: none

(c) If a Bidder is a Consortium, then the Consortium and its Members shall comply with the following conditions:

   (i) The number of Members in such Consortium shall not exceed 3.

   (ii) The Bid submitted by the Consortium should contain the required information for each Member and a brief description of the roles and responsibilities of each Member.

   (iii) The Consortium will nominate one of the Members as the Lead Member. Such nomination will be supported by a power of attorney from each Member of the Consortium and will be in the format set out in Annexure 1J. The Lead Member will have the authority to represent and bind all the Members during the Bid Process.

   (iv) The Members of the Consortium shall enter into a binding and enforceable Joint Bidding Agreement, in the format set out in Annexure 1K, and shall appoint one of the Members to represent the Consortium. All Members shall be jointly and severally liable for the performance of the Project till the end of the term of the Concession Agreement or till the date of exit from the Concessionaire subject to clause 3.2(b)(iii) of the RFP document, whichever is earlier. The Members will not be permitted to amend or terminate the Joint Bidding Agreement, at any time during the validity of the Bid without the prior consent of [EXECUTING AGENCY].

3.2 **Lock-in Restrictions and Change in Control**

   (a) Each Bidder (whether a single entity or Consortium) is required to incorporate a Special Purpose Vehicle to implement the Project.

   (b) If the Selected Bidder is a Consortium, then the Members are required to comply with the following conditions with respect to the SPV to be incorporated by the Selected Bidder to implement the Project:
(i) the Lead Member shall hold not less than 26% of the total Capital and voting rights of the Concessionaire until 3 years after the COD;

(ii) any Member, other than the Lead Member, whose Technical Capacity or Financial Capacity is being assessed for the purpose of qualification, shall hold at least 26% of the total Capital and voting rights of the Concessionaire for 3 years after the COD; and

(iii) after the expiry of 3 years from the COD, the Lead Member and/or other Members can exit the Concessionaire, subject to: (A) the Member who demonstrated the O&M experience for the purposes of qualification continuing to be part of the Concessionaire; or (B) the entity acquiring the shareholding of the Lead Member/any other Member in the Concessionaire meeting the technical qualification criteria set out in Clause 4.1 (b); or (C) the Concessionaire appointing an O&M contractor who complies with the technical qualification criteria set out in Clause 4.1 (b).

(c) If the Selected Bidder is a single entity, then:

(i) the Selected Bidder shall hold at least 51% of the total Capital and voting rights of the Concessionaire until the COD, and at least 26% of the total Capital and voting rights of the Concessionaire for 3 years after the COD; and

(ii) after the expiry of 3 years from the COD, the Selected Bidder can exit the Concessionaire, subject to: (A) the entity acquiring the shareholding of the Selected Bidder in the Concessionaire meeting the technical qualification criteria set out in Clause 4.1 (b); or (B) the Concessionaire appointing an O&M contractor who complies with the technical qualification criteria set out in Clause 4.1 (b).

(d) If, post submission of the Bid, any Associate and/or Nominated STP Sub-Contractor, whose credentials have been taken into consideration for determining Technical Capacity and/or Financial Capacity, ceases or will cease to be an Associate of the Bidder or such Member, or Nominated STP Sub-Contractor of the Bidder, then, the Selected Bidder shall seek the approval of the [EXECUTING AGENCY] for such occurrence. If the [EXECUTING AGENCY] is of the view that such occurrence is likely to affect the Technical Capacity and/or Financial Capacity of the Bidder adversely, then the [EXECUTING AGENCY] may disqualify the Bidder from participation in the Bid Process; or, if the Bidder has been declared as the Selected Bidder, withdraw the LOA or treat such occurrence as a Concessionaire event of default in accordance with the Concession Agreement, without the [EXECUTING AGENCY] incurring any liability towards the Selected Bidder or the Concessionaire for such withdrawal or possible
termination. While the [EXECUTING AGENCY] will not unreasonably withhold or delay such approval, the decision of the [EXECUTING AGENCY] will be final in this regard.

(e) In the event of the experience of Nominated STP Sub-Contractor being claimed for qualification purpose, as per clause 4.1, and if such entity ceases to be the sub-contractor after the issue of LoA and/ or before the completion of 2 years from the COD, then with prior approval of [EXECUTING AGENCY] and/ or (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY) , the Selected Bidder shall propose to substitute such entity with another sub-contractor who shall meet the qualification criteria set out in Clause 4.1(a)(B), 4.1(a)(F)(ii) and 4.1(b)(ii) of this RFP. The substituted sub-contractor shall then be the Nominated STP Sub-Contractor. While the [EXECUTING AGENCY] will not unreasonably withhold or delay such approval, the decision of the [EXECUTING AGENCY] will be final in this regard.

If the [EXECUTING AGENCY] is of the view that such occurrence is likely to affect the Technical Capacity of the Bidder adversely, then the [EXECUTING AGENCY] may withdraw the LOA or treat such occurrence as a Concessionaire event of default in accordance with the Concession Agreement, without the [EXECUTING AGENCY] incurring any liability towards the Selected Bidder or the Concessionaire for such withdrawal or possible termination.

3.3 Conflict of Interest

Any Bidder found to have a conflict of interest (Conflict of Interest) shall be disqualified. A Bidder, a Member (in case of a Consortium), its Group Companies or Associates may be considered to have a Conflict of Interest with one or more Bidders, its Members, its Group Companies or Associates in this Bid Process if, as indicated in this Clause 3.3:

(a) they have a common Controlling partner, except that this disqualification shall not apply to any ownership by a bank, insurance company, pension fund or a public financial institution referred to in the Companies Act, 2013. Bidder can view the Companies Act, 2013 at http://www.mca.gov.in/Ministry/pdf/CompaniesAct2013.pdf. The current list of Public Financial Institutions is annexed at Annexure 6. The Bidders are advised to ascertain the updated list of Public Financial Institutions from the available sources; or

(b) they receive or have received any direct or indirect subsidy from any of them; or

(c) they have the same legal representative for purposes of this Bid; or

(d) they have a relationship with each other, directly or through common third parties, that puts them in a position to access the information about or influence the Bid of another
Bidder, or influence the decisions of [EXECUTING AGENCY] regarding this Bid Process; or

(e) the Bidder participates in more than one Bid for the same Project (as described in Clause 17); or

(f) the Bidder, or any of its Group Companies or Associates participated as a consultant in the preparation of any documents, design or technical specifications of the Project that are subject of the Bid; or

(g) the Bidder or any of its Group Companies or Associates has been hired (or is proposed to be hired) by [EXECUTING AGENCY] as project manager for the Project.

(h) The Bidder or any of its Group Companies or Associates has a close business or family relationship with a professional staff of (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY) (or of [EXECUTING AGENCY], or of a receipt of a part of the loan) who:

(i) are directly or indirectly involved in the preparation of the bidding documents or specifications of the contract, and/or the bid evaluation process of such contract; or

(ii) would be involved in the implementation or supervision of such contract unless the conflict stemming from such relationship has been resolved in a manner acceptable to [EXECUTING AGENCY] the Bank throughout the Bid Process and execution of the Concession Agreement.

3.4 Fraud and Corrupt Practices

It is the Bank’s policy to require that Borrowers (including beneficiaries of Bank loans), bidders, suppliers, contractors and their agents (whether declared or not), sub-contractors, sub-consultants, service providers or suppliers, and any personnel thereof, observe the highest standard of ethics during the procurement and execution of Bank-financed contracts. In pursuance of this policy, the Bank:

(a) defines, for the purposes of this provision, the terms set forth below as follows:

(i) “corrupt practice” is the offering, giving, receiving, or soliciting, directly or indirectly, of anything of value to influence improperly the actions of another party;

13 In this context, any action to influence the procurement process or contract execution for undue advantage is improper.

14 For the purpose of this sub-paragraph, “another party” refers to a public official acting in relation to the procurement process or contract execution. In this context, “public official” includes World Bank staff and employees of other organizations taking or reviewing procurement decisions.
(ii) “fraudulent practice” is any act or omission, including a misrepresentation, that knowingly or recklessly misleads, or attempts to mislead, a party to obtain a financial or other benefit or to avoid an obligation; ¹⁵

(iii) “collusive practice” is an arrangement between two or more parties designed to achieve an improper purpose, including to influence improperly the actions of another party; ¹⁶

(iv) “coercive practice” is impairing or harming, or threatening to impair or harm, directly or indirectly, any party or the property of the party to influence improperly the actions of a party; ¹⁷

(v) “obstructive practice” is

(aa) deliberately destroying, falsifying, altering, or concealing of evidence material to the investigation or making false statements to investigators in order to materially impede a Bank investigation into allegations of a corrupt, fraudulent, coercive or collusive practice; and/or threatening, harassing or intimidating any party to prevent it from disclosing its knowledge of matters relevant to the investigation or from pursuing the investigation, or

(bb) acts intended to materially impede the exercise of the Bank’s inspection and audit rights provided for under paragraph 1.16(c) below.

(b) will reject a proposal for award if it determines that the bidder recommended for award, or any of its personnel, or its agents, or its sub-consultants, sub-contractors, service providers, suppliers and/or their employees, has, directly or indirectly, engaged in corrupt, fraudulent, collusive, coercive, or obstructive practices in competing for the contract in question;

(c) will declare misprocurement and cancel the portion of the loan allocated to a contract if it determines at any time that representatives of the Borrower or of a recipient of any part of the proceeds of the loan engaged in corrupt, fraudulent, collusive, coercive, or obstructive practices during the procurement or the implementation of the contract in question, without the Borrower having taken timely and appropriate action

¹⁵ For the purpose of this sub-paragraph, “party” refers to a public official; the terms “benefit” and “obligation” relate to the procurement process or contract execution; and the “act or omission” is intended to influence the procurement process or contract execution.

¹⁶ For the purpose of this sub-paragraph, “parties” refers to participants in the procurement process (including public officials) attempting either themselves, or through another person or entity not participating in the procurement or selection process, to simulate competition or to establish bid prices at artificial, non-competitive levels, or are privy to each other’s bid prices or other conditions.

¹⁷ For the purpose of this sub-paragraph, “party” refers to a participant in the procurement process or contract execution.
satisfactory to the Bank to address such practices when they occur, including by failing to inform the Bank in a timely manner at the time they knew of the practices;

(d) will sanction a firm or individual, at any time, in accordance with the prevailing Bank’s sanctions procedures, including by publicly declaring such firm or individual ineligible, either indefinitely or for a stated period of time: (i) to be awarded a Bank-financed contract; and (ii) to be a nominated;

(e) will require that a clause be included in bidding documents and in contracts financed by a Bank loan, requiring bidders, suppliers and contractors, and their sub-contractors, agents, personnel, consultants, service providers, or suppliers, to permit the Bank to inspect all accounts, records, and other documents relating to the submission of bids and contract performance, and to have them audited by auditors appointed by the Bank.”

3.4.1 Inspection and Audit

In further pursuance of the policy referred to in ITB 3.4 above, Bidders shall permit and shall cause its agents (whether declared or not), sub-contractors, sub-consultants, service providers, or suppliers and any personnel thereof, to permit the Bank to inspect all accounts, records and other documents relating to any prequalification process, bid submission, and contract performance (in the case of award), and to have them audited by auditors appointed by the Bank.

3.5 Other Eligibility Criteria

(a) A Bidder or any Member of a Consortium that has been sanctioned by the Bank in accordance with the Bank’s Guidelines on Preventing and Combating Corruption in Projects Financed by IBRD Loans and IDA Credits and Grants, shall be ineligible to be awarded a Bank-financed contract, or benefit from a Bank-financed contract, financially or otherwise, during such period of time as the Bank shall determine.

(b) If the Bidder or any Member (in case of a Consortium) is party to any litigation (required to be disclosed as per Annexure 1H), in which, any subsequent ruling/judgment by any court/judicial authority after the submission of bid affects or could have a material adverse effect on the financial condition, prospects or business of such Bidder or

---

18 A firm or individual may be declared ineligible to be awarded a Bank financed contract upon: (i) completion of the Bank’s sanctions proceedings as per its sanctions procedures, including, inter alia, cross-debarment as agreed with other International Financial Institutions, including Multilateral Development Banks, and through the application the World Bank Group corporate administrative procurement sanctions procedures for fraud and corruption; and (ii) as a result of temporary suspension or early temporary suspension in connection with an ongoing sanctions proceeding. See footnote 14 and paragraph 8 of Appendix 1 of these Guidelines.

19 A nominated sub-contractor, consultant, manufacturer or supplier, or service provider (different names are used depending on the particular bidding document) is one which has either been: (i) included by the bidder in its pre-qualification application or bid because it brings specific and critical experience and know-how that allow the bidder to meet the qualification requirements for the particular bid; or (ii) appointed by the Borrower.
Member or its ability to fulfill its obligations under the Concession Agreement, the Bid will not be evaluated further by [EXECUTING AGENCY].

(c) If a Company has entered into a contract for operation of the e-Procurement Portal, which is currently valid and subsisting, then such Company and its Associates will not be eligible to submit a Bid. The e-Procurement portal (etender.up.nic.in) is operated by National Informatics Centre.

(d) If any contract of the Bidder or any Member (in case of a Consortium) has been suspended or terminated and/or performance security has been called by an employer for reasons related to the non-compliance by the Bidder with any ESHS requirements or safeguard in the past 5 years (required to be disclosed as per Annexure 1L), which, in [EXECUTING AGENCY]'s opinion, affects or could have a material adverse effect on the financial condition, prospects or business of such Bidder or Member or its ability to fulfill its obligations under the Concession Agreement, the Bid will not be evaluated further by [EXECUTING AGENCY].

Bidders will provide such evidence of their continued eligibility as [EXECUTING AGENCY] may request at any time during or after the Bid Process.

If a Bidder is a Consortium, then the term "Bidder" as used in Clause 3.3, Clause 3.4 and Clause 3.5 shall include each Member of such Consortium, and the term "Associate" as used in Clause 3.3, Clause 3.4 and Clause 3.5 shall include Associates of each Member of the Consortium.

If the Bidder has a Nominated STP Sub-Contractor to meet the Technical Criteria defined in Clause 4.1 (a) and Clause 4.1 (b), then the Clause 3.3, Clause 3.4 and Clause 3.5 shall also be applicable to such Nominated STP Sub-Contractor.

4. QUALIFICATION CRITERIA

The Bidders should satisfy the following minimum technical criteria and financial criteria set out in Clause 4.1 and Clause 4.2 respectively to qualify for evaluation of the Financial Proposals:

4.1 Technical Criteria

To demonstrate its technical capacity and experience (Technical Capacity), the Bidder must have the following experience:

(a) Development/Design and Construction experience

(A) For demonstrating technical capacity and experience (the “Technical Capacity”), the Bidder shall, during the 5 Financial Years immediately preceding the Bid Due Date, have:
(i) paid for, or received payments for, construction of Eligible Project(s); and/or

(ii) paid for development of Eligible Project(s) in Category 1 and/or Category 2 specified in Clause 4.1(a)(B); and/or

(iii) collected and appropriated revenues from Eligible Project(s) in Category 1 and/or Category 2 specified in Clause 4.1(a)(B),
such that the sum total of the above, is more than Rs. [Capital Cost of the Project] (the “Threshold Technical Capability”).

If the Bidder is a Consortium, then the Threshold Technical Capability as required above shall be demonstrated cumulatively, i.e. the Consortium as a whole should meet the requirement.

If the Bidder is relying on a Nominated STP Sub-Contractor for the Project Specific STP experience as per the clause 4.1(a)(F), then 25% of the Threshold Technical Capability shall be met by such Nominated STP Sub-Contractor. The bidder shall meet the remaining 75% of the Threshold Technical Capability requirement.

The Bidder shall provide the necessary information relating to Technical Capacity in the formats provided in Annexure 1E Part-III and Annexure 1E Part-IV along with the necessary supporting documents as per this RFP.

(B) Technical Capacity for purpose of evaluation

Subject to the provisions of Clause 4.1(a)(A), the following categories of experience would qualify as Technical Capacity and Eligible Experience (the "Eligible Experience") in relation to eligible projects, as stipulated in Clauses 4.1(a)(C) and 4.1(a)(D) (the "Eligible Projects"):

- Category 1: Development (PPP) experience on Eligible Projects in Infrastructure Sector that qualify under Clause 4.1(a)(C)
- Category 2: Construction experience on Eligible Projects in Infrastructure Sector that qualify under Clause 4.1(a)(D)

(i) For the purpose of this RFP, Infrastructure Sector would be deemed to include highways/roads, power, telecom, ports, airports, railways, metro rail, industrial parks/ estates, logistic parks, pipelines, irrigation, sewerage network, water, waste water, drainage and real estate development.
(ii) Eligible Experience in respect of each category shall be evaluated only for
Eligible Projects.

(iii) The Bidders shall quote experience in respect of a particular Eligible
Project under any one category only, even though the Bidder (either
individually or along with a member of the Consortium) may have played
multiple roles in the cited project. Double counting for a particular
Eligible Project shall not be permitted in any form.

(iv) The Bidder shall furnish the required Project-specific information and
evidence in support of its claim of Technical Capacity, in the format
provided in Annexure 1E Part-IV.

(C) For a project to qualify as an Eligible Project under Category 1:

(i) It should have been undertaken as a PPP project on BOT, BOLT, BOO,
BOOT or other similar basis for providing its output or services to a
public sector entity or for providing non-discriminatory access to users
in pursuance of its charter, concession or contract, as the case may be.
For the avoidance of doubt, a project which constitutes a natural
monopoly such as an airport or port should normally be included in this
category even if it is not based on a long-term agreement with a public
entity;

(ii) the entity claiming experience should have held, in the company owning
the Eligible Project, a minimum of 26% (twenty-six per cent) equity
during the entire year for which Eligible Experience is being claimed;

(iii) the capital cost of the project should be more than Rs. [10% of the
Project Capital Cost]; and

(iv) the entity claiming experience shall, during the 5 Financial Years
immediately preceding the Bid Due Date, have (1) paid for development
of the project (excluding the cost of land), and/ or (2) collected and
appropriated the revenues from users availing of non-discriminatory
access to or use of fixed project assets, such as revenues from highways,
airports, ports and railway infrastructure, but shall not include revenues
from sale or provision of goods or services such as electricity, gas,
petroleum products, telecommunications or fare/freight revenues and
other incomes of the company owning the Project.

(D) For a project to qualify as an Eligible Project under Category 2:

(i) the entity claiming experience shall, during the 5 Financial Years
immediately preceding the Bid Due Date, have paid for the execution of
its construction works or received payments from its client(s) for construction works executed, fully or partially, during the 5 Financial Years immediately preceding the Bid Due Date. For the avoidance of doubt, construction works shall not include operation and maintenance costs, supply of goods or equipment except when such goods or equipment form part of a turn-key construction contract/ EPC contract for the project. Further, the cost of land shall not be included hereunder.

(ii) only the payments (gross) actually made or received, as the case may be, during such 5 (five) financial years shall qualify;

(iii) the capital cost of the project should be more than Rs. [10% of the Project Capital Cost];

(E) Experience for any activity relating to an Eligible Project shall not be claimed by two or more Members of the Consortium. In other words, no double counting in respect of the same experience shall be permitted in any manner whatsoever. Provided that, the experience taken into assessment will be only of those who contribute a minimum 26% share to the Consortium.

Further, in case of a Nominated STP Sub-Contractor, experience for any activity relating to an Eligible Project shall not be claimed by both the Nominated STP Sub-Contractor and the Bidder.

(F) Specific Experience to the project:

(i) The Bidder shall have developed and/or designed and constructed, in the last 10 years immediately preceding the Bid Due Date, 1 Sewage Treatment Plant (STP) / Effluent Treatment Plant (ETP) / Common Effluent Treatment Plant (CETP) of at least [25% of the Project STP/CETP Capacity] Capacity, which shall have been developed or designed and constructed using any technology;

(ii) Provided if the Bidder does not have the STP/ ETP/ CETP experience, then the bidder may rely upon the experience of a Nominated STP Sub-Contractor for the purpose. In such case, the Nominated STP Sub-Contractor shall meet the eligibility criteria under this section. Further, the same Nominated STP Sub-contractor shall also meet the Operation & Maintenance Experience specified under clause 4.1(b) of this RFP.

(iii) The bidder shall submit a Sub-contractor Undertaking to the extent that such Nominated STP Sub-Contractor will be engaged for designing and/or constructing the proposed Project along with the certificate of experience from the relevant government authority/client for the project experience. In addition to this, both the Nominated STP Sub-Contractor
and the bidder shall each submit 50% of the Performance Security as mentioned in Clause 16.1 of this RFP. The Performance Security submitted by the Nominated STP Sub-Contractor shall be liable to be forfeited in the event of the Nominated STP Sub-Contractor leaving the project before the COD. In such situation, the Concessionaire is required to nominate another sub-contractor as per the Clause 3.2(e) of this RFP.

(iv) One Nominated STP Sub-Contractor can associate with only one Bidder at any point in time during the bidding. The approved Nominated STP Sub-Contractor shall not be changed without prior approval of [EXECUTING AGENCY] and/or (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY).

(v) The experience claimed shall be evidenced by the issuance of a completion certificate by the relevant government authority/client, certifying that the STP/ETP/CETP have been completed in terms of the concession agreement or similar contract executed for such plants;

(vi) To claim development experience, the entity claiming the experience shall have held, in the company developing the STP/ETP/CETP, a minimum of 26% equity share capital as on the commercial operations date of such project.

(vii) To claim design and construction experience, the entity claiming experience should have been appointed as the principal contractor (i.e., the contractor hired directly by the owner of the project/entity developing the relevant STP/ETP/CETP) and any other subcontractor experience is not permitted for claiming Technical Capacity.

(viii) The Bidder shall be required to develop the [LOCATION] STP Project using any technology prescribed in the CPHEEO Manual.

(ix) For using technologies other than those mentioned in the CPHEEO manual, the bidder shall tie up with a suitable technology provider subject to following conditions:

a. That the Bidder shall clearly indicate the name of the technology provider in Annexure 1B;

b. That the STPs using such new technology have been developed or designed and constructed in the 5 years preceding the Bid Due Date, as evidenced by the issuance of a completion certificate by the relevant government authority/client, certifying that the STP(s) have been completed in terms of the
concession agreement or similar contract executed for such STP(s); and

c. That the STPs using such new technology have been successfully operational for any 24 consecutive months in the 5 years preceding the Bid Due Date, in accordance with the relevant concession agreement or similar contract executed for such STP(s), as evidenced by a certificate from the relevant government authority.

d. That the technology provider undertakes to associate with the construction of the proposed Project up to completion of 2 years from COD as evidenced by a suitable Technology Agreement and a Technology Performance Security of 5% of the Bid Project Cost, which shall be forfeited if the technology provider leaves the project before the completion of 2 years from COD. The Technology Performance Security shall be returned on completion of 2 years from COD.

e. That one technology provider can associate with one Bidder at any point in time during the bidding

(b) Operation and maintenance experience

(i) The Bidder shall have successfully operated and maintained 1 STP/ETP/CETP of at least [25% of the Project STP Capacity] capacity for any 12 consecutive months in the 10 years immediately preceding the Bid Due Date, in accordance with the relevant concession agreement or similar contract executed for such STP/ETP/CETP. For demonstrating O&M experience of STP/ETP/CETP, the Bidder (and in case of a Consortium, any Member) is required to submit a certificate from the relevant governmental authority, evidencing successful operations and maintenance of the STP/ETP/CETP for which the Bidder is claiming O&M experience.

(ii) Provided if the Bidder does not have the required experience, then the bidder may rely upon the experience of the Nominated STP Sub-Contractor whose experience is claimed for the requirement under clause 4.1(a)(F) for the purpose.

(iii) The bidder shall submit a Sub-contractor Undertaking to the extent that such Nominated STP Sub-Contractor will be engaged for the Operation & Maintenance of the proposed Project, along with the certificate of experience from the relevant government authority/client for the project experience. In addition to this, both the Nominated STP Sub-Contractor
and the bidder shall each submit 50% of the O&M Securities as mentioned in Clause 16B.1 of this RFP. The performance security submitted by the Nominated STP Sub-Contractor shall be liable to be forfeited in the event of the Nominated STP Sub-Contractor leaving the project before the completion of 2 years from the COD. In such situation, the Concessionaire is required to nominate another sub-contractor as per the Clause 3.2(e) of this RFP. Also, one Nominated STP Sub-Contractor can associate with only one Bidder at any point in time during the bidding.

(c) It is clarified that:

(i) the Bidder must demonstrate both development/design and construction experience specified in Clause 4.1(a) above and O&M experience specified in Clause 4.1(b) above to be technically qualified for evaluation of the Financial Proposals;

(ii) the Bidder/Member may rely on the experience of its Associate(s) for demonstrating the Technical Capacity (including, if applicable, under Clause 4.1(d). However, a Bidder claiming the experience of the Associates for Technical Capacity, shall submit a Letter of Commitment from such Associate that the expertise of the Associate will be made available during the development and operation of the Project;

(iii) in case of a Consortium, the development/design and construction experience set out in Clause 4.1(a) above, may be demonstrated by one Member and the O&M experience of the STP set out in Clause 4.1(b) may be demonstrated by a different Member;

(iv) if the development/design and construction experience as set out in clause 4.1(a)(i) and the O&M experience as set out in the clause 4.1(b) is being claimed by a different Member, then the Member who demonstrates development/design and construction experience and the Member who demonstrates the O&M experience must each hold 26% of the total Capital and voting rights of the Concessionaire for atleast 3 years post COD;

(v) the development/design and construction experience of STP as set out in clause 4.1(a)(i) and the O&M experience as set out in clause 4.1(b) may be claimed in relation to the same STP. If, however, the development/design and construction experience and the O&M experience is being claimed for different STP, then it is clarified that the STP for which O&M experience is being claimed may be based on a
technology which is different from the technology used in the STP(s) for which development/design and construction experience is being claimed; and

(vi) for certificates claiming Technical Capacity through an experience that are issued overseas, the document will also have to be legalised by the Indian Embassy and notarised in the jurisdiction where the certificate is being issued. However, the certificates provided by the Bidders from countries that have signed the Hague Legislation Convention, 1961 are not required to be legalised by the Indian Embassy if it carries a conforming Apostille certificate.

(d) [The Bidder shall set up a biogas power plant at the [LOCATION] Facilities Site.]\(^{20}\) [If the Bidder proposes to setup a biogas power plant at its own discretion,]\(^{21}\), the Bidder/Member will be required to demonstrate its experience (in the format set out in Annexure 2) in developing or designing and constructing a biogas power plant, which should have:

- (A) a capacity of at least 0.25MW;
- (B) been based on STP effluent/faecal sludge;
- (C) been developed or designed and constructed in the 10 years preceding the Bid Due Date, as evidenced by the issuance of a completion certificate by the relevant government authority/client, certifying that the biogas power plant has been completed in terms of the relevant contract executed for such biogas power plant; and
- (D) successfully operational for any 24 consecutive months in the 10 years preceding the Bid Due Date, in accordance with the relevant contract executed for such biogas power plant, as evidenced by a certificate from the relevant government authority/client;

If the Bidder or any Member of the Consortium does not have any experience of having developed or designed and constructed a biogas power plant, the Bidder will be required to nominate an experienced power plant developer which has developed and/or designed a biogas power plant, which meets the criteria set out in (A) to (D) above. The nominated Subcontractor will be engaged to develop the power plant for the Project, if the Bidder is declared the Selected Bidder, and will be required to provide a consent letter in the format set out in Annexure 3 (along with certificate(s) from the relevant government authority).

\(^{20}\) Applicable if the STP capacity is > 40MLD

\(^{21}\) Applicable if the STP capacity is < 40MLD
4.2 Financial Criteria

To demonstrate its financial capacity to undertake the Project (Financial Capacity), the Bidder must meet each of the financial qualification criteria specified in this Clause 4.2.

(a) Net worth

(i) In each of the Financial Years [Mention the 3 Financial Years preceding the Bid Due Date], the Bidder’s Net Worth (as per the audited annual financial statements) shall be at least INR [25 to 33% of the Bid Project Cost].

(ii) If the Bidder is a Consortium, then the Net Worth, as required in Clause 4.2 (a)(i) above shall be demonstrated cumulatively, i.e., the Consortium as a whole should meet the requirement. Provided further that if the Bidder is subsequently declared the Selected Bidder for the Project, then any Member of the Consortium whose Net Worth was assessed for the purposes of demonstrating that the Consortium has the Financial Capacity to undertake the Project, shall hold at least 26% of the total Capital and voting rights of the Concessionaire for 3 years post the COD.

(iii) A Bidder or a Member of a Consortium may rely on the Net Worth of its Associate(s) for demonstrating its Financial Capacity. In such a case, the Bidder or a Member of a Consortium shall submit an undertaking from the Associate(s) stating that the necessary proportionate equity for the project will be provided for successful implementation of the project. In addition to this, during Financial Closure, necessary board resolution from the Associate(s) has to be submitted to the extent of equity contribution.

(b) The Bidder (and in case of a Consortium, any Member) and its Associate(s) (in case the Net Worth of the Associate is being claimed) is not affected by and has not been affected by any of the following events, conditions or circumstances in the 3 Financial Years immediately preceding the Bid Due Date, as certified by the statutory auditor of the Bidder (and in case of a Consortium, the statutory auditor of a Member) and its Associate(s) (if applicable):

(i) the Bidder (and the Associate(s), if applicable) having been categorized as a wilful defaulter in accordance with Applicable Laws or laws of the country of its incorporation;

(ii) the Bidder (and the Associate(s), if applicable) being subject to proceedings for declaration of or being declared bankrupt, being wound up, or having its affairs administered or conducted by any court, administrator, receiver; or

(iii) the Bidder (and the Associate(s), if applicable) having been declared by a court or other competent authority as being unable to pay its debts, or having made
any composition or arrangements with creditors or having had the repayment of its debts suspended.

(c) The Bidder (and in case of a Consortium, any Member) and its Associate(s) (if applicable) has not been convicted or otherwise being found responsible (or having any of its directors, partners, trustees, officers or managers convicted or being found responsible) by any court, tribunal, regulatory, public or other competent authority for a breach of any laws or regulations which:

(i) related to any act of fraud or dishonesty for which a fine, penalty, damages, compensation or other payment was levied against the Bidder (and the Associate(s), if applicable) or any of its directors, partners, trustees, officers or managers; or

(ii) resulted in the permanent or temporary suspension of the rights of the Bidder (and the Associate(s), if applicable) to provide any service or carry on any type of business or operations.
SECTION III
INSTRUCTION TO BIDDERS

PART A. GENERAL

5. SCOPE OF RFP

5.1 [EXECUTING AGENCY] wishes to receive Bids in accordance with this RFP for award of the Project.

5.2 The RFP must be read as a whole. If any Bidder finds any ambiguity or lack of clarity in this RFP, the Bidder must inform [EXECUTING AGENCY] at the earliest. [EXECUTING AGENCY] will then direct the Bidders regarding the interpretation of the RFP. If any discrepancy, ambiguity or contradiction arises between the terms of the RFP and the Concession Agreement in relation to:

(a) the Bid Process, the provisions of the RFP shall prevail; and

(b) the scope of services or any other terms or conditions of the Concession Agreement, including Technical Specifications, the provisions of the Concession Agreement shall prevail.

6. ACKNOWLEDGEMENT BY THE BIDDER

6.1 It shall be deemed that by submitting the Bid, the Bidder has:

(a) made a complete and careful examination of the RFP (including all instructions, forms, terms and specifications) and any other information provided by [EXECUTING AGENCY] under this RFP and the Bidder acknowledges that its submission of a Bid that is not substantially responsive to the RFP in every respect will be at the Bidder’s risk and may result in rejection of the Bid;

(b) received all relevant information requested from [EXECUTING AGENCY] and (NAME OF THE STATE/NATIONAL LEVEL AGENCY IF ANY);

(c) accepted the risk of inadequacy, error or mistake in the information provided in the RFP or furnished by or on behalf of [EXECUTING AGENCY];

(d) satisfied itself about all things, matters and information, necessary and required to submit a Bid;

(e) acknowledged and agreed that inadequacy, lack of completeness or incorrectness of information provided in the RFP or ignorance of any matter in relation to the Project shall not be a basis for any claim for compensation, damages, extension of time for performance of its obligations or loss of profits or revenue from [EXECUTING
AGENCY] or (NAME OF THE STATE / NATIONAL LEVEL AGENCY IF ANY), or a ground for termination of the Concession Agreement;

(f) satisfied itself regarding the suitability of the Site conditions to undertake the Project; and

(g) agreed to be bound by the undertakings provided by it under and in terms of this RFP.

6.2 [EXECUTING AGENCY] shall not be liable for any omission, mistake or error in respect of any of the above or on account of any matter or thing arising out of or relating to the RFP or the Bid Process.

7. RIGHTS OF [EXECUTING AGENCY]

7.1 [EXECUTING AGENCY], in its sole discretion and without incurring any obligation or liability, reserves the right, at any time, to:

(a) suspend the Bid Process and/or amend and/or supplement the Bid Process or modify the dates or other terms and conditions relating thereto;

(b) consult with any Bidder in order to receive clarification or further information at any stage of the Bid Process;

(c) retain any information, documents and/or evidence submitted to [EXECUTING AGENCY] by and/or on behalf of any Bidder;

(d) independently verify, disqualify, reject and/or accept any and all documents, information and/or evidence submitted by or on behalf of any Bidder;

(e) reject any Bid, if:

(i) at any time, a material misrepresentation is made or uncovered; or

(ii) the Bidder in question does not provide, within the time specified by [EXECUTING AGENCY], the supplemental information sought by [EXECUTING AGENCY] for evaluation of the Bid; or

(f) accept or reject a Bid, annul the Bid Process and reject all Bids, at any time, without any liability or any obligation for such acceptance, rejection or annulment and without assigning any reasons whatsoever to any Person, including the Bidders.

If [EXECUTING AGENCY] annuls the Bid Process and rejects all Bids, it may in its sole discretion invite fresh Bids for the Project.

7.2 If [EXECUTING AGENCY] exercises its right under this RFP to reject a Bid and consequently, the Preferred Bidder for the Project gets disqualified or rejected, then [EXECUTING AGENCY] reserves the right to:
(a) select the Second Preferred Bidder as the Selected Bidder for the Project; or

(b) take any such measure as may be deemed fit in the sole discretion of [EXECUTING AGENCY], including inviting fresh Financial Proposals from the qualified Bidders or annuling the entire Bid Process.

7.3 If it is found during the Bid Process, at any time before signing the Concession Agreement or after its execution and while it is in force, that one or more of the Qualification Criteria and/or the Eligibility Criteria have not been met by a Bidder or that the Bidder has ceased to meet them, or a Bidder has made material misrepresentations or has given any materially incorrect or false information, then such Bidder will be disqualified.

If such Bidder has been declared as the Selected Bidder or has already been issued the LOA or has entered into the Concession Agreement, the LOA or the Concession Agreement, as the case may be, shall be liable to be terminated, by a notice in writing from [EXECUTING AGENCY] to the Selected Bidder. Upon any disqualification, cancellation or termination in accordance with this Clause 7.3, [EXECUTING AGENCY] will not be liable in any manner whatsoever to the Bidder. Additionally, [EXECUTING AGENCY] will have the right to forfeit and appropriate the Bid Security or, as the case may be, appropriate an equivalent amount from the Performance Security if the Concession Agreement has been executed, as a mutually agreed genuine pre-estimate of the loss suffered by [EXECUTING AGENCY] for, amongst others, [EXECUTING AGENCY]’s time, cost and efforts in conducting the Bid Process. Such forfeiture will be without prejudice to any other right or remedy that [EXECUTING AGENCY] may have under the RFP, the Concession Agreement or Applicable Laws.

8. CLARIFICATIONS ON THE RFP

8.1 Clarifications and Queries

(a) If a Bidder requires any clarification on or has any query in relation to the RFP, it should submit such query or request for clarification to [EXECUTING AGENCY] on the e-Procurement Portal or send an email to [email ID] before the specified time and date mentioned in the Bid Schedule. All queries or clarification requests should be received on or before the date and time mentioned in the Bid Schedule.

(b) [EXECUTING AGENCY] shall make reasonable efforts to respond to the queries or requests for clarifications on or before the date mentioned in the Bid Schedule. [EXECUTING AGENCY]’s responses (including an explanation of the query but not identification of its source) will be made available to all the Bidders and shall be uploaded on the e-Procurement Portal.

(c) [EXECUTING AGENCY] may, on its own initiative, if deemed necessary, issue
clarifications to all the Bidders. All clarifications and interpretations issued by [EXECUTING AGENCY] shall be deemed to be part of this RFP. Should [EXECUTING AGENCY] deem it necessary to amend the RFP as a result of a request for clarification, it will do so following the procedure under Clause 9.

(d) It shall be the responsibility of the Bidders to check the e-Procurement Portal for the response to the queries or requests for clarifications.

(e) Verbal clarifications and information given by (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY), [EXECUTING AGENCY] or any other Person for or on its behalf shall not in any way or manner be binding on (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY) or [EXECUTING AGENCY].

8.2 Pre-Bid Meeting

(a) All interested Companies shall be invited to attend the Pre-Bid Meeting on the date, time and place mentioned in the Bid Schedule. The purpose of the Pre-Bid Meeting will be to clarify issues and answer questions on any matter relating to the RFP, the Bid Process and the Project.

(b) All interested Companies may nominate up to 3 authorized representatives to participate in the Pre-Bid Meeting, by confirming the participation of its authorized representatives at the Pre-Bid Meeting at least 3 days prior to the date of the Pre-Bid Meeting. Such confirmation shall be sent by e-mail to [email ID].

(c) During the course of the Pre-Bid Meeting, all interested Companies will be free to seek clarifications and make suggestions to [EXECUTING AGENCY].

(d) Non-attendance at the Pre-Bid Meeting will not be a cause for disqualification of an interested Company from participating in the Bid Process.

9. AMENDMENT OF THE RFP

9.1 Up until the date that is mentioned in the Bid Schedule, [EXECUTING AGENCY] may, for any reason, whether on its own initiative or in response to a query raised or clarifications requested by a Bidder, amend the RFP by issuing an Addendum or an amended RFP and amended draft Concession Agreement. The addendum will appear on the e-Procurement Portal under “Latest Corrigendum” and email notification is also automatically sent to those bidders who have moved this tender to their “My Tenders” area. Any addendum thus issued shall be part of the bidding documents and deemed to have been communicated to all the bidders who have moved this tender to their “My Tenders” area.

9.2 All Addenda/amendments and amended RFP & amended draft Concession Agreement will be uploaded on the e-Procurement Portal.
9.3 The Bidders are required to visit the website before submission of the Bid so as to take into account with any Addenda/amendments that may be issued in accordance with this Clause 9.

9.4 Each Addendum/amendment will be binding on the Bidders, whether or not the Bidders convey their acceptance of the Addendum/amendment.

9.5 Any oral statements made by (NAME OF THE STATE / NATIONAL LEVEL AGENCY IF ANY) or [EXECUTING AGENCY] or its advisors regarding the Bid Process, the RFP or on any other matter, shall not be considered as amending the RFP.

9.6 [EXECUTING AGENCY] will assume that the information contained in the Addendum/amendments will have been taken into account by the Bidder in its Bid. [EXECUTING AGENCY] assumes no responsibility for the failure of a Bidder to submit the Bid in accordance with the terms of the Addendum/amendments or for any consequent losses suffered by the Bidder.

10. AVAILABILITY OF INFORMATION

10.1 The information relating to or in connection with the Project, the Bid Process and this RFP, including all notices issued by [EXECUTING AGENCY] to all Bidders in accordance with this RFP; queries and responses or clarifications and any Addenda will be uploaded on the e-Procurement Portal.

10.2 All such information will be made available for review by the Bidders until the Bid Due Date.

10.3 If a Bidder faces any technical issue or technical error in accessing the e-Procurement Portal, the Bidder may seek assistance from [EXECUTING AGENCY] by sending an e-mail request to [email ID], no later than 3 days prior to the Bid Due Date.

10.4 [EXECUTING AGENCY] will use its best endeavours to respond to a written e-mail request and resolve the technical issue or error or provide an alternative solution to the Bidder within 3 days of receipt of such request.

11. CORRESPONDENCE WITH BIDDERS

Save as expressly provided in this RFP, (NAME OF THE STATE / NATIONAL LEVEL AGENCY IF ANY) and [EXECUTING AGENCY] will not entertain any correspondence with the Bidders, whether in connection with the acceptance or rejection of their Bids or otherwise.

12. CONFIDENTIAL INFORMATION AND PROPRIETARY DATA

12.1 Proprietary Data
All documents and other information provided by [EXECUTING AGENCY] or submitted by a Bidder to [EXECUTING AGENCY] will remain or become the property of [EXECUTING AGENCY], as the case may be. Bidders are required to treat all information provided by [EXECUTING AGENCY] in the RFP as strictly confidential and not to use them for any purpose other than for preparation and submission of their Bids.

12.2 **Confidentiality Obligations of [EXECUTING AGENCY]**

[EXECUTING AGENCY] will treat all information, submitted as part of a Bid as confidential and will require all those who have access to such material to treat it in confidence. [EXECUTING AGENCY] may not divulge any such information or any information relating to evaluation of Bids or the qualification of Bidders unless:

(a) such publication is contemplated under this RFP;

(b) such publication is made to any Person who is officially involved with the Bid Process or is a retained professional advisor advising [EXECUTING AGENCY], (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY) or the Bidder on matters arising out of or in connection with the Bid Process;

(c) it is directed to do so by any statutory authority that has the power under law to require its disclosure;

(d) such publication is to enforce or assert any right or privilege of the statutory authority and/or [EXECUTING AGENCY] and/or (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY) or as may be required by law (including under the Right to Information Act, 2005); or

(e) in connection with any legal process.

13. **GOVERNING LAW AND JURISDICTION**

13.1 **Governing Law**

The Bid Process, this RFP and the Bids shall be governed by, and construed in accordance with, the laws of India.

13.2 **Exclusive Jurisdiction**

The competent courts in [Name of the State] shall have exclusive jurisdiction over all disputes arising under, pursuant to and/or in connection with the Bid Process, this RFP and the Bids.

14. **VALIDITY OF THE BIDS**

14.1 The Bids shall remain valid for a period of 180 days from the Bid Due Date. A Bid valid for a shorter period shall be rejected by [EXECUTING AGENCY] as being non-responsive.

14.2 In exceptional circumstances, prior to the expiry of the Bid validity period, [EXECUTING AGENCY] may request Bidders to extend the Bid validity period. The request and the responses
shall be made in writing. A Bidder may refuse [EXECUTING AGENCY]’s request to extend the validity period of its Bid, without forfeiting its Bid Security. A Bidder granting the request shall not be required or permitted to modify its bid.

PART B. BID SECURITY, PERFORMANCE SECURITY AND ESHS PERFORMANCE SECURITY

15. BID SECURITY

15.1 The Bidder shall furnish as part of its Bid, a bid security for the Project (the Bid Security). The Bid Security shall be for an amount equivalent to INR [2% of the capital cost for contracts estimated to cost up to INR 1000 million, or 1% of the capital cost subject to a minimum of INR 20 million if estimated cost exceeds INR 1000 million. In case of NCB, amount should be in INR only. Provide US$ option in case of ICB] or an equivalent amount in a freely convertible currency.

15.2 The Bid Security shall remain valid for 45 days beyond the Bid validity period specified in Clause 14.

15.3 The Bidder shall provide the Bid Security in the form of a bank guarantee issued by a Scheduled Bank in India or by a foreign bank listed with the Reserve Bank of India having its branches in India or a guarantee issued by a Public Financial Institution. The Bid Security shall be issued in favour of the "[EXECUTING AGENCY]", represented by the [Designation of the Representative]{-, payable at [LOCATION], and in the format set out in Annexure II.

15.4 Unless forfeited in accordance with Clause 15.5 below, the Bid Security of the unsuccessful Bidders will be returned by [EXECUTING AGENCY] no later than 30 days from the date of execution of the Concession Agreement with the SPV incorporated by the Selected Bidder.

The Bid Security of the Selected Bidder will be returned upon the SPV incorporated by the Selected Bidder furnishing the [LOCATION] Facilities’ Performance Security, ESHS Security, and, if applicable, Additional Performance Security, in accordance with Clause 16 and ESHS Performance Security in accordance with Clause 16A.
15.5 The Bid Security shall be forfeited and appropriated by [EXECUTING AGENCY] as mutually agreed genuine pre-estimated compensation and damages payable to [EXECUTING AGENCY] for time, cost and effort of [EXECUTING AGENCY], without prejudice to any other right or remedy that may be available to [EXECUTING AGENCY] hereunder or otherwise, under the following conditions:

(a) if a Bidder is disqualified in accordance with, Clause 3.2 (Lock-in Restrictions and Change in Control), Clause 3.3 (Conflict of Interest), Clause 3.5 (Other Eligibility Criteria), Clause 7.3 (Rights of [EXECUTING AGENCY]), Clause 17 (Number of Bids) and Clause 31 (Execution of Concession Agreement);

(b) if, after the Bid Due Date, a Bidder withdraws its Bid during the Bid validity period; or

(c) if a Bidder is selected as the Selected Bidder and it fails, within the specified time limit, to:

(i) sign and return, as acknowledgement, the duplicate copy of the LOA;

(ii) cause the Concessionaire to furnish the Performance Security, and if applicable, the Additional Performance Security, in accordance with Clause 16;

(iii) cause the Concessionaire to furnish the ESHS Performance Security in accordance with Clause 16A;

(iv) cause the Concessionaire to furnish the O&M Performance Security in accordance with Clause 16B;

(v) fulfil any other condition precedent to the execution of the Concession Agreement; or

(vi) cause the Concessionaire to execute the Concession Agreement.

16. PERFORMANCE SECURITY

16.1 Subject to clause 16.2, the Selected Bidder shall cause the Concessionaire to furnish to [EXECUTING AGENCY] the Performance Security for a value equal to 9% of the [LOCATION] Facilities Bid Project Cost, on or before execution of the Concession Agreement to secure the obligations of the Concessionaire under the Concession Agreement.

If the Selected Bidder has nominated a Sub-Contractor to meet the Technical Criteria defined in Clause 4.1(a), the bidder and the Nominated STP Sub-Contractor shall each submit 50% of the [LOCATION] Performance Security as mentioned in this Clause 16.1. On substitution of Nominated STP Sub-Contractor as per Clause 3.2 (e), the new sub-contractor shall submit to the [EXECUTING AGENCY] 50% of the [LOCATION] Performance Security.

16.2 The Performance Security/Securities shall remain valid until 1 month from the COD.
16.3 The Selected Bidder shall cause the Concessionaire to provide the [LOCATION] Performance Security in the form of bank guarantee(s) issued by a Scheduled Bank in India or a guarantee issued by a Public Financial Institution. The [LOCATION] Performance Security shall be issued in favour of “[EXECUTING AGENCY]”, represented by the [Designation of the Representative], payable at [LOCATION] and in the format set out in Annexure 4.

16.4 If the Selected Bidder fails to cause the Concessionaire to furnish the Performance Security /Securities in accordance with this Clause 16 on or before the execution of the Concession Agreement, then [EXECUTING AGENCY] shall have the right to forfeit the Bid Security of the Selected Bidder in accordance with Clause 15.5.

16.5 During evaluation of Financial Proposal and before award of the Project, if it is found that the Selected Bidder has submitted an unreasonable Bid for the entire Project or for any components thereof, [EXECUTING AGENCY] reserves right to seek Additional Performance Security over and above that is mentioned in the Clause 16.1. The quantum of such Additional Performance Security will be determined by [EXECUTING AGENCY] on the basis of reasonable assessment of various Project components and after seeking suitable justifications/clarifications on the price components of the Bid from the Selected Bidder. The Selected Bidder shall submit this Additional Performance Security together with the Performance Security and ESHS Performance Security. The Additional Performance Security shall be in force till the end of Construction period if the Bid Project Cost is found to be unreasonable and till the end of the Concession Period if [LOCATION] Facilities O&M Charges are found to be unreasonable. The Additional Performance Security shall be liable to be forfeited, either fully or partially, as it deems fit for the reasons mentioned in Clause 16.1 of the draft Concession agreement.

16.6 If the Bidder has associated with a technology provider to meet to meet the technology requirement to be adopted for the proposed STP/FSTP in this Project, as defined in Clause 4.1(a)(F)(ix) of this RFP, then the technology provider shall furnish to the [EXECUTING AGENCY] a Technology Performance Security of 5% of the Bid Project Cost.

The Technology Performance Security shall be forfeited if the technology provider leaves the project before the completion of 2 years from COD. The Technology Performance Security shall be returned to the technology provider on completion of 2 years after COD.

16A. **ESHS PERFORMANCE SECURITY**

16A.1 The Selected Bidder shall cause the Concessionaire to furnish to [EXECUTING AGENCY], the [LOCATION] Facilities ESHS Performance Security for a value equal to 1% of the [LOCATION] Facilities Bid Project Cost, on or before execution of the Concession Agreement to secure due performance of the ESHS obligations of the Concessionaire under the Concession Agreement.
16A.2 The ESHS Performance Security/Securities shall remain valid for the entire term of the Concession Agreement. The ESHS Security shall have an initial validity period till COD, which must thereafter be renewed on a year-on-year basis, before the expiry of the 11th month of the relevant year, until the Expiry Date. If any of the ESHS Security is not renewed by the expiry of the 11th month of the relevant year, then [EXECUTING AGENCY] shall be entitled to drawdown the total amount available under the ESHS Security and retain such amount as cash security until such time that the Concessionaire submits an extension or replacement of the ESHS Security.

16A.3 The Selected Bidder shall cause the Concessionaire to provide the [LOCATION] ESHS Performance Security in the form of bank guarantees issued by a Scheduled Bank in India or a guarantee issued by a Public Financial Institution. The [LOCATION] ESHS Performance Security shall be issued in favour of “[EXECUTING AGENCY]”, represented by the [Designation of the Representative], payable at [LOCATION], in the format set out in Annexure 5.

16A.4 If the Selected Bidder fails to cause the Concessionaire to furnish the ESHS Performance Security/Securities in accordance with this Clause 16A on or before the execution of the Concession Agreement, then [EXECUTING AGENCY] shall have the right to forfeit the Bid Security of the Selected Bidder in accordance with Clause 15.5(c).

16B. O&M SECURITY

16B.1 The Selected Bidder shall cause the Concessionaire to furnish to [EXECUTING AGENCY], the O&M Security, within 60 days of the Construction Completion Date or 30 days before COD, whichever is earlier. The O&M security should be an unconditional and irrevocable bank guarantee to [EXECUTING AGENCY] for an amount corresponding to 4% of the Bid Project Cost. The O&M security for [LOCATION] Facilities would need to be furnished to secure the obligations of the Concessionaire under the Concession Agreement. If the Selected Bidder has nominated a Sub Contractor to meet the Technical Criteria defined in Clause 4.1(a), the bidder and the Nominated STP Sub-Contractor shall each submit 50% of the [LOCATION] O&M Performance Security as mentioned in this Clause 16B.1. On substitution of Nominated STP Sub-Contractor as per Clause 3.2 (e), the new sub-contractor will furnish the O&M Security. Further, in case the Nominated STP Sub-Contractor choses to leave the project after 2 years from COD, the Concessionaire shall fulfil the requirement of O&M Security, as specified in this Clause, for the remaining period.

16B.2 The O&M Security shall have an initial validity period of 1 year, which must be renewed on a year-on-year basis, before the expiry of the 11th month of the relevant year, until the expiry of the O&M Period. If any of the O&M Securities is not renewed by the expiry of the 11th month of the relevant year of the O&M Period, then [EXECUTING AGENCY] shall be entitled to drawdown the total amount available under the O&M Security, and retain such amount as cash.
security until such time that the Concessionaire submits an extension or replacement of the O&M Security

16B.3 The Selected Bidder shall cause the Concessionaire to provide the [LOCATION] O&M Security in the form of bank guarantees issued by a Scheduled Bank in India or a guarantee issued by a Public Financial Institution. The [LOCATION] O&M Security shall be issued in favour of “[EXECUTING AGENCY]”, represented by the [Designation of the Representative], payable at [LOCATION].

16B.4 If the Selected Bidder fails to cause the Concessionaire to furnish the O&M Security/Securities in accordance with this Clause 16B on or before the respective due dates, then [EXECUTING AGENCY] shall have the right to forfeit the Bid Security of the Selected Bidder in accordance with Clause 15.5.
PART C. PREPARATION AND SUBMISSION OF BIDS

17. NUMBER OF BIDS

Each Bidder shall be permitted to submit only 1 Bid for the Project, either individually or as a Member of a Consortium. A Bidder applying individually or as a Member of a Consortium shall not be entitled to submit another Bid either individually or as a Member of any other Consortium, as the case may be. A Bidder who submits or participates in more than 1 Bid for the Project shall cause all the Bids with the Bidder’s participation to be disqualified.

18. LANGUAGE OF BIDS AND CORRESPONDENCE

18.1 The Bid prepared by the Bidder and all correspondence and documents related to the Bid exchanged by the Bidder and [EXECUTING AGENCY] shall be in English.

18.2 Any document furnished by the Bidder may be in another language, as long as such document is accompanied by an English translation, in which case, for purposes of interpretation of the Bid, the English translation shall take precedence. If any document submitted by a Bidder is in a local language, then the English translation must be certified by an advocate and notarised in India. If any document submitted by a Bidder is in a foreign language, then the English translation must be certified by the embassy/consulate/high commission of the relevant foreign country in India or the Ministry of Foreign/External Affairs or any other relevant ministry empowered to certify such English translations in the foreign country where the project is situated. Supporting materials which are not translated into English or certified/notarised in accordance with this Clause 18.2 may not be considered by [EXECUTING AGENCY].

19. BID DUE DATE

19.1 The Bid shall be submitted on or before the date, time and place specified in the Bid Schedule.

19.2 [EXECUTING AGENCY] may, at its discretion and for any reason, extend the Bid Due Date for all Bidders by issuing an Addendum in accordance with Clause 9, in which case all rights and obligations of [EXECUTING AGENCY] and the Bidders will thereafter be subject to the Bid Due Date as extended.

19.3 Bids received by [EXECUTING AGENCY] after the specified time on the Bid Due Date will not be eligible for consideration and will be summarily rejected.

20. QUALIFICATION PROPOSAL

The Bidder shall submit Bids online in two separate Folders/Envelopes as under:

Folder I - for submission of Qualification Proposal; and

Folder II – for submission of Financial Proposals

20.1 The Qualification Proposal submitted by a Bidder shall comprise scanned copies of the
following:

(a) bid letter in the format set out in **Annexure 1A**;

(b) description of the Bidder/ Members/ Nominated STP Sub-Contractor / technology provider (if applicable) in the format set out in **Annexure 1B**;

(c) Power of Attorney in the format set out in **Annexure 1C**, executed by the Bidder or the Lead Member authorizing the signatory of the Bid to commit the Bidder;

(d) certificate issued by the statutory auditor of the Bidder (and its Associate(s), if applicable), in the format set out in **Annexure 1D**, certifying the Net Worth of the Bidder (and its Associate(s), if applicable) and compliance with other financial qualification criteria specified in Clause 4.2;

(e) details of the eligible STP/ ETP/ CETP for which development/design and construction experience is being claimed in the format set out in **Annexure 1E – Part 1** and details of the eligible STP/ ETP/ CETP for which O&M experience is being claimed in the format set out in **Annexure 1E – Part 2**;

(f) certificate from the statutory auditor certifying the shareholding of the Bidder (or in case of a Consortium, the relevant Member) or Nominated STP Sub-Contractor (if applicable) in the Company developing the STP/ ETP/ CETP, for which development experience is being claimed by the Bidder in the format set out in **Annexure 1F**;

(g) self-attested certificate regarding Associate, if applicable, in the format set out in **Annexure 1G**;

(h) information on any litigation that the Bidder (or in case of a Consortium, the relevant Member) or Nominated STP Sub-Contractor (if applicable) is a party to, in the format set out at **Annexure 1H**;

(i) Bid Security in the format set out at **Annexure 1I**;

(j) if applicable, experience certificate for a biogas power plant in the format set out at **Annexure 2** or a consent letter for a biogas power plant in the format set out at **Annexure 3**, along with certificate(s) from the relevant government authority / client;

(k) for each STP/ ETP/ CETP for which O&M experience is being claimed, certificate from the relevant government authority certifying that the Bidder (or, in case of a Consortium, the relevant Member) has successfully operated and maintained the STP/ ETP/ CETP for which O&M experience is being claimed, for at least 12 consecutive months in the 10 years immediately preceding the Bid
Due Date, in accordance with the relevant concession agreement or similar contract executed for such STP;

(l) audited annual financial statements of the Bidder (including profit and loss statements) as well as the Associate (if the Net Worth of the Associate is being claimed) for the 3 Financial Years FY2016-17, FY2017-18 and FY2018-19;

(m) Self-attested copies of the certificate of incorporation, memorandum of association and articles of association. If the Bidder is a Consortium, then each Member shall submit self-attested copies of its certificate of incorporation, memorandum of association and articles of association; In case of a Nominated STP Sub-Contractor being nominated by the Bidder for meeting the Technical Criteria defined in Clause 4.1(a) and Clause 4.1(b), then such Nominated STP Sub-Contractor shall also submit self-attested copies of its certificate of incorporation, memorandum of association and articles of association; and

(n) declaration listing the contract(s) of the Bidder or each Member (in case of a Consortium) and the Nominated STP Sub-Contractor (if applicable) that has/have been suspended or terminated and/or performance security that has been called by an employer for reasons related to the non-compliance by such Bidder or Member(s) with any ESHS requirements or safeguard in the past 5 years, in the format set out at Annexure 1I.

(o) Details of the Eligible Projects for which development or construction experience is being claimed for meeting the Threshold Technical Capability, in the formats set out in Annexure 1E Part-III and Annexure 1E Part-IV.

(p) For each project submitted in Annexure 1E Part-IV, certificate(s) from the relevant government authority/client certifying the experience being claimed, along with certificate from the statutory auditors stating the payments made/received, as the case may be, during the past 5 financial years, in respect of the projects specified in clause 4.1(a)(A). In case a particular job/contract has been jointly executed by the entity (Bidder and/or the Nominated STP Sub-contractor) claiming the experience (as part of a Consortium), it should further support its claim for the share in work done for that particular job/contract by producing a certificate from its statutory auditor or the client. (In jurisdictions that do not have statutory auditors, the firm of auditors which audits the annual accounts of the Bidder may provide the certificates required under this RFP);

20.2 If the Bidder is a Consortium, it will also be required to submit the following documents:

(a) Power of Attorney in the format set out at Annexure 1J, executed by the Members of the Consortium authorizing the Lead Member of the Consortium to act on behalf of and
commit the Consortium.

(b) Joint Bidding Agreement in the format set out at Annexure 1K.

21. FINANCIAL PROPOSAL

21.1 The Financial Proposal submitted by a Bidder shall comprise the Bid Price Sheet provided on the e-Procurement Portal.

21.2 The Bidders shall quote in the Bid Price Sheet, for the [LOCATION] Facilities, the: (a) Bid Project Cost (including all Taxes); (b) [LOCATION] Facilities O&M Charges for the first month after COD (including all Taxes); (c) Guaranteed Energy Consumption for the O&M Period; and (d) [LOCATION] Facilities Land Requirement. Based on these components quoted by a Bidder, the Bid Price is calculated by the system using the formula set out in the Bid Price Sheet.

21.3 The Bidder shall quote 1 (one) figure for any of the components of the [LOCATION] Facilities Bid Price after all discounts the Bidder wishes to offer on any or all of the components of the [LOCATION] Facilities Bid Price.

21.4 If the Bidder: (a) quotes more than 1 figure for any of the components of the [LOCATION] Facilities Bid Price; (b) offers a discount on any or all of the components of the [LOCATION] Facilities Bid Price; (c) quotes a [LOCATION] Facilities Land Requirement which is in excess of the area of the Facilities STP and/or FSTP Site(s); then the Financial Proposal of such Bidder will be deemed to be non-responsive.

21.5 Bidders may like to ascertain availability of excise/custom duty exemption benefits available in India to the contracts financed under World Bank loan/credits. They are solely responsible for obtaining such benefits which they have considered in their bid and in case of failure to receive such benefits for reasons whatsoever, [EXECUTING AGENCY] will not compensate the bidder (Operator). The bidder shall furnish along with his bid a declaration to this effect in the Declaration Format provided in Annexure 7 of the bidding documents.

21.6 Where the bidder has quoted taking into account such benefits, he must give all information required for issue of certificates in terms of the Government of India Central Excise Notification and Customs Notification as per form stipulated in Annexure 7 of the bidding documents. In case the bidder has not provided the required information or has indicated to be furnished later on in the Declaration Format, the same shall be construed that the goods/equipment for which certificate is required is Nil.

21.7 To the extent [EXECUTING AGENCY] determines the quantities indicated therein are reasonable keeping in view the work schedule, construction programme and methodology, the certificates will be issued, and no subsequent changes will be permitted. The certificate will be
issued within 60 days of signing of the Concession Agreement for material, equipment and machinery.

21.8 If the bidder has considered the customs/excise duty exemption for materials/construction equipment to be bought for the work, the bidder shall confirm and certify that [EXECUTING AGENCY] will not be required to undertake any responsibilities of the Government of India Scheme or the said exemptions being available during the contract execution, except issuing the required certificate.

21.9 The bids which do not conform to the above provisions or any condition by the bidder which makes the bid subject to availability of customs duty/Tax exemption for materials/construction equipment or compensation on withdrawal of any variations to the said exemptions will be treated as non-responsive and rejected.

21.10 Any delay in procurement of the construction equipment /machinery/goods as a result of the above shall not be entertained as a reason for granting any extension of time.

22. COST AND CURRENCY OF BIDS

22.1 Cost of the Bid

The Bidders will bear their own costs associated with or relating to the preparation and submission of their Bids, including copying, postage, delivery charges and expenses associated with any presentations which may be required by [EXECUTING AGENCY] or (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY) or any other costs incurred in connection with or relating to their Bids, including any costs incurred on conducting any due diligence. All such costs and expenses will be borne by the Bidders and [EXECUTING AGENCY], (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY) and their employees and advisors will not be liable in any manner whatsoever for such costs and expenses, regardless of the conduct or outcome of the Bid Process.

22.2 Currency of the Bid

All amounts in the Bid should be stated in INR (Indian Rupees).

23. SIGNING OF BIDS

23.1 Each Bidder (and in case of a Consortium, the Lead Member) must affix the digital signature of its authorised signatory to the soft copies of both the Qualification Proposal and the Financial Proposal, upon uploading the soft copy of the Qualification Proposal and submission of the Financial Proposal to the e-Procurement Portal.
24. SUBMISSION OF BIDS

24.1 Each Bidder is required to upload a soft copy/scanned copy of its Bid on the e-Procurement Portal.

24.2 While uploading the Bid on the e-Procurement Portal, Bidder must ensure that files containing the Qualification Proposal and scanned copies of the Bid Security are uploaded separately under the relevant heads in a PDF format. The Bidder shall be required to fill all mandatory forms and fields indicated in the e-Procurement Portal at the time of uploading its Bid.

24.3 The Bidders should ensure the legibility of the documents uploaded to the e-Procurement Portal.

24.4 The Bidder shall upload the Bid sufficiently before the specified time on the Bid Due Date to avoid any technical issues or malfunction in the network caused by heavy traffic of Bidders on the Bid Due Date. [EXECUTING AGENCY] and (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY) will not be responsible for any failure, malfunction or breakdown of the electronic system during the e-procurement process.

24.5 The Bidder should check the system generated summary of its Bid submission to confirm successful uploading of its Bid.

24.6 All Bids uploaded to the e-Procurement Portal will be encrypted and the encrypted Bids can only be opened by the authorised representatives of [EXECUTING AGENCY] at or after the specified time for opening of Bids (Qualification Proposals).

24.7 Each Bidder shall also submit a hard copy of the original Bid Security, Power of Attorney, Joint Bidding Agreement, Sub-contractor Undertaking (if applicable) to [EXECUTING AGENCY], before the date/time specified in clause 2.12 (c).

It is clarified that the Bidder will not be required to submit a hard copy of its Financial Proposal, and if a hard copy of the Financial Proposal is submitted, then the Bid submitted by such Bidder shall be rejected as being non-responsive.

24.8 The Bid will contain no alterations, omissions or additions, unless such alterations, omissions or additions are signed by the authorized signatory of the Bidder/Lead Member. Any interlineations, erasures, or overwriting will be valid only if they are signed by the authorized signatory of the Bidder/Lead Member.

24.9 The hard copy of the Bid Security, Power of Attorney, Joint Bidding Agreement, Sub-contractor Undertaking (if applicable), etc. will be duly sealed in an envelope, which will be super-scribed as follows:

"[LOCATION] STP PPP PROJECT
QUALIFICATION PROPOSAL"
24.10 The sealed envelope containing the Bid Security, Power of Attorney, joint bidding agreement, etc will clearly indicate the name, address and contact details of the Bidder. If the envelope is not sealed, marked and submitted as instructed in this Clause 24, [EXECUTING AGENCY] assumes no responsibility for the misplacement or premature opening of the contents of the envelope and consequent losses, if any, suffered by the Bidder.

24.11 The hard copy of the Bid Security, Power of Attorney, Joint Bidding Agreement, etc. will either be hand delivered or sent by registered post acknowledgement due or courier to the address below:

[Designation of the Representative, and Address]

Bids submitted by fax, telex, telegram or e-mail shall not be entertained and will be rejected.

24.12 [EXECUTING AGENCY] will not be responsible for any delays, loss or non-receipt of Bids.

25. SUBSTITUTION/WITHDRAWAL/MODIFICATION OF BIDS

25.1 Bidders may modify their bids by using the appropriate option for bid modification on e-Procurement Portal, before the deadline for submission of bids. For bid modification and consequential resubmission, the Bidder is not required to withdraw his bid submitted earlier. The last modified Bid submitted by the Bidder within the Bid Due Date shall be considered as the Bid. For this purpose, modification/withdrawal by other means will not be accepted. In online system of bid submission, the modification and consequential re-submission of Bid is allowed any number of times. A bidder may withdraw his Bid by using the appropriate option for Bid withdrawal, before the deadline for submission of Bids. However, if the Bid is withdrawn, re-submission of the Bid is not allowed.

25.2 Bids requested to be withdrawn in accordance with ITB 25.1 shall not be opened.

25.3 No Bid may be withdrawn, substituted, or modified in the interval between the Bid Due Date and the expiration of Bid validity period specified by the Bidder in the Bid Letter or any extension thereof. This will result in the forfeiture of the Bid Security pursuant to ITB 15.5.
PART D. OPENING AND EVALUATION OF BIDS

26. OPENING OF BIDS

26.1 [EXECUTING AGENCY] will publicly open all Bids that are submitted on or before the specified time on the Bid Due Date, and this could be viewed by the Bidders online.

26.2 [EXECUTING AGENCY] will open the soft copy of the Bids (Qualification Proposals) at the time and on the date specified in the Bid Schedule at the following address:

[ Designation of the Representative and Address]

The Financial Proposals of the Bids shall remain unopened in the e-Procurement System, until the subsequent public opening in accordance with Clause 28 following the evaluation of the Qualification Proposals of the Bids.

The Bids will be opened in the presence of the Bidders whose designated representatives choose to be present. The Bidders can also view the summary of opening of Bids by logging on to the e-Procurement Portal.

26.3 If the specified date for opening the Qualification Proposals is declared a holiday in [EXECUTING AGENCY]'s office, then the Qualification Proposals will be opened at the specified time and location on the next working day, which will be notified through an addendum.

26.4 [EXECUTING AGENCY] will prepare a record of the opening of the Bids that will include, as a minimum, the names of the Bidders from whom Bids have been received. The Bidders' representatives who are present will be requested to sign the record. The omission of a Bidder's representative's signature on the record will not invalidate the contents and effect of the record.

26.5 Once all the Qualification Proposals have been opened, they will be evaluated for responsiveness and to determine whether the Bidders are qualified for opening of the Financial Proposals. The procedure for evaluation of the Qualification Proposals is set out in Clause 27.

26.6 Once the Qualification Proposals have been evaluated, all Bidders whose Qualification Proposals meet the Qualification Criteria and the Eligibility Criteria, will be informed of a date, time and place for opening of their Financial Proposals. The Financial Proposals will be opened in the presence of the representatives of the qualified Bidders that choose to be present. The procedure for evaluation of the Financial Proposals is set out in Clause 28.

26.7 The qualification of Bidders will be entirely at the discretion of [EXECUTING AGENCY]. Bidders will be deemed to have understood and agreed that no explanation or justification on any aspect of the Bid Process or selection will be given.
26.8 Any information contained in a Bid will not in any manner be construed as binding on [EXECUTING AGENCY], its agents, successors or assigns; but will be binding on the Bidder.

27. **DETERMINATION OF RESPONSIVENESS AND EVALUATION OF QUALIFICATION PROPOSALS**

27.1 [EXECUTING AGENCY] will examine the Qualification Proposals to determine whether they are complete, whether the documents have been properly signed, and whether the Qualification Proposals are generally in order. If any Bidder is found to be disqualified in accordance with the terms of the RFP or if any Qualification Proposal is found to be non-responsive or not meeting the Technical Capacity or the Financial Capacity, the Bid comprising such Qualification Proposal will be rejected by [EXECUTING AGENCY] and not included for further consideration. No request for alteration, modification, substitution or withdrawal shall be entertained by [EXECUTING AGENCY] in respect of such Bid.

27.2 Prior to evaluation of the Qualification Proposals, the Qualification Proposals will be evaluated to determine responsiveness to the RFP. A Qualification Proposal, shall be considered responsive only if:

(a) the Qualification Proposal and all documents specified in Clause 20 are received in the prescribed formats and original documents are received as specified in Clause 24.7;

(b) the Bid is received by the specified time on the Bid Due Date;

(c) it is signed, marked, and uploaded as stipulated in Clauses 23 and 24;

(d) it contains all the information and documents (complete in all respects) as requested in this RFP; and

(e) it does not contain any condition or qualification.

27.3 [EXECUTING AGENCY] shall then evaluate and determine whether the Bidders who have submitted responsive Qualification Proposals satisfy the Eligibility Criteria and the Qualification Criteria set out at Clause 3 and Clause 4 respectively.

27.4 In order to determine whether the Bidder satisfies the Eligibility Criteria set out at Clause 3 and the Qualification Criteria set out in Clause 4, [EXECUTING AGENCY] will review the documentary evidence of the Bidder’s eligibility and qualifications submitted by the Bidder and any additional information which [EXECUTING AGENCY] seeks from the Bidder.

27.5 Where any information provided by a Bidder is found to be patently false or amounting to a material misrepresentation, [EXECUTING AGENCY] reserves the right to reject the Bid submitted by such Bidder.

27.6 Upon completion of evaluation of the Qualification Proposals, and the issuance of Bank’s no objection (if applicable), [EXECUTING AGENCY] will notify in writing those Bidders whose
Bids were considered non-responsive to the RFP or failed to meet the Qualification Criteria set out in this RFP, advising them of the following information:

(a) their Qualification Proposals of Bid failed to meet the requirements of the RFP and the reasons for disqualification;

(b) their Financial Proposals of Bid shall not be opened; and

(c) notify them of the date and time for public opening of Financial Proposals of the Bids.

27.7 [EXECUTING AGENCY] shall, simultaneously, notify in writing those Bidders whose Qualification Proposals have been evaluated as substantially responsive to the RFP and met all Qualifying Criteria, advising them of the following information:

(a) their Qualification Proposal has been evaluated as substantially responsive to the RFP and met the Qualification Criteria;

(b) their Financial Proposal of Bid will be opened at the public opening of the Financial Proposals; and

(c) notify them of the date and time on which their Financial Proposals will be opened.

28. PUBLIC OPENING AND EVALUATION OF FINANCIAL PROPOSALS

28.1 [EXECUTING AGENCY] shall open the Financial Proposals of only those Bidders, whose Qualification Proposals meet the criteria set out in this RFP.

28.2 The Financial Proposals of the Bids shall be opened publicly in the presence of Bidders’ designated representatives and anyone who chooses to attend, and this could also be viewed by the Bidders online. [EXECUTING AGENCY] shall open the Financial Proposal of each qualified Bidder and announce the [LOCATION] Facilities Bid Price quoted by each Bidder. [EXECUTING AGENCY] shall prepare the minutes of the online opening of the Financial Proposals which will be signed by the representatives of the Bidders present at the time of opening and upload these minutes for viewing online.

28.3 Evaluation of Financial Proposals

(a) Following the opening of the Financial Proposals, [EXECUTING AGENCY] shall evaluate the Financial Proposals for responsiveness. If any Financial Proposal is found:

(i) not to be complete in all respects;

(ii) not duly signed by the authorized signatory of the Bidder/Lead Member;

(iii) not to be in the prescribed format; or

(iv) to contain any handwritten values

(v) not in accordance with the Clause 21.3;
then such Financial Proposal shall be deemed to be substantially non-responsive.

(b) Financial Proposals, which are substantially responsive to the Bidding Documents (comprising RFP and Concession Agreement), shall be evaluated for each STP included in the scope of work, by adding various components of quoted [LOCATION] Facilities Bid Price for as under (on the basis of net present value):

(i) **Design-Build Price (Bid Project Cost) including all taxes & GST**;

(ii) **O&M prices for STP and/or FSTP for 15 years**

   = ([LOCATION] Facilities O&M Charges including all taxes & GST for first month after COD) * 180

(iii) **Cost of Energy Consumption for STP and /or FSTP during 15 years of O&M Period**= Average Guaranteed Energy Consumption per MLD flow rate * Base Energy Tariff Rate * STP and/or FSTP Design Capacity * Number of days of the O&M period

   For the purpose of this calculation of energy cost:

   Average Guaranteed Energy Consumption per MLD flow rate = Average of different Guaranteed Energy Consumption figures in KWh quoted in Bid Price Sheet for treating various combinations of effluent flow rates and BOD;

   Base Energy Tariff Rate = INR [Rate]/KWh; and

   Number of days of the O&M period = 5475

(iv) **Cost of Land required for the STP and/or FSTP** = [LOCATION] Facilities Land Requirement in sq.m. as quoted by the Bidder * [LOCATION] Facilities Land Price per sq.m.

   For the purpose of evaluation, land price = INR [Price] per sqm

(v) **O&M prices for Associated Infrastructure for 15 years**= ([LOCATION] Facilities O&M Charges including all taxes & GST for first month after COD) * 180

(vi) **Cost of Energy Consumption for Associated Infrastructure during O&M period**= Average Guaranteed Energy Consumption per MLD flow rate * Base Energy Tariff Rate * Pumping Capacity* Number of days of the O&M period

   For the purpose of this calculation of energy cost:

   Average Guaranteed Energy Consumption per MLD flow rate = Average of different Guaranteed Energy Consumption figures in KWh quoted in Bid Price Sheet for treating various combinations of effluent flow rates and BOD;
Base Energy Tariff Rate = INR [Rate]/KWh; and

Number of days of the O&M period = 5475

Total Evaluated [LOCATION] Facilities Bid Price = (i) + (ii) + (iii) + (iv) + (v) + (vi)

(c) [EXECUTING AGENCY] shall compare the Total Evaluated [LOCATION] Facilities Bid Price of all substantially responsive Financial Proposals to determine the Lowest Evaluated Bid.

(d) The Bidder whose Bid has been determined to be the Lowest Evaluated Bid, will be the Preferred Bidder, and shall be selected for award.

(e) The Preferred Bidder shall ordinarily be the Selected Bidder.

(f) If the Bid Price determined for 2 or more qualified Bidders is the same, then the Bidder whose Net Worth is higher shall be the Preferred Bidder.

If the Preferred Bidder is disqualified or rejected for any reason whatsoever, then the procedure set out in Clause 7.2 shall follow.

29. CLARIFICATION ON BIDS

29.1 To facilitate evaluation of the Bids, [EXECUTING AGENCY] may, in its sole discretion, seek clarifications and/or any additional information from any Bidder regarding its Bid (including if the Bid is not signed, marked and sealed in accordance with Clauses 23 and 24). Such clarification(s) will be provided within the time specified by [EXECUTING AGENCY] for this purpose. Any request for clarification(s) and all responses to such clarification(s) will be in writing. Any clarification submitted by a Bidder that is not in response to a request by [EXECUTING AGENCY] will not be considered.

29.2 If a Bidder does not provide clarifications and/or any additional information sought under Clause 29.1 within the prescribed time, its Bid may be liable for rejection. If the Bid is not rejected, [EXECUTING AGENCY] may proceed to evaluate the Bid by construing the particulars requiring clarification to the best of its understanding, and the Bidder will be barred from subsequently questioning such interpretation of [EXECUTING AGENCY].

PART E. AWARD OF PROJECT

30. LETTER OF AWARD (LOA)

30.1 After declaration of the Selected Bidder, [EXECUTING AGENCY] will issue the LOA to the Selected Bidder in duplicate:

(a) declaring it as the Selected Bidder;
(b) accepting its Financial Proposal;
(c) requesting it to sign and return, as acknowledgement, a copy of the LOA within 15 days of receipt of the LOA;
(d) requesting it to submit the Performance Securities and O&M securities in accordance with Clause 16, 16A and 16B; and
(e) requesting it to incorporate the Special Purpose Vehicle, which will act as the Concessionaire.

30.2 If the Selected Bidder fails to return a duly signed copy of the LOA to [EXECUTING AGENCY] within 15 days of receipt of the LOA, then [EXECUTING AGENCY] may, unless it consents to an extension, without prejudice to any of its rights under the RFP or law, disqualify the Selected Bidder, revoke the LOA, and forfeit the Bid Security. If [EXECUTING AGENCY] elects to disqualify such Bidder and revoke the LOA, then the procedure set out in Clause 7.2 shall follow.

30.3 After notification of award in accordance with Clause 30.1, [EXECUTING AGENCY] may also notify all other Bidders of the results of the bidding, and shall publish in UNDB online and the Procurement Portal, results of the bidding process and the following information:

(i) name of each Bidder who submitted a Bid;
(ii) results of evaluation of Qualification Proposals;
(iii) names of bidders whose Qualification Proposals were rejected and the reasons for their rejection;
(iv) bid prices as read out at opening of Financial Proposals;
(v) name and evaluated prices of each Bid that was evaluated;
(vi) names of bidders whose Financial Proposals were rejected and the reasons for their rejection; and
(vii) name of the Selected Bidder, the Price it offered, and summary scope of the contract awarded.

30.4 [EXECUTING AGENCY] shall promptly respond in writing to any unsuccessful Bidder who, after notification of award in accordance with Clause 30.3, requests in writing the grounds on which its bid was not selected.

31. EXECUTION OF THE CONCESSION AGREEMENT

31.1 The Special Purpose Vehicle incorporated by the Selected Bidder shall execute the Concession Agreement in the draft form provided by [EXECUTING AGENCY], with minimal changes or
amendments to reflect facts or to correct minor errors. [EXECUTING AGENCY] shall, within 15 days of the acceptance of the LOA by the Selected Bidder, provide the Selected Bidder with the final execution draft of the Concession Agreement.

31.2 [EXECUTING AGENCY] shall not entertain any request from the Selected Bidder for negotiations of or deviations to the final execution draft of the Concession Agreement provided by [EXECUTING AGENCY] under Clause 31.1.

31.3 If the Selected Bidder seeks to materially negotiate or seeks any material deviations from the final execution draft of the Concession Agreement, [EXECUTING AGENCY] may elect to disqualify the Selected Bidder and revoke the LOA issued to the Selected Bidder. If [EXECUTING AGENCY] elects to disqualify such Bidder and revoke the LOA, then the procedure set out in Clause 7.2 shall follow.

31.4 Subject to satisfaction of the conditions specified in Clause 30.1 and any other conditions specified in the LOA, the Special Purpose Vehicle incorporated by the Selected Bidder shall execute the Concession Agreement within 45 days from the date of acceptance of the LOA by the Selected Bidder.

31.5 If the Special Purpose Vehicle fails to execute the Concession Agreement on or before the date specified in Clause 31.4, [EXECUTING AGENCY] may, unless it consents to an extension, without prejudice to any of its rights under the RFP or law, disqualify the Selected Bidder, revoke the LOA and forfeit the Bid Security. If [EXECUTING AGENCY] elects to disqualify such Bidder and revoke the LOA, then the procedure set out in Clause 7.2 shall follow.
ANNEXURES

ANNEXURE 1A

FORMAT OF BID LETTER

[The bidder must prepare this Letter of Bid on stationery with its letterhead, clearly showing the Bidder’s complete name and business address]

Date:                       Place:

To,

[Designation of the Representative]

[EXECUTING AGENCY],

[LOCATION]

Sub: Bid for [LOCATION] STP PPP Project

Sir/Madam,

Please find enclosed our Qualification Proposal in respect of the above-mentioned project and complying with the Request for Proposal (RFP) issued by the [EXECUTING AGENCY] dated [Date of issue of RFP].

We hereby confirm the following:

1. The Qualification Proposal is being submitted by ______________________ (name of the Bidder/Lead Member), who is the Bidder/Lead Member of the Consortium [comprising ________________(mention the names of the entities who are Members)]22, [in association with __________(mention the name of the entity) as the Nominated STP Sub-Contractor]23 [, in association with __________ (mentioned the name of the entity) as the technology provider]24 in accordance with the terms and conditions stipulated in the RFP.

2. We have examined in detail and have understood the terms and conditions stipulated for qualification of the Bidders in the RFP issued by [EXECUTING AGENCY]. We agree and undertake to abide by all these terms and conditions. We acknowledge and agree to submission of an unconditional Bid.

---

22 To be deleted if the bidder is a single entity
23 To be deleted if not applicable
24 To be deleted if not applicable
3. This statement is made for the express purpose of qualifying as a Bidder for the design, finance, construction, completion, operation and maintenance of the Moradabad Facilities in accordance with the relevant Concession Agreement.

4. We acknowledge that [EXECUTING AGENCY] and (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY) will be relying on the information provided in the Bid and the documents accompanying such Bid for selection of the Bidder for implementing the Project, and we certify that all information provided in the Bid and Annexures is true and correct; nothing has been omitted which renders such information misleading; and all documents accompanying such Bid are true copies of their respective originals.

5. The information submitted with respect to our Qualification Criteria is complete, and strictly as per the requirements stipulated in the RFP. We would be solely responsible for any errors or omissions in our Bid.

6. We shall make available to [EXECUTING AGENCY] any additional information it may find necessary or require to supplement or authenticate the Bid.

7. We acknowledge the right of [EXECUTING AGENCY] to reject our Bid without assigning any reason or otherwise and we hereby waive, to the extent permitted by applicable law, our right to challenge the same on any account whatsoever.

8. We acknowledge the right of [EXECUTING AGENCY] to not award the Project without assigning any reason or otherwise and we hereby waive, to the extent permitted by applicable law, our right to challenge the same on any account whatsoever.

9. We certify that in the 3 Financial Years immediately preceding the Bid Due Date, we or any Member of our Consortium [or Nominated STP Sub-Contractor]25 has not been affected by any of the following circumstances:

   (i) failure to perform any contract, as evidenced by the imposition of a penalty by an arbitral or judicial authority or arbitration award or a judicial pronouncement against us or any Member;

   (ii) expulsion from any project or contract by GoI or any State Government, or its instrumentalities;

   (iii) termination of a contract by GoI or any State Government, or its instrumentalities for breach by us or any Member;

   (iv) having been categorized as a wilful defaulter in accordance with Applicable Laws;

   (v) being subject to proceedings for declaration of or being declared bankrupt, being wound up, or having its affairs administered or conducted by any court, administrator, receiver;

25 To be deleted if not applicable
(vi) having been declared by a court or other competent authority as being unable to pay its debts, or having made any composition or arrangements with creditors or having had the repayment of its debts suspended; or

(vii) having being convicted or otherwise being found responsible (or having any of its directors, partners, trustees, officers or managers convicted or being found responsible) by any court, tribunal, regulatory, public or other competent authority for a breach of any laws or regulations which:

(a) related to any act of fraud or dishonesty for which a fine, penalty, damages, compensation or other payment was levied against us or any of our directors, partners, trustees, officers or managers; or

(b) resulted in the permanent or temporary suspension of our rights to provide any service or carry on any type of business or operations.

10. We certify that we or any Member of our Consortium [or the Nominated STP Sub-Contractor] have not been determined to be ineligible by the World Bank/ any other multi-lateral agency under the guidelines on preventing and combating fraud and corruption.

11. We certify that we or any Member of our Consortium [or the Nominated STP Sub-Contractor] have not been barred by GoI or any State Government, or its instrumentalities from participating in any project or being awarded any contract and no such bar subsists on the Bid Due Date.

12. We declare that:

(a) we have examined and have no reservations to the RFP and do not seek any deviations to the RFP, including any Addendum issued by [EXECUTING AGENCY];

(b) we do not have any Conflict of Interest in accordance with Clauses 3.3 of the RFP;

(c) we have not directly or indirectly or through an agent engaged or indulged in any corrupt practice, fraudulent practice, coercive practice, undesirable practice or restrictive practice, as defined in Clause 3.4 of the RFP, in respect of any tender or request for proposal issued by or any agreement entered into with [EXECUTING AGENCY] or (NAME OF THE STATE / NATIONAL LEVEL AGENCY IF ANY) ; and

(d) we hereby certify that we have taken steps to ensure that in conformity with the provisions of the RFP and submission of the Bid, no person acting for us or on our behalf has engaged in any corrupt practice, fraudulent practice, coercive practice, undesirable practice or restrictive practice.

26 To be deleted if not applicable

27 To be deleted if not applicable
13. We understand that [EXECUTING AGENCY] may cancel the Bid Process at any time and that [EXECUTING AGENCY] is neither bound to accept any Bid that it may receive nor to invite the Bidders to submit a Bid for the Project, without incurring any liability to the Bidders, in accordance with Clause 7 of the RFP.

14. The [Bidder/ Consortium of which we are the Lead Consortium Member (strike out whichever is not applicable),] satisfies the legal requirements and in our opinion by itself/along with its Members and Associates [and the Nominated STP Sub-Contractor]28 [and the technology provider]29 meets all the Qualification Criteria and Eligibility Criteria laid down in the RFP.

15. We declare that we and our Associates [and the Nominated STP Sub-Contractor]30 [and the technology provider]31 are not submitting separate Bids for the Project.

16. We declare that we are not submitting more than 1 Bid for the Project.

17. We certify that in regard to matters other than security and integrity of the country, we or any Member [or the Nominated STP Sub-Contractor]32 has not been convicted by a court of law or indicted or adverse orders passed by a regulatory authority which could cast a doubt on our ability to undertake the Project.

18. We further certify that in regard to matters relating to security and integrity of the country, we or any Member [or the Nominated STP Sub-Contractor]33 has not been charge-sheeted by any agency of the state or convicted by a court of law.

19. We further certify that no investigation by a regulatory authority is pending either against us or against any Member [or the Nominated STP Sub-Contractor]34 or against our CEO or any of our directors/managers/employees, which could have a material adverse effect on our ability to undertake the Project.

20. I/ We further certify that we are qualified to submit a Bid in accordance with the guidelines for qualification of bidders seeking to acquire stakes in Public Sector Enterprises through the process of disinvestment issued by the GOI vide Department of Disinvestment OM No. 6/4/2001-DD-II dated 13th July, 2001 which guidelines apply mutatis mutandis to the Bid Process.

21. Subject to the disclosures made in Annexure 1L, we further certify that any work contracts previously undertaken by us have not been suspended or terminated and/or performance
security called by an employer for reasons related to the non-compliance with any ESHS requirements or safeguard in the past 5 years

22. We undertake that in case due to any change in facts or circumstances during the Bid Process, we attract the provisions of disqualification in terms of the provisions of the RFP, we shall inform [EXECUTING AGENCY] of the same immediately.

23. In the event of us being declared as the Selected Bidder for the Project, we agree to incorporate a Special Purpose Vehicle, which will enter into a Concession Agreement provided by [EXECUTING AGENCY]. We agree not to seek any changes in or deviations from the aforesaid draft and agree to abide by the same.

24. We agree and undertake to abide by all the terms and conditions of the RFP.

25. We have studied the RFP and all the information carefully. We understand that except to the extent expressly set forth in the Concession Agreement, we shall have no claim, right or title arising out of any documents or information provided to us by [EXECUTING AGENCY] or in respect of any matter arising out of or concerning or relating to the Bid Process including the award of the Project.

26. [A power of attorney, by all Members of the Consortium, appointing the Lead Member, authorizing the Lead Member to sign the Bid related documents and sign the Concession Agreement, is included as part of the Bid.] 35

27. A Power of Attorney from the [Bidder/Lead Member] 36 authorizing the undersigned as the authorised representative, signatory and contact person who is authorised to perform all tasks including, but not limited to providing information, responding to queries, entering into contractual commitments on behalf of the Bidder etc., in respect of the Project is included as a part of the Bid.

28. [We have submitted an undertaking from the Associate for deploying the expertise of the associate for the development of the project and/or commitment of the equity during the construction of the project.] 37

29. We certify that in terms of the RFP, our Net Worth is INR [_____________] (Rupees in words).

30. We certify that we have the Technical Capacity and Financial Capacity to undertake the Project.

31. We agree and understand that the Bid is subject to the provisions of the RFP. In no case, we shall have any claim or right against [EXECUTING AGENCY] if the Project is not awarded to us or our Bid is not opened.

35 To be deleted for a single entity bidder.
36 Delete Lead Member if the Bidder is a single entity.
37 To be deleted if not applicable. If the Bidder is claiming the credentials of an Associate for meeting the Technical Capacity and/or Financial Capacity requirement, the Bidder shall submit a suitable undertaking in the Associate firm’s letter head, in addition to the formats mentioned in this RFP.
32. We have submitted all the relevant information as per the formats specified in the RFP, in 1 original and, where required, 1 copy, along with the requisite Bid Security.

33. Our Bid shall remain valid for a period of not less than 180 days from the Bid Due Date.

</tr>
</tbody>
</table>

*Instructions:*
Bidders are expected to provide information in respect of the STP/ETP/CETP project for which they are claiming design and construction/development experience. A separate sheet should be filled for each STP project. In case of development experience, details such as name, postal address, email address and contact details of the authority/implementing agency (i.e., concession grantor) should be provided. In case of design and construction experience, details such as name, postal address, email address and contact details of both the developer (i.e., the concessionaire) and the authority/implementing agency (i.e., the concession grantor) should be provided.

The date of award of the project and completion or commissioning of the project, as the case may be, should be indicated.

In case of development experience, the completion certificate/commissioning certificate issued by the relevant government authority and signed by the executive engineer or an equivalent officer, certifying the date of award of the project, the date of completion/commissioning of the project and that the project has been commissioned and completed (as required under the relevant concession agreement or similar contract) should be provided. In case of design and construction experience, the completion certificate/commissioning certificate issued by the client and signed by a duly authorized officer, certifying the date of award of the project, the date of completion/commissioning of the project and that the project has been successfully commissioned and completed (as required under the relevant concession agreement or similar contract for the STP) should be provided.

In the event that credit is being taken for the experience of an Associate, the Bidder should also provide a certificate in the format set out at Annexure 1G.

A certificate from the statutory auditor should be furnished stating the shareholding in the entity developing the STP/ETP/CETP project in the format set out at Annexure 1F.

Experience for any activity relating to a STP/ETP/CETP project shall not be claimed by two or more Members of the Consortium or the Nominated STP Sub-Contractor (if applicable. In other words, no double counting by a Consortium in respect of the same experience shall be permitted in any manner whatsoever.

It may be noted that in the absence of any detail in the above format and/or the certificate(s) issued by the relevant government authority/client, the information would be considered inadequate and could lead to exclusion of the relevant project in determining whether the Bidder meets the Qualification Criteria.

**Instructions:**

(1) Bidders are expected to provide information in respect of the STP/ ETP/ CETP for which they are claiming operations and maintenance experience. A separate sheet should be filled for each STP project.

(2) Details such as name, postal address, email address and contact details of the client and/ the relevant government authority (i.e., the implementing agency) should be provided.

(3) The duration of the O&M experience must be at least 12 consecutive months in the 10 years immediately preceding the Bid Due Date. For each STP/ ETP/ CETP project, a certificate issued by the relevant government authority (i.e., the implementing agency) and signed by the executive engineer or an equivalent officer...
certifying the Bidder/Member/Associate that the Bidder/Member/Associate has successfully operated and maintained the STP/ETP/CETP for at least 12 consecutive months in the 10 years immediately preceding the Bid Due Date, in accordance with the relevant concession agreement or similar contract executed for such STP/ETP/CETP should be provided.

(4) In the event that credit is being taken for the experience of an Associate, the Bidder should also provide a certificate in the format set out at Annexure 1G.

(5) It may be noted that in the absence of any detail in the above format and the certificate(s) issued by the relevant government authority, the information would be considered inadequate and could lead to exclusion of the relevant project in determining whether the Bidder meets the Qualification Criteria.

@ Provide details of only those projects that have been undertaken by the Bidder under its own name and/or by an Associate and/or by a project company eligible under Clause 4.1(a)(C)(ii). In case of Category 1, include only those projects which have an estimated capital cost exceeding the amount specified in Clause 4.1(a)(C)(iii) and for Category 2, include only those projects where the payments made/received exceed the amount specified in Clause 4.1(a)(D).
A Bidder consisting of a single entity should fill in details as per the row titled Single entity Bidder and ignore the rows titled Consortium Member. In case of a Consortium, the row titled Single entity Bidder may be ignored. In case credit is claimed for an Associate, necessary evidence to establish the relationship of the Bidder with such Associate, in terms of Clause 20.1(g), shall be provided.

** Refer Annexure-1E Part-IV.

$ Refer Clause 4.1(a)(B).

¥ In the case of Category 2, construction shall not include supply of goods or equipment except when such goods or equipment form part of a turn-key construction contract/ EPC contract for the project. In no case shall the cost of land be included for submission as an Eligible Project.

$$ For conversion of US Dollars to Rupees, the rate of conversion shall be as per the rate as on date 60 (sixty) days prior to the Bid Due Date. In case of any other currency, the same shall first be converted to US Dollars as on the date 60 (sixty) days prior to the Bid Due Date, and the amount so derived in US Dollars shall be converted into Rupees at the aforesaid rate. The conversion rate of such currencies shall be the daily representative exchange rates published by the International Monetary Fund for the relevant date.

**Instructions:**

1. **Bidders are expected to provide information in respect of each Eligible Projects in this Annex. The projects cited shall comply with the eligibility criteria specified in Clause 4.1(a)(C) and 4.1(a)(D) of the RFP, as the case may be. Information provided in this section is intended to serve as a backup for information provided in the Bid.**
2. A separate sheet should be filled for each Eligible Project.

3. Refer to Clause 4.1(a)(B) of the RFP for category number.

4. The total payments received/made and/or revenues appropriated for each Eligible Project are to be stated in Annexure-1E Part-III. The figures to be provided here should indicate the break-up for the 5 (five) financial years as mentioned in the table. For Category 1, expenditure on development of the project and/or revenues appropriated, as the case may be, should be provided, but only in respect of projects having an estimated capital cost exceeding the amount specified in Clause 4.1(a)(C)(iii). In case of Category 2, payments made/ received only in respect of construction should be provided, but only if the amount paid/received exceeds the minimum specified in Clause 4.1(a)(D). Payment for construction works should only include capital expenditure and should not include expenditure on repairs and maintenance.

5. In case of projects in Category 1, particulars such as name, address and contact details of owner/Authority/Agency (i.e. concession grantor, counter party to PPA, etc.) may be provided. In case of projects in Category 2, similar particulars of the client need to be provided.

6. Provide the estimated capital cost of Eligible Project. Refer to Clauses 4.1(a)(C) and 4.1(a)(D).

7. For Category 1, the date of commissioning of the project, upon completion, should be indicated. In case of Category 2, date of completion of construction should be indicated. In the case of projects under construction, the likely date of completion or commissioning, as the case may be, shall be indicated.

8. For Category 1, the equity shareholding of the Bidder, in the company owning the Eligible Project, held continuously during the period for which Eligible Experience is claimed, needs to be given (Refer Clause 4.1(a)(C)).

9. Experience for any activity relating to an Eligible Project shall not be claimed by two or more Members of the Consortium. In other words, no double counting by a Consortium in respect of the same experience shall be permitted in any manner whatsoever. Further, in case of a Nominated STP Sub-Contractor, the experience for any activity relating to an Eligible Project shall not be claimed by both the Bidder and the Nominated STP Sub-Contractor.

10. Certificate from the Bidder’s statutory auditor or its respective clients shall be furnished as per formats below for each Eligible Project. In jurisdictions that do not have statutory auditors, the auditors who audit the annual accounts of the Bidder/Member/Associate/ Nominated STP Sub-Contractor may provide the requisite certification.
11. If the Bidder is claiming experience under Category 1, it should provide a certificate from its statutory auditor in the format below:

Certificate from the Statutory Auditor regarding PPP projects

Based on its books of accounts and other published information authenticated by it, this is to certify that …………… (name of the Bidder/Member/Associate/ Nominated STP Sub-Contractor) is/ was an equity shareholder in (title of the project company) and holds/held Rs.……….. (Rupees ………..) of equity (which constitutes ……… % of the total paid up and subscribed equity capital) of the project company from ……..(date) to …….. (date). The project was/is likely to be commissioned on …….. (date of commissioning of the project).

We further certify that the total estimated capital cost of the project is Rs. …………. (Rupees ……………….), of which Rs.……….. (Rupees ……………….) of capital expenditure was incurred during the past five financial years as per year-wise details noted below:

<table>
<thead>
<tr>
<th>Year 1</th>
<th>Year 2</th>
<th>Year 3</th>
<th>Year 4</th>
<th>Year 5</th>
</tr>
</thead>
</table>

We also certify that the eligible annual revenues collected and appropriated by the aforesaid project company in terms of Clauses 4.1(a)(B) and 4.1(a)(C)(iv) of the RFP during the past five financial years were Rs. ………………… as per year-wise details noted below:

Name of the audit firm:

ANNEXURE II

FORMAT OF BID SECURITY (BANK GUARANTEE)

(On stamp paper)

B.G. No:  

Dated:  

WHEREAS, ................................(name of Bidder including names of all Joint Venture Participants) (hereinafter called “the Bidder”) has submitted its Bid (hereinafter called the “Bid”) dated (date) for the performance of (name of Contract).

KNOW ALL PEOPLE by these presents that We .................... (name of Bank) of .................... (name of country) having our registered office at .................... (hereinafter called “the Bank”) are bound unto .................... (hereinafter called “the Owner”) in the sum of .................... for which payment well and truly to be made to the said Owner, the Bank binds itself, its successors, and assigns by these presents.

[The Bidder should insert the amount of the guarantee in words and in figures. This figure should be the same amount as set out in ITB Section 15.1 and the Bid Data Sheet. The details related to the Bid Security are set out in the same ITB Section 15]

The CONDITIONS of this obligation are:

a. if the Bidder withdraws its Bid during the Bid Validity Period; or

b. if the Bidder, having been notified of the acceptance of its Bid by the Owner during the period of Bid validity,

   1. fails to sign the Form of Contract in accordance with and when required by ITB Section 23; or

   2. fails to provide the performance security to the Owner in accordance with and when required by ITB Section 16.

We undertake to pay to the Owner up to the above amount upon receipt of its first written demand, without the Owner having to substantiate its demand, provided that in its demand the Owner will note that the amount claimed by it is due to it owing to the occurrence of one or more of the conditions set out above, specifying the occurred condition or conditions.

This Guarantee will remain in full force up to and including 45 days after the expiry of the Bid
Validity Period and it may be extended by the Owner in accordance with the Bidding Documents, notice of which extension(s) to the Bank is hereby waived. Any demand in respect of this Guarantee should reach the Bank not later than the above date or the extended date.

This guarantee is subject to the Uniform Rules for Demand Guarantees (URDG) 2010 Revision, ICC Publication No. 758 except that the supporting statement under Article 15(a) is hereby excluded.

SEALED with the Common Seal of the said Bank this ...... day of ..................., [Year].

ANNEXURE 1J

FORMAT OF POWER OF ATTORNEY FOR APPOINTING LEAD MEMBER

(On requisite stamp paper)

Whereas the [EXECUTING AGENCY] ([EXECUTING AGENCY]) has invited Bids from interested parties for the (NAME OF THE STATE /NATIONAL LEVEL AGENCY IF ANY) – [EXECUTING AGENCY] [LOCATION] STP PPP Project (the Project).

Whereas, ……………………………. and ……………………………………………. (collectively, the Consortium) being Members of the Consortium are interested in submitting a Bid for the Project in accordance with the terms and conditions of the Request for Proposal (RFP) issued by [EXECUTING AGENCY] on [Insert Date], and

Whereas, it is necessary for the Members of the Consortium to designate one of them as the Lead Member with all necessary power and authority to do for and on behalf of the Consortium, all acts, deeds and things as may be necessary in connection with the Consortium’s Bid for the Project and its implementation.

NOW, THEREFORE, KNOW ALL MEN BY THESE PRESENTS

We, …………………….. having our registered office at …………………….., ………………………..having our registered office at ………………….., and ………………………... having our registered office at ……………………………..., (hereinafter collectively referred to as the Principals) do hereby irrevocably designate, nominate, constitute, appoint and authorise …………………………... having its registered office at ………………………., being one of the Members of the Consortium, as the Lead Member and true and lawful attorney of the Consortium (hereinafter referred to as the Attorney). We hereby irrevocably authorize the Attorney (with power to sub-delegate) to conduct all business for and on behalf of the Consortium and any one of us during the Bid Process and, in the event the Consortium is awarded the Project, during the implementation of the Project and in this regard, to do on our behalf and on behalf of the Consortium, all or any of such acts, deeds or things as are necessary or required or incidental to the submission of the Consortium’s Bid for the Project, including but not limited to signing and submission of all Bid related documents and other documents and writings, participate in bidders and other conferences, respond to queries, submit information/documents, sign and execute contracts and undertakings consequent to acceptance of the Bid of the Consortium and generally to represent the Consortium in all its dealings with [EXECUTING AGENCY] and the ----------------- (Name of the state /national level agency if any)\textsuperscript{44}, and/or any other government agency or any person, in all matters in connection with or relating to or arising out of the Consortium’s Bid for the Project and/or upon award of the Project and/or till the Concession Agreement

\textsuperscript{44} Delete if not applicable.
is entered into with [EXECUTING AGENCY] and the (Name of the state/national level agency if any)\(^45\).

**AND** hereby agree to ratify and confirm and do hereby ratify and confirm all acts, deeds and things done or caused to be done by our said Attorney pursuant to and in exercise of the powers conferred by this Power of Attorney and that all acts, deeds and things done by our said Attorney in exercise of the powers hereby conferred shall and shall always be deemed to have been done by us/Consortium.

IN WITNESS WHEREOF WE THE PRINCIPALS ABOVE NAMED HAVE EXECUTED THIS POWER OF ATTORNEY ON THIS……………DAY OF……………………, 20……..

(Name, Title and Address of the Attorney)

*Instructions:*

1. *The mode of execution of the Power of Attorney should be in accordance with the procedure, if any, laid down by the applicable law and the charter documents of the executant(s) and when it*

\(^{45}\) Delete if not applicable
is so required, the same should be under common seal affixed in accordance with the required procedure.

(2) Also, wherever required, the Bidder should submit for verification the extract of the charter documents and documents such as a board or shareholders’ resolution/power of attorney in favour of the person executing this Power of Attorney for the delegation of power hereunder on behalf of the Bidder.

(3) For a power of attorney executed and issued overseas, the document will also have to be legalised by the Indian Embassy and notarised in the jurisdiction where the power of attorney is being issued. However, the power of attorney provided by the Bidders from countries that have signed the Hague Legislation Convention, 1961 are not required to be legalised by the Indian Embassy if it carries a conforming Apostille certificate.
ANNEXURE 1K

FORMAT OF JOINT BIDDING AGREEMENT

THIS JOINT BIDDING AGREEMENT ("Agreement") is entered into on this [●] Day of [●] 201[●]

AMONGST

1. [●], with its registered office at (referred to as the First Part which expression will, unless repugnant to the context include its successors and permitted assigns);

AND

2. [●], with its registered office at (referred to as the Second Part which expression will, unless repugnant to the context include its successors and permitted assigns);

[[AND

3. [●], with its registered office at [●] (referred to as the Third Part which expression will, unless repugnant to the context include its successors and permitted assigns).]

The above mentioned parties of the FIRST [and] [●], SECOND, [and] [●] [THIRD] are collectively referred to as the Parties and each is individually referred to as a Party.

WHEREAS

(A) [EXECUTING AGENCY] (referred to as [EXECUTING AGENCY], which expression will, unless repugnant to the context or meaning thereof, include its administrators, successors and assigns) has invited Bids by its Request for Proposal No_________ dated [●] (the RFP) for selection of a

(B) Bidder for the design, finance, construction, completion, operation and maintenance of the Facilities on the relevant Site in [LOCATION], on a hybrid annuity PPP basis in accordance with the Concession Agreement (the Project).

(C) The Parties are interested in jointly bidding for the Project as Members of a Consortium and in accordance with the terms and conditions of the RFP.

(D) It is a necessary condition under the RFP that the Members will enter into a Joint Bidding Agreement and furnish a copy of it with the Bid.

NOW IT IS HEREBY AGREED as follows:

1. Definitions and interpretations

   In this Agreement, the capitalised terms will, unless the context otherwise requires, have the meaning ascribed thereto under the RFP.

2. Consortium
2.1 The Parties do hereby irrevocably constitute a consortium (the **Consortium**) for the purposes of jointly participating in the Bid Process for the Project.

2.2 The Parties hereby undertake to participate in the Bid Process only through this Consortium and not individually and or through any other consortium constituted for the Project, either directly or indirectly or through any of their Associates.

### 3. Covenants

3.1 The Parties hereby undertake that in the event the Consortium is declared the Selected Bidder and awarded the Project, it will incorporate a special purpose vehicle (**SPV**) under the Companies Act for entering into the Concession Agreement with (Name of the state/national level agency if any)\(^{46}\) and [EXECUTING AGENCY] for undertaking the Project.

3.2 The Members of the Consortium undertake that they shall be jointly and severally responsible and liable for all matters arising out of or in relation to this RFP.

### 4. Role of the Parties

4.1 The Parties hereby agree that Party of the First Part will be the Lead Member of the Consortium and will have the power of attorney from all Parties and bind all Parties for and in conducting all business for and on behalf of the Consortium during the Bid Process and, if the Consortium is declared as the Selected Bidder, during the execution of the Project.

4.2 Party of the Second Part will be [ ].

4.3 Party of the Third Part will be [ ]

### 5. Shareholding in the SPV

5.1 The Parties agree that the proportion of shareholding among the Parties in the SPV will be as follows:

First Party:

Second Party:

[Third Party:]

5.2 The Parties undertake that:

(a) the First Party, acting as the Lead Member of the Consortium, will control the SPV and subscribe for and hold a minimum of 26% of the total Capital and voting rights of the SPV from the Effective Date until 3 years after the [LOCATION] Facilities COD, and

\(^{46}\) Delete if not applicable. In such a case the agreement will be bipartite.
(b) the [Second and/or the Third] Party, whose [Technical Capacity and/or Financial Capacity] is being assessed, will hold at least 26% of the total Capital and voting rights of the SPV from the Effective Date until 3 years after the [LOCATION] Facilities COD.

5.3. The Parties undertake that they will comply with all equity lock-in requirements set out in this Agreement and in the Concession Agreement.

6. **Representations of the Parties**

Each Party represents to the other Parties as of the date of this Agreement that:

(a) such Party is duly organised, validly existing and in good standing under the laws of its incorporation and has all requisite power and authority to enter into this Agreement;

(b) the execution, delivery and performance by such Party of this Agreement has been authorised by all necessary and appropriate corporate or governmental action and a copy of the extract of the charter documents and board resolution/power of attorney in favour of the person executing this Agreement for the delegation of power and authority to execute this Agreement on behalf of the Consortium Member is annexed to this Agreement, and will not, to the best of its knowledge:

(i) require any consent or approval not already obtained;

(ii) violate any applicable law presently in effect and having applicability to it;

(iii) violate the memorandum and articles of association, by-laws or other applicable organisational documents;

(iv) violate any clearance, permit, concession, grant, license or other governmental authorisation, approval, judgment, order or decree or any mortgage agreement, indenture or any other instrument to which such Party is a party or by which such Party or any of its properties or assets are bound or that is otherwise applicable to such Party; or

(v) create or impose any liens, mortgages, pledges, claims, security interests, charges or encumbrances or obligations to create a lien, charge, pledge, security interest, encumbrances or mortgage in or on the property of such Party, except for encumbrances that would not, individually or in the aggregate, have a material adverse effect on the financial condition or prospects or business of such Party so as to prevent such Party from fulfilling its obligations under this Agreement;
(c) this Agreement is the legal and binding obligation of such Party, enforceable in accordance with its terms against it;

(d) there is no litigation pending or, to the best of such Party's knowledge, threatened to which it or any of its Associates is a party that presently affects or which would have a material adverse effect on the financial condition or prospects or business of such Party in the fulfilment of its obligations under this Agreement, and

(e) there is no suspension or termination of any contract of any Party and/or calling of any performance security by an employer for reasons related to the non-compliance by such Party with any ESHS requirements or safeguard in the past 5 years that presently affects or which would have a material adverse effect on the financial condition or prospects or business of such Party in the fulfilment of its obligations under this Agreement.

7. Termination

This Agreement will be effective from the date hereof and will continue in full force for the entire duration of the Project in accordance with the Concession Agreement, in case the Project is awarded to the Consortium. However, in case the Consortium is not selected for award of the Project, the Agreement will stand terminated upon return of the Bid Security as per the RFP.

8. Miscellaneous

8.1 This Agreement will be governed by the laws of India.

8.2 The Parties acknowledge and accept that this Agreement will not be amended by the Parties without the prior written consent of [EXECUTING AGENCY].

IN WITNESS WHEREOF THE PARTIES ABOVE NAMED HAVE EXECUTED AND DELIVERED THIS AGREEMENT AS OF THE DATE FIRST ABOVE WRITTEN.

ANNEXURE 1M

Undertaking for the Nominated STP Sub-Contractor

(On the Rs. 100 stamp paper and to be duly notarised)

From

[insert name of the entity issuing the undertaking]
[insert address of the entity issuing the undertaking]

Date: [insert date]

To

[EXECUTING AGENCY]

[ ]

Dear Sir,

Sub: Undertaking from the Nominated STP Sub-Contractor for the [Name of the Project]

We, the undersigned ……. [insert name of the entity issuing the undertaking] hereby undertake and confirm that we have [developed]/[designed and constructed] and operated and maintained the following [Sewage Treatment Plant/ Effluent Treatment Plant/ Common Effluent Treatment Plant]:

<table>
<thead>
<tr>
<th>Title and Nature of the Project</th>
<th>Capacity of the Project</th>
<th>Location</th>
<th>Entity for which the [STP/ETP/CETP] was developed and/or designed and constructed</th>
<th>Date of completion</th>
</tr>
</thead>
</table>

The following information and relevant documents are being submitted along with the Bid to satisfactorily meet the RFP conditions:

1. Total payments received/ made and/ or revenues appropriated for each Eligible Project in the format set out in Annexure 1E Part-IV of the RFP document along with the certificate from the statutory auditor, meeting the requirement of 25% of the Threshold Technical Capability as per Clause 4.1(a)(B) of the RFP, amounting to Rs. _____________ (Rupees _____________);

2. certificate(s) issued by relevant government authorities to demonstrate that the [STP/ETP/CETP], experience for which is being claimed in the Bid, was developed and/or

47 Delete as applicable.
designed and constructed in the 10 years immediately preceding the Bid Due Date in accordance with the contract executed for the STP/ETP/CETP;

3. certificate(s) issued by relevant government authorities to demonstrate that the STP/ETP/CETP, experience for which is being claimed in the Bid, was operated and maintained for any 12 consecutive months in the 10 years immediately preceding the Bid Due Date in accordance with the contract executed for the [STP/ETP/CETP].

We hereby agree that if [Insert name of the single Bidder/details of Consortium] is selected as the Selected Bidder,

1. we shall enter into a contract with the Special Purpose Vehicle incorporated by the Selected Bidder to develop the Sewage Treatment Plant(s) for [Name of the Project] in accordance with the Concession Agreement;

2. we shall submit the hard copy of the original contract, as stated above, to the [EXECUTING AGENCY] on or before the Effective Date;

3. we shall submit to [EXECUTING AGENCY], prior to the Appointed Date, an unconditional and irrevocable bank guarantee for an amount corresponding to 50% of the Performance Securities in accordance with the Concession Agreement. We hereby undertake that, as per the conditions stated in the Concession Agreement, the Performance Securities submitted shall be liable to be forfeited as per the Clause 4.1(a)(F)(iii) of the RFP document.

4. we shall submit to [EXECUTING AGENCY], within 60 days of the relevant Construction Completion Date or 30 days before the relevant COD, whichever is earlier, an unconditional and irrevocable bank guarantee for an amount corresponding to 50% of the O&M Securities in accordance with the Concession Agreement. We hereby undertake that, as per the conditions stated in the Concession Agreement, the O&M Securities submitted shall be liable to be forfeited as per the Clause 4.1(b)(iii) of the RFP document.

We hereby confirm that the information provided above is true and correct to the best of our knowledge, and no material fact has been concealed.

WHEREOF WE, ………………… [insert name of the entity issuing the undertaking], HAVE EXECUTED THIS UNDERTAKING ON THIS …….. DAY OF ………., 20…….

For
………………………….

(Signature, name, designation and address)

(Notarised)

Accepted
………………………….
Instructions:

(1) For an undertaking executed and issued overseas, the document will also have to be legalised by the Indian Embassy and notarised in the jurisdiction where the power of attorney is being issued. However, the sub-contractor undertaking provided by the Bidders from countries that have signed the Hague Legislation Convention, 1961 are not required to be legalised by the Indian Embassy if it carries a conforming Apostille certificate.
ANNEXURE 2

EXPERIENCE CERTIFICATE FOR BIOGAS POWER PLANT

(On the letter head of the Bidder/Member)

From

[insert name of Bidder/Member]
[insert address of Bidder/Member]

Date: [insert date]

To

[Designation of the Representative]
[EXECUTING AGENCY],
[LOCATION]

We, the undersigned[insert name of the Bidder/Member] having read, examined and understood in detail the RFP for development of the Project, hereby confirm that we have [developed]/[designed and constructed] the following biogas power plant based on STP effluent:

<table>
<thead>
<tr>
<th>Capacity of the biogas power plant</th>
<th>Location</th>
<th>Entity for which biogas plant was set up</th>
<th>Date of completion</th>
<th>Duration for which O&amp;M experience is being claimed (From month, year)</th>
</tr>
</thead>
</table>

The certificate(s) issued by relevant government authorities to demonstrate that (1) the biogas power plant was developed or designed and constructed in the 10 years immediately preceding the Bid Due Date in accordance with the contract executed for the biogas power plant; and (2) the biogas power plant [was/has been] in successful operation for at least 24 months in the 10 years immediately preceding the Bid Due Date; have been attached.

If selected as the Selected Bidder, we undertake that the Concessionaire shall set up a biogas power plant in accordance with the Concession Agreement.

Dated the__________ day of__________ 2019.

48 Delete as applicable.
.........................

(Name and signature of Authorized Signatory)
ANNEXURE 3

CONSENT LETTER FOR EXPERIENCE OF BIOGAS POWER PLANT

(On the letter head of the entity issuing the consent letter)

From

[insert name of the entity issuing the consent letter]

[insert address of the entity issuing the consent letter]

Date: [insert date]

To

[ Designation of the Representative]

[EXECUTING AGENCY],

[LOCATION] (  

Dear Sir,

Sub: Consent Letter for Experience for Biogas Power Plant for the [LOCATION] STP PPP Project

We, the undersigned [insert name of the entity issuing the consent letter] hereby confirm that we have [developed]/[designed and constructed] the following biogas power plant based on STP effluent:

<table>
<thead>
<tr>
<th>Capacity of the biogas power plant</th>
<th>Location</th>
<th>Entity for which biogas plant was set up</th>
<th>Date of completion</th>
<th>Duration for which O&amp;M experience is being claimed (From month, year to month, year)</th>
</tr>
</thead>
<tbody>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The certificate issued by relevant government authorities/clients to demonstrate that (1) the biogas power plant was developed or designed and constructed in the 10 years immediately preceding the Bid Due Date in accordance with the contract executed for the biogas power plant; and (2) the biogas power plant [was/has been] in successful operation for at least 24 months in the 10 years immediately preceding the Bid Due Date; have been attached.

We hereby agree that if [Insert name of the single Bidder/details of Consortium] is selected as the Selected Bidder, we shall enter into a contract with the special purpose vehicle incorporated by the Selected Bidder to develop a biogas power plant at the [Location Name] Site in accordance with the Concession Agreement:

Dated the________ day of________ 2019.

49 Delete as applicable.
Thanking you,

Yours truly,

........................................

(Name and signature of Authorized Signatory)
ANNEXURE 4: FORM OF PERFORMANCE SECURITY

FORM OF PERFORMANCE SECURITY

_____ [Bank’s Name, and Address of Issuing Branch or Office]

Beneficiary: __ [Name and Address of Owner]

Date: __

PERFORMANCE GUARANTEE NO.: ___

We have been informed that [name of Operator] (hereinafter called “the Bidder”) has entered into Contract No. __ [reference number of the contract] dated _____ with you, concerning a contract to design, build, operate and transfer STP, New/Replace Outfall/Interceptor sewer Line Pumping Stations, all appurtenant structures and allied works in the city of [LOCATION] (hereinafter called “the Contract”) [ , with _______ [name of the Nominated STP Sub-Contractor] (hereinafter called “the Sub-Contractor”) being nominated by the Bidder as the Sub-Contractor for STP construction and operation and maintenance.] 50.

Furthermore, we understand that, according to the conditions of the Contract, a performance guarantee is required.

At the request of the [Bidder/Sub-Contractor] 51, we [name of Bank] hereby irrevocably undertake to pay you any sum or sums not exceeding in total an amount of __ [amount in figures] (___) [amount in words], upon receipt by us of your first demand in writing accompanied by a written statement stating that the [Bidder/Sub-Contractor] 52 is in breach of its obligations under the Contract, without your needing to prove or to show grounds for your demand or the sum specified therein.

This guarantee shall expire no later than the earlier of:

(a) six months after the End Date, as defined in the Contract; or

(b) six months after the date of termination of the Contract pursuant to its terms. Consequently, any demand for payment under this guarantee must be received by us at this office on or before that date.

This guarantee is subject to the Uniform Rules for Demand Guarantees (URDG) 2010 Revision, ICC Publication No. 758 except that the supporting statement under Article 15(a) is hereby excluded.

Yours truly,

50 To be deleted if not applicable

ESHS Demand Guarantee

[On requisite stamp paper]

[Guarantor letterhead or SWIFT identifier code]

**Beneficiary:** [EXECUTING AGENCY] with its registered office – [insert address]

**Date:** [Insert date of issue]

**ESHS PERFORMANCE GUARANTEE No.:** [Insert guarantee reference number]

**Guarantor:** [Insert name and address of place of issue, unless indicated in the letterhead]

We have been informed that _________ (hereinafter called the **Applicant**) has been selected as the Selected Bidder for award of contract by the Beneficiary for undertaking the Project (hereinafter called the **Contract**).

Furthermore, we understand that, according to the conditions of the Contract, a performance guarantee to secure the Concessionaire's ESHS obligations is required to be submitted by the Applicant prior to signing of the **Contract**.

At the request of the Applicant, we as Guarantor, hereby irrevocably undertake to pay the Beneficiary any sum or sums not exceeding in total an amount of INR [ ] (Rupees [ ]) ([Insert amount equal to [1%] of the relevant Bid Project Cost]), such sum being payable in the types and proportions of currencies in which the contract price is payable, upon receipt by us of the Beneficiary's complying demand supported by the Beneficiary's statement, whether in the demand itself or in a separate signed document accompanying or identifying the demand, stating that the Applicant is in breach of its Environmental, Social, Health and Safety (ESHS) obligation(s) under the **Contract**, without the Beneficiary needing to prove or to show grounds for your demand or the sum specified therein.

This guarantee shall be valid for the term of the **Contract**, and any demand for payment under it must be received by us at this office indicated above on or before that date.
This guarantee is subject to the Uniform Rules for Demand Guarantees (URDG) 2010 Revision, ICC Publication No. 758, except that the supporting statement under Article 15(a) is hereby excluded.

However, Bidders may check the correctness of above list before submitting the bid.
Annexure -7

Declaration regarding customs/excise duty exemption for materials to be purchased for use in building the sewerage network including pumping stations etc.

(Bidder’s Name and Address)

To:

-------------------------------------------------------------

-------------------------------------------------------------

Dear Sir:

1. We confirm that we are solely responsible for obtaining customs/excise duty waivers which we have considered in our bid and in case of failure to receive such waivers for reasons whatsoever, the Owner will not compensate us.

2. We are furnishing below the information required by the [EXECUTING AGENCY] for issue of the necessary certificates in terms of the Government of India Central Excise Notification No. 108/95 along with all subsequent amendments including the amendment dt.01-03-2008 and Customs Notification No. 85/99.

3. The goods, equipment and materials for which certificates are required are as under:

<table>
<thead>
<tr>
<th>Items</th>
<th>Make/Brand Name/Class</th>
<th>Capacity [where applicable]</th>
<th>Quantity</th>
<th>Value</th>
<th>State whether it will be procured locally or imported [if so from which country]</th>
<th>Remarks regarding justification for the quantity and their usage in setting up Sewerage Network</th>
</tr>
</thead>
<tbody>
<tr>
<td>Goods</td>
<td>[a]</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>[b]</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
4. We agree that no modification to the above list is permitted after bids are opened.

5. We agree that the certificate will be issued only to the extent considered reasonable by the EXECUTING AGENCY for the work, based on the bid submitted by us, construction programme and methodology furnished along with the bid.

6. We confirm that the above goods will be exclusively used for the construction of the above work. We are aware that exemption will be issued to only goods/material/equipment which form part of the work on permanent basis but not for the goods/material/equipment which are used by the us for execution of project and after completion of the project, the goods remain with the us being owner of such goods for further deployment in other projects.

GUIDELINES

FOR PREPARATION OF DPRs

FOR WORKS OF INTERCEPTION AND DIVERSION OF

DRAINS AND SEWAGE TREATMENT PLANTS

National Mission for Clean Ganga
Ministry of Water Resources,
River Development & Ganga Rejuvenation
Govt. of India, New Delhi

August 2018
DISCLAIMER

The data, information, used in this report has been obtained from different sources. Every care has been taken to ensure that the information is correct, consistent and complete as far as possible.

The constraints of time and resources available to this nature of assignment, however do not preclude the possibility of errors, omissions etc. in the data and consequently in the guideline preparation.

The contents of this guidelines can be used freely with the request that a reference may be made as follows:
“Guideline For preparation of DPRs for works of interception and diversion of drains and sewage treatment plants”, National Mission for Clean Ganga, Ministry of Water Resources, River Development & Ganga Rejuvenation, Govt. of India, New Delhi, June 2018.
ACKNOWLEDGEMENT

The National Mission for Clean Ganga (NMCG), Ministry of Water Resources, River Development & Ganga Rejuvenation (MoWR, RD & GR) has given the assignment of developing fresh ‘Guidelines for Interception, Diversion & Sewage Treatment Plant Works’ to the Alternate Hydro Energy Centre, Indian Institute of Technology – Roorkee, which would serve as DPR Template to be used by States & Consultants to prepare specific DPRs.

A workshop was also organized by NMCG at New Delhi where all stakeholders covering state nodal agencies, state project management groups, PSUs, academic institutions and multilateral bodies participated and the matter was deliberated. Observations/ comments received via emails from World Bank, Support for Ganga Rejuvenation (SGR) Project, UP-SPMG, IIT Kharagpur, Tata Consulting Engineers Ltd, Engineers India Ltd (EIL), NBCC, Engineering Projects India Ltd (EPIL) and Aligarh Muslim University (AMU) were considered and after a series of discussions at NMCG, the guidelines were finalized.

We are especially grateful to Shri Upendra Prasad Singh, Secretary, MoWR, RD & GR and to the group of officials of NMCG led by Shri Rajiv Ranjan Mishra, Director General, NMCG and Shri Hitesh Kumar S. Makwana, Executive Director (Projects) including Dr. Pravin Kumar, Director (Technical) and Shri Rajat Gupta, Sr. Specialist. Suggestions received from Shri Devendra Pratap Mathuria, Executive Director (Technical) are thankfully acknowledged.

Shri Vinay Shankar and Shri V. K. Gupta were other members of the team that prepared the guidelines. Their contributions are thankfully acknowledged.

(ARUN KUMAR)
AHEC, IIT Roorkee
3.3 DEVELOPING OPTIONS FOR THE SCHEMES

3.3.1 Utilising an existing system
3.3.2 Condition assessment
3.3.3 Alternatives
3.3.4 Techno Economic Evaluation

3.4 RIVER WATER QUALITY

3.4.1 Water Quality Standards for Rivers as per CPCB
3.4.2 Actual Water Quality of the River

EXECUTIVE SUMMARY

National Mission for Clean Ganga (NMCG) was constituted for effective abatement of pollution and rejuvenation, protection and management of the River Ganga and its tributaries. Under the above mission, no untreated municipal sewage and industrial effluent is to be discharged into the River Ganga.

An Integrated Ganga Conservation Mission namely “Namami Gange” has been approved as ‘Flagship Programme’ set up in June 2015 to accomplish effective abatement of pollution, conservation and rejuvenation of the river.

An ideal approach to achieve the above objective, is to prepare an integrated and comprehensive scheme to intercept and treat the entire quantity of waste water generated in the town and would flow through the drains into the Ganga. To improve the water quality of the Ganga in the immediate term, is to prevent untreated wastewater of drains from joining the river by intercepting those having their outfalls in the Ganga, divert them through sewers to Sewage Treatment Plants (STPs) for treatment and allow only treated sewage to be discharged into the Ganga.

The present ‘Guidelines for preparation of project reports under NRCP and NGRBA, Ministry of Environment & Forests’ were prepared in Dec 2010. These guide lines provided for preparation of DPRs for pollution abatement of rivers in three steps namely City Sanitation Plan (CSP), Feasibility Report (FR) followed by the Detailed Project Report (DPR).

In view of the need to prevent pollution in the immediate term and the changes that have been introduced, the Guidelines for the preparation of DPRs for interception and diversion of drains out-falling in to the river and divert them to STPs for treatment need to be revised.

The draft guidelines were circulated by NMCG on Mar 30, 2017 to all stakeholders covering state nodal agencies, state project management groups, PSUs, academic institutions and multilateral bodies. Observations / comments were received from the World Bank, Support for Ganga Rejuvenation (SGR) Project, UP-SGRCA, IIT Kharagpur, Tata Consulting Engineers Ltd, Engineers India Ltd (EIL), NBCC, Engineering Projects India Ltd (EPIL) and Aligarh Muslim University (AMU).

A workshop was also organized on May 18, 2017 by NMCG at New Delhi where all stakeholders participated and matter was deliberated for the whole day. After considering the suggestions / comments received from different stakeholders through emails and during the workshop, the guidelines were finalised. Salient features of the guidelines are as follows:

- The guidelines provide for interception and diversion of drains out-falling in to the river, divert them through sewers to STP (s) for treatment. New CPHEEO Manual on Sewerage and Sewage Treatment Systems has since been published in Nov 2013. Many provisions of the manual have been incorporated into the guidelines.
- Water Quality Monitoring of the river should be done following the “Uniform Protocol on Water Quality Monitoring Order, 2005”.
- Design periods for STPs has been increased to 15 years.
- Rate of water supply for users other than domesticsuch as hotels, hostels, schools/colleges, railway stations, offices, factories, cinemas etc. has been included.
• Methodology for measurement of flows in drains / sewers has now been provided in detail. A standard format for recording flow measurements has been prescribed.

• Design Flows for different components of proposed works have been clarified.

• Configuration of sewage pumps, hydraulic retention time, volume of sump, immersible pumps etc. as recommended in CPHEEO Manual Nov 2013 for sewage pumping stations, have been introduced.

• Instead of working out economical size, size of rising mains shall be selected, ensuring velocities between 0.8 to 3 m/sec at any time, to avoid silting. Rising mains must be designed for Water Hammer Head also.

• Trenchless technology may be proposed to be adopted at major road crossings/junction, railway tracks and highly dense roads for laying of sewers/rising main.

• For STPs, sulphates and emerging contaminants have been included in the list of raw sewage quality parameters. Some upcoming treatment technologies have also been referred. Highest flood levels of drains/river to provide safety and uninterrupted O&M of the STP/SPS are to be taken in to consideration.

• Funds for O&M of the assets created shall now be provided by the center for a period of 15 years, after which the responsibility of O&M will rest with the State Government/ ULB. However, such period shall be subject to policy of GoI in vogue.

• Annual O&M cost beyond 1st year is to be worked out by compounding present cost with general price index/inflation, which may be taken as 5% on Manpower and 2% on Chemicals. However, no escalation is to be considered on Power.

• Provision of quarters for maintenance staff has been deleted, as O&M shall be carried out by the contractor.

• On line monitoring of water quality at inlet and outlet of STPs has been proposed to be carried out for which devices shall be installed on STPs for proper monitoring of their performance and taking timely remedial measures when necessary.

• The chapter on Social and Environment Impact Assessment and Environmental Management Plan has been provided.

• Suggestive structure of the DPRs earlier provided in the Guide Lines has been revised.

• A flow chart showing different broad activities for preparation of DPRs has been provided.

• A list of drawings to be provided in DPRs has been provided.

• Reuse of treated water to a minimum extent of 20% shall be mandatorily explored.

• A detailed Sludge Management Plan including the treatment, storage, handling and approvals from ULBs to accept the solid waste generated by the STPs for its safe disposal / effective management is now to be prepared.

• Septage/faecal sludge management practices are to be assessed and appropriate provisions need to be built in while designing the STPs.

• Soil investigation has been proposed to be carried out at all major sites such as deep sewers, SPS, STPs and for locations such as flood plains, landfill sites and locations having dispersive soil characteristics.
CHAPTER 1: Introduction

1.1. GANGA BASIN

Ganga basin is the largest of the 12 major river basins of India. The river Ganga passes through the states of Uttarakhand, Uttar Pradesh, Bihar, Jharkhand, and West Bengal. Ganga has many tributaries. Even though the surface water resource potential of Ganga has been assessed as 525 billion cubic meters (BCM), substantial abstraction of water for various purposes from the river has impacted the quantity of flows in the river. A map of the Ganga River Basin, a flow Diagram of the River may be seen in Annexure I and Annexure II.

1.2. STATUS OF WATER QUALITY

Rapidly increasing population, rising standards of living and exponential growth of industrialization and urbanisation have exposed the river to various forms of degradation. The dominant source of pollution is the discharge of untreated wastewater from the towns on the banks of Ganga.

It is estimated that in the year 2011, the amount of wastewater discharged into the river by 36 Class I and 14 Class II towns situated along the mainstream of river Ganga, was 2723 Mld. Of this quantity, the capacity to treat it was limited to only 1209Mld (Source: Pollution Assessment: River Ganga, published by CPCB in July 2013). Although there are non-point sources of pollution as well, their contribution is relatively small.

On the basis of the sources that cause pollution of Ganga, the parameters that have been adopted for judging the water quality of the river are Dissolved Oxygen (DO), Biochemical Oxygen Demand (BOD) and Faecal Coliform (FC). Except in the upper reaches of the Ganga i.e., from its origin up to Rishikesh, the presence of FC is higher than the permissible limit for bathing throughout the river. The BOD levels are much higher than the desired level in the stretch of Ganga from Kannauj to Varanasi. It is therefore a critical stretch. In West Bengal again, the BOD is higher in the stretch from Uluberia to Diamond Harbour.

Thus the water quality of Ganga river is fit for bathing (Class B) except a few locations only, which have already been identified and corrective actions by sanctioning project have been taken by NMCG.

1.3. ACTION TAKEN BY AUTHORITIES FOR RIVER GANGA

A beginning towards its restoration was made with the launching of the Ganga Action Plan (GAP) in 1985. Its objective was to improve the water quality in the river. But for a variety of reasons only partial success in the objective of pollution abatement could be achieved.

1.3.1. National Mission for Clean Ganga (NMCG)
National Mission for Clean Ganga (NMCG), a society registered under the Societies Registration Act, 1860 (21 of 1860), is an authority constituted under the River Ganga (Rejuvenation, Protection and Management) Authorities Order, 2016 of Govt of India. NMCG is a nodal agency for the implementation of the provisions of this Order and for effective abatement of pollution and rejuvenation, protection and management of the River Ganga and its tributaries. It is an empowered arrangement with two tier management having administrative, appraisal and approval powers and duties, functions and powers for the purpose of effective abatement of pollution and rejuvenation, protection and management of the River Ganga.

The States comprising River Ganga Basin, namely, Himachal Pradesh, Uttarakhand, Uttar Pradesh, Madhya Pradesh, Chhattisgarh, Bihar, Jharkhand, Haryana, Rajasthan, West Bengal and the National Capital Territory of Delhi and such other States, having major tributaries of the River Ganga are covered under this mission. NMCG shall approve the planning, financing and execution of programmes for abatement of pollution in the River Ganga including augmentation of sewerage and effluent treatment infrastructure, catchment area treatment, protection of flood plains, creating public awareness, conservation of aquatic and riparian life and biodiversity and such other measures for promoting environmentally sustainable river rejuvenation. NMCG shall also coordinate, monitor and review the implementation of various programmes or activities taken up for prevention, control and abatement of pollution and protection and management in the River Ganga and its tributaries.

1.3.2. Ganga River Basin Management Plan

The Ganga River Basin Management Plan (GRBMP) is an integrated river basin management plan for maintenance and restoration of wholesomeness of Ganga system and improvement of its ecological health with due regard to resolution of conflict of interest in water uses in the entire river Basin. This Plan is presumed to have an adequate provision for soil, water and energy conservation to accommodate the growing population, urbanization, industrialization and agriculture while ensuring that the continuous flow (AviralDhara), unpolluted flow (NirmalDhara), longitudinal and lateral connectivity, fluvial geomorphology and ecology of the river are protected.

1.3.3. Integrated Ganga Conservation Mission Namely “NamamiGange”

An Integrated Ganga Conservation Mission namely “NamamiGange” has been set up. While it seeks to ensure that ultimately i.e. in the long term there is an integrated and comprehensive plan of collection, conveyance and treatment of wastewater in the towns covering the point and non-point sources of pollution, in the immediate term its objective would be to ensure that the quality of Ganga is improved so that it can be put to its best designated use i.e., bathing. A list of 118 important towns, which contribute to the pollution of the Ganga, has been prepared by NMCG. Important drains that carry the wastewater from these towns to the Ganga have been also been identified.

Thus the immediate objective would be to prevent untreated wastewater of drains from joining the river by intercepting the drains that have outfalls in the Ganga, divert them through sewers to Sewage Treatment Plants for treatment and allow only treated sewage to be discharged into the Ganga.

1.3.4. Categorisation of Towns on the Basis of I&D and Treatment Infrastructure
The towns may fall in several categories based on the type of the existing arrangements for the collection, conveyance and treatment of wastewater. In one category of towns / cities there may not be any sewers and the wastewater including that from the septic tanks and toilets would flow in the covered or uncovered drains on the sides of the streets reaching a storm water drain, which in turn would discharge into the Ganga.

In another category of towns/cities, there may be localities where sewers are laid and localities not provided with sewers. The wastewater would be carried through the sewer or the drain to a sewage treatment plant (STP). If a STP has not been installed, the wastewater would be discharged into the Ganga.

In yet another category of towns, I&D and STP schemes may have been constructed. However, the system is unable to handle the entire wastewater and there is need to repair, upgrade and refurbish the existing infrastructure.

1.3.5. Integrated Plan of Management of Wastewater – Measures Involved

A sustainable programme to achieve the improvement in the water quality of Ganga should deal with the issue of pollution in an integrated and comprehensive manner dealing with both point and non-point sources of pollution. It will imply that the following steps be taken

i. Prepare an integrated and comprehensive scheme to intercept and treat the entire quantity of wastewater that would be generated in the town and would flow through the drains into the Ganga. The existing infrastructure, if any, would be integrated with the comprehensive scheme that would be prepared.

ii. If under the GAP, schemes for pollution abatement of the Ganga have been implemented, an assessment of the condition of the prevailing infrastructure that exists in the town for the disposal of wastewater would be required to be made so that it could be repaired, upgraded and refurbished.

1.3.6. Phase wise preparation and implementation of the Pollution Abatement Scheme

A comprehensive approach as outlined above will require resources and considerable time for preparing and implementing schemes. It, therefore, makes sense that the objective of improving the water quality may be achieved in two phases.

Phase 1 will seek to improve the water quality of the Ganga in the immediate term. The wastewater from the towns / cities situated on the bank of river Ganga in five basin states of Uttaranchal, Uttar Pradesh, Bihar, Jharkhand and West Bengal, flowing into the Ganga through the drains may be intercepted, diverted and treated before discharge in to Ganga. The interception, diversion and treatment schemes should be so designed that they take into consideration the wastewater load that will need to be dealt with when the long term integrated comprehensive wastewater management plan is prepared.

Phase 2 will consist of the integrated and comprehensive schemes to deal with the pollution from both point and non-point sources of pollution. The works planned and implemented in Phase 1 will be integral part of the schemes in Phase 2.
Since the formation of existing guidelines, a number of changes such as policy decisions, revision of water quality parameters and design criteria in new CPHEEO Manual on Sewerage and Sewage Treatment Systems in Nov 2013 etc. have taken place. The Guidelines, therefore, need to be revised. These Guidelines, accordingly, deal with the various aspects of schemes in Phase 1.
CHAPTER 2: COLLECTION OF DATA

2.1. INTRODUCTION

This chapter deals with collection of data required for preparing DPRs for works of interception and diversion of drains and sewage treatment plants of the project area.

The DPR should be prepared on the basis of available data that has been generated by the concerned agencies. Additional data (primary data) may be needed. It will have to be generated by undertaking suitable survey and investigation. However, DPR should integrate all the data provided by agencies concerned for pollution abatement.

2.2. PROJECT AREA

As the DPR is for intercepting the drains and treating the diverted sewage, the project area for the purpose of the DPR is only that area of the town which is discharging into drains and contributing to the pollution of river and may not the whole town within municipal limits.

There may be towns where some areas outside the municipal limits are also discharging into drains of the town under consideration and subsequently polluting the river, but for some or the other reasons are not included within its municipal limits. These areas must also be considered as a part of the project area.

It is therefore, of utmost importance to precisely demarcate the project area so as to correctly project design population, sewage flows and design proposed works. The project area under consideration should be clearly marked on a key plan of the town so that the area can be measured from the map.

2.3. DATA REQUIRED

The data needs to be gathered for the town whose wastewater is causing pollution of the river and for which the project is to be prepared for abatement of pollution. A town may have to be divided into a number of sewerage districts for getting optimal results and data gathered should meet this need.

2.4. TOWN RELATED DATA

2.4.1. General Information of the town

i. Location – Latitude, Longitude
ii. Important features
iii. Climate
iv. Brief history of the city
v. Commercial activities
vi. Industrial activities
vii. Educational activities
viii. Cultural activities
ix. Religious activities
x. City development plan or city sanitation plan, if prepared, should be obtained.
xii. Data on water supply as per para 2.4.6.
xii. Project reports of sewerage and pollution works in the city executed, under execution and proposed for future should be obtained.

xiii. Slum population and their development/rehabilitation plan.

xiv. Community toilets

xv. Present sewerage management including existing or proposed septic tanks, number of septic tanks and their maintenance scenario in the catchment such as septic tank sludge/septage treatment etc.

xvi. Solid Waste Management (SWM) system.

xvii. Areas within and adjoining the town contributing to the pollution of river, its boundary and area

xviii. HFL of the river at the sites of all infrastructure works proposed near the river

xix. Minimum and maximum flow in the river, along with dates.

2.4.2. Maps

Digital maps, as may be available, showing the following features on a scale large enough to understand the physical features may be prepared.

i. Important land marks of the town

ii. Rivers

iii. Other water bodies

iv. River banks where solid waste is dumped

v. Drains, and points of their respective outfalls and catchments (drainage areas)

vi. Surface utilities

vii. Municipal wards

viii. Open spaces

ix. Residential areas

x. Industrial estates

xi. Industrial units outside industrial estates

xii. Points of discharge of industrial effluents

xiii. Slums

xiv. Areas covered with septic tanks

xv. Water supply system – Including intake points and ground water.

xvi. Places used for open defecation

xvii. Community toilets

xviii. Existing sewers in each drainage area of the town with diameters and invert levels, if existing.

xix. STPs and sewage pumping stations, if existing.

xx. Points of discharge of treated effluents into the river and their distance from points of water supply intake works.

xxi. Garbage dumping sites including land fills

xxii. Bio-medical waste treatment facilities

xxiii. Pollution abatement works carried out in the past with details

xxiv. Components of proposed works along with those of existing works, if any, are to be shown on maps with different colours and legends.

xxv. Areas within and adjoining the town contributing to the pollution of river, its boundary and area

2.4.3. Use of State of Art Tools Like Remote Sensing and GIS
Maps of Survey of India may be used. If there are easily accessible facilities with the State Remote Sensing Centre or other specialized agencies, an attempt should be made to use remote sensing to gather spatial information observable from space and present it and other data mentioned above in Geographical Information System (GIS) format. It gives the ability to prepare maps on different themes as required. For cities with a population of one million or more the data must be presented in GIS format. For other cities it is optional.

As expertise of this kind may not be generally available with the implementing agencies, the work may be done by hiring qualified experts for such purposes from outside. A good map depicting all the above features would help in improving decision making and finalizing appropriate sewerage routes without disturbing other civic utilities.

2.4.4. Status of Sewerage Management Works Undertaken in the Past, if any

In the past, some works related to pollution abatement and sewerage may have been planned and implemented, for which the following details may be collected:

a. A note describing in brief history / details of sewer system introduced in the town, works carried out / under progress in different programmes, sanctioned cost, year of sanction, year of commissioning, brief details of works done such as SPS (with their diameters, details of pumps installed, rising mains, year of commissioning etc.), STPs (with their capacity, type, year of commissioning etc.), sewer network, other works, technical studies / condition assessment reports conducted in the past for assessing the condition of existing structures.

b. Photographs of existing works

c. Number of drains out falling into the river(s), nos. intercepted and diverted to STPs, copies of reports on discharge measurement and sewage quality of drains carried out in the past.

d. Designed capacity/performance, present performance & O&M details

e. A plan showing existing major works such as drains, SPS, rising mains, STPs and major trunk sewers etc.

f. A separate plan of existing sewers showing diameters, lengths and RLs etc.

g. Information relating to existing sewage disposal works, Septic tanks, existing STPs and drains intercepted may be presented in tables 2.1, 2.2 and 2.3.

h. Condition assessment of existing works: Condition assessment should invariably be carried out for all existing works. Normally this is carried out by destructive and or non-destructive tests on structures and other works by qualified and experienced test houses and experts. For this draining out of the tanks, if required, may also be done so that the true assessment of life of works can be made. If the performance of the works is less than the designed one or that required at the end of the design period, the causes and remedial measures may be identified component wise

1. Interception works
2. Sewers
3. SPS
4. STPs
5. Septic tanks

2.4.7. Status of River

i. Purposes for which river water is being used
   a. Drinking
   b. Irrigation
   c. Industry
   d. Navigation
   e. Other uses such as water sports, boating, etc.
   (State the location of the above works and show them in a map)

ii. River Water Quality

   Central Pollution Control Board (CPCB) has classified all inland waters in five categories according to the designated – best - use class (Table 3.1, Chapter 3). The designated best use as well as actual quality of river water should be reported.

   Water quality of the river should be analysed at the following points:
   a. upstream of the city,
   b. downstream of the city
   c. downstream points of outfalls of major drains
   d. downstream points of outfalls of treated effluents of STPs
   e. upstream of intakes of waterworks.

   The programme aims at improving the river water quality to Class B for outdoor bathing. Though, pH, Dissolved Oxygen (DO), Biochemical Oxygen Demand (BOD), and Total coliform organisms have been prescribed as water quality parameters for Class B, for actual base line data water quality monitoring should be done following the “Uniform Protocol on Water Quality Monitoring Order, 2005”. The relevant order is attached as
Annexure III. The towns may be treated as Trend or impact or flux stations. Ideally, there should be a report for every month, in all 12 reports. But for the purpose of this programme, the parameters such as pH, BOD, DO, FC and TC prescribed for water quality of the river for bathing, may be monitored quarterly and the remaining parameters may be monitored pre-monsoon once a year.

Water quality monitoring is necessary to assess the current water quality and the extent of improvement that can be achieved through interventions proposed in the DPR. The sampling for water quality should be from well-mixed section of the river or main stem 30 cm below the water surface to represent accurate impact. Copies of laboratory test reports should be made a part of DPR.

Water quality of the river may be presented as given in table 2.6

*Required to view the impact of discharge of treated sewage into surface water to be used as source of drinking water d/s.

In addition to parameters mentioned in the above table, other parameters prescribed under Uniform Protocol (Pesticides, toxic metals, major ions) may be included, if required, depending upon site conditions. If any secondary data is available from the State Pollution Control Board (SPCB) or the Central Pollution Control Board (CPCB), that too should be reported. Report on Pollution Assessment: River Ganga July 2013 published by CPCB carries spatial distribution of water quality data w.r.t. DO, BOD, Faecal coliform, Total Coliform and Conductivity for the period 2011 at various places in the country. Data if available for the town, may also be extracted from the said report and presented in the DPR. Comments on river water flows and quality on the basis of the above shall also be given.

2.4.8. Sewage Generation

Quantity and quality of sewage generated in a town carried by the drains untreated into the river and by sewers to STP(s) for treatment need to be measured and tested.

2.4.8.1. Volume of Sewage Generation

A note and a plan showing the names of drains, discharge carried by them, location points of their outfalls into the water body, points of their interception and STPs into which diverted should be prepared.

Actual present flows should be recorded three times: Pre-monsoon, during monsoon and after monsoon. If this is not feasible, flows may be recorded in dry weather before the point of outfall into the water body for at least one month. Samples should be taken on a day in every week for diurnal variation on hourly basis for twenty four hours. Considering a four-week month, three sample days are to be taken on weekdays, whereas the fourth one on an off day i.e. Sunday.

If the drain has been intercepted for treating the sewage, the discharge diverted to the STP should be measured. Data on the flows measured in the past should also be collected and reported.

Details of the quantity of sewage reaching STPs through sewers may be collected from the records of STPs for the last 3 years. In the absence of records, the same may be measured in dry weather.

Details of flows may be provided as in tables 2.7, 2.8 and 2.9.

2. Copies of flow measurement reports / log books of STP need to be made a part of DPR.

2.4.8.2. Measurement of Flows in Existing Drains/Sewers

The assessment of the flows in drains can be done by a variety of methods right from the rudimentary crude method to the most sophisticated dye tracer method. The choice of methods presented hereunder is considered to be appropriate to the conditions in the country particularly, away from metropolitan centres.
Measurement of flows may be carried out as described in para 3.10 of CPHEEO Sewerage Manual Nov 2013 and reproduced as below. The float measurement is normally not recommended for discharge measurement due to its large uncertainty. However, it may be adopted in consultation with NMCG under some exceptional situations, justification for which may be provided.

a) **The Float Method**

In this method, surface velocity of flow of the drain is worked out by the time taken by a float like an empty match-box or a plastic box to travel for about 3 m in a straight reach and flow is calculated by measuring the depth and flow in the drain.

b) **The V notch method**

Preferably, V-notch method should be used up to discharge of 20 Mld. This requires the insertion of a V notch plate in the drain at a location where the downstream discharge can be a free fall. These plates can be cut out from stainless steel (SS) or Teflon sheets of nominal thickness of about 2 mm and inserted tightly into the drain and the gaps can be closed by a mixture of clay and cement in equal proportion mixed to a thick consistency and smeared on the downstream side. The V notch is the best chosen such that the angle subtended is 90 degrees. The clearances to be ensured are shown in Figure 1.

![Fig. 1: Typical mounting of a V Notch in a drain](image)

The depth of flow is measured over the lower tip of the V bottom and the discharge is

\[ Q = 1.42 \times \tan \text{ of angle of V notch} \times H^{2.5} \]

As the angle is 90 degrees, the tangent is equal to 1 and hence, the equation simplifies to

\[ Q = 1.42 \times H^{2.5} \]

Where Q is cum/sec and H is in m
c) The rectangular weir method

This can be used if there is already an existing leveled overflow weir like the overflow culverts in irrigation canals. In smaller drains and in places where workmanship of V notch cuts are difficult, these can be used easily by cutting a mild steel or wood sheet as shown in Figure 2.

This method may be used for discharges more than 20 Mld.

![Typical mounting of a rectangular weir in a drain](image)

The depth of flow is measured over the overflow edge of the notch and the discharge is

\[ Q = 1.85 \times L \times H^{1.5} \]

Where,
- \( Q \) is cum/sec,
- \( H \) is in m,
- \( L \) is the length of weir

d) The rectangular weir with end contractions method

These are similar to the rectangular weir except that the length of the weir is smaller than the width of the drain as in Figure 3-3 overleaf.

The depth of flow is measured over the overflow edge of the notch and the discharge is

\[ Q = 1.85 \times (L - 0.2H) \times H^{1.5} \]

Where
- \( Q \) is cum/sec,
- \( H \) is in m,
- \( L \) is the length of weir
e) The Palmer-Bowlus Flume

This can be used in case of both the drains and pipes flowing under gravity. Its major advantages are (i) less energy loss; (ii) minimal restriction to flow and (iii) Easy installation in existing conduits. It is a readymade piece for various widths and diameters. The placement in a drain will be as in Figure 4 and that in a sewer pipe will be as in Figure 5 overleaf.
This has the specific advantage of its ability to be placed in a manhole to measure the sewage flow in the gravity sewer as long as the flow is not exceeding the diameter of the sewer. Typical installation details are seen in Figure 6 overleaf.

The depth of flow needs to be measured in only one location and thus it is a lot easier. In addition, it can be easily removed after measurement. The only disadvantage is it cannot be used when the depth of flow exceeds the diameter of the sewer and to this extent, it may have limitations in the surcharged condition of sewers in historical cities. This also has the advantage of facilitating a flow measurement in large diameter sewers, which flow under gravity and the flume itself is much simpler as in Figure 7.

The chart for getting at the flow once the depth is measured is obtained by relating to a standard curve supplied by the plume manufacturer depending on the shape of the plume. This is also available as software linked to a personal computer.

The combination of the Palmer-Bowlus and Tracer dye techniques have been reported as early as 1974 as illustrated in Figure 7. It is a system worth inducting in large trunk sewers near the outfalls to have an integrated measurement of the flows and key quality parameters or at least for the flow details and variation patterns.
Top Left and Right- The installation in manholes by inserting the pipe ends into the sewer and measuring the depth of flow by ultrasonic sensor to integrate to a computer as needed.

Bottom left- The Flume, originally invented by Palmer &Bowlus for the Los Angeles County Sanitation District and in use for over three decades, is made by many manufacturers.

Bottom Right- The installation, in a large circular sewer by merely placing the ready-made flume at the invert and measurement of the depth, which can be done by ultrasonic sensor.

Fig. 6: Configuration and use of Palmer-Bowlus flume

Source: J. Marsalek, 1974
f) The Venturi Pipe or the Dall Tube

While dealing with old pumping mains, there is a chance of detecting a venturi pipe fitting in the pipeline, as was the standard practice in those years. The flow through it is a function of the difference in head of the fluid at the mouth and the throat and the formula for a given venturi metre is very simple as

\[ Q = K \times (a_1 \times a_2) \times \text{factor} \]

\[ \text{factor} = \sqrt{\frac{2gh}{(a_1^2 - a_2^2)}} \]

Where
- \( K = 0.95 \) to \( 0.98 \)
- \( a_1 = \text{area in sqm at mouth} \)
- \( a_2 = \text{area in sqm at throat} \)
- \( h = h_1 - h_2 \)
- \( h_1 = \text{piezometric water level in m at mouth} \)
- \( h_2 = \text{piezometric water level in m at throat} \)

It is thus clear that once the difference in head is measured between sewage pressure head at mouth and at throat, the square root of the same is directly proportional to the flow. It is possible to connect a differential Mercury manometer to the sampling ports in the metre and open the quarter turn-cock when flow needs to be measured and to note the reading. A simple wall chart relating the difference to the flow will be more than needed. Of course, instrumentation is possible by connecting the two pressures to a differential pressure transmitter and taking its output to a square root extractor and then to a multiplier for the constant for the metre and thereby get a continuous reading of the flow without any interventional systems.

Suffice to say that so far as estimation of flows for design of sewer systems or augmentation of sewer systems are concerned, where an existing pumping station with a venturimeter in the delivery main is available, a simple mercury manometer U tube, connected to the ports of the venturi meter may help in ascertaining the variation of the flow pattern and arrive at peak flow factors etc. more realistically.

A Dall tube is nothing but a venturi pipe-fitting of a reduced length and as otherwise all other properties of flow measurements are the same.

In fact, if possible this can be inserted into an existing pumping main for the evaluation of the above flow patterns.

g) Salt Dilution method

May be used for lower range of flows in the drains up to 6 m$^3$/s in the hills where flow is highly turbulent and is difficult to measure by other methods. In this method, the tracer i.e. common salt and other chemicals is injected at some point along the stream, and the tracer concentration in streamwater is measured at a downstream point by an electrical conductivity meter, where the tracer has become uniformly mixed with the streamwater. The probe of
conductivity meter should be immersed, close to the bed of the stream or ideally at the mid-depth. After injecting the salted water, the salt starts spreading itself out while travelling downstream. At a certain point downstream it will have filled the width of the stream. For a given volume or rate of injection, greater stream discharges will result in greater tracer dilution and lower concentrations measured at the downstream site. Equations based on the mass balance principle are applied to compute the stream discharge.

The method of flow is easy to accomplish, accurate (<±7%), and reliable for a wide range of stream types. Using this method, stream flow can be measured in less than 10 minutes and very little equipment is needed. The total streamflow, assuming that the streamflow was constant over the test, is

\[ Q = \frac{\text{Mass of Salt}}{\text{Conversion Factor} \times \text{Area under Curve}} \]

2.4.8.3. Characteristics of Raw Sewage

The characteristics of raw sewage carried by the drains / reaching STPs may vary from town to town depending upon rate of water supply, per capital pollution load and prevailing socio-economic conditions. The values should be collected from recent records or tested in dry weather (pre-monsoon).

Samples should be analysed for the parameters prescribed in para 5.1.14 of CPHEEO Manual and the following table.

Samples for testing water quality should be composite and flow proportional, taken on a day in every week for diurnal variation on hourly basis from the existing drain or sewage outfall. Considering a four-week month, three sample days are to be weekdays, whereas the fourth is to be an off day i.e. Sunday.

Sampling for water quality should be conducted for at least one month during dry weather (pre-monsoon) to assess pollution load quantitatively and qualitatively. Water quality of the drain should be monitored just before its outlet into the river. The test report should indicate the time of drawing sample and its testing.

This information may be provided in table 2.10.

**Table 2.10: Raw Sewage Characteristics, as measured on ----.**

2.4.8.4. Pollution from commercial, industrial and agricultural activities.

Broad raw water quality parameters that need to be tested have been listed in table 2.10. However, typical waste compounds produced by commercial, and agricultural activities and specific industrial activities are available in Wastewater Engineering Treatment and Reuse standard text books authored by like Metcalf and Eddy. Depending on the nature of activity that is undertaken in the town, appropriate parameters may be monitored in the water samples drawn from the drain or the river.
Data related to industrial waste water, points of discharge into the sewer network/drain etc. may also be provided by the CPCB/SPCB/concerned Govt. body.

The effluent from slaughter houses contains high BOD (1000 to 4000 mg/l), COD (2000 to 10,000 mg/l), SS (200 to 1500 mg/l), total dissolved solids (4000 to 5500 mg/l), high oil and grease, high chloride from skins, etc. If it is suspected that wastewater from any slaughter house may reach a drain or the river, attention should be paid to monitoring of the above water quality parameters and changes in their values should be looked for.

The mixing of industrial effluents with domestic sewage adversely affects the sewage treatment process. In such cases, necessary corrective / enabling actions may be adopted and the flow parameters should be measured accordingly before finalizing the STP technology.

2.4.8.5. Raw Sewage Characteristics for newly developed areas and in the absence of drain or outfall

For newly developed areas and in the absence of drain or outfall discharging into the river, raw sewage characteristics may be adopted from the table 2.11 or preferably actual measurements from nearby town(s) having similar rate of water supply and socioeconomic conditions. Table has been prepared with the rate of water supply as 135 lpcd and may be revised depending on rate of water supply.

Table may be revised based on rate of water supply

2.4.9. Soil Investigations

For laying deep sewers, soil investigation and test bores must be made at suitable intervals along the alignment of sewers to ascertain the type of soil at different depths and
behaviour of ground water table and bearing capacity of the soil. For deep sewer laying, wherever required, a mechanical system may be proposed as a safety and speedy measure.

Soil investigation should be carried out at all major sites such as deep sewers, SPS, STPs and for locations such as flood plains, landfill sites and locations having dispersive soil characteristics.

Soil investigation report should include soil description, characteristics, bearing capacity etc. HFL at the disposal point is also to be provided in the DPR.

2.4.10. **Ground Water Investigations:**

The information about groundwater levels and their fluctuation should be obtained along the river bank where the interception sewer is to be laid. The levels should be recorded pre monsoon and just after the monsoon when the levels are the highest.

2.5. **SOURCES OF DATA**

The following sources may provide the needed information:

i. State Pollution Control Board and the Central Pollution Control Board.

ii. Executive Engineer of Water Resources department in the District maintains information about drainage basins and rivers in his district.

iii. District planning office

iv. District officers of agriculture, forests etc.

v. Survey of India topographical sheets

vi. India Meteorological Department

vii. State Remote Sensing Agency

viii. District Census Office

ix. For flora and fauna Botanical Survey of India, Zoological Survey of India, State Pollution Control Board / Central Pollution Control Board and (local University in case any research has been done).

x. Urban Local Body

xi. CGWB / State GWBs; State UDD; NIC cell at State / District level; PHED/ Water & Sewerage Board/Authority

xii. CWC / State Water Resources Department about the flows in the river.
CHAPTER 3: PREPARATION OF DETAILED PROJECT REPORT

The DPR shall be prepared to achieve clearly spelt objective and outcome in terms of abatement of pollution from the drains carrying waste water of the town and improving water quality of the river to make it suitable for bathing.

3.1 OBJECTIVES OF DPR AND OUTCOME

The objective is to prepare a project report for constructing Interception and Diversion works of drains including Trunk Sewers and Sewage Pumping Stations and Sewage Treatment Plants in an optimal manner so that the wastewater from the town carried by the drains is treated to the desired standards before it is discharged into the river.

The expected outcome from the implementation of the DPR is that the water quality of the river should be improved to satisfy the standards prescribed for the best designated use of the river as prescribed by the CPCB and thus make it suitable for the best designated use (bathing in this case).

3.2 DESIGNS

Detailed designs and engineering of the works shall be based on extensive survey and investigation and collection of the required data. In data collection, their analysis, design and implementation of the DPR, the relevant provisions of the CPHEEO Manual on Sewerage and Sewage Treatment Systems, Nov 2013 (http://moud.gov.in/sewerage) may be followed. In the event of absence of guideline in the manual on a particular aspect, relevant specifications of Bureau of Indian Standards (BIS), standard books, State/CPWD manuals may be followed. Highest Flood Levels (HFL) of drains/Nala/Rivers should be considered for designing the interception works/Sewage pumping stations (SPS)/Sewage treatment plants (STPs).

An integrated and comprehensive scheme of management of wastewater in the town will include other aspects such as covering all the localities with sewers and connecting every household to it, dealing with non-point sources of pollution, solid waste management etc. These Guidelines deal with the preparation of a part, though a major part, of the Integrated Scheme. Thus the interception and diversion sewers, sewage pumping stations and sewage treatment plants proposed under this DPR would ultimately become a part of the town’s integrated and comprehensive system of dealing with wastewater. This aspect should be kept in mind while designing the infrastructure works. The sizes and invert levels of different components shall, therefore, be provided accordingly and for the needs of the next 30 years.

For a town that is sewered, even if partly, the existing Master Plan of sewerage of the town, sewerage zones, designs of trunk sewers, locations of sewage pumping stations and STPs will need to be referred to in order to determine the invert levels of Diversion Sewers now being proposed.

In case of towns with no sewerage system and no sewerage plan, ideally it would be desirable to prepare the Master Plan for sewerage, if not prepared earlier and carry out the design of sewerage network of sewers. However, in case it is not feasible or practical for any reason to prepare a master plan of sewerage, it is necessary to ensure that in the future when a comprehensive sewerage plan of the town is prepared and implemented, the proposed works that will come up then will be in consonance with the diversion works that are being planned.
now. For this purpose, topography of the area, gradient, obstructions, levels of the localities need to be ascertained and mapping using total station and GIS.

3.3 DEVELOPING OPTIONS FOR THE SCHEMES

3.3.1 Utilising an existing system

In drainage areas and districts where there is an existing system of interception and diversion of waste water from drains, their (existing system’s) status may be presented on a plan and in the form of a note stating the components, their details and condition etc.

3.3.2 Condition assessment

The condition of every component of the system should invariably be assessed for their status, designed performance, present performance, designed capacity and present capacity and useful life left, and whether they should be repaired, refurbished, upgraded or modernized. If it is found that the system can be brought to a degree that the waste water satisfies the prescribed standards by the time it reaches the river, items of work that are needed should be identified and details worked out and costs estimated. Existing sewerage works should be dovetailed with the proposed scheme.

3.3.3 Alternatives

Alternatives systems if I&D and STPs, keeping in view the location of drains and availability of land for construction of sewage pumping stations and STPs, should be developed so that the optimal system may be adopted and accordingly DPR prepared.

i. Centralised System

The wastewater from all the drains is intercepted in a sewer and conveyed to a centralised STP for treatment from where it could be suitably disposed of into the river or used for irrigation, or, locating the STP further away where land is available at cheaper rates and cheaper technology can be adopted. In this approach the sizes and length of sewers would be relatively large and the STPs also would need to have much larger capacity. Such a system is useful in towns where it is difficult to get the needed land at one place. In this system, the sewers may have to be laid over a long distance involving high costs.

ii. Decentralised System

As opposed to the Centralised System in which all the wastewater of a town is treated at a single point STP, in a decentralised system the entire town is divided into convenient areas. The wastewater of one area is taken to a point where it is treated in STP. The division of areas is done on the basis of topography and overall cost of I&D including treatment. In such a system, wastewater flowing in one or, sometimes more than one drains, is intercepted and carried in sewer(s) to treatment plant(s) near to their outfalls. In the decentralised approach, sizes of sewers and STPs would be smaller involving lower capital cost. The staff requirement is more and the land required would be at a number of places.

3.3.4 Techno Economic Evaluation
Techno-economic evaluation should be done for each alternative. Economic evaluation should be carried out on life cycle analysis of major components. This analysis should include cost of implementation, capitalised annual O&M cost less revenue from resource recovery, recycling and by-product utilization and cost of mitigation of any adverse environmental impacts. Interest on borrowed capital, debt servicing charges & depreciation provisions should also be taken into consideration to arrive at the Net Present Values (NPV).

Technological evaluation may include ability of the proposed system to achieve the desired outcomes, ease of O&M, time required to implement the project, likely adverse environmental impacts and the feasibility of undertaking measures to mitigate them. The quality of human and physical resources required, electrical and other forms of energy needed, other pros and coins, reliability and long term sustainability should also be given appropriate weightages.

On such an evaluation, the best option should be selected.

3.4 **RIVER WATER QUALITY**

3.4.1 **Water Quality Standards for Rivers as per CPCB**

The classification of Designated - Best - Use of inland surface water as stipulated by CPCB is given in table 3.1.

**Table 3.1: River Classification Based on Designated Best Use**

3.4.2 Actual Water Quality of the River

Data collected on river water quality as discussed in Chapter 2 of these guidelines shall be commented upon and tabulated here.

3.5 DESIGN PERIODS

Design periods for sewerage mains and STPs have been often debated due to cost considerations. Keeping in view the resource constraints and optimum utilization of assets, a modular approach may be followed for the different components of the system.

The year of expected commissioning of the project shall be taken as the base year for design of various components of all projects. The base year may be taken as three (3) years later from the year of preparation of the DPR. Design periods of various components, as prescribed by CPHEEO Sewerage Manual, 2013 are as given below in table 3.2.

Source: CPCB
3.6 FUTURE POPULATION

Correct and realistic projections of population for design of various components must be done to optimize costs. Floating population in respect of cities having cultural, tourism or religious importance may be considered judiciously and basis for the same be given.

3.6.1 Census Population

Population should be collected from past census records up to the year 2011. In case ULB is established after 1971, respective rural population of the geographical boundary of the ULB should be considered for this purpose.

Data collected on past census population, as discussed in Chapter 2 of these guidelines, shall be commented upon and tabulated here.

There may be towns where the whole area / population within municipal limits is not contributing to pollution of the river. As the DPR is for intercepting the drains and treating the diverted sewage, it is of utmost importance to precisely consider the population of the area contributing to flows in drains, for projecting design population and sewage flows.

On the other hand, there may be towns where some areas outside the municipal limits are discharging into drains of the town, but for some or the other reasons are not included with in municipal limits. Such areas may also be considered as a part of the project area.

3.6.2 Future Population Projections

The base year shall be taken as year of completion of the project for which the DPR is being prepared. Population projections for the base, after 10 years, mid and design years shall be made considering the past decadal growths using different recognized methods such as:

a. Arithmetical increase method  
b. Incremental increase method  
c. Geometrical increase method  
d. Decreasing rate of growth  
e. Graphical projection method  
f. Logistic method  
g. Land use and future density method - This shall be carried out at micro level for individual wards depending upon the growth potential of individual wards in consultation with local body, development authority (if any) and city country planning department.

Future population, which appears to be more realistic and acceptable, shall be adopted by giving proper justification for the same.

3.6.3 Floating population
Floating population should also be considered, which includes number of persons visiting the project area for tourism, pilgrimage or for working. The numbers should be decided in consultation with the tourism departments and specified for water supply and sewerage. Equivalent permanent population shall be worked out in proportion to the rate of water supply required for floating and permanent population.

3.6.4 Unauthorized Population:

In major cities, slum areas, unauthorized colonies, houses and establishments have been generating substantial amount of wastewater. Population of such areas should also be considered during estimation of population and sewage generation.

3.6.5 Design Population adopted (including floating population)

Design population shall be adopted as a sum of permanent and equivalent floating and unauthorized population and shall be given for base year, 10, 15, 30 years. In case the town has been divided into a number of sewerage zones, design population in different years shall also be given zone wise.

3.7 RATE OF WATER SUPPLY

3.7.1 Required rate of water supply, as per CPHEEO Manual

As per CPHEEO Manual on Water Supply and Treatment 1999, the recommended values of water supply for domestic and non-domestic purposes are given in Table 3.3.

<table>
<thead>
<tr>
<th>S. No.</th>
<th>Classification of towns / cities</th>
<th>Recommended Maximum Water Supply Levels (lpcd)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Towns provided with piped water supply but without sewerage system</td>
<td>70</td>
</tr>
<tr>
<td>2.</td>

<td>135</td>
</tr>
<tr>
<td>3.</td>
<td>Metropolitan and Mega cities provided with piped water supply where sewerage system is existing/ contemplated</td>
<td>150</td>
</tr>
</tbody>
</table>

NOTE:
1. In urban areas, where water is provided through public stand posts, 40 lpcd should be considered.
2. Figures exclude “unaccounted for water (UFW), which should be limited to 15%.
3. Figures include requirements of water for commercial, institutional and minor industries.
   However, bulk supply to such establishments should be assessed separately with proper justification.
   Source: Table 2.1 of CPHEEO Manual on Water Supply and Treatment, May 1999

3.7.2 Rate of water supply required for institutions

The water requirements for institutions should be provided in addition to the provisions indicated in para above, where required, if they are of considerable magnitude and
not covered in the provisions already made. The individual requirements would be as per table 3.4:

**Table 3.4: Water Supply Requirements for Institutional Needs**

### 3.7.3 Status of Existing Water Supply in the project area

Status of existing water supply shall be prepared as stated in para 2.4.6 and table 2.5.

It shall be ensured that the existing water supply or that proposed to be added by projects under execution, has the potential to meet the water demand of the projected design population at the rate specified in the above table. Details of projects (such as estimated cost, source of water, year of sanction/completion, brief details of works, lpcd proposed, design population etc.) which have been taken up or are contemplated for augmentation of water supply should be given.
3.7.4 Rate of water supply adopted

Rate of water supply adopted for design purposes should be mentioned, keeping in view the existing water supply, plans for augmentation and required for the project, giving full justification of the same.

3.8 INTERCEPTION FACTOR

The observed dry weather flow reaching the sewer system is less than that of the per capita water supply due to loss of some water in leakage and evaporation. It varies from 40% of water supplied in arid regions to 90% in well developed areas. For design purposes, interception factor or return factor may be adopted as 0.80 in developed areas. However, conventional sewers shall be designed for a minimum sewage flow of 100 lpcd or higher as the case may be.

3.9 GROUND WATER INFILTRATION

The inflow to sanitary sewers may also include flows due to infiltration of groundwater through joints. As per CPHEEO manual, since sewers are designed for peak discharges, allowances for groundwater infiltration for the worst condition shall be made as per table 3.5 and that design infiltration value shall be limited to a maximum of 10% of the design value of sewage flow.

Table 3.5: Ground Water Infiltration

<td>500</td>
</tr>
</tbody>
</table>

Source: Table 3.3 of CPHEEO Sewerage Manual 2013

The depth of subsoil water in the project area be mentioned. For design purposes, ground water infiltration through sewers may be adopted depending on depth of sewers to be laid and depth of sub soil water.

3.10 PEAK FACTORS

Flow in drains and sewers varies hourly and seasonally. However, for design purposes, peak factors may be adopted as per table 3.6. Minimum flow may vary from 1/3 to ½ of average flow. For population less than 10,000, Babbit’s formula with minimum and maximum limit of 3.0 and 6.0 respectively may be used.

Table 3.6: Peak Factors for contributory population

</tr>
</tbody>
</table>

*Source: Table 3.2 of CPHEEO Sewerage Manual 2013*

1 Babbitt formula for peak factor = $5 \times P^{-0.2}$, where $P$ is population in thousand.

### 3.11 DESIGN FLOWS

Sewage flows in design years (base, 10, 15 and 30 years), should be worked out by the following methods:

- Computed flow based on rate of water supply and projected population (including floating) of the catchment, in design years. For calculating sewage flows, ground water drawn through private bores and ground water infiltration through sewers laid below ground water table should also be added.

- Actual flows measured in drains and sewers in dry season projected for design period, taking into consideration the population for the respective design period. In hills, actual flow should be measured during yatra season also. Copies of reports of flow measurements indicating the date / method of measurement should invariably be made a part of DPR. Data collected on actual sewage carried by drains, as discussed in Chapter 2 of these guidelines, shall be commented upon and tabulated here.

Higher values, worked out above, may be adopted as design flow unless justified for the specific city having specific reasons and climatic condition. In some towns, the flow in the drains is many times higher than the computed flow based on the water supply indicating the contribution of ground water or some other sources like back water, canal or springs. In such situation, a judicious and well considered value should be taken for designing the interception/diversion works, SPS and STPs. Efforts should be made to isolate the sewage from such other sources.

In towns, where water supplied is higher than recommended rate of water supply, a programme for gradually decreasing the same to recommended rate of water supply shall be adopted, in view of the National policy of water conservation.

A hydrograph for 24 to 72 hrs. exhibiting the peaks may be plotted against measured flows and area, to make an assessment of volume of accumulated flows. The assessment based on population projection may, quite often, neglect, some areas which are not accounted for or are outside municipal limits, but are actually contributing to flows in drains. The estimated quantity based on hydrograph may therefore be used as reference figures for taking a judicious decision.

Design flows adopted in different years shall be worked out and tabulated sewerage zone wise / drain wise so as to indicate the raw sewage flow to be diverted for treatment.

However, in towns where present water supplied is less than recommended rate and there is no possibility of increasing the same in near future, design sewage flows for STPs and E/M works of SPS may be based on current drain flows projected for the design period instead of on computed flows. Their capacity be increased as and when the rate of water
supply and flow in the drains increases. However, suitable provisions in the structure and space be provided in the beginning.

Design flows shall also include the flow reaching STPs from drains flowing into the city from areas outside city boundary limits.

As Per 2.4.9 (CPHEEO Manual) Geographical Information Systems (GIS) should be an integral part of sewage collection system. The spatial modelling capabilities of GIS can be used to estimate current and future sewage flows, evaluate the capacity of the sewers and estimate the condition of the sewers.

Design flows shall be adopted in different components as per table 3.7.

**Table 3.7: Design Sewage Flows to be adopted for different components**

*Depending upon size of town

### 3.12 INTERCEPTION WORKS

a. These shall comprise of cross overflow weir, gates, screens, interception channel, diversion drain, grit chamber, proportional flow weir etc.

b. These shall be provided near the outfall of the drains carrying untreated sewage into the river.

c. These shall be provided taking into account the design peak flow, size of the drain and highest flood level (HFL) of the river. These should not be designed using empirical rainfall-runoff formulae’s. Data should preferably be obtained from CWC/other government agencies as defined in para 2.5 of this report. In absence of authentic data, proper observations need to be carried out.

d. Some portion of the drain u/s and d/s of the interception works shall be remodelled to suit the site requirement.

e. During the rainy season, the sewage flowing into the drains will be supplemented by storm water. As this happens, the gates provided at the interception chamber shall be raised to allow rain water to pass through and bypass the STP for which suitable arrangements shall be made.
f. Suitable arrangements shall be provided for removal and disposal of solids, floating materials and silt to prevent silting of diversion sewers.
g. There is a wide variation in the discharge in the Indian rivers during dry months and the rainy season. Because of this phenomenon, the flood plain of the rivers especially in Gangetic plains is very wide. The location of the interception works shall take due consideration of the flood plain of the river to provide unobstructed approach for O&M.
h. Anti-corrosive measures like cathode protection and use of anti-corrosive materials shall be taken to prevent corrosion of the works.
i. Hydraulic design shall be provided for every component of I&D works along with hydraulic flow diagram.
j. I&D works to be so provided that they become integral part of the comprehensive sewerage plan of the town.

3.13 DIVERSION / INTERCEPTING SEWERS

(i) The sewers proposed under the DPR should be so designed that they ultimately become a part of the town integrated and comprehensive system dealing with wastewater. The sizes and invert levels of sewers shall therefore, be provided accordingly and for the needs of next 30 years.
(ii) Minimum size of sewers shall be adopted as 200 mm for towns having present/base year population of over 1 lac and 150 mm in smaller towns. In hills, minimum diameter of 100 mm shall be adopted.
(iii) Minimum velocity at initial/ultimate peak flow shall be adopted as 0.6/0.8 m/s and maximum velocity not to be more than 3 m/s. In hills, CI/CI pipes may be adopted along with suitable drop manhole arrangement to reduce the velocity greater than 3 m/s.
(iv) Maximum depth of flow shall be limited to 0.8 of the diameter at ultimate peak flow for ventilation.
(v) Life cycle cost analysis of different pipes shall be done and included in the DPR, if pipes other than RCC are proposed in gravity sewers.
(vi) Condition assessment of existing sewers shall be carried out and the same shall be integrated into the proposed sewers. The report of such condition assessment should be invariably appended with DPR. Hydraulic design of sewers shall show integration of existing sewers with proposed ones.
(vii) The alignment of proposed sewers shall take due consideration of HFL and flood plain of the river to provide safety of works and unobstructed approach for O&M. Measures taken in this regard, shall be stated.
(viii) Trenchless technology method may be adopted at major road crossings, railway tracks and other important junctions for laying of sewers. However, full justification for adopting trenchless technology instead of open excavation will need to be given along with plans showing such stretches.
(ix) Sewers rehabilitation or laying of sewers by trenchless method shall be proposed on technology neutral basis.
(x) The plans should show basic details such as GLs, contours, land marks, major drains, their points of outfall, diameter and invert levels of existing and proposed major sewers, especially at junction points.

3.14 SEWAGE PUMPING STATIONS
a. The civil works of sewage pumping stations proposed under this DPR would be provided for 30 years need and would ultimately become a part of the town’s integrated and comprehensive system of dealing with wastewater. The sizes of pumping stations and RLs of different components shall therefore, be provided accordingly. However, considering modular approach, pumping plants shall be provided to cater to next 15 years and further pumps may be provided with a modular approach in a phased manner as the population grows.

b. The configuration of sewage pumps may be adopted as per table 3.8:

**Table 3.8: Configuration of Sewage Pumps, based on length of rising mains**

<table>
<thead>
<tr>
<th>Length of rising main</th>
<th>Pumps</th>
<th>No. of pumps</th>
</tr>

<td>Peak Flow/4 pumps</td>
<td>6 nos. (including 2 standby)</td>
</tr>
</tbody>
</table>

*Source: Table 5.1, Guide Lines for preparation of Project Reports under NRCP and NGRBA, Dec 2010*

c. Alternatively, pumps may be provided as given in table 3.9.

**Table 3.9: Configuration of Sewage Pumps, based on size of sewage pumping station**

<table>
<thead>
<tr>
<th>Size of Sewage Pumping Station</th>
<th>Pumps</th>
<th>No. of pumps</th>
</tr>
</thead>
<tbody>
<tr>
<td>Small capacity pumping station</td>
<td>1 pump of 1 DWF 1 pump of 2 DWF 1 pump of 3 DWF</td>
<td>3 nos.</td>
</tr>
<tr>
<td>Large capacity pumping station</td>
<td>2 pumps of 1/2 DWF 2 pumps of 1 DWF 1 pump of 3 DWF</td>
<td>5 nos.</td>
</tr>
</tbody>
</table>

*Source: Para 4.5.4 CPHEEO Manual on Sewerage and Sewage Treatment Systems Nov 2013*

d. The number of pumps may be so chosen to provide a 100% standby capacity during peak hours, if the site conditions so warrant. For the purpose, required number of pumps may be kept in reserve in store for use in emergency.

e. Design of pumping stations should take into consideration the lean, average and peak flows. Pumping configuration should be appropriate for effective pumping of sewage in any of these flow conditions.

f. Hydraulic retention time (Volume of wet well below invert of incoming sewer) shall be worked out as below:

\[ \text{Volume of wet well} \ V = \text{T} \times \frac{\text{Q}}{4} \]

Where,
V: Effective volume of wet well (in cubic meters)
T: Time for one pump cycle (in minutes)
Q: Pumping rate (cubic meters per minute)

The value of T is related to the number of starts per hour and it is not advisable to exceed 6 starts per hour. Accordingly, the value of T in the design is to be taken as 10 minutes for smaller pumps but 15 minutes is desirable.

Ideally this volume has to be provided below the invert of the lowest incoming sewer. However, it may not always be possible especially in large sized pumping stations. In such cases, volume in the sewers calculated at 0.8 times their total volume can be considered as the extended wet well volume. *(Source: Para 4.6.6 CPHEEO Sewerage Manual (Nov 2013)).*

g. Size of sump of the pumping station shall be checked with the pump manufacturer(s) for adequacy and so mentioned in the DPR.
h. Provision of control room shall be made in the DPR as per specifications of the respective Discom.
i. Submersible sewage pumps may be used, which are more economic in terms of both capital and operating cost besides being operation friendly.
j. Recent version to submersible pumps are immersible pumps with a seal of oil around the motor which takes care of its cooling. Thus it is possible to pump out the wet well to almost the mid height of the pump and reduce the height of wet well below the incoming sewer, saving considerable construction cost. *(Chapter 4 of CPHEEO Sewerage Manual (Nov 2013)).*
k. Condition assessment of existing pumping stations shall be carried out and the same shall be integrated into the proposed ones. The report of such assessment should be invariably appended with the DPR.
l. To ensure constant running of pumping stations, diesel operated generating sets may be proposed at each pumping station. Provision should also be made for dedicated feeder line as well, as discussed in para 3.21 of these guidelines.
m. HFL of the river shall be taken into consideration while deciding RLs of different components of the SPS to provide safety and uninterrupted operation and maintenance of SPS.
n. DG set capacity needs to be provided for peak flow requirement.
o. To scale site plans of the proposed pumping stations should be provided, showing land available, layout plan of the proposed works and open space available for future requirement.
p. Hours of power availability in the project area should be mentioned in the project.

### 3.15 RISING MAINS

In case of water supply works, economical size of the rising main is worked out by trying out various sizes and finding out net present value of the capital costs of pipe line/pumping machinery and capitalised electric energy costs. In case of rising mains carrying sewage it is not possible to calculate the economical size because of complexity of varying pumping rates etc. As such,

a. size of rising main selected should be such that to avoid silting, ensuring velocities not less than 0.8 m/sec (barest minimum) and not exceeding 3 m/sec at any time *(Para
4.20 of CPHEEO Manual on Sewerage and Sewage Treatment Systems Nov 2013. Suitable provision of rising main accessories, wherever needed, such as thrust blocks, anchor blocks, expansion joints, scour/drain valves, air/vacuum release valves and surge protection devices shall be made in the DPR. Surge/water hammer analysis shall be calculated and made a part of the DPR.

b. Rising mains must be designed for WHH (Water Hammer Head) also: It is important to select the suitable class of the pipe based on clause no. 6.17.3(a), (b) and (c) of CPHEEO manual on water supply. Accordingly, if (a) Pumping Head (PH) + Water Hammer Head (WH) < 1.1 × Allowable Pressure (AP)/Working Pressure (WP) of pipe, then the same class of pipe can be used, if (b) PH + WH > 1.1 × AP/WP < 1.5 × AP/WP, the same class of pipe can be used with provision of water hammer controlling devices and if (c) PH + WH > 1.5 × AP/WP, then higher class pipe shall be proposed.

3.16 SEWAGE TREATMENT PLANTS

3.16.1 Raw Sewage Quality for STP Design

3.16.1.1 Past experience indicates that normative values of parameters like BOD and SS have been taken for influent sewage despite actual quality characteristics having been established through field investigations. Such considerations result in over design of STPs with higher cost implications. This must be avoided and actual influent quality with an appropriate mark up only be considered for design purposes. For adopting BOD levels above 150 mg/l, proper justification must be provided. Copies of laboratory test reports of waste water incoming at existing SPS/STPs in the town or other towns in the vicinity, under similar situation, shall form part of DPR. The date and time of measurement of raw water quality shall invariably be mentioned in test reports.

3.16.1.2 The raw sewage quality should be ascertained by composite sampling once a week for diurnal variation on hourly basis from the drain or nearby existing sewage outfall (SPS/STP). Considering a 4-week month, 3 samples are to be collected on weekdays and the fourth on an off day i.e. Sunday. Sampling for water quality should be conducted for at least one month during dry weather to assess pollution load quantitatively and qualitatively.

3.16.1.3 The samples should be analysed for the parameters: pH, temperature, colour, odour, alkalinity, TSS, VSS, BOD (Total & filtered), COD (Total & filtered), N (NH3, TKN, NO3), Phosphorus (Ortho-P, T-P), TC, FC, TDS, Cl, Sulphates. For chances of industrial contamination - Heavy metals, Pesticides (Organo Chlorides, Organo Phosphates, Carbonates), Detergents, other parameters as per type of industry. One or two samples may also be tested for emerging contaminants involving presence of pesticides, personal care products and antibiotics etc. as these are becoming important in future treatment processes. Such tests shall provide a good baseline data.
3.16.1.4 In the absence of existing SPS / STP(s), actual measurements of raw sewage quality, from nearby town(s) having same rate of water supply and similar socioeconomic conditions, should be carried out as stated above.

3.16.1.5 Copies of raw sewage quality being monitored at the influent of existing STPs should also be collected for the last 2 years and shall be made a part of DPR.

3.16.1.6 Summary of above laboratory water quality test reports should be provided along with their copies and shall be made a part of DPR.

3.16.1.7 Raw sewage quality for design of STPs should be adopted accordingly. Basis of raw sewage quality adopted should be given.

3.16.2 Treated effluent Quality

MoEFCC, vide Gazette notification, 843 dated 15th October, 2017 under Environment (Protection) Rules, has prescribed the effluent discharge standards for Sewage Treatment Plants (STPs) as given in Table 3.10.

### Table 3.10: Effluent Standards for Sewage treatment plants

</table>
Fecal Coliform (FC) (Most Probable Number per 100 milliliter, MPN/100ml)

Anywhere in the country

<1000

*Metro Cities are Mumbai, Delhi, Kolkata, Chennai, Bengaluru, Hyderabad, Ahmedabad and Pune.

Note:

(i) All values in mg/l except for pH and Fecal Coliform.

(ii) These standards shall be applicable for discharge into water bodies as well as for land disposal/applications.

(iii) The standards for Fecal Coliform shall not apply in respect of use of treated effluent for industrial purposes.

(iv) These Standards shall apply to all STPs to be commissioned on or after the 1st June, 2019 and the old/existing STPs shall achieve these standards within a period of five years from date of publication of this notification in the Official Gazette.

(v) In case of discharge of treated effluent into sea, it shall be through proper marine outfall and the existing shore discharge shall be converted to marine outfalls, and in cases where the marine outfall provides a minimum initial dilution of 150 times at the point of discharge and a minimum dilution of 1500 times at a point 100 meters away from discharge point, then, the existing norms shall apply as specified in the general discharge standards.

(vi) Reuse/Recycling of treated effluent shall be encouraged and in cases where part of the treated effluent is reused and recycled involving possibility of human contact, standards as specified above shall apply.

(vii) Central Pollution Control Board/State Pollution Control Boards/Pollution Control Committees may issue more stringent norms taking account to local condition under section 5 of the Environment (Protection) Act, 1986”.

These standards should be followed. However, if is felt that more stringent norms are required, they may be adopted after giving justification

3.16.3 Sewage Treatment Technology

Sewage treatment plants are based on the technology which may have the natural, chemical, powered or non-powered based processes. The choice of technology option for sewage treatment is of great importance. In the NRCD MOEFCC document “Compendium of Treatment Technologies” published in 2009, (http://moef.nic.in/modules/recent-initiatives/NGRBA/Final%20Compendium.pdf) technologies have been evaluated on basis of

i. Performance,

ii. Energy requirement,

iii. Resource requirements and associated costs,

iv. Land requirements.

v. Annualized cost has also been worked out.

This compendium may be referred for selection of an appropriate sewage treatment technology. It implies that depending on the desired water quality of the effluent of the STP,
land requirement, availability of electricity and funds available, the technology that appears feasible should be selected using the matrix given in Compendium of Technologies. Graph showing annualised cost (as in 2008) of treatment and corresponding land requirement for various treatment technologies, as given in the above compendium, is placed as Fig 8. Constructed wetland technology may also be included in the sewage treatment plant technology options as it offers one of the most promising methods to treat sewage with low capital expenditure (CAPEX) and operation expenditure (OPEX) subject to the availability of land. This option may also be studied for improving the performance of existing oxidation and stabilization ponds to the desired level.

Fig. 8: Annualised cost (as in 2008) of treatment and corresponding land requirement for various treatment technologies
(Source: Compendium of Treatment Technologies – MoEF 2009)

Description of these technologies has been given in the Compendium, which may be referred to. Since the publication of the Compendium, more technologies have been developed and used. Up-coming technologies like A2O process, MLE (modified ASP) may also be included as these address exclusively Nitrogen and Phosphorus, apart from conventional pollutants.

Bioremediation technique has also been developed involving the use of organisms to neutralize pollutants from a drain itself. However, most of the work on Bioremediation has been done on laboratory scale or limited pilot instances. A State-of-the-Art report on ‘Bioremediation, its Applications to Contaminated Sites in India’ has been published by the MoEF, Govt. of India (http://www.moef.nic.in/downloads/public-information/BioremediationBook.pdf). This report gives a list of institutions having expertise
in bioremediation. Appropriate institution may be consulted if bioremediation appears to be a feasible solution to the problem in the circumstances of a town.

The CPHEEO Manual on Sewage Treatment Nov 2013 (para 5.8) makes the following observation:

“It covers such of those technologies for which validated design guidelines are available in India over the past many decades. There are more recent technologies with each of them having their own design guidelines by the respective equipment vendors and for which obviously there are proprietary issues in procurement out of public funds. No doubt, unless these are tried out at some point in time, there is no way of inheriting these forever, but at the same time, the proprietary issue has to be got over. Hence, these technologies will be addressed later in this chapter under the title “Recent Technologies”. Accordingly, the technologies to be considered in this chapter will be the Activated Sludge Processes, Attached Growth Systems, Treatment Methods Using Immobilization Carrier, Stabilization Ponds and Anaerobic Treatment. It is decided to phase out the stone mediatrix trickling filter technology considering the difficulties of upkeep of its rotary distributor, Psychodaflies nuisance and the recent lightweight media which give much more surface area for unit volume of the media as compared to the stone media.”

NRCD has, in the year 2011, sanctioned 4 (four) demonstration/pilot project of “In-situ treatment of sewage through bio-remediation” at (i) BudhaNala, Ludhiana, Punjab (ii) Bakarganj Nala at Patna, Bihar (iii) Morigate Nala, Allahabad, UP and City Drain, Farukhabad, UP under NRCP/NGRBA with CPCB as the nodal agency for project implementation. The results of the project are not published yet. However, expected BOD from the pilot projects is limited to only 30 to 50 and TSS 80 to 130 only which are not in conformity to the new effluent parameters.

Hence those technologies should be considered for selection in respect of which reliable information is available along with those mentioned in the compendium of Treatment Technologies (2009) and the Manual of CPHEEO on Sewage Treatment Nov (2013).

3.16.4 Life Cycle Cost Analysis

The most cost effective and feasible option may be selected through their life cycle cost analysis of various technologies. The cost components that should be included are the following:

a) Capital (One time cost)
   i. Land
   ii. Cost of various components of the system.

b) Recurring (Annual)
   i. Energy (electricity & diesel)
   ii. Manpower cost in operation and maintenance
   iii. Consumables
   iv. Repair and maintenance
   v. Resource recovery (negative cost.)
c) Water quality parameters – Influent quality, effluent quality standards, effluent quality for reuse.

This analysis should include capitalized costs, less revenue from resource recovery, recycling, by-product utilization etc. Ease of O & M, time required to construct and for achieving the desired objectives and costs of mitigation of any adverse environmental impacts must be considered on the costs assigned for the alternatives. Best option arrived from the LCC analysis should be selected and details should be presented in the DPR.

Standard methodology for calculating life cycle costs should be adopted.

3.16.5 Provision for STPs on technology neutral basis

Provision for STPs should be made on technology neutral basis. The technology provider may be asked to quote the rates based on the criteria such as raw sewage quality, effluent quality for reuse of effluent, availability of land and O&M cost and ease in maintenance of the STPs etc.

Costs of STPs constructed elsewhere on latest effluent parameters should be given in support of estimated cost adopted in the DPR.

3.16.6 Capacity / location of STP

a. Present Capacity of STP shall be provided to cater to the needs of the next 15 years and construction may be done with a modular approach in a phased manner as the population grows. Condition assessment of existing STPs shall be carried out and the same shall be integrated into the proposed ones.

b. The DPR is for intercepting the drains and treating the diverted wastewater. It is presumed that in the dry months the drains will carry mainly the wastewater from the town and there will be negligible storm water. Therefore, the entire flow in the drain should be diverted to the STP and treated. The STPs will, therefore, need to be designed based on the flow in the drains for the flow in the dry months and the sewage generation based on the population, whichever is higher.

c. Proposed STP shall take due consideration of HFL (Highest Flood Level) of drain / nala / river to provide safety and uninterrupted operation and maintenance of the STP.

3.16.7 Condition assessment of existing STPs

Condition assessment and integration of existing STPs with the proposed one should invariably be carried out. Non Destructive tests on RCC structures should be done to provide confirmation of the stability and integrity of civil structures. The report of such condition assessment should be appended with the DPR.

3.16.8 Resource Recovery

Following methods of resource recovery are:
i. Sale of sludge as manure or fuel
ii. Sale of treated water for irrigation, horticulture
iii. Fisheries etc.
iv. Generation of electricity
v. Carbon credit

All key parameters should be explained with detailed justification in the DPR.

3.16.9 Sludge Management

The DPR should have provision for a detailed Sludge Management Plan including the treatment, storage, handling facilities at site and approvals from ULBs to accept the solid waste generated by the STPs for its safe disposal / effective management.

Chapter 6 of CPHEEO Sewerage Manual (2013) has laid down detailed Guiding Principles on sludge treatment and its uses. These need to be followed. Disposal of sludge shall have to be as per the hazardous waste (handling and management) rules of MoEF if ceiling concentration of heavy metals and faecal coliform limits are violated. Every effort should be made to go eco-friendly in dealing with biological sludge from STPs. They need to be dried to about 20% moisture and then integrated with the agriculture and farm forestry. If needed to be applied on sensitive lawn, Gamma ray radiation of the sludge is mandatory before such application. The advancement in anaerobic sludge digestion in the coming years may address these processes.

3.16.10 Septage / Faecal Sludge Management

In areas where the sewerage network coverage is low, there has been reported tendencies of the septage being dumped at the receiving chambers or the drains to the STPs causing shock loads and leading to failure of the STP’s performance. Hence Septage / Faecal Sludge management practices are to be assessed and appropriate provisions need to be built in while designing the STPs.

3.16.11 Reuse of treated sewage

Paragraph 2.12.1.7 of CPHEEO Manual recommends that reuse of treated water to a minimum extent of 20% shall be mandatorily explored. This should be kept in mind. In view of higher treated effluent quality, concerted efforts will have to be made to explore and sell all the treated effluent to the potential buyers, 1st in industrial application, 2nd in domestic purpose and 3rd in agriculture sector. These may include laying new pipe lines for reusing the treated water by industries, domestic (toilet, cleaning) and horticulture. For the purpose, the end users will need to be identified, user agreement finalized and provision for recycled water network need to be established to ensure the recycling of treated sewage.

3.16.12 Instrumentation and Data Acquisition

The process instruments of proven technology may be provided for efficient continuous online monitoring at inlet and outlet of STPs, measurement of flows / water
quality parameters and safety of operating staff and equipment as per prevailing norms. The instruments should show compliance to agencies such as ISO, BIS, EPA etc. as applicable.

The SCADA system should be capable of taking care of the complete Data Monitoring and Data Logging facility and should be based on latest version of SCADA system.

3.17 LAND REQUIREMENT

Sewers are laid on the road side on publicly owned land. Hence no land is required to be acquired for sewers. However, land is required for sewage pumping stations and sewage treatment plants. In the above referred Compendium i.e., “Compendium of Treatment Technologies” published in 2009, (http://moef.nic.in/modules/recent-initiatives/NGRBA/Final%20Compendium.pdf), the land required per unit of wastewater treated in treatment plants has been given. It should be used to estimate the land required for STPs.

3.17.1 Land for Sewage Pumping Stations and STPs should be arranged to meet the requirement for next 30 years.

3.17.2 To scale site plan should be provided in the DPR showing the layout of proposed works, land required for proposed works and open space for future requirement.

3.17.3 Status of availability of land to be given on a statement showing land required for ultimate needs (of Interception works, SPS, STP, other works), land available, balance required, funds required for acquisition, provision made in DPR.

3.17.4 Land for construction of various structures / sewage pumping stations / STPs shall be in possession of executing agencies and land documents shall be attached to the DPRs.

3.17.5 Photographs of the existing and the proposed land sites be attached with the DPR.

3.18 FACTORS IN SELECTION OF SYSTEM OF WASTE WATER MANAGEMENT

Sewerage Districts – Configuration of STPs.

Depending on the availability of land especially for STPs, the locations of STPs may be determined. At one location where wastewater will be treated will receive wastewater from areas covered by one drain or more. This area will be the Sewerage area or Sewerage district of the STP.

Factors which affect the selection of system are given below:

i. Feasibility of utilising an existing interception & diversion system with necessary repairs, renovation, up gradation and modernisation.

ii. Where new systems are to be established, availability of land is a critical factor. In a district if suitable land of the required size is not available for installing STP, waste water must be carried to a place where land for the STP is available.

iii. Availability of electricity. It is crucial as a centralised system usually involves a long interception sewer necessitating laying of sewers at considerable depth and installation of intermediate pumping stations. These require power and since in most states there is shortage of power, standby arrangements in the form of DG sets have to
be provided for. Thus centralised system involves high capital cost and high O&M cost.

iv. There are pros and cons of centralised and decentralised systems. They should be carefully analysed and compared. Life cycle costs of different systems should be compared.

v. The ability and willingness of the people to meet their obligations to sustain the system etc.

vi. Over the life cycle of the system, the net present value of annual costs and revenues should be worked out of systems that are considered feasible and on that basis the system found to cost the least should be selected.

Based on the above factors the most suitable system may be selected.

3.19 PREPARING DRAWINGS

Drawings of works proposed should be incorporated in the project report. The DPR should be prepared in the Geographical Information System (GIS) format if it is feasible.

Following drawings should be provided in DPRs:

<table>

**Note:** All drawings shall be in appropriate scale to ensure the legibility and easy handling of drawings.

- a. A design memorandum providing the design calculations, assumptions and specifications adopted to be provided in the report.
- b. Details of water hammer pressure in form of calculation sheet indicating that the pressurized pipe system pipe system viz. rising main is safe against water hammer needs to be provided.

### 3.20 DEDICATED ELECTRICITY FEEDERS AND GENERATORS

**3.20.1** Sewage pumping and treatment need uninterrupted electricity supply. Therefore, average duration of supply of electricity should be ascertained so that the number of hours during which the Diesel generation (DG) sets will need to be operated can be known. Diesel generation sets will need to be provided to ensure constant running of the same. However, provision of dedicated electricity feeders for SPSs and STPs is also essential to meet programme objectives. DPR should contain details of such feeders like the length of the cable from the source of power, specifications of transformers, and estimated cost. However, capacity is to be determined on the basis of requirement.

**3.20.2** Hrs. of availability of power at the sites of existing and proposed works in the project area should be given.

### 3.21 OBJECTIVES, PERFORMANCE PARAMETERS AND RISK FACTORS

The objectives and outcome of the project, in terms of abatement of pollution of the river and improvement of water quality and of environment improvement, should be clearly spelt. There should be performance parameters of the system as a whole and of each component so that the effectiveness can be monitored and evaluated.
3.22 PERFORMANCE PARAMETERS

There should be performance parameters of each project component and the system as a whole so that the effectiveness can be monitored and evaluated. Sub-system alternatives for major components such as sewage should include the alternatives of centralised systems and decentralised systems.

Since the systems consisting of sewers involving pumping stations, and STPs are complex and are energy and capital intensive, the guidelines may be followed for designing the components of the system.

3.23 COST ESTIMATES

Based on survey and investigation, data collection and design criteria, detailed estimates may be prepared, and abstract of cost may be presented as per Table 13.1.

3.24 STRUCTURE OF DPRs

Suggestive structure of DPRs is placed at Annexure IV.

3.25 FLOW CHART OF ACTIVITIES FOR PREPARATION OF DPRS

A flow Chart showing different broad activities for preparation of DPRs is shown in Fig 9.
Fig. 9: Flow chart of Activities for Preparation of DPR
CHAPTER 4: OPERATION AND MAINTENANCE

4.1 CRITICALITY OF O&M

Operation and maintenance of assets has emerged as a major concern in the success of this programme. NGRBA has now decided that funds for O&M for a period of 15 years initially, would be funded by the center. The O & M responsibility beyond the 15th year will rest with the State Government/ULB.

Tripartite MoA amongst MoEF, State Government and the local body is also to be signed. State governments are expected to take all necessary measures available at their control to address this problem in a sustainable manner.

A centralized and computerized monitoring of performance of the system is also required to be established by state for all STPs to monitor the performance and take necessary remedial actions as required. Directions have been issued by CPCB vide notification dated Mar 02, 2015 for online monitoring of influent and effluents of highly polluting industries, CETPs etc. Copy of notification dated Mar 02, 2015 may be seen as Annexure V. Accordingly, devices may be installed on STPs dealing with domestic waste also for their proper monitoring of the performance and taking timely remedial measures when necessary.

It is necessary to accurately work out O&M cost. The records of O&M of assets created under GAP/NRCP may be examined carefully and updated to the current levels as well as the periods when new facilities would be ready for operation. Cost of electricity is the major component of O&M accounting singly for 65-70%. These as well as other components like manpower, consumables, etc. should be calculated on a realistic basis to arrive at the total annual cost to operate an asset. Continuous availability of electricity for both STPs and PSs must be ensured on around the clock basis by the implementing agency.

Preventive maintenance or repairs needed after a few year’s initial operations are often lost sight of. This is an important element of overall O&M cost and must be provided for appropriately.

The DPR must clearly reflect the component-wise and total funds needed for O&M and how and wherefrom these would be provided.

The O&M should be optimized by adopting tools like SCADA etc. and as per CPHEEO Sewerage Manual. Manpower required for maintenance need to be assessed considering optimization using SCADA and centralized automation.

Given the provision of 15 years O&M expenditure in the project cost, outsourcing of O&M for this period would seem to be obvious. The contractor must be asked to offer performance guarantees through proper O&M to achieve the outcomes. If O&M is outsourced, effort should also be made to build O&M capacity within the organization also. The contractor must also provide operation manual with answers to FAQs, identification to sensitive locations, risk involved and preventive measures with Dos and Don’ts properly listed.
As part of capacity building programme, operation and maintenance manuals have to be made available to the ULB’s staff by the DBO contractor.

4.2 RESOURCE RECOVERY AND REVENUE GENERATION

With little additional and dedicated efforts, sewage treatment could be converted into a resource generation activity to partly meet the O&M costs. Treated sewage and sludge are both rich in nutrients and, therefore, can be suitably marketed as biological manure. With the increasing health consciousness, people prefer to eat food grown with such manure. It is, therefore, necessary to exploit this potential to the extent possible as a source of revenue generation.

Biogas rich in methane is available from ASP based plants and much more from anaerobic treatment of sludge and also from anaerobic treatment process like UASB. It is necessary to fully exploit the potential of biogas through cogeneration of power. A well-designed treatment system may produce electricity from biogas to meet the entire in-house requirement. Anaerobic process like UASB, which is energy effective, may even produce extra power to supply to the grid after meeting the in-house requirement.

Additionally, a cogeneration project can be converted into a CDM (Clean Development Mechanism-of Kyoto Protocol) activity, which would provide additional revenue through generation and sale of CER (Certified Emission Reduction) certificates. Given the global warming potential of methane as 21 times that of CO₂, a well-designed CDM project could help generate considerable revenue through the sale of CERs.

Given the fact that electricity alone accounts for nearly 65% to 70% of the O&M cost, a cogeneration project with CDM benefits could help in offsetting the expenditure on this account to a large extent. Therefore, STPs proposed on treatment processes like ASP, UASB etc. may include the cogeneration component depending upon economic viability. The project team must study well operating plants in the country in this regard. In this connection reference is invited to the Ministry of New and renewable Energy, GoI publication. “Guidebook – Power from Biogas as Sewerage treatment Plants” available on their website.

It is necessary for the local bodies to enlarge the property tax base and utilize the additional revenue so generated to meet the O&M cost. There could be several other innovative ways for local bodies to raise revenue towards O&M costs e.g. taxes from pilgrim/tourist/floating population visiting the city, undertaking plantation on municipal lands and generating revenue there from etc. The underlying need is to explore all avenues to raise matching resources for O&M to achieve sustainability.

- Net O&M cost to be worked out after considering recovery of resources from treated sewage, bio gas, power generation, sewage sludge etc.
- Present tariff, annual revenue/ expenditure, revenue collection efficiency, sewer connection ratio be intimated.

4.3 COST ESTIMATES FOR O&M

The abstract of cost of annual O&M expenditure may be presented as per table 4.1. The estimates of costs of each component and the abstract shall form a part of DPR. If it is
proposed to install the STP on a turnkey basis, the O&M may be made a part of the work of turnkey contract of the STP. The O&M cost of each component shall be supported by its details. O&M cost shall be worked out for 15 years of commissioning of works

**Average annual repairs and maintenance cost may be taken as 1% of the capital works.**

**Annual O&M cost beyond 1st year to be worked out by compounding present cost with general price index/inflation which may be taken as 5% on Manpower and 2% on Chemicals. However, no escalation may be considered on Power.**
CHAPTER 5: PUBLIC PARTICIPATION & PUBLIC AWARENESS AND STAKEHOLDERS CONSULTATION

5.1 INTRODUCTION

The programme is for the preservation of natural resources and these are necessary for the benefit and welfare of public. The benefits of involving public in the decision making process are immense. It greatly helps in increasing public understanding of pollution abatement and subsequently defusing conflicts on government action by generating support of beneficiaries. The river cannot be conserved without the cooperation of the public and also they must have a sense of ownership with the programme. With a small investment public awareness, public ownership and public participation can be generated and many complex problems can be resolved.

It is necessary to formulate an effective public education, awareness and participation programme as part of DPR so as to make them socially inclusive. The programme must take into consideration the following issues.

An expert agency with right kind of background and experience may be engaged to formulate public participation strategy. Two types of outcomes are expected from this activity. The first one is public participation and through it agreement on complex issues like house connections, water conservation at household levels, proper collection of garbage so that it does not choke sewers/drains, sharing increased burden of O&M cost, proper layout of sewerage systems and location of STPs, diffusing conflicts, if any, on programme components etc. This can be best achieved through consultation at various stages of project formulation and implementation. The second one is increasing public understanding about the programmes through awareness. This should be achieved through workshops, seminars, street plays, city runs and riverside walks. Active involvement of students and teacher’s community in schools and colleges can greatly help in achieving the objectives. Public can also play the role of a watchdog in supervising project implementation and operation and maintenance which would help improve the quality of the programme.

Emphasis may be placed on increasing public participation for the projects/schemes supported by NMCG or NamamiGange. Apart from hiring expert agencies for this purpose, arrangements to involve active non-governmental organisations should also be made.

In the above background, a comprehensive programme giving details of the activities with timetable and cost involved should be prepared and presented in the DPR. This should be taken as a continuous activity right from the beginning of the programme and must continue in post commissioning stages also.

5.2 OBJECTIVE

The objective of public education, awareness and participation programmes should be to ensure that
i. The communities are aware that -
   a. There is a need for the programme to intercept the drains that carry the wastewater of the town into Ganga and treat it before it is finally discharged and that they will derive multiple benefits from it. The benefits need to be specified.
b. Though there will be recoveries in the form of compost and nutrient rich water and electricity, still there would be additional costs in O&M and these costs may have to be borne by them,

ii. The communities are effectively involved in all stages of the project cycle from conceptualisation, to preparation, to finalisation, to implementation and finally O & M. Such involvement will generate a sense of ownership of the programme among the stakeholders.

iii. To keep the stakeholders and citizens informed of the progress of the project at all stages, a website with updated information about important features of the project may be created and arrangement made to send replies to project related queries.

5.3 PUBLIC AWARENESS AND PUBLIC PARTICIPATION AS FRONT END ACTIVITY

Public Awareness & Public Participation should be a front-end activity of the project. The entire programme of conservation should be conceived, formulated, implemented, monitored and evaluated in close consultation with the stake holding communities following the approach of ‘Participatory Appraisal’.

The agency that will plan, implement and coordinate the awareness campaign should be identified. With a view to focus on issues relating to protection and improvement and cleaning of rivers, a massive program of environment education and awareness is imperative. Centre and states may launch this campaign through a program of volunteers called GREEN VOLUNTEERS.

5.4 TARGET GROUPS

i. Local influential/Community leaders,
ii. Local NGOs,
iii. School teachers and students,
iv. Elite groups and organisation like Rotary Club, Lions club, Associations and forums of writers and artists, doctors, lawyers and other professional bodies etc.,
v. Religious leaders and priests,
vi. Representatives of industry and commerce,
vii. Leaders of trade unions and organisations like safai karamcharisanghs,
viii. Leaders of teachers and students associations,
ix. Representatives of political parties including the elected office bearers and members of local bodies,
x. Members of legislative assemblies, legislative councils and parliament representative of local constituencies,
xi. Representatives of media viz. editors/correspondents of local press and key functionaries of local radio and TV stations,
xii. Grassroot level functionaries of Municipalities and state government departments like public health, forestry, Jal Nigam, PWD, etc.,

5.5 ACTION POINTS FOR COMMUNITY AWARENESS

i. Action be taken to get the Urban Local Body (ULB) to discuss the issue of river pollution – causes and effect and the need to take conservation measures.
ii. Request the ULB to set up a Committee on Awareness Generation and Public Participation for the entire city. Members of the Lok Sabha and the Vidhan Sabha may be co-opted as special invitees. In turn, the Committee should invite civil society
organisations in the city that are active to participate in the Awareness Generation and Public Participation Programme.

iii. With the involvement and help of the ULB, or otherwise, for each ward identify an active NGO or promote a group of interested and committed people to be involved in Ganga Pollution Abatement Project.

iv. The agency preparing the Pollution Abatement Project should prepare a plan of awareness generation and public participation and submit it to the Committee on Awareness Generation and Public Participation for approval. The plan could consider including the following activities, among others:-

a) Print and electronic media including the local news papers should be invited and supported in covering the issue of pollution of rivers.

b) A website may be created to provide facts about the state of sanitation, in particular, the degradation of the river. It should be regularly updated.

c) Holding locality wise meetings and group discussions with influential people, whereby the extent of river pollution, the related physical and human factors, the consequent health hazards and the possible remedial measures are highlighted through talks and technical presentations by the experts and social workers (Action: Identified NGO of reputation).

d) Motivating influential group to play a leading role in promoting environmental sanitation and community health, particularly prevention of river pollution (Action: Identified NGO of reputation).

e) Motivating and advising local NGOs to participate in outlining execution and follow up efforts of community action plans for ensuring a clean and healthy community life in general and protection of river water quality in particular (Action: Identified NGO of reputation).

f) Promoting schools as models of clean living and healthy environments and training school teachers and students as motivators and informal change agents for involving families and communities in clean river programmes in general and maintenance of toilets/bathing ghats/crematoria in particular (Action: Identified NGO with excellent track record of having rendered specialised services in the area).

g) Motivating school management, administrative and teaching faculty to organize events and special programmes for checking river pollution and plantation of trees on river banks (Action: Identified NGO and functionaries of the Department of Forestry).

h) Motivate the local influential trade, business, professional, social service, religious associations/chambers/Clubs and individuals to participate in awareness generation programme.

i) Inform, educate and invite potential investors to associate themselves in activities such as solid and liquid waste management services through an effective strategy of public-private partnership. They can also sponsor plantations on river banks and adopting a certain planted area for protection and preservation.

j) Inform, educate, organise and motivate religious leaders and priests to participate actively in river pollution control through such efforts as educating the masses, checking the dumping of temple waste on the river bank and immersing half burnt or unburnt dead bodies into the river (Action: NGO of reputation).
k) Motivate the office bearers of trade unions and other professional organisations like teachers and students associated to win public support for their cause by rendering some fruitful service to the society. While doing so they may give highest priority to community health promotional measures like river pollution control and conservation of the quality of river water (Action: NGO of reputation).

l) Motivate local MLAs and MPs and leaders of political parties to participate actively in the promotional efforts of community involvement for protecting river against the hazards of pollution—an effort, which shall pay them abundantly through the building of positive public opinions. They should also be motivated to form local level all party organisations/forums to promote the measures of river pollution control. In addition, they should be motivated to take keen interest in the proper utilisation of the funds provided for river pollution. In addition, they should be persuaded to play effective liaison between the government and the people to ensure the timely completion of different programmes and activities undertaken by the Directorate of National River Conservation Programme (Action: NGO having a sound background of linkages with the legislative and political leaders).

m) Motivate leading persons representing local press and electronic media. They need to be encouraged to be conscious of their social commitment and social obligations. They should also be convinced that socially conscious media shall always be aptly recognised and enormously rewarded through the creation of a sound base of enlightened clientele group which in the long run will help them through the image building process. Accordingly, the editors and correspondents of local press, the officers and key functionaries of the programme of river pollution control measures through the active involvement of the people need to be associated with creation of public awareness and participation. (Action: NGOs of repute having a sound organisation infrastructure of public relations unit).

n) Awaken, educate and encourage the grassroot level functionaries belonging to Urban local bodies, offices and agencies dealing with public health, sewerage, forestry, water supply, public works, electricity, industry, tourism etc. to take special interest in the activities which are directly related to the aspect of river pollution control. They should be particularly motivated to be more conscious of their commitment and obligation to ensure the purity of river water so that the future of the present and coming generations of the society and so also the members of their own community is safe-guarded against health hazards. (Action: NGO having the background of specialised contribution to the area concerned).

o) Organise campaigns to encourage the use of community toilets and discourage open defecation, especially on open land near river banks.

p) In areas where there are sewers, encourage people to connect their houses to the sewer.

q) Organise, for different sections, events such as essay, debates, posters, slogan, painting, script etc.

r) Send information sought by the stake holders about the project during different phases beginning with preparation of the project to its implementation, commissioning, operation and management.
5.6 IMPORTANT STAGES OF STAKEHOLDER CONSULTATION

AWARENESS GENERATION AND SECURING PUBLIC PARTICIPATION

i. Preparation of DPR
ii. Submission of the project to the State Government
iii. Stage of sanction by the NRCD
iv. During implementation
v. Any stage when obstacle if faced, say in identification of land needed for works.
vi. Implementation of DPR
vii. Commissioning and evaluation

5.7 COST ESTIMATE

A provision of 2%-3% of the project cost may be made for generation of public awareness and securing public participation. Various items of cost for which provision should be made are illustrated in the table 5.1.

CHAPTER 6: TRAINING, HRD AND CAPACITY BUILDING

6.1 PHASES OF POLLUTION ABATEMENT PROJECT

A project passes through the following phases:

1. Project preparation
2. Project implementation,
3. Operation and maintenance
4. Monitoring and evaluation
5. Management of the completed project

6.2 DOMAINS OF KNOWLEDGE INVOLVED

1. Scientific and technical – water quality, aquatic biology, civil engineering, electrical engineering, mechanical engineering, remote sensing and GIS
2. Social sciences– stakeholders analysis; social survey,
3. Communication science: awareness generation and public participation
4. Financial & economic: financial evaluation of projects, raising of financial resources
5. Institutional: institutional effectiveness in performing its functions
6. Administrative: administrative aspects
7. Legal and regulatory: developing suitable laws and regulations for effective functioning of the ULB

6.3 HUMAN RESOURCE REQUIRED

Successful project preparation, implementation and management need the manpower with diverse expertise in the above domains of knowledge with relevant experience in similar works. Skill acquisition is achieved through education, training and experience.

6.4 EDUCATION NEEDS

The table 6.1 the required educational attainments of manpower.

6.5 TRAINING NEEDS

Training needs of skilled manpower are met through short term training programmes of duration of a few days, weeks and months. But training can be imparted only if the trainee has the necessary educational attainment. Regarding a project that is under execution, after it has been commissioned, it is necessary that staff with proper training and experience is in place for O&M of assets. The responsibility of operation and maintenance of STPs and main pumping stations should rest with the contractor who supplied the plant, for 10 years after commissioning of the project. It should be ensured that the contractors/suppliers of equipments deploy properly trained and experienced staff for this work. Even if contractors and suppliers are bound by the contract to operate and maintain the equipment they supplied or erected, they should be required to

i. Impart training to the identified personnel of the agency that owns the project and has the responsibility for its proper functioning.

ii. Provide operating manuals of the equipment installed.

6.6 EXPERIENCE NEEDS

These needs are met by the personnel working on real assignments. Those in charge of personnel management need to ensure that the needed experience is available to them within the organization.

6.7 FULFILLING MANPOWER NEEDS – MANPOWER DEVELOPMENT PLAN

The State Government, in the light of the state of degradation of their water resources, in particular of their rivers, should prepare a plan of capacity building and manpower development, in addition to their normal plan for capacity building, for deployment in the 118 towns where the I&D and STP projects are to be taken up.

An assessment of the personnel needed for various functions, their training needs and availability of persons who can be trained should be prepared. Academic disciplines in which personnel with postgraduate degree, undergraduate degree, diploma and certificate are needed and the numbers in each need to be identified. The personnel that would, after education and training constitute, a pool of human resource that is equipped to handle the items of work, mentioned in these guidelines including O&M should be identified. They should be sent to undergo suitable educational programmes and training programmes. The O&M personnel are mandated to acquire the certification of Waste water treatment plant technicians and Helpers by Skill Council for Green Jobs (SKGJ), M/o Skill Development & Entrepreneurship, GOI. Two National Occupational Standards SGI/Q6601 and SGI/Q6602 have been developed by SCGJ for waste water treatment plant technicians and helpers respectively.
A list of institutions of higher education with the academic disciplines where the personnel can be sent for education should be prepared.

Training need identification is a continuous process and in the identified subject areas training institutions can be requested to develop training programmes.

It is the responsibility of those in charge of human resource development in the States – in the government and local bodies – to ensure that they have the necessary manpower resources with needed educational attainments, training and experience for undertaking the work arising out of the programme of pollution abatement of rivers.

Standing arrangement with institutions engaged in education and training can help the States to ensure that they are not short of the needed manpower.

In case of shortage of manpower in specific disciplines, suitable persons can be obtained on loan or on contract or the work can be assigned to an agency that has the capability to deliver.

6.8 CAPACITY BUILDING

Capacity is a function of two aspects, namely human resource and physical and financial resources. Human resource has been dealt with above. Physical resources imply equipping the staff deployed for this work with necessary financial resources and physical resources such as space, laboratory, tools etc. The DPR should incorporate the requirement of these resources for proper operation and maintenance and management of the project.

6.9 COST ESTIMATES

Various activities involved in HRD and capacity building are mentioned in the table 6.2.

CHAPTER 7: PROJECT IMPLEMENTATION MECHANISM

The State Nodal Department and the state PMG must explore the possibility of promoting joint ventures in Public Private Partnership (PPP), departmental implementation of projects, existing state/central governmental undertakings or setting up a special purpose vehicle to implement these projects.

The State Government may employ a number of project executing agencies for different types of projects. For the preparation of DPR reputed professional consultants may be engaged by the State Government.
CHAPTER 8: PROJECT MANAGEMENT & INSTITUTIONAL ISSUES

The institutional arrangement for the implementation of this programme at the Central and State levels is visualized as below.

8.1 NATIONAL MISSION FOR CLEAN GANGA (NMCG)

It has been established as a registered society that is responsible for effective implementation of the overall NGRBA program at the national level with well-defined functions, powers, resources and autonomy. It has (i) formal devolution of powers to ensure appropriate level of operational autonomy; (ii) single-point responsibility for planning and execution of the NGRBA program; (iii) powers to manage its human resources, with the objective of attracting and retaining well-qualified staff; and (iv) institutional sustainability as the permanent entity responsible for the conservation and health of the river Ganga in the long term. The Program Management Group (PMG) is headed by the Director General.

8.1.1 State Program Management Group (SPMG)

Each state has a State (SGRCA) Program Management Group (SPMG) as a registered society, to ensure effective implementation at state level with the exception of Jharkhand, which has a dedicated cell within the UD Department, as a very small stretch of the Ganga main stem passes through the state.

The SPMGs are the respective state level counterparts of the PMG and have state level responsibilities for management and implementation of the NGRBA Program in accordance with the agreed NGRBA program framework. They are also responsible for capacity building of Executing Agencies (EAs); managing state level IEC campaigns, stakeholder consultations and community participation; and other state level activities in the Institutional Development Component (Component One) of the project.

The SPMG is headed by a Project Director and includes specialists in basin planning, wastewater engineering and management, ecology, environment and social management, finance & economics, operations, procurement, knowledge management, IT, communications, human resources management, and monitoring and evaluation.

8.1.2 Executing Agencies

Execution of the infrastructure investments is done by the Executing Agencies (EAs), selected for each investment. The choice of EAs includes the existing state-level technical agencies, which have the mandate of urban infrastructure (especially wastewater) management in their respective states.

8.1.3 Program Management Consultancy

This consultant is to provide program management support to PMG, including planning, technical support for investments review and appraisals, portfolio management, procurement, financial management, monitoring and evaluation, and reporting.

8.1.4 Technical Support Consultancy
This consultant is to provide technical support to SPMGs and EAs, for upgrading the process and practice of preparation of schemes of investments and their execution to global standards.

8.1.5 Other Partner Agencies

The PMG and SPMGs are to collaborate with and seek support from and partnership with a range of other agencies, to draw upon their specialized expertise and supplement the capacity of main implementing agencies. These will include international, national and local knowledge institutions, private sector business houses and industries, and civil society groups.

8.1.6 Tiered Implementation Structure

Thus the programme implementation at various levels is envisaged as follows: (a) National Level: PMG, (b) State level: SPMG, and (c) Activity level: Executing Agencies (EAs) selected for specific activities with local coordination for planning and implementation provided by Urban Local Bodies (ULBs) where needed.

8.1.7 Programme Framework

NGRBA has prepared a Programme Framework containing provisions in detail that will govern this programme. These include

- Implementation Arrangement
- Detailed Investment Framework
- Financial Management Manual
- Environmental and Social Management Framework
- Communications and Public Outreach Framework
- Governance and Accountability Action Plan
- Memorandum of Agreement – Programme
- Memorandum of Agreement – Investment
- Procurement Manual

8.1.8 Preparation of DPR Component Scheme Wise and Integrated Summary

Works are sanctioned only on the basis of a DPR. Each component scheme will have a DPR. Therefore, a pollution abatement project in respect of a city may have as many DPRs as the number of component schemes so that it is convenient to submit it to the funding agency. However, there should be a consolidated summary of all DPRs that gives an overall view of the project, its components and costs.

DPR is very crucial and forms the foundation for the success of efforts to improve the water quality of rivers and to achieve the objectives of the NRCP. Every care should be taken to ensure that it is of high quality and, therefore, preparation of DPR deserves to be treated as a project in itself. A suggestive structure of DPR is given in Annexure IV.

8.1.9 Appointment of Team to Prepare DPR Departmentally
Every agency that is assigned a component scheme should appoint a team of competent staff to undertake different activities that are required to be performed at different stages of the scheme. The project reports can either be prepared departmentally if there is in-house capacity or through a competent consultant.

8.1.10 Appointment of Consultants to Prepare DPR

If it is felt that circumstances are such that it will be difficult to departmentally undertake all the activities involved in the preparation of the DPR, an outside agency can be appointed to undertake identified activities or prepare the entire DPR. However, care has to be exercised in selecting the agency. For selecting the agency Expression of Interest (EOI) may be invited from agencies and then selecting agencies that have the manpower, financial and physical resources to prepare the DPR. Papers for submitting the EOI have to be prepared carefully so that it can be ensured that all the information needed to evaluate the capacity, competence and suitability of the agencies is provided by the interested parties. Technical and financial offers may then be invited from the selected parties.

8.1.11 ULB participation

The participation of the concerned Urban Local Body (Municipality / Municipal Corporation) in the project should be ensured by getting their concurrence to the DPR and including MOM of the meetings with the ULB in the DPR. They should be encouraged to build technical capacity to undertake O&M the assets and to manage the system.

8.1.12 Responsibility for activities and schemes

Table 8.1 suggests the agencies that can be given responsibility for schemes

8.2 MONITORING, SUPERVISION, GUIDANCE AND QUALITY CONTROL

Whether the DPR is prepared departmentally or by a Consultant, it is necessary for the implementing agency to arrange regular monitoring, supervision of activities involved in preparation of the DPR and provide guidance from time to time and exercise quality control. This should be done by the State PMG’s own staff or, if there is shortage of suitable expertise, help of suitable consultants can be taken.

8.3 IMPLEMENTATION OF DPR – EXECUTION OF WORKS PROPOSED IN THE DPR

8.3.1 Mode of Implementation:

For implementing the works in the DPR, there are a number of options available as described below:

i. Departmental supervision,
ii. Project management agency
iii. Combination of above

8.4 INSTITUTIONAL ISSUES IN MANAGEMENT

8.4.1 Activities

In conservation and management there are a number of institutions dealing with activities including:

i. Policy, strategy and programme formulation and their implementation
ii. Supply of services
iii. Development,
iv. Management,
v. Regulation and enforcement,
vi. Coordination with national, state and local organizations.

8.4.2 Overlap in roles of institutions:

The role of three bodies is very crucial. These are:

i. Municipality which is responsible for sanitation in the city,
ii. City Development Authority which regulates the new colonies.
iii. State Pollution Control Board, which is responsible for ensuring compliance by industry and other institutions of the standards, prescribed under the Environmental Protection Act for effluent, solid waste and air emissions.
iv. State Agencies - performing functions of municipal bodies relating to water and waste water.
v. District administration.
Many times there is an overlap in roles of several bodies with the result that the efficiency with which the function should be performed suffers. The State PMG should identify such areas of overlap and move the state Government to resolve such overlaps. The role of each institution involved needs to be very clearly specified.

In the chapter on collection of secondary data it has been mentioned which data should be collected so that the strengths and weaknesses of the ULB and other institutions working in the city are reflected. This needs to be analysed to identify the areas where remedial measures are needed.

The SPMG should solve any issues that may arise.

### 8.5 COST ESTIMATE OF PROJECT MANAGEMENT AND INSTITUTIONAL ARRANGEMENTS

The SPMG, which is the state implementing agency, may need financial support. Illustrative items for which funds may be required are mentioned in table 8.2 and table 8.3.

Project preparation and implementation cell for specific projects agency wise

An estimate of expenses required for each component on the above lines should be prepared.
CHAPTER 9: PERFORMANCE MONITORING

9.1 The programme aims at improving the water quality of river and sanitary conditions in the city. Benchmarks of water quality are already available for the designated best use. The success of the programme would be established if the benchmark water quality is achieved.

9.2 THIRD PARTY INSPECTION SYSTEM

A monitoring mechanism is to be put in place to monitor the performance of STPs and pumping stations and their impact on water quality of the river. A Third Party Inspection (TPI) system should be established for the project in each town. It will review and monitor the performance of the project through the entire life cycle of implementation on the basis of detailed onsite review, examination of appropriate documents and discussions with the EAs and other key stakeholders.

Engineering educational institutions available in the city or in the State or office of the State Pollution Control Board may be considered as appropriate agencies for this purpose.

9.3 MONITORING PERFORMANCE OF ASSETS AND OUTCOME OF THE PROJECT

A detailed plan of monitoring the performance of assets as well as the outcome of project, which is reflected in the river water quality, must be prepared covering, among other things, the name of the monitoring agency, parameters to be monitored and their frequencies and presented in the DPR. The NMCG will assign this work to reputed academic / R&D institutions and will bears the expenses. However, there is a need for a dedicated person to collect data from the monitoring institution, create data bases, study and analyse it to see if any corrective measure is required to be taken at the local level. Expenditure on this dedicated cell should be included in the cost estimates.

Directions have been issued by CPCB vide notification dated Mar 02, 2015 (Annexure V) for online monitoring of influent and effluents of highly polluting industries, CETPs etc. Such similar / suitable devices if installed on STPs dealing with municipal sewage as well would be helpful in proper interpretation of results and taking timely remedial measures on their performance.
CHAPTER 10: COMPLETION SCHEDULE

Completion schedule for every component scheme of the project should be prepared and should be watched by the executing agency. Generally completion schedules are prepared without considering the odds that would be faced during its implementation and hence most projects are delayed. Completion schedule should, therefore, be prepared on a realistic basis. It should be presented in the form of a PERT/CPM and Gantt chart for monitoring purposes.

Completion schedule should be accompanied by a quarterly physical and financial progress schedule. This should form the basis of monitoring of expenditure and obtaining grants from MoEF on a quarterly basis. Upon completion of the project, a completion report is submitted in a standard format. This format should be presented in the DPR and is given as Annexure –VI. Utilization certificates for the funds released by NMCG/MoWR, RD&GR shall be submitted in the formats given as Annexure VII.
CHAPTER 11: ENVIRONMENT IMPACT ASSESSMENT AND ENVIRONMENTAL MANAGEMENT PLAN

This chapter deals with the assessment of impact on Environment of I&D and STP schemes proposed and preparation of Impact Management Plan to minimize environmental impacts. For making such an assessment, baseline (pre-project) information about the components that are expected to be affected either negatively or positively has to be gathered.

11.1 Components of Environment Affected

The baseline situation is that the drains carry sewage to the river thus adversely affecting its physical, chemical and biological parameters and adding, among other things, pathogens.

Thus drains carrying sewage potentially affects the environment. If the drains are intercepted and the water is treated in Sewage Treatment Plants to the desired standards before it is discharged into the river, the adverse impacts of these wastewaters on the river is eliminated and water becomes suitable for the uses corresponding to the water quality of the river achieved as a result of implementation of the project of I&D and Treatment of the sewage carried in the drains.

The following components are likely to be affected and the impact on them should be assessed:

i. Air
ii. Ground/ Surface water
iii. Soil

Methodology

The steps in studying environmental impacts of proposed project shall be:

- Phase-I Environmental Site Assessment of proposed project sites
- Alternative site assessment study
- Project feasibility study

From above studies, environmental issues of the related work can be known. The project feasibility report can come up with various kinds of pollution sources, nature and pathways of pollutants.

Data collection of secondary data OR baseline study for primary data can be carried out. Then environmental impact assessment on present baseline environment can be studied. The mitigation measures can be planned to minimize the impacts.

11.2 Impact Management Plan:

The I&D and STP projects have generally favourable impact on the components of social environment. If, however, some components are assessed to be adversely affected, a management plan must be prepared to keep the values of the component within acceptable limits. The following steps to be considered for impact management plan.
i. Baseline study of environmental parameters: Brief description of baseline environmental conditions (ambient air quality, surface and ground water quality, noise quality, ecological setting based on secondary data sources of recent origin of last 1-2 years or so). The baseline data for one week or so may be generated as site by appointing a NABL accredited laboratory

ii. Environmental impacts (a brief description) of the envisaged project on the present baseline environment during construction and operational period

iii. Environmental Management Plan (EMP) to be prepared to minimize the impacts and bring them to acceptable levels.

iv. EMP costs to be estimated for environment protection and safety principally during construction and operation period.
CHAPTER 12: GOVERNANCE AND ACCOUNTABILITY ACTION PLAN (GAAP)

The Governance and Accountability Action Plan (GAAP) is to minimize accountability risks to the NMCG Program. Specific arrangements shall be proposed to mitigate these risks and to ensure that funds are used effectively and efficiently. The main purpose of the GAAP is to ensure that the NMCG Program’s objectives are achieved with avoidance of all kinds of internal/external risks. This GAAP summarizes the mitigation measures being taken as a part of program. The mitigation measures are grouped into three categories: (i) Implementation Arrangements; (ii) Transparency and Citizen Voice; and (iii) Grievance Redressal.

Following needs to be done for the GAAP:

i. **Disclosure and dissemination of information:** As per the Municipality Disclosure Act, RTI and NGRBA guidelines on stakeholders’ consultation would be adhered for the purpose of information dissemination. The disclosure of information should be made on a regular basis to the public. This is to be carried out in close coordination with communication and public outreach activities.

ii. **Under RTI Act,** the disclosure applies to all public project related documents, including but not limited to project components and sub-components, cost estimates, procurement plans, details of tender notices, details of award of contracts and contract amounts, selection of consultants/contractors, and details of officials implementing the project.

iii. **Use of Social Audits.** Social Audit, a viable instrument of sustainable program delivery, is in fact People’s Audit, which provides a succinct view of performance based on society’s perceptions and analysis at large. Citizen’s Monitoring Committee will perform Social Audit in a manner prescribed by the Government of India.

iv. **Adherence to the RTI Act.** In addition, in compliance with the requirements of the Right to Information (RTI) Act (2005), the project shall provide information voluntarily and on demand as prescribed by law. As per the RTI Act, the project will ensure proactive disclosure and sharing of information with key stakeholders, including with communities and beneficiaries.

v. **Grievance Redressal System:** The purpose of a robust and responsive grievance redressal system is to ensure that any query or complaint with regard to any aspect of project implementation and management is fairly heard and promptly addressed. The development of an integrated system will enable the integration of feedback from the public, effective handling of complaints, and immediate automatic updates on the status of response. A GR system will be established with Grievance Redressal Cells (GRCs), with necessary officers, officials and systems at the local EA level which will be integrated with other levels. Grievances may be submitted through various media, including in person, in written form to a noted address, through a toll free phone line or through direct calls to concerned officials, and online. All local contact information and options for complaint submission will be available on site on local information boards.

The estimated cost for the GAAP arrangements would be worked out to cover the following expenses during construction and O&M:
• On CMC’s Social Audits, Information Cell
• Running the Grievance Redressal Cell
CHAPTER 13: COST ESTIMATES

Estimation of Cost of Some Items

Each of the following items has been treated as a component scheme of the project in the town. These items take care of the requirements of all the component schemes in the town.

i. Awareness generation and public participation
ii. Training, human resources development and capacity building
iii. Institutional development & strengthening
iv. Monitoring & evaluation

Based on survey and investigation, data collection and design criteria, detailed estimates may be prepared, as given in the respective chapter. The project cost may be provided in the format given in the table 13.1, under the following subheads for each scheme:

</tbody>
</table>

On many occasions, land is to be acquired involving an elaborate procedure under the land acquisition act. Projects are often delayed on this account. Such situations must be avoided. As per the present policy, the cost of land for SPS/STP works is to be borne by the State Govt.
Cost estimates of other components should be based on the detailed bill of quantities, specifications of materials structures and rates as per the latest SORs. It is generally seen that latest and updated SORs are always not available for the city. This results in underestimation of cost involving revision in cost. It is necessary to note that NMCG does not entertain any revised cost estimate after the project is approved and revision in cost, if any, would have to be borne by the implementing agency only. Care should, therefore, be taken that estimates are prepared taking the following into consideration.

Non-schedule items should be estimated on the basis of the prevailing market cost and budgetary offers from 2 or 3 reputed firms. In case some sewers are proposed to be laid by trenchless technology, latest SOR approved by the respective state agency or Indian Society for Trenchless Technology may be adopted for working out estimates. Copies of quotations of Electro-Mechanical items should be provided in the DPR.

Estimated cost of STP may also be worked out based on recently awarded cost of similar capacities of STPs (average cost of different STPs) based on conventional technologies in the concerned State. If the awarded cost is not available in the concerned State, the awarded cost in the neighbouring State may be adopted. Costs of STPs constructed elsewhere on latest effluent parameters should be given in support of estimated cost adopted in the DPR.

Contingencies are not permissible as a separate item and is covered under centage.

The estimates should mention specifications of all proposed works and reference of SOR used for adopting the rates. All applicable cess / taxes / GST should be included in estimated costs of items.

It takes some time to complete the DPR and then submit it to NMCG through State Government and finally appraisal and approval of DPR in NMCG. Sometimes, when the project cost is high, the proposal may require approvals at higher levels in Government which is a time consuming process. Therefore, implementing agency should be able to foresee escalation, if any, in the cost on this account and should make appropriate provisions in the project cost accordingly.

Bills of quantities and specifications must be presented in a separate volume.

For each major component, the estimated cost needs to be justified. For this purpose, it would be advisable to compare the cost estimate with that of a similar one approved earlier after necessary updating. This would help expediting approval in NMCG.

Necessary provision may be made in the estimate for Centage as approved by NMCG.

The DPR would also be used for preparation of Notice Inviting Tender (NIT) and tendering the project. It should, therefore, contain complete engineering drawings, longitudinal sections etc. of the proposal that would be needed for NIT as well as monitoring of project implementation.

MINISTRY OF ENVIRONMENT AND FORESTS

NOTIFICATION
New Delhi, the 17th June, 2005

S.O. 2151 – WHEREAS the Water Quality Assessment Authority (WQAA) was constituted by the Central Government vide Order No. S.O. 583 (E) dated the 29th May, 2001 and No. S.O. 635 (E) dated the 27th October, 2004 to exercise powers under section 5 of the Environment (Protection) Act, 1986 (29 of 1986) for issuing directions and for taking measures with respect to matters referred to in clauses (ix), (xi), (xii) and (xiii) of sub-section (2) of section 3 of the said Act and to standardize method(s) for water quality monitoring and to ensure quality of data generation for utilization thereof and certain other purposes;

AND WHEREAS it is necessary and expedient to evolve water quality assessment and monitoring protocol as directed by the Water Quality Assessment Authority in order to maintain uniformity in the procedure for water quality monitoring mechanism by all monitoring agencies, departments, Pollution Control Boards and such other agencies so that water related action plans may be drawn up on the basis of reliable data;

AND WHEREAS the uniform process on water quality monitoring shall provide frequency of monitoring, procedure for sampling, parameters for analysis, analytical techniques, quality assurance and quality control system, infrastructure requirement for laboratories, procedure for data processing, reporting and dissemination and such other matters as the Central Government deems necessary for the said purpose, both for surface and ground water;

AND WHEREAS due to the deterioration of the river water quality, health and livelihood of the downstream people are being severely affected and concerns are raised time and again;

AND WHEREAS the immediate maintenance and restoration of ‘wholesomeness’ of the river water quality is the mandate under the Water (Prevention and Control of Pollution) Act, 1974 (6 of 1974) and that of maintenance of the ground water quality by the Central Ground Water Authority constituted under the provisions of the Environment (Protection) Act, 1986;

AND WHEREAS sub-rule (4) of rule 5 of the Environment (Protection) Rules, 1986, provides that whenever it appears to the Central Government that it is in public interest to do so, it may dispense with the requirement of notice under clause (a) of sub-rule(3) of the said rule”;

AND WHEREAS the Central Government is of the opinion that it is in public interest to dispense with the requirement of notice under clause (a) of sub-rule (3) of rule 5 of the said rules to issue the Order.

NOW, THEREFORE, in exercise of the powers conferred by section 3 of the Environment (Protection) Act, 1986, the Central Government hereby makes the following order, namely:-

1. Short title and commencement:-
a) This order may be called the Uniform Protocol on Water Quality Monitoring Order, 2005”.

b) It shall come into force on the date of its publication in the Official Gazette.

2. Application:- It shall apply to all organizations, agencies and any other body monitoring surface and ground water quality for observance of uniform protocol on water quality monitoring.

3. Definitions:-

In this Order, unless the context otherwise requires –

I. “Agencies” means water quality monitoring agencies (government or non-government, local bodies) and other organizations including research and academic institutions involved in water quality monitoring of surface and ground waters;

II. “Authority” means the Water Quality Assessment Authority (WQAA) constituted under sub-sections (1) and (2) of section 3 of the Environment (Protection) Act, 1986;

III. “Baseline stations” means the monitoring location where there is no influence of human activities on water quality;

IV. “Flux stations or Impact stations” means the location for measuring the mass of particular pollutant on main river stem for measuring the extent of pollution due to human interference or geological feature at any point of time and is necessary for measuring impact of pollution control measures adopted;

V. “Monitoring” means standardized measurement of identified parameters in order to define status and trends of water quality;

VI. “Protocol” means a system of uniform water quality monitoring mechanism developed by the Water Quality Assessment Authority constituted under sub-sections (1) and (3) of section 3 of the Environment (Protection) Act, 1986;

VII. “Quality Assurance Programme” means a programme described in paragraph 12 of this Order.

VIII. “Trend station” means the monitoring location designed to show how a particular point on a watercourse varies over time due, normally, to the influence of man’s activities.

IX. “Water quality monitoring network” means a systematic planning for collection, preservation and transportation, storage, analysis of water samples and dissemination of data for national water bodies restricted to surface and ground water in the country.

4. Monitoring station and frequency of sampling:-

1) The frequency of sampling in respect of surface water shall be as follows:-

   a) all the stations shall be a combination of Baseline, Trend and Flux or Impact stations

   b) the Baseline stations shall be monitored four times a year for perennial rivers and lakes and three to four times a year for seasonal rivers. Trend stations shall be monitored with an increased frequency of once in a month i.e. twelve times in a year. Flux or Impact stations shall be monitored twelve or twenty-four times in a year depending upon pollution potential or importance of water use.
c) all agencies shall follow the sampling frequency and parameters for analysis of surface water as mentioned in the Table – I given below:

Table – I Frequencies and parameters for analysis of surface water samples

<table>

</tbody>
</table>
Once every month starting April-May (pre-monsoon) i.e. 12 times a year

A. **Pre-monsoon**: Analyse 25 parameters as listed for baseline monitoring

B. **Other months**: Analyse 15 parameters as listed below
   (a) **General**: Colour, Odour, Temp, pH, EC, DO and Turbidity
   (b) **Nutrients**: NH$_3$ - N, NO$_2$ + NO$_3$, Total P
   (c) **Organic Matter**: BOD, COD
   (d) **Major ions**: Cl
   (e) **Microbiological**: Total and Faecal coliforms

C. **Micropollutant**: Once in a year/pre monsoon.
   a) **Pesticides**: Alpha Benzenehexachloride (BHC), Beta BHC, Gama BHC (Lindane), OP-Dichlorodiphenyltrichloroethane (OP-DDT), PP-DDT, Alpha Endosulphan, Beta Endosulphan, Aldrin, Diedrin, Carbaryl (Carbamate), Malathian, Methyl Parathian, Anilophos, Chloropyriphos
   b) **Toxic Metals**: Arsenic (As), Cadmium (Cd), Mercury (Hg), Zinc (Zn), Chromium (Cr), Lead (Pb) Nickel (Ni), Iron (Fe)
   (The parameters may be selected based on local needs)

**Note:**

I. The parameters mentioned in the above Table shall be the minimal requirement. This does not, however, restrict analysis of more parameters depending upon the specific requirements of the analyzing agency and its manpower availability.

II. For lakes or reservoirs, monitoring of additional parameters, like total Kjeldhal Nitrogen, Chlorophyll, total Plankton count and productivity, shall be included in the list of parameters.

III. If biomonitoring is done in river or lakes or reservoirs, additional specific parameters are to be considered.

2) **Ground Water**

The frequency of sampling in respect of ground water shall be as follows:

a. All stations shall be classified as Baseline stations
b. 20-25% of Baseline stations shall be classified as Trend stations where there is a perceived problem.

c. All agencies shall follow the sampling frequency and parameters for analysis of ground water as mentioned in the Table-2 given below:

**5. Sample Collection**

1) The procedure for sample collection in respect of surface water shall be as under:

a. Samples for Baseline and Trend stations shall be collected from well-mixed section of the river or main stem 30 cm below the water surface using a Dissolved Oxygen (DO) sampler or weighted bottle.
b. Samples for impact stations shall be collected from the point of interest, such as bathing ghat, downstream of point discharge, water supply intakes and other sources.

c. The Dissolved Oxygen (DO) in the sample shall be fixed immediately after collection and Dissolved Oxygen (DO) analysis shall be done either in the field or in laboratory.

(2) The procedure for sample collection in respect of ground water shall be as under:

a) Open dug wells, which are not in use or have been abandoned, shall not be considered as water quality monitoring station. However, such well could be considered for water level monitoring.

b) Weighted sample bottle to collect sample from an open well about 30 cm below the surface of water may be used. The plastic bucket, which is likely to skim the surface layer only, shall not be used.

c) samples from the production tube wells shall be collected after running the well for about five minutes.

d) Non-production piezometers shall be purged using a submersible pump. The purged water volume shall equal 4 to 5 times the standing water volume, before sample is collected.

e) for bacteriological samples, when collected from tube wells or hand pump, the spout or outlet of the pump shall be sterilized under flame by spirit lamp before collection of sample in container.

Table – 2 Frequencies and parameters for analysis of Ground Water samples
Note:-
I. The parameters mentioned in the above Table shall be the minimal requirement. This does not, however, restrict analysis of more parameters depending upon the specific requirements of the analyzing agency and its manpower availability.
II. If chemical Oxygen Demand (COD) value exceeds 20 mg/l, the sample shall be analysed for Biochemical Oxygen Demand (BOD) also.

6. Sample preservation and transportation

1) The type of containers and sample preservation to be adopted shall be as mentioned in the Table-3 below:

2) Samples shall be transported to concerned laboratory as soon as possible, preferably within forty-eight hours of collection.

3) Analysis for coliforms shall be started within twenty-four hours of collection of sample. If time is exceeded, it should be recorded with the result.

4) Samples containing microgram / 1 metal level should be stored at 4°C and analyzed as soon as possible. If the concentration is of mg /1 level, it can be stored for up to 6 months, except mercury, for which the limit is 5 weeks.

5) Sample Identification for the water sample analysis for surface and ground water samples shall be as mentioned in the Form-I and Form-II.

7. Sample records

1) Each laboratory shall have a bound register, which shall be used for registering samples as they are received. A format for sample receipt register is annexed as Form-III.

2) The Laboratory In-charge shall maintain a register for assignment of work to specific analyst.

8. Analytical techniques

Each agency shall follow the analytical techniques prescribed in the Standard Methods for Analysis of Water and Wastewater published by American Public Health Association (Latest Edition) or Bureau of Indian Standard(BIS) Methods for Testing Water and Wastewater-methods of sampling and testing (physical and chemical) (IS:3025)

9. Analysis records and data validation

A recommended format for recording data including all parameters except toxic metals and trace organics is enclosed as Form – IV. Report of heavy metals and trace organics as per Table 2 may be recorded separately. Validation check should be performed in the laboratory on completion of the analysis. The results of laboratory analyses shall be entered in the format provided in Form – II for validation.

10. Manpower requirements in laboratories
The manpower requirements shall be optimized by the concerned monitoring agencies in order to get the maximum utilization of mandays, for timely completion of analysis.

11. Data Processing, Reporting and Dissemination

Each monitoring agency shall process the analytical data and report the data after validation to the Data Centre at the Central Pollution Control Board. The Central Pollution Control Board shall store the data and disseminate through website or electronic mail to various users on demand.

12. Quality Assurance and Accreditation of Laboratories

The Quality Assurance Programme for the laboratories of various agencies shall contain a set of operating principles, written down and agreed upon by the organization, delineating specific functions and responsibilities of each person involved. Each laboratory of water quality monitoring agencies shall follow the guidelines of Quality Assurance Programme prescribed by their respective Central Laboratory or Headquarters and shall participate in Inter Laboratory Quality Assurance Programme like Proficiency Testing (PT) organized by them or any other agency on regular basis. The water quality laboratories shall seek recognition from the ministry of Environment and Forests, Government of India or accreditation from National Accreditation Board for Testing and Calibration Laboratories (NABL) under the Ministry of Science and Technology, Government of India.
S.O.1799 (E) – Whereas by the notification of the Government of India in the Ministry of Environment and Forests, number S.O. 133 (E), dated the 4th February, 2003 (hereinafter referred to as the said notification), the Central Government notified Matheran and surrounding region in the State of Maharashtra as an Eco-sensitive Zone and imposed restrictions on industries, operations, processes and other developmental activities in the said region;

Now, therefore, in exercise of the powers conferred by Sub-section (1) read with clause (v) of Sub-section (2) of Section 3 of the Environment (Protection) Act, 1986 (29 of 1986) and rule 5 of the Environment (Protection) Rules, 1986, the Central Government hereby makes the following further amendments in the said notification, namely:-

In the said notification-

in paragraph 4, in sub-paragraph (n), after the words “in addition, one ambulance and one fire engine as stand by”, the words “railways and ropeways” shall be inserted;

1. in Annexure – A, for the brackets, words and figure “(see section 2)”, the brackets, words and figure “(see paragraph 2)”, shall be substituted;
2. in Annexure – B, for the brackets, words and figure “(see section 2)”, the brackets, words and figure “(see paragraph 2)”, shall be substituted;
3. in Annexure – C, for the brackets, words and figure “(see section 2)”, the brackets, words and figure “(see paragraph 2)”, shall be substituted;
4. in Annexure – D
   a) for the brackets, words, figures and letters “[see Section 4(a)(iv)(c)]” the bracket, words, figures and letters “[see paragraph 4(a)(iv)(3)]” shall be substituted;
   b) in sub-heading 3, relating to Green Zone – 1, in item (j) of entry 3.1, after the words “small check dams for watershed management”, the word “ropeways” shall be inserted;
   c) in sub-heading 4, relating to Urbanisable Zone-2,-
      I. in item (n) of entry 4.1, after the words “small check dams for watershed management”, the word “ropeways.” shall inserted;
      II. in entry 4.2, for the word “paragraph”, the word ‘entry’ shall be substituted.

[F.No. J-20011/1/99-LA-III]
R. CHANDRAMOHAN, Jr. Secy.

Note: The principal notification was published in the Gazette of India, Extraordinary, vide Number S.O.133(E) dated the 4th February, 2003, and subsequently amended vide Numbers S.O. 83 (E) dated the 16th January, 2004.

### PROJECT REPORT

#### 1.1 Authority for preparation of project

#### 1.2 Brief Description of the project area

- Brief history of the town
- Geographical location
- Climate
- Topography
- Administrative divisions
- Commercial aspects
- Industrial activities
- Educational activities
- Cultural activities
- Religious activities
- Socio –Economic status
- Town Management
- Soil characteristics and sub soil water level
- Drains – Total nos., nos. discharging into river(s), nos. intercepted
- City Sanitation Plan, if any – Date of preparation/sanction, copy of Executive Summary and abstract of cost estimate to be attached
- Master plan of development of the city, if any - Date of preparation/sanction, copy of Executive Summary and abstract of cost estimate to be attached
- Sewerage Master Plan, if any - Date of preparation/sanction, copy of Executive Summary and abstract of cost estimate to be attached
- Feasibility Report, if any - Date of preparation/sanction, copy of Executive Summary and abstract of cost estimate to be attached
- Agency responsible for execution and O&M of works, brief note on agencies
- Hrs. of availability of power at the sites of SPS / STPs

#### 1.3 Existing sewerage works

- Existing, under execution, sanctioned but not yet started.
- Condition assessment report of existing sewers, SPS & STPs with details of CC TV survey, stating dia/length of sewers to be desilted, rehabilitated, abandoned (with reasons) etc.
- Proposed renovation, up gradation, augmentation etc. of the existing sewerage works

#### 1.4 River water quality

- Water quality standards of river water quality

Annexure – V: Directions issued by CPCB vide notification dated Mar 02, 2015 For On Line Monitoring of Influent and Effluent Quality of Highly Polluting Industries

B-29016/04/06/PCI-I/

SPEED POST

March 02, 2015

To

The Chairman
(All SPCBs/PCCs)

SUB: DIRECTIONS UNDER SECTION 18(1)(b) OF THE WATER (PREVENTION & CONTROL OF POLLUTION) ACT, 1974 and THE AIR (PREVENTION & CONTROL OF POLLUTION) ACT, 1981 IN THE MATTER OF POLLUTION CONTROL IN 17 CATEGORY OF HIGHLY POLLUTING INDUSTRIES, CETPs AND COMMON HAZARDOUS WASTE & BIOMEDICAL WASTE INCINERATORS REGARDING SELF MONITORING OF COMPLIANCE

WHEREAS, under Section 17 of the Water (Prevention & Control of Pollution) Act, 1974, and under Section 17 of the Air (Prevention & Control of Pollution) Act, 1981, one of the function of the State Pollution Control Boards (SPCBs)/Pollution Control Committees (PCCs) is to plan a comprehensive programme for the prevention, control or abatement of pollution of streams, wells and air pollution in the State/Union territory and to secure the execution thereof; and

WHEREAS, under section 16 of the Water (Prevention and Control of Pollution) Act, 1974 and under Section 16 of the Air (Prevention & Control of Pollution) Act, 1981, one of the functions of the Central Pollution Control Board (CPCB), constituted under Water (Prevention and Control of Pollution) Act, 1974 is to coordinate activities of the State Pollution Control Boards and Pollution Control Committees and to provide technical assistance and guidance to SPCBs / PCCs; and

WHEREAS, the SPCBs and PCCs are empowered to stipulate standards for discharge of environmental pollutants for various categories of industries and common effluent treatment plants (CETPs), Common Hazardous waste and Biomedical waste incinerators even more stringent than those notified by the Central Government, under the Environmental (Protection) Act, 1986 and rules framed there under; and

WHEREAS, Pharmaceuticals, Chlor Alkali, Fertilizers, Oil Refinery, Dye and dye intermediate, Pesticides, Petrochemical, Large Power plants, Cement, Aluminium, Zinc, Copper, Iron & steel, Large Pulp & paper, Distillery, Sugar and Tannery industries located in States/UTs have been discharging environmental
pollutants directly or indirectly into the ambient air and water, which pose constant threat to cause adverse effect on the water and air quality; and

WHEREAS, Common Hazardous waste and Biomedical waste incinerators and Common Effluent Treatment Plants (CETPs) located in States/UTs have been discharging environmental pollutants directly or indirectly into the ambient air and water; and

WHEREAS, the SPCBs and PCCs are also required to ensure installation and regular operation of the requisite pollution control facilities in the polluting industries; and

WHEREAS, there is need to inculcate habit of self monitoring mechanism within the industries for complying the prescribed standards and this can be achieved by the methods like installing online effluent and emission monitoring devices; and

WHEREAS, number of industries under 17 category which are operating in the state/UT have been identified can be suitably directed for installation and commissioning of online monitoring systems (emission and or effluent); and

WHEREAS, number of Common Hazardous waste and Biomedical waste incinerators and CETPs operating in the state/UT can also be considered for installation and commissioning of online monitoring systems (emission and or effluent); and

WHEREAS, for strengthening the monitoring and compliance through self regulatory mechanism, online source and effluent monitoring systems need to be installed and operated by the developers and the industries on ‘polluter pays principle’; and

WHEREAS, some of the SPCBs have already given specific conditions in consent to operate of 17 categories of highly polluting industries/ and Common
Hazardous waste and Biomedical waste incinerators to install continuous emission and effluent monitoring systems; and

WHEREAS, it is envisaged in "National Environment Policy- 2006" that to strengthen the testing infrastructure and network for monitoring ambient environmental quality and progressively ensure real-time, and online availability of the monitoring data; and

WHEREAS, CPCB had earlier issued letter dated January 12, 2011 to SPCBs /PCCs to direct all the 17 categories of highly polluting industries to install automatic air and water quality stations to monitor the ambient quality; and

WHEREAS, it is becoming a need and necessity to regulate and minimize inspection of industries on routine basis and instead efforts need to be made to bring self discipline in the industries to exercise self monitoring & compliance and transmit data of effluent and emission compliance to SPCBs/PCCs and to CPCB on continuous basis; and

WHEREAS, there could be some time needed for getting such devices standardised and requiring confidence on data generated but needless to emphasize that efforts towards setting up to continuous monitoring devices is essential; and

WHEREAS, the ground truthing of the values indicated by the online devices need to be done before bringing them in public domain for proper interpretation and such measures need to be taken at the level of SPCBs/PCCs. And whereas for regulatory purposes and for purposes of actions to be taken against non complying industries /facilities, the existing methods of sampling, analysis and related procedures under the existing statutes need to be continued; and

WHEREAS, SPCBs and PCCS have prescribed standards for various parameters as per the notified standards under Environment(Protection) Act, 1986
and the State Boards may refer to the parameters which should be monitored by installing continuous effluent and emission monitoring devices (Annexure -II); and

WHEREAS, continuous effluent and emission monitoring devices can be installed in those industries which are continuously letting out effluents and emissions out of their premises; and

WHEREAS following direction under Section 18(1)(b) of the Water (Prevention & Control of Pollution) Act, 1974, and 18(1)(b) of the Air (Prevention & Control of Pollution) Act, 1981 have been issued to all SPCBs/PCCs on 05.2014;

a) To Install online continuous Stack Emission Monitoring Systems (CSEMS) in 17 categories of highly polluting industries and in Common Hazardous waste and Biomedical waste incinerators for the parameters(industry/sector specific parameter) mentioned in the consent to operate/authorisation not later than by March 31,2015;

b) To install online effluent quality monitoring system at the outlet of effluent treatment plants of the 17 category industries and in CETPs for the measurement of the parameters(industry/sector specific parameter) like flow, pH, COD, BOD, TSS and for other consented parameters as per the guidelines provided; not later than by March 31, 2015;

c) To connect and upload the online emission and effluent monitoring data at SPCBs/PCCs and CPCB server in a time bound manner but not later than by March 31,2015;

d) To ensure regular maintenance and operation of the online system with temper proof mechanism having facilities for online calibration;

e) To submit bank guarantee of 25 % of the cost of online monitoring systems (emission and effluent whichever applicable) for ensuring timely installation of online monitoring systems within 90 days from the date of receipt of directions issued by SPCBs/PCCs to the industries;

WHEREAS in order to sensitize the issues among SPCBs/PCCs , CPCB also highlighted the status of compliance of setting up online monitoring system in the conference of Chairman and Member Secretaries(February 21-22,2014 at

Page 4 of 6
Bangalore and January 09, 2015 at Chandigarh) at the National as well as Regional level on online monitoring system; and

WHEREAS CPCB has organized five interaction meets on 06/8/2014, 19/09/2014, 29/09/2014, 8/10/2014 and 16/10/2014 respectively to have an interaction with SPCBs, representative of industries, industrial associations and instrument suppliers on online monitoring system; and

WHEREAS CPCB has already published a guidelines for online continuous monitoring system for effluents on 07.11.2014; and

WHEREAS a letter has been issued to all SPCBs/PCCs on October 31, 2014 and subsequent reminder sent on December 24, 2014 to provide action taken report to CPCB in the format before January 10, 2015; and

Now, therefore, in exercise of the powers conferred under Section 18 (1) (b) of the Water (Prevention & Control of Pollution) Act, 1974, and 18 (1) (b) of the Air (Prevention & Control of Pollution) Act, 1981 and keeping in view strengthening of the monitoring mechanism for effective compliance through self regulatory mechanism, you are directed to

(i) All the industries will submit bank guarantee of 100% of the cost of online monitoring systems (emission and effluent whichever applicable) for ensuring timely installation of online monitoring systems by 30.06.2015 and such bank guarantee will be discharged if they install the system before June 30, 2015.

(ii) If the industries will not install the online monitoring system by June 30, 2015 their consent to operate of the industry shall be withdrawn and bank guarantee shall be forfeited.

OFFICE MEMORANDUM

Subject: Utilization of Services of Empanelled list under the MoEF&CC for Third Party Appraisal (TPA) evaluation of DPRs for project related to NGRBA/NMCG.

The undersigned is directed to refer letters of offers of empanelment conveyed to independent institute for evaluation of DPRs for projects on the subject mentioned above. The term and condition/TOR for the task of evaluation and payment to empanelled Institute will adhere to the office memorandum no. A-12011/34/2009/NRCD, dated 29.11.2010. The validity of empanelment has been extended for a period of one year from 13.02.2017 with reference no. T-03/2014-15/662/NMCG. To escalate the TPA process, few new Institutes (last enclosed) also have been included in the empanelled list with same term and conditions for utilization there services for Third Party Appraisal (TPA) evaluation of DPRs for project related to NGRBA/NMCG. The empanel list will remain in operation till further order and can be modified/changes in accordance to any changes in the empanelled list of NMCG, MoWR, RD&GR.

This issues with the approval of the Competent Authority.

(Dr. Pravin Kumar)
Director T-III, NMCG

Schedule a Description of Project Appraisal Services to be provided

1.1 Objective

To appraise the Detailed Project Reports (DPRs) related to programmes for prevention, control and abatement of pollution in the river Ganga under the National Mission for Clean Ganga (NMCG) programme. These include DPRs for works relating to maintenance of river ecology, maintenance of ecological flows in the river, augmentation of sewerage infrastructure, catchment area treatment, protection of flood plains, promotion of water conservation practices, including recycling and re-use, rain water harvesting, maintenance of water quality, river front development, etc.

1.2 Scope of Work

The Consultant Institution (CI) is required to appraise the DPRs through interactive process including visits to the proposed sites. The CIs will be required to undertake minimum one site visit for two persons. The detailed appraisal shall be broadly for the following aspects:

a. Technical feasibility and Design Criteria
b. Reasonability of cost estimates & financial viability,
c. Impact on environment
d. Rehabilitation, statutory compliances and social safeguards &
e. Sustainable O&M of assets to be created through a well devised O&M plan

The CI will ensure that

- The projects meets the present and future requirements of the town/area in terms of services and utilities, over an approved time horizon to be agreed upon.
- The specifications of technical parameters and technical designs are sound, realistic and technically feasible;
- The cost estimates are prepared as per the latest PWD/CPWD Common Schedule of Rate (SOR) / scheduled rates specified by various Central/State regulatory authorities for specific projects of the respective States / budgetary estimates based on market rates, and are reasonable;
- The Project as a whole is financially & economically viable.
- The Project has synergy with other ongoing / project schemes
- The implementing agency has sound organizational capacity to execute the project as per the implementation schedule given in the report and raw materials and other inputs required for the Project have been tied up,
- Impact on environment, if any, is being taken care of to minimize any adverse impact (DPR should address social and environmental impacts with mitigation measures. Special attention is required to be paid to the services to poor and the vulnerable including those required to be resettled, moreover, the consultant should quantify the environmental impact (to the extent possible);
- The various statutory clearances, as applicable have been obtained or application filed with the competent authorities; and
- Any other inputs/remarks/suggestions for sound and successful implementation of the project.
2. Deliverable
   
a) The CI is required to discuss the preliminary observation/ comment on Detailed Project Reports (DPRs) with the NMCG and the Implementing Agency within 10 days of award of work for clarification/compliance by the implementing agency.

b) The Final Project Appraisal Report along with the proper certification of the technical, financial, environmental and quality wise feasibility containing the details as per Appendix-I to this Schedule, shall have to be submitted within four weeks of award of work.

(c) To provide clarifications and assistance, as and when required by the NMCG till the sanction of the project(s).

Prices, Taxes, Duties

(a) Prices

For projects of up to Rs. 50 crore, the reimbursement to the consulting institutions will be Rs. 1.50 lakh per project. For projects costing between Rs. 50 to 150 crore, the reimbursement will be Rs. 2.00 lakh and for project above Rs. 150 crore the reimbursement of Rs. 2.50 Lakh will be payable.

(b) Service Taxes extra as per the actual.

(c) Travel cost will be extra on actual basis, as per entitlements of the Consultants in his organization, subject to a ceiling of entitlement of Executive director in NMCG. The travel cost will be for a maximum of two persons and for at most 2 visits.
Schedule B Terms and conditions:

1. NMCG shall provide a copy of the Details Project Report (DPR) along with a soft copy to CI.

2. The CI shall discuss the Preliminary observations/comments on the DPR with Implementing Agency (IA) and NMCG officials within 10 days of award of work and hand over the same to the IA for clarification/compliance.

3. Validity of Contract Period of the agreement running price contract shall be valid for the period up to 31.03.2018

4. Time for Submission of Final Appraisal Report:
   Detailed Project Reports received by the NMCG during the validity of contract will be assigned to the selected CI of the sub-sector to which the DPRs pertain to. The appraisal of the DPR assigned is to be completed within four weeks from the date of receipt of DPRs, by CI or in a time frame as may be fixed by NMCG. This time period shall be inclusive of time required for undertaking visits to sites etc. Decision on approval of the final appraisal report will be conveyed by NMCG within a period of 10 days from the receipt of the report.

5. Site visits:
   CI shall make site visits, if necessary, for appraisal of the project, with intimation to NMCG. The CI will have to make necessary arrangements for site visits in consultation with the IAs including travel and stay arrangements.

6. Payment Schedule
   Schedule for release of payment for the study shall be as follows:

<table>
<thead>
<tr>
<th>SL. No.</th>
<th>Description</th>
<th>Amount (Percentage of the total cost)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Initial payment at the time of allotment of work.</td>
<td>25</td>
</tr>
<tr>
<td>2.</td>
<td>On submission of the Appraisal Report.</td>
<td>50</td>
</tr>
<tr>
<td>3.</td>
<td>On approval of the Appraisal report.</td>
<td>25</td>
</tr>
</tbody>
</table>

7. Liquidated Damages (Penalty Clauses)
   - If the CI requires an extension of time in completion, he shall apply in writing to the NMCG before the stipulated date of submission of appraisal report. Extension in the period may be granted with or without liquidated damages by the NMCD.
   - In case of extension in the period with liquidated damages the recovery may be made on the basis of following percentages of claim amount which the CI has delayed.

<table>
<thead>
<tr>
<th>No.</th>
<th>Condition</th>
<th>LD Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>

Model Bidding Documents
(for National Mission for Clean Ganga)

INTERNATIONAL/NATIONAL COMPETITIVE BIDDING

TO (I) DESIGN AND BUILD SEWAGE TREATMENT PLANT OF INSTALLED CAPACITY .... MLD AND ALL APPURtenANT STRUCTURES AND ALLIED WORKS; (II) SURVEY, REVIEW THE DESIGNS, REDESIGN WHERE NECESSARY, AND BUILD NEW UNDERGROUND SEWERAGE NETWORK AND/OR DIVERSION WORKS WITH INTERCEPTION SEWER OF ABOUT .... KM LENGTH INCLUDING SURVEY, DESIGN, CONSTRUCTION OF .... NO. PUMPING STATIONS AND ALL APPURtenANT STRUCTURES AND ALLIED WORKS; AND (III) OPERATION & MAINTENANCE OF THE COMPLETE WORKS OF SEWAGE TREATMENT PLANT, SEWERAGE NETWORK AND/OR INTERCEPTION & DIVERSION WORKS AND PUMPING STATIONS FOR A PERIOD OF 15 YEARS IN …… , STATE OF …… , INDIA.

May 2018

[Note: The scope of work in this bidding document covers: (i) design & build for STP, (ii) review the design and build for sewerage network and/or interception & diversion works, and (iii) O&M for both. However, depending upon the requirement, the document may be modified suitably to include repair/ refurbishment and O&M of existing STP or sewerage network and/or interception & diversion works in the scope of the work]
PREFACE

This Model Bidding Document for DBOT contract for STP together with Sewerage Network and/or Interception and Diversion (I&D) works has been prepared for the use of Executing Agencies (EAs) of National Mission for Clean Ganga.

ITB and GCC sections of this Bidding Document are based extensively on the corresponding provisions in the World Bank’s Model Bidding Documents (for National Ganga River Basin Project, India) for International/National Competitive Bidding to (I) Design and Build Sewage Treatment Plant of Installed Capacity …. MLD and all Appurtenant Structures and Allied Works; (II) Survey, Review the Designs, Redesign where Necessary, and Build New Underground Sewerage Network of about …. km Length Including Survey, Design, Construction of …. No. Pumping Stations and all Appurtenant Structures and Allied Works; And (III) Operation & Maintenance of the Complete Works of Sewage Treatment Plant, Sewerage Network and Pumping Stations for a Period of 10 Years in ……, State of ……, India as also published bid documents of UP Jal Nigam, BUIDCo, Rajasthan Urban Drinking Water Sewerage and Infrastructure Corporation Limited. The Model Bidding Document provides that the Operator shall operate and maintain the STP and the Sewerage Network and/or Interception & Diversion Works for a period of 15 years after successful commissioning and testing of these facilities and works. The Model Bidding Document is structured such that the EA invites the bids, signs the contract and continues performing the role assigned to the Owner under the Contract for the entire duration of the Contract including the O & M period of 15 years.

The Model Bidding Document provides options to the EAs for using it for International Competitive Bidding (ICB) or National Competitive Bidding (NCB). It also includes provisions for price adjustment that need to be adapted to the particular contract with appropriate indices. The EAs should refer to the guidance notes and the relevant provisions to ensure that the optional features applicable for the respective mode of procurement are properly used while preparing the bidding document for a specific procurement.

It is advisable to introduce price adjustment provisions for both NCB and ICB to minimize the risk to the bidder that would reflect on the offered prices. In case of ICB, the Bidding Document should provide neutral venue for arbitration.

The Contract Conditions of the Model Bidding Document provide that the Owner (which is the role intended to be performed by the EA) shall appoint the Design-Build-Operations Engineer who shall be responsible for day to day contract management and supervision during the Design-Build Period and the Operations Period. Accordingly, the selection of the Design-Build-Operations Engineer should be carried out and concluded at the time of contract award to the Operator. The terms of reference for the Design-Build-Operations Engineer should correspond with the obligations under the contract with the Operator.

The Model Bidding Document comprises various sections, including Instructions to Bidders, Bid Data Sheet, Schedules to the Bidding Document containing Bid Form, Price Schedules, Qualification Criteria and other relevant Forms, Form of Contract, General Conditions of Contract and various Schedules attached to the Contract.
Executing Agencies are advised to familiarize themselves fully with the Bidding Document; they must in particular go through various footnotes which are intended to provide guidance for preparation of the bidding document for a specific contract. This preface and all footnotes intended for reference of the Executing Agencies should be deleted from the final bidding document for a specific contract.

Executing Agencies should note that all designs and drawings pertaining to the proposed Sewerage Network and/or Interception and Diversion works including alignment have to be finalized and Bill of Quantities included in the document before inviting the bids.

Provisions have been made in the Model Bidding Documents for operation and maintenance of Sewage Pumping Station(s) for pumping effluent from the sewerage network and/or Interception and Diversion works to the STP. However, the EAs should carefully examine the need for such provisions or their deletion based on the scope of work of a specific contract.

The Bidding Document assumes that no prequalification has taken place, and bids are being invited directly from the prospective bidders.

A draft Invitation for Bid (IFB) along with guidance notes has been added, in the beginning of the Model Bidding Documents, which may be used for publishing the IFB in the national newspaper. The Executing Agencies have the option of publishing a shorter version of the advertisement text (in lieu of the complete text given in the draft IFB) in a widely circulated national daily provided that the full text is simultaneously published in the official gazette or on a widely used website or electronic portal with free national and international access. An illustrative Abridged IFB to be published in a widely circulated national daily has also been included in the Model Bidding Document for the reference of the Executing Agencies.
Invitation for Bids

FOR A CONTRACT

TO (i) DESIGN AND BUILD SEWAGE TREATMENT PLANT OF INSTALLED CAPACITY .... MLD AND ALL APPURtenANT STRUCTURES AND ALLIED WORKS; (ii) SURVEY, REVIEW THE DESIGNS, REDESIGN WHERE NECESSARY, AND BUILD NEW UNDERGROUND SEWERAGE NETWORK AND/OR DIVERSION WORKS WITH INTERCEPTION SEWER OF ABOUT .... KM LENGTH INCLUDING SURVEY, DESIGN, CONSTRUCTION OF .... No. PUMPING STATIONS AND ALL APPURtenANT STRUCTURES AND ALLIED WORKS; AND (iii) FOR OPERATION & MAINTENANCE OF THE COMPLETE WORKS OF SEWAGE TREATMENT PLANT, SEWERAGE NETWORK AND/OR INTERCEPTION & DIVERSION WORKS AND PUMPING STATIONS FOR A PERIOD OF 15 YEARS IN ...... , STATE OF ......, INDIA.
NATIONAL MISSION FOR CLEAN GANGA
(NAMAMI GANGE PROGRAMME)
Invitation for Bid
International/ National1 Competitive Bidding

No:…………………………… Dt:…………..

1. ‘Namami Gange Programme’, is an Integrated Conservation Mission, approved as ‘Flagship Programme’ by the Union Government in June 2014 with budget outlay of Rs.20,000 Crore to accomplish the twin objectives of effective abatement of pollution, conservation and rejuvenation of National River Ganga. The National Mission for Clean Ganga (NMCG) (Ministry of Water Resources, River Development & Ganga Rejuvenation, Government of India) is the funding agency for Namami Gange Programme and intends to apply a part of the said budget outlay towards payments under the contract for work detailed below.

2. Qualification requirements as listed briefly below are required to be fulfilled by the bidder. [Bidders are advised to refer to the bidding documents for complete details.]

Financial:

a. The Bidder shall demonstrate that it possesses a net worth equivalent to minimum of INR _____2 Cr. in each of the last three financial years preceding the date of submission of bid.

b. The Bidder shall demonstrate by submitting along with its bid, a banker’s certificate that it has available cash credit facility equivalent to minimum INR  .... million3 as on the date of submission of bid.

Technical:

1. The Bidder shall provide evidence that it has Designed, developed, built, tested and commissioned during last 7 years preceding the month of publication of NIT, STPs as per following criteria4:

1.a) <50 MLD Capacity: [Nearest lower integer]
   1 STP – 80 % of Total capacity (MLD)
   2 STP – 60 % of Total capacity (MLD)
   3 STP – 40 % of Total capacity (MLD)

1.b) 51-100 MLD Capacity: [Nearest lower integer]
   1 STP – 60 % of Total capacity (MLD)
   2 STP – 40 % of Total capacity (MLD)
   3 STP – 30 % of Total capacity (MLD)

1.c) 100-150 MLD Capacity: [Nearest lower integer]

1 Select as applicable

2 The net worth is recommended to be 25% of the estimated Capital Cost for which the bids are being invited.

3 This amount should be equivalent to estimated average cash flow for 3 months in construction period.

4 The clause corresponding to the capacity of STP in the bid only may be retained among 1 (a), 1 (b), 1 (c) and 1 (d).
1. STP – 50 % of Total capacity (MLD)
2. STP – 40 % of Total capacity (MLD)
3. STP – 25 % of Total capacity (MLD)

1.d) >150 MLD Capacity:
Case to Case basis

*In case of special treatments, tertiary treatment etc. The Qualification Criteria maybe suitably modified on case to case basis*

2. The bidder or his nominated sub-contractor has successfully commissioned at least one Sewage Treatment Plant with the same technology as proposed for this contract for the lowest STP capacity mentioned in clause 1.4 (a) 1. above, operating successfully for a period of 1 year during the last 7 years preceding the month of publication of NIT. *In case of special treatments, tertiary treatment etc. The Qualification Criteria maybe suitably modified on case to case basis*

3. The Bidder has the experience in operating and maintaining successfully STPs as per following criteria during 1 year over the last 7 years preceding the month of publication of NIT

   1.a) <50 MLD Capacity: [Nearest lower integer]
   1 STP – 80 % of Total capacity (MLD)
   2 STP – 60 % of Total capacity (MLD)
   3 STP – 40 % of Total capacity (MLD)

   1.b) 51-100 MLD Capacity: [Nearest lower integer]
   1 STP – 60 % of Total capacity (MLD)
   2 STP – 40 % of Total capacity (MLD)
   3 STP – 30 % of Total capacity (MLD)

   1.c) 100-150 MLD Capacity: [Nearest lower integer]
   1 STP – 50 % of Total capacity (MLD)
   2 STP – 40 % of Total capacity (MLD)
   3 STP – 25 % of Total capacity (MLD)

   1.d) >150 MLD Capacity:
Case to Case basis

*In case of special treatments, tertiary treatment etc. The Qualification Criteria maybe suitably modified on case to case basis*

4. The treatment technology proposed for this contract has been adopted (not necessarily built by the bidder) in at least 3 locations during last 7 years preceding the month of publication of NIT and that such STP has been operating successfully (meeting the required performance standards and environmental norms specified in the Contract) for a period of minimum 2 years over a period of last 7 years preceding the month of publication of NIT.

5. It has designed, developed, built, tested and commissioned Sewerage Network and Pumping Station(s) of 80% length of the total scope of sewerage network
collectively from maximum 3 projects during the last 7 years preceding the month of publication of NIT; of which 50% should be above the pipe diameter (mm) of the highest dimension as proposed in the project scope as per the following criteria:

- Up to 500mm – same dia or any higher diameter
- 500-1000mm – next lower dia (Maximum by 100mm) or higher diameter
- 1000 – 1500mm – next to next lower dia (Maximum by 200 mm) or higher diameter
- >1500mm- Case to case basis shall be decided

6. The bidder or his nominated sub-contractor has operated and maintained Sewerage Network and Pumping station of 80% length of the total scope of sewerage network collectively from maximum 3 projects during 1 year over the last 7 years preceding the month of publication of NIT.

7. The bidder or his nominated sub-contractor has designed, built and commissioned Sewerage Network using trenchless technology for a minimum of 50% of the proposed length of the network to be laid using trenchless technology, during the last 7 years preceding the month of publication of NIT.

3. Bidding will be conducted through the International/ National Competitive Bidding and is open to all eligible bidders.

4. The ______________ for and on behalf of the Owner in the State of ____, India invites sealed bids from eligible bidders for the works detailed in the table below. The bidders may submit bids for the following work as per Instructions to Bidders and the Annexures thereto.

<table>

works; and (iii) operation & maintenance of the complete works of sewage treatment plant, sewerage network and/or interception & diversion works and pumping stations in State of ……, India.

5. Interested eligible bidders may obtain further information from and inspect the bidding documents at the office of the ___________, at the address given below during office hours i.e. …… to …… hours.

6. A complete set of bidding documents will be available on the ________website (www._____________) w.e.f. _________. The bidders who are interested to participate in the bidding process can download the bid documents from the website for their reference. Bidders are advised to obtain the hard copy of the bidding document for preparation of their bids.

7. The bidders who download the documents from the website and use the same for submission of the bids should note that if there is any discrepancy between the downloaded document and the hard copy of the document issued to the bidders, the hard copy shall be treated as final and shall prevail over the downloaded documents.

8. The bidders who download the documents shall have to pay along with their bid submission, the non-refundable cost of Rs. ……. including GST in the form of a Certified Cheque/Demand Draft issued by a scheduled bank in India listed with the Reserve Bank of India, payable to the ______________ payable at ________, ________.

9. Bidders can also purchase the bid documents commencing from ____________ on payment of Rs. ……. including GST in the form of a Demand Draft issued by a scheduled bank in India listed with the Reserve Bank of India payable to the _______ payable at ________, State of ……, State of …..... The _______ (Insert name of Executing Agency) will not be held responsible for the postal delay if any, in the delivery of the documents or non-receipt of the same.

10. The bidders may also note that the pre-bid proceedings, corrigendum if any will also be uploaded on the website mentioned hereinabove.

11. All bids must be accompanied by Bid Security of the amount specified in the table above, drawn in favour of ______________.

12. Bids shall be submitted electronically only to ______________ on or before ….. hours on ______ [insert date]. Bids will be opened on …….. at …… hours, in the presence of the bidders’ representatives who choose to attend. If the office happens to be closed on the last date for receipt of the bids as specified, the bids will be received and opened on the next working day at the same time and venue. Late bids will be rejected.

INSTRUCTIONS TO BIDDERS

Section 1. Introduction

1.1. Source of Funds & Scope of work

a. ‘Namami Gange Programme’, is an Integrated Conservation Mission, approved as ‘Flagship Programme’ by the Union Government in June 2014 with budget outlay of Rs.20,000 Crore to accomplish the twin objectives of effective abatement of pollution, conservation and rejuvenation of National River Ganga. The National Mission for Clean Ganga (NMCG) (Ministry of Water Resources, River Development & Ganga Rejuvenation, Government of India) is the funding agency for Namami Gange Programme and intends to apply a part of the said budget outlay towards payments under the contract for which these Bidding Documents are issued.

b. Owner named in the Bid Data Sheet intends to use the 100% funds from the Government of India (National Mission for Clean Ganga, NMCG)/ ......% funds from the Government of India (National Mission for Clean Ganga, NMCG) and ...... % of funds provided by the Government of ......[State] towards the Capital Cost and Operation and Maintenance Cost for the Operations Period as per the provisions of this Contract.

c. Scope of work: The bidder’s scope of work shall include (i) design and build sewage treatment plant of installed capacity indicated in the Bid Data Sheet and all appurtenant structures and allied works; (ii) survey, review the designs, redesign where necessary, and build new underground sewerage network and/or interception & diversion works including sewage pumping station(s) of length and capacity indicated in the Bid Data Sheet and all appurtenant structures and allied works; and (iii) operation & maintenance after successful commissioning and testing of the complete works (“Project”) of sewage treatment plant, sewerage network and/or interception & diversion works and pumping stations for a period of 15 years at the Place and State indicated in the Bid Data Sheet.

d. The Owner shall make available (i) the Right of Way and the land area for the Sewage Treatment Plant and all appurtenant structures up to the area allocated for this facility as indicated in the Bid Data Sheet; and (ii) the Right of Way for the Sewerage Network and/or Interception & Diversion Works, and the land area allocated for setting up the Sewage Pumping Station(s) and all appurtenant structures as indicated in the Bid Data Sheet.

e. For Sewage Treatment Plant: the selected Bidder shall adopt the most appropriate and techno economically feasible treatment process technology and Design the Sewage Treatment Plant ensuring that the Design standards and the performance standards as specified in the Contract are satisfied along with other conditions as may be applicable under the law.

f. For Sewerage Network and/or Interception & Diversion Works:

(a) the Owner shall make available all the designs and drawings pertaining to the proposed Sewerage Network and/or Interception & Diversion Works including alignment, peripheral land etc.;
(b) the selected bidder shall conduct field survey, review the available designs, redesign where necessary the Sewerage Network and/or Interception & Diversion Works based on the survey, ensuring that the design standards and the performance standards as specified in the Contract are satisfied along with other conditions as may be applicable as per the law; and

(c) if the selected bidder (Operator) redesigns where necessary, he shall obtain Owner’s approval of the redesigned component and work shall be carried out as per the revised approved design. Payments will be made for the actual quantities as per rates quoted by the bidder and incorporated in the Contract. Rates for items not found in the original BOQ or variations in quantities from the original BOQ will be regulated as per provisions of the Contract.

1.2. Eligible Bidders

1.2.1 A bidder may be a firm that is a private entity, a government-owned entity—subject to ITB 1.2.4 — or any combination of such entities in the form of a joint venture (JV) under an existing agreement or with the intent to enter into such an agreement supported by a letter of intent. In the case of a joint venture, all members shall be jointly and severally liable for the execution of the Contract in accordance with the Contract terms. The JV shall nominate a Representative who shall have the authority to conduct all business for and on behalf of any and all the members of the JV during the bidding process and, in the event the JV is awarded the Contract, during contract execution. The number of members in a JV shall be limited to the number specified in the BDS

1.2.2 Bidder shall not have a conflict of interest. Any Bidder found to have a conflict of interest shall be disqualified. A Bidder may be considered to have a conflict of interest for the purpose of this bidding process, if the Bidder:

(a) directly or indirectly controls, is controlled by or is under common control with another Bidder; or

(b) receives or has received any direct or indirect subsidy from another Bidder; or

(c) has the same legal representative as another Bidder; or

(d) has a relationship with another Bidder, directly or through common third parties, that puts it in a position to influence the bid of another Bidder, or influence the decisions of the Owner regarding this bidding process; or

(e) participates in more than one bid in this bidding process. Participation by a Bidder in more than one Bid will result in the disqualification of all Bids in which such Bidder is involved. However, this does not limit the inclusion of the same subcontractor in more than one bid; or

(f) any of its affiliates participated as a consultant in the preparation of the design or technical specifications of the works that are the subject of the bid; or

(g) any of its affiliates has been hired (or is proposed to be hired) by the Owner or NMCG as Engineer for the Contract implementation; or

(h) would be providing goods, works, or non-consulting services resulting from or directly related to consulting services for the preparation or implementation of the project specified in the BDS ITB 1.1 that it provided or were provided by any affiliate that directly or indirectly controls, is controlled by, or is under common control with that firm; or
has a close business or family relationship with a professional staff of the the project implementing agency, who: (i) are directly or indirectly involved in the preparation of the bidding documents or specifications of the contract, and/or the bid evaluation process of such contract; or (ii) would be involved in the implementation or supervision of such contract throughout the procurement process and execution of the contract.

1.2.3 A Bidder may have the nationality of any country. A Bidder shall be deemed to have the nationality of a country if the Bidder is constituted, incorporated or registered in and operates in conformity with the provisions of the laws of that country, as evidenced by its articles of incorporation (or equivalent documents of constitution or association) and its registration documents, as the case may be. This criterion also shall apply to the determination of the nationality of proposed sub-contractors or sub-consultants for any part of the Contract including related Services.

1.2.4 Bidders that are Government-owned enterprises or institutions in the Owner’s Country may participate only if they can establish that they (i) are legally and financially autonomous (ii) operate under commercial law, and (iii) are not dependent agencies of the Owner. To be eligible, a government-owned enterprise or institution shall establish through all relevant documents that it: (i) is a legal entity separate from the government (ii) does not currently receive substantial subsidies or budget support; (iii) operates like any commercial enterprise, and, inter alia, is not obliged to pass on its surplus to the government, can acquire rights and liabilities, borrow funds and be liable for repayment of its debts, and can be declared bankrupt; and (iv) is not bidding for a contract to be awarded by the department or agency of the government which under their applicable laws or regulations is the reporting or supervisory authority of the enterprise or has the ability to exercise influence or control over the enterprise or institution.

1.2.5 A Bidder shall not be under suspension from bidding by the Owner as the result of the operation of a Bid–Securing Declaration.

1.2.6 A Bidder shall provide such evidence of eligibility satisfactory to the Owner, as the Owner shall reasonably request.

1.3 Eligible Materials, Equipment, and Services

The materials, equipment and services to be supplied under the Contract may have their origin in any country, subject to the restrictions specified in Annexure A Part g - Eligible Countries, and all expenditures under the Contract will not contravene such restrictions. At the Owner’s request, Bidders may be required to provide evidence of the origin of materials, equipment and services.
1.4. **Inspection and Audit**

The NMCG and Owner require compliance with their policies in regard to corrupt and fraudulent practices as set forth in Section 6.8. In further pursuance of this policy, Bidders shall permit and shall cause its agents (whether declared or not), sub-contractors, sub-consultants, service providers, or suppliers and any personnel thereof, to permit the Owner to inspect all accounts, records and other documents relating to any prequalification process, bid submission, and contract performance (in the case of award), and to have them audited by auditors.

1.5. **Cost of Bidding**

The Bidder shall bear all costs associated with the preparation and submission of its bid, and the Owner will in no case be responsible for these costs, regardless of the conduct or outcome of the bidding process.
Section 2. The Bidding Documents

2.1. Content of Bidding Documents

a. The nature of the services, the site and the plant that are to be designed, built, operated and maintained by the Bidder, the procedures that are to be followed during the bidding process and the contract terms and technical requirements are prescribed in the Bidding Documents. The Bidding Documents consist of:

1. the Instructions to Bidders (ITB);
2. the Bid Data Sheet;
3. Annexure A to the Bidding Documents – Forms
   a. Bidder’s Bid Form
   b. Bidder’s Price Schedules
   c. Form of Bid Security
   d. Form of Performance Security
   e. Format of Curriculum Vitae for Proposed Key Staff
   f. Form for Clarification Questions
   g. List of eligible Countries
   h. Qualification Criteria
   i. Information Forms
   j. Declaration Format for Deemed Export Benefits
   k. Form of Letter of Intent by JV Partners
   l. Form of Power of Attorney for Joint Venture
   m. Form of undertaking by JV Partners
4. Annexure B to the Bidding Documents – the contract (the “Draft Contract”) consisting of:
   i. Form of Contract;
   ii. General Conditions of the Contract; and
   iii. Schedules attached to the Contract
5. Addenda to the documents listed in ITB Section 2.1(a) (1) to (4), if any are issued by the Owner.

The Invitation for Bids issued by the Owner is not part of the Bidding Documents.

2.1.1. The documents listed in ITB Section 2.1(a) (1), (2), (3), (4) and (5) are collectively the “Bidding Documents”.

2.1.2. Each Bidder shall examine all instructions, terms and conditions, forms, specifications and other information contained in the Bidding Documents. If the Bidder fails to provide all documentation and information required by the Bidding Documents; or submits a Bid which is not substantially responsive to the terms and conditions of the Bidding
Documents, such action is at the Bidder’s risk and the Owner may determine that the Bid is non-responsive to the Bidding Documents and may reject it.

2.2. Clarification of Bidding Documents

a. A prospective Bidder requiring any clarification of the Bidding Documents may notify the Owner in writing by mail, courier, fax or hand delivery at the Owner’s mailing address indicated in the Bid Data Sheet. Similarly, if a Bidder feels that any important provision in the Bidding Documents, such as those listed in ITB Section 3.3, will be unacceptable, such an issue must be raised during the clarification stage.

b. All such queries and requests for clarification shall be submitted using the Form for Clarification Questions contained in Annexure A Part f to the Bidding Documents.

c. The Owner will respond in writing to any request for clarification or modification of the Bidding Documents that it receives on the Form for Clarification Questions no later than the date set out in the timetable in the Bid Data Sheet. Written copies of the Owner’s response, including an explanation of the query but not identification of its source, (the “Response to Questions Document”) will be sent to all prospective Bidders that have received the Bidding Documents. If similar or repeated queries are made by Bidders, the Owner may list those queries as one query & respond to such query only once.

2.3. Site Visit

a. Each Bidder is advised to visit and inspect the site/alignment of (a) the proposed Sewage Treatment Plant; and (b) the Sewerage Network and/or Interception & Diversion Works, SPS (the “Site Visit”) and their surroundings and obtain for itself on its own responsibility all information that may be necessary for preparing the Bid and entering into the Contract. The Owner will schedule a time on or after the date set out in the timetable specified in the Bid Data Sheet and develop a procedure for Bidders to conduct a Site Visit. The costs of visiting the site shall be at the Bidder’s own expense.

b. Each Bidder and any of its personnel or agents will be granted permission by the Owner to enter upon its premises and lands for the purpose of such a Site Visit, but only upon the express condition that the Bidder, its personnel and agents will release and indemnify the Owner, the Borrower and their personnel and agents from and against all liability in respect thereof and will be responsible for death or personal injury, loss of or damage to property and any other loss, damage, costs and expenses incurred as a result of the Site Visit.

2.4. Data Room and Background Information

Owner shall establish a data room (the “Data Room”) at the location specified in Bid Data Sheet with a collection of relevant data to be accessible to Bidders or their representatives from the date set out in the timetable specified in the Bid Data Sheet until the deadline for submission of Bids (the “Submission Deadline”), in accordance with a schedule established by the Owner.

2.5. Pre-Bid Meeting

Each prospective Bidder is invited to attend a Pre-Bid Meeting, which will take place at the venue and time stipulated in the Bid Data Sheet. While attendance at the pre-bid
meeting is not mandatory, Bidders are strongly encouraged to attend. The purpose of the pre-bid meeting is to provide a technical presentation and to clarify issues and answer questions on any matter that may be raised at the meeting. Each prospective Bidder is requested, as far as possible, to submit any question in writing to reach the Owner not later than one week before the pre-bid meeting. It may not be practicable at the meeting to answer questions received late, but questions and responses will be transmitted as indicated hereafter. Minutes of the pre-bid meeting will be transmitted without delay to all prospective Bidders that have been issued Bidding Documents. All responses to questions raised at the pre-bid meeting will be included in the Response to Questions Document. The proceedings of the pre-bid meeting, reply to the queries and corrigendum if any will also be uploaded on the website specified in the Bid Data Sheet.

2.6. Amendment of Bidding Documents

a. At any time prior to the Submission Deadline, the Owner may, for any reason, whether at its own initiative, or in response to a clarification requested by a prospective Bidder, amend the Bidding Documents by addendum. No other communications of any kind whatsoever, including, without limitation, the minutes of the pre-bid meeting or the Response to Questions Document, shall modify the Bidding Documents.

b. Addenda, if any, will be sent in writing by air mail, courier or facsimile to all prospective Bidders and will be binding on them. Bidders shall immediately acknowledge receipt to the Owner of any such amendment, and it will be assumed that the information contained therein has been taken into account by the Bidder in its Bid. Such Addenda will also be uploaded on the website specified in ITB 2.5.

c. In order to afford prospective Bidders reasonable time in which to take the amendment into account in preparing their Bids, the Owner may, at its discretion, extend the Submission Deadline, in which case, the Owner will notify all prospective Bidders in writing of the extended deadline.

2.7. Contact with the Owner for the Purpose of Clarification

The prospective Bidders shall contact only the persons named at the addresses in the Bid Data Sheet for the purpose of requesting information and clarification or for any other purpose relating to the bidding process. The prospective Bidders shall not contact any other person at the Owner during the bidding process. From the time of Bid opening to the time of Contract award, if any Bidder wishes to contact the Owner on any matter related to the bidding process, it may do so in writing.

2.8. Information Provided by the Owner/Bidders Due Diligence

a. Each Bidder is solely responsible for conducting its own independent research, due diligence, and any other work or investigations and for seeking any other independent advice necessary for the preparation of Bids, negotiation of agreements, and the subsequent delivery of all services to be provided by the Bidder that has been successful in the bidding process (the “Successful Bidder”). The Bidder shall submit its bid considering that the treated effluent from the STP has to be discharged into the location as specified in the Bid Data Sheet under ITB 3.3(b).
b. No representation or warranty, express or implied, is made and no responsibility of any kind is accepted by the Owner or its advisors, employees, consultants or agents, for the completeness or accuracy of any information contained in the Bidding Documents or the Response to Questions Document, or provided during the bidding process or during the term of the Contract. The Owner and its advisors, employees, consultants and agents shall not be liable to any person or entity as a result of the use of any information contained in the Bidding Documents or the Response to Questions Document, or provided during the bidding process or during the term of the Contract.

c. Bidders shall not rely on any oral statements made by the Owner or its advisors, employees, consultants or agents.

d. All Bidders shall, prior to submitting their Bid, review all requirements with respect to corporate registration and all other requirements that apply to companies that wish to conduct business in the Owner’s country. The Bidders are solely responsible for all matters relating to their legal capacity to operate in the jurisdiction to which this bidding process applies.

2.9. Timetable

a. The estimated timetable, from the issuance of the Bidding Documents to the identification by the Owner of the Successful Bidder and the execution of the Contract, is set out in the Bid Data Sheet.

b. The Owner may, in its sole discretion and without prior notice to the Bidders, amend the estimated timetable specified in the Bid Data Sheet. Bidders shall not rely in any way whatsoever on the estimated timetable specified in the Bid Data Sheet and the Owner shall not incur any liability whatsoever arising out of amendments to the estimated timetable. The Owner shall give notice of timetable changes, if any, by addenda.
Section 3. Preparation of Bids

3.1. Language of Bid

The Bid prepared by the Bidder, all correspondence and documents related to the Bid exchanged by the Bidder and the Owner and the bidding process shall be written in the language specified in the Bid Data Sheet, provided that any printed literature furnished by the Bidder may be written in another language, as long as such literature is accompanied by a translation of its pertinent passages in the language specified in the Bid Data Sheet, in which case, for purposes of interpretation of the Bid, the translation shall govern.

3.2. Documents Comprising the Bid

a. Each Bidder shall submit only one Bid comprising of two covers, one containing the Technical Bid/ Proposal and the other the Financial or Price Bid/ Proposal. The bid shall consist of:

1. One Technical Bid/ Proposal which contains the following parts in the following order:
   i. Part I – the information required by ITB Section 3.3;
   ii. Part II – the Bid Security required by ITB Section 3.4;
   iii. Part III – the Bid Form required by ITB Section 3.5(a), and the information required by ITB Section 3.5(b) and Appendix to Bid containing completed Tables of Schedule of Adjustment Data as required by ITB Section 3.11 b;
   iv. Part IV – where applicable, the joint venture documents required by ITB Section 3.6;
   v. Part V – the power of attorney required by ITB Section 3.7;
   vi. Part VI – the declaration of commissions and gratuities required by ITB Section 3.8;
   vii. Part VII – Optional, separately bound pre-printed literature as per ITB Section 3.9; and

2. One Financial Bid/Proposal which shall consist of the Price Schedules completed in accordance with ITB Section 3.10.

b. Each Bidder shall also submit an initialled Draft Contract, in accordance with ITB Section 3.15 (b), in the same envelope as its Technical Section.

3.3. Technical Section – Part I – Technical and Staffing Information

The Bidder, while making his technical proposal shall consider the following aspects.

For STP

a. The Owner shall make available the right of way and the land area allocated for this facility for setting up of Sewage Treatment Plant. The Owner shall also make available the right of way to the facilities to be set up under the contract, for making
arrangements in connection with reuse of treated effluent from STP as specified in the contract.

The bidders will be free to offer STP based on a technology of their choice and indicate in their bid the actual land requirement for setting up treatment facility as offered by them. The status of availability and ownership of the land is specified in the Bid Data Sheet.

b. The location for disposal of treated Sewage and sludge shall be as specified in the Bid Data Sheet.

c. The land that will be required for STP, roads, drains and other appurtenant structures shall be indicated by the bidder and the cost of such Land requirement as determined on the basis of land price specified in the Bid Data Sheet shall be added to the bid price for evaluation of the lowest evaluated substantially responsive bidder.

d. The Operator shall design and construct the STP with installed capacity as indicated in the Bid Data Sheet clause 1.1(d).

For Network

e. The owner shall make available the right of way for the Sewerage Network and/or Interception & Diversion Works and land area allocated for setting up the Sewage Pumping Station and all appurtenant structures. The status of availability and ownership of the land is specified in the Bid Data Sheet.

Part-I of the Technical Section of the Bid

f. For STP: Part-I of the Technical Section of the Bid shall consist of the following sub-parts in the following order:

1. an executive summary of the Technical Section;

2. a detailed design-build work plan including a detailed program timetable (the “Design-Build Work plan”) setting out the manner in which the Bidder proposes to carry out the Design-build services as defined in the Draft Contract (the “Design-Build Services”) and meet the Design-build technical standards in accordance with the Technical Standards Schedule to the General Conditions.

   The Design-Build Work plan shall be divided into the following sections:

   i. (a) A well-defined proposal for the treatment process technology proposed by the Bidder with evidence showing the ability of the treatment process technology of meeting the service standards and the environmental norms;

   (b) Plan for reuse of treated effluent along with conceptual drawings, to meet the requirements specified in the Schedule 2 of the Contract, namely Design Build Services Schedule (DBSS);

   (c) Proposal for using solar photovoltaic cells for power generation for minimum ........ watts for STP and ........ watts for each SPS which should be adequate to meet the lighting & fans load of these facilities.

The Owner will make available the land required for the STP and ancillary works up to the limit specified in Section 3.3(a) above. The Bidder’s Design
should aim at optimizing the land requirement. This shall also include details of modules of the treatment process and the details of modular approach to capacity addition if it is adopted in the proposal.

ii. a section entitled “Drawings” which consists of conceptual drawings that are sufficiently detailed to communicate the Bidder’s Design intent for all components of the proposed Sewage Treatment Plant. The conceptual drawings shall include the following:

a. a site plan showing the location of the STP area, alignment and limits to the Bidders construction activities; along with the land required for the total planned area for STP. The site plan / layout shall include new STP, Layout of various units of preliminary and secondary treatment, Layout of piping between various units and unit bypass for each unit, plant bypass, Layout of internal roads, hard standing, parking, compound wall and gate house, etc. Location of power transformer, switch room, control room and switchgear, Power wiring and underground cable layout, Relative location of administrative office, lab and control centre, Internal roads and parking provisions, Landscaping and reservations for future expansion, possible future tertiary treatment and Any other features for safe and efficient working during operations and maintenance.

b. a site plan showing all proposed works listed in the Bid Data Sheet;

c. a detailed narrative in support of the conceptual drawings setting out the Bidder’s plan for compliance with the Design-Build Services Schedule and the technical standards set out in the Technical Standards Schedule, to include construction quality assurance and control;

iii. a detailed program and schedule setting out the proposed sequence of works to be undertaken, including estimated start date, finish date and time allocations for individual units of the works, proposed resources to be allocated and the identification of all major milestones, including the submission of schematic Design documents, Design development documents, the Design-Build Documents and the commissioning of individual units of the Sewage Treatment Plant (STP); and

iv. an itemised list of the principal codes of practice and standards proposed to be used for the Design-Build Services

3. a section specifying the power consumption for Operations and Maintenance of the STP on an annual basis. The Bidder shall further provide the breakup of electricity consumption in various facilities in the STP on an annual basis. The Bidder shall provide the total estimated connected load in KW, maximum power demand, average energy consumption in kWh per day with full load up to the installed capacity of the STP, estimated power factor, any proposals for improving efficiency in terms of lower power consumption.
g. **For Network and/or Interception & Diversion Works:** Part-I of the Technical Section of the Bid for Network and/or Interception & Diversion Works shall consist of the following sub-parts in the following order:

1. An Executive Summary of the Technical Section;

2. A detailed work plan for conducting field survey, reviewing the designs provided by the owner, redesigning (where necessary or can submit a full design but the specifications such as proposed pipe materials etc. remain the same so that there will not be any need for revising BOQ etc. except modifying some quantities) and build-work-plan comprising a detailed program timetable (the "Design-Build Work Plan") setting out the manner in which the Bidder proposes to carry out the design-build services as defined in the Draft Contract (the "Design-Build Services") and meet the design-build technical standards in accordance with the Technical Standards Schedule to the General Conditions. The Design-Build Work plan shall be divided into the following sections:

   i. A well-defined proposal for the configuration of Sewerage Network and/or Interception & Diversion Works proposed by the bidder along with the details of the manholes, Pumping Stations, system design of the pumping stations etc. The bidder’s design should aim at optimizing the energy requirements for pumping of the sewage.

   ii. A section entitled “Drawings” which consists of conceptual drawings that are sufficiently detailed to communicate the Bidder’s design intent for all components of the proposed Sewerage Network and/or Interception & Diversion Works. The conceptual drawings shall include the following:

      a. The site plan / layout for Pumping Station, Layout of piping between various units and unit bypass for each unit, plant bypass, compound wall and gate house, etc. Location of power transformer, if applicable, location of administrative office and control centre, and any other features for safe and efficient working during operations and maintenance.

      b. A layout plan showing all proposed works listed in the Bid Data Sheet;

   iii. A detailed narrative in support of the conceptual drawings setting out the Bidder’s plan for compliance with the Design-Build Services Schedule and the technical standards set out in the Technical Standards Schedule, to include construction quality assurance and control;

   iv. A detailed program and schedule setting out the proposed sequence of works to be undertaken, including estimated start date, finish date and time allocations for individual units of the works, proposed resources to be allocated and the identification of all major milestones, including the submission of schematic design documents, design development documents, the Design-Build Documents and the commissioning of individual units of the Sewage Pumping Station; and

   v. An itemized list of the principal codes of practice and standards proposed to be used for the Design-Build Services; and
A section specifying the Power Consumption for Operations and Maintenance of the Sewage Pumping Station on annual basis. The Bidder shall provide the total estimated connected load in kW, maximum power demand, average energy consumption in kWh per day with full load of pumping sewage up to the installed capacity, estimated power factor, any proposals for improving efficiency in terms of lower power consumption.

h. **For Both STP and Network** and/or Interception & Diversion Works: Part-I of the Technical Section of the Bid shall further consist of the following sub-parts in the following order:

1. a section entitled “Plant and Equipment and Operator’s Equipment” which consists of a list of proposed suppliers of major Plant and Equipment and Operator’s Equipment (Design-Build) and Operator’s Equipment (Operations), including:
   i. plant and equipment;
   ii. materials including pipe work and principal construction materials.

   For all items listed in ITB Section 3.3(h)(1), the Bidders shall provide either catalogues or detailed information with respect to manufacturer and source, model Designation, primary specifications, and year of manufacture, as applicable.

2. a detailed work plan (the “Operations Work Plan”) setting out the manner in which the Bidder proposes to carry out the operation of the STP and Sewerage Pumping Station as set out in the Contract (the “Operations Services”) and meet the operating technical standards in accordance with the Technical Standards Schedule to the General Conditions. The Operations Work Plan shall contain a section entitled “Operation and Maintenance Plan” which provides an outline contents and overview of the Bidder’s proposed plans and programs for Operations and Maintenance of STP and Sewerage Network and/or Interception & Diversion Works;

3. a detailed description of the Bidder’s plans and methodologies to ensure that the requirements of the applicable Environmental Management Plan specified in the special conditions of contract for the proposed STP, Sewerage Network and/or Interception & Diversion Works and allied services at Site will be implemented and monitored;

4. a detailed staffing plan (the “Staffing Plan”) setting out the Bidder’s proposed staffing arrangements for the carrying out of the Design-Build and Operations Services. The Staffing Plan shall be divided into the following sections:
   i. two sub-sections, (one for the Design-Build Services and one for the Operations Services) each entitled the “Staffing Chart” and each consisting of a chart setting out a list of all proposed Operator’s Personnel positions, the role of each position, the duration of existence of the position, and the location of the staff person filling the position during the periods of assignment to carry out the Design-Build and Operations Services;
ii. a section entitled “Summary of Staff Qualifications” which consists of a summary table setting out,

a. for the Key Staff positions, the names of the Bidder’s employees who will occupy the Key Staff positions during Design-Build Services; and

b. all proposed positions for the Operator’s Key Personnel and the qualifications, years of experience and areas of expertise, including a clear indication of the expertise that the staff will provide consistent with the requirements set out in the Bid Data Sheet for each of the proposed positions; The Bidder’s personnel as indicated in the bid proposals shall not be changed during the period of the contract. In case if the successful Bidder, intends to change the key staff, such change will be subject to approval from the Owner on justification provided by the successful Bidder. The replaced key staff shall have to be of equivalent or higher qualification and experience.

iii. a section entitled, “Curriculum Vitae” which contains the signed curriculum vitae for each of the Key Staff, in the format set out in Annexure A Part e to the Bidding Documents;

5. For the purpose of ITB Section 3.3(h)(4), “Key Staff” means those individuals that will fill the positions listed in the Bid Data Sheet; and

6. A list of all nominated sub-contractor and sub-consultants and a detailed description of the services to be carried out or the Plant and Equipment to be provided by the nominated sub-Contractor and sub-consultants. The Bidder shall provide the name and nationality of all nominated sub-contractors and sub-consultants. The Bidder shall ensure that all nominated sub-contractors and sub-consultants comply with ITB Sections 1.3 and 6.8. The Bidder shall not exceed the maximum percentage of subcontracting and sub consulting set out in Bid Data Sheet.

i. Environmental, Social, Health and Safety (ESHS) Code of Conduct (For both STP and Network -combined or separate)

1. The Bidder shall submit the Environmental, Social, Health and Safety (ESHS) Code of Conduct that will apply to the Contractor’s employees and subcontractors. The Code of Conduct shall ensure compliance with the ESHS provisions of the contract including those described in the following documents.
a. [Scope of work];

b. [Environmental and Social Impact Assessment (ESIA)];

c. [Environmental and Social Management Plan (ESMP)];

d. [Consent Conditions (regulatory authority conditions attached to any permits or approvals for the project)]; and

e. Environmental and Social Management Framework for the Namami Gange Program

f. [specify any other relevant documents]

2. The code of conduct will contain obligations on all project staff (including sub-contractors and day workers) that are suitable to address the following issues, as a minimum. Additional obligations may be added to respond to particular concerns of the region, the location and the project sector or to specific project requirements. The issues to be addressed include:

i. Compliance with applicable laws, rules, and regulations of the jurisdiction

ii. Compliance with applicable health and safety requirements (including wearing prescribed personal protective equipment, preventing avoidable accidents and a duty to report conditions or practices that pose a safety hazard or threaten the environment)

iii. The use of illegal substances

iv. Non-Discrimination (for example on the basis of family status, ethnicity, race, gender, religion, language, marital status, birth, age, disability, or political conviction)

v. Interactions with community members (for example to convey an attitude of respect and non-discrimination)

vi. Sexual harassment (for example to prohibit use of language or behavior, in particular towards women or children, that is inappropriate, harassing, abusive, sexually provocative, demeaning or culturally inappropriate)

vii. Violence or exploitation (for example the prohibition of the exchange of money, employment, goods, or services for sex, including sexual favors or other forms of humiliating, degrading or exploitative behavior)

viii. Protection of children (including prohibitions against abuse, defilement, or otherwise unacceptable behavior with children, limiting interactions with children, and ensuring their safety in project areas)

ix. Sanitation requirements (for example, to ensure workers use specified sanitary facilities provided by their employer and not open areas)

x. Avoidance of conflicts of interest (such that benefits, contracts, or employment, or any sort of preferential treatment or favors, are not provided to any person with whom there is a financial, family, or personal connection)

xi. Respecting reasonable work instructions (including regarding environmental and social norms)

xii. Protection and proper use of property (for example, to prohibit theft, carelessness or waste)

xiii. Duty to report violations of this Code

xiv. Non retaliation against workers who report violations of the Code, if that
report is made in good faith.

3. The Code of Conduct should be written in plain language and signed by each worker to indicate that they have:
   i. received a copy of the code;
   ii. had the code explained to them;
   iii. acknowledged that adherence to this Code of Conduct is a condition of employment; and
   iv. understood that violations of the Code can result in serious consequences, up to and including dismissal, or referral to legal authorities.

4. In addition, the Bidder shall submit an outline of how this Code of Conduct will be implemented. This will include: how it will be introduced into conditions of employment/engagement, what training will be provided, how it will be monitored and how the Contractor proposes to deal with any breaches.

3.4. Technical Section – Part II – Bid Security

a. In Part II of the Technical Section of its Bid, the Bidder shall furnish, as part of its Bid, a Bid security in the amount and currency stipulated in the Bid Data Sheet. The bid security of a Joint Venture must define as “Bidder” all Joint Venture Partners and list them in the following manner:

   “a Joint Venture consisting of ‘……’, ‘..........’ and ‘..........’.

b. The Bid Security shall, at the Bidder’s option, be in the form of a certified cheque, but only if the certified cheque shows a validity date, letter of credit/demand draft or a bank guarantee from a scheduled bank in India selected by the Bidder. The format of any bank guarantee provided by a Bidder shall be in accordance with the form of Bid Security contained in Annexure A Part c to the Bidding Documents. The Bidder shall ensure that the Bid Security remains valid for a period of 45 days after the end of the original Bid Validity Period, as defined in ITB Section 3.14(a), and 45 days after any extension subsequently requested by the Owner in accordance with ITB Section 3.14(b).

c. Any Bid not accompanied by an acceptable Bid Security shall be rejected by the Owner as being non-responsive. The Bid Security of a joint venture must be in the name of all of the participants in the joint venture submitting the Bid.

d. The Owner will return the Bid Securities of the unsuccessful Bidders as promptly as possible, upon the successful Bidder’s signing the contract and furnishing the required performance security and ESHS Performance Security.

e. The Bid Security of the Successful Bidder will be returned when the Bidder has signed the Form of Contract pursuant to ITB Section 6.4 and has provided the required Performance Security and ESHS Performance Security as set out in the Contract and ITB Section 6.5.

f. The Bid Security may, in the discretion of the Owner, be forfeited,

   1. if the Bidder withdraws its Bid during the Bid Validity Period; or
   2. in the case of the Successful Bidder, if the Successful Bidder fails within the specified time limit,
i. to execute the Form of Contract in accordance with ITB Section 6.4; or
ii. to furnish the Performance Security and ESHS Performance Security to the Owner in accordance with ITB Section 6.5.

3.5. Technical Section – Part III – Bid Form and Qualification Information

a. In Part III of the Technical Section of its Bid, each Bidder shall provide a completed Bid Form in the same form and substance as the Bid Form contained in Annexure A Part a to the Bidding Documents.

b. In Part III of the Technical Section of its Bid, Bidders shall submit Information Forms duly completed to evidence compliance with the Qualification Criteria provided in the Annexure A Part h to the bidding documents. The Information Forms are provided in the Annexure A Part i to the Bidding Documents.

3.6. Technical Section – Part IV - Joint Venture Documents and Requirements

a. Each Joint Venture Bidder shall submit, as Part IV of the Technical Section of its Bid, a written commitment, in the form of a letter duly executed by an authorized officer of each joint venture participant which,

   1. Confirms each joint venture participant’s commitment to the joint venture and acceptance of the joint venture arrangements described in the Bid in accordance with ITB Section 3.6(b);

   2. Confirms each joint venture participant’s willingness to provide a joint and several guarantee to the Owner to underwrite the performance of the joint venture in respect of the Contract; and

   3. Identifies which joint venture participant,

      i. will assume the leading role on behalf of the other joint venture participants; and

      ii. will have the authority to commit all joint venture participants.

      iii. will have the authority to incur liabilities and receive instructions for and on behalf of any and all participants of the joint venture.

b. A copy of the Joint Venture Agreement entered into by the Partners (JV Participants) shall be submitted with the bid. Alternatively, a Letter of Intent as per format provided under Annexure A - Part K to execute a Joint Venture Agreement in the event of a successful bid shall be signed by all partners and submitted with the bid together with a copy of the proposed Agreement, clearly indicating the objectives of the joint venture, the proposed management structure, the contribution of each participant to the joint venture operations, the commitment of the participants to joint and several liability for performance of the contract, recourse or sanctions within the joint venture in the event of default or withdrawal of any participant, and arrangements for providing the required indemnities.

c. If the Successful Bidder is a Joint Venture to whom the contract is awarded, each partner of the Joint Venture shall sign and execute the contract with the Owner and shall be jointly and severally responsible to Owner for the performance of the contract.
3.7. Technical Section – Part V – Power of Attorney

Each Bidder shall provide, as Part V of the Technical Section of its Bid, a written power of attorney in accordance with ITB Section 3.15(c).

3.8. Technical Section – Part VI – Commissions and Gratuities

In Part VI of the Technical Section of its Bid, each Bidder shall provide detailed information listing all commissions and gratuities, if any, paid or to be paid by the Bidder to agents relating to this Bid or the Contract if the Bidder is awarded the Contract. The Bidder shall list the name and address of any agents, the amount and currency paid or to be paid to the agents and the purpose of the commission or gratuity. If no such commissions and gratuities have been paid, the Bidder shall provide this information in Part VI of the Technical Section of its Bid.

3.9. Technical Section – Part VII – Pre-Printed Literature

If the Bidder wishes to provide pre-printed literature about the Bidder or the joint venture participants, that pre-printed literature shall be contained in Part VII of the Technical Section of the Bid only and shall be separately bound.

3.10. Financial Section – Price Schedules

Each Bidder shall submit completed and properly executed Price Schedules in the forms contained in Annexure A to the Bidding Documents. Bidders shall complete the Price Schedules in full and shall not amend or change the form in any way. The Financial Section of each Bidder’s Bid shall consist of only completed and properly executed Price Schedules.

3.11. Financial Section – Bid Prices

a. Bidders shall quote their Bid Price covering the total cost of (i) design, construction, testing, commissioning of the Sewage Treatment Plant; and of (ii) survey, review of design, redesign where necessary, construction, testing and commissioning of Sewerage Network and/or Interception and Diversion works (including pumping stations), and all appurtenant structures and allied works within the period indicated in the Bid Data Sheet, and of (iii) operation and maintenance of the complete works of Sewage Treatment Plant, Sewerage Network and/or Interception and Diversion works, and Pumping Stations for a further period of 15 years on a “single responsibility” basis such that the total Bid Price covers all of the Operator’s obligations mentioned in or to be reasonably inferred from the Bidding Documents in respect of the design/ redesign, construction, commissioning, installation, testing, operation and maintenance and provisions mandated in Environmental Management Plan (attached as ..........) [EA should insert the reference in the blank.] etc. of the Sewage Treatment Plant and Sewerage Network and/or Interception and Diversion works (including pumping stations) as set out in the Contract.

b. The Bidders shall quote their Bid Price in the following components:

For Sewage Treatment Plant:

1) Part A - Design-Build Price:

   (i) The bidder shall quote total cost of design, development, construction, testing and commissioning of the STP including the cost for all materials,
electro mechanical equipment, labour, temporary works required for the construction, ancillary & allied works, consumables, acquisition of all permits / approvals / licences, duties and taxes and all related items of work as may be necessary for setting up the STP and making it fully functional in compliance with the provisions of the Contract.

Design-Build Price shall remain firm and fixed and will not be subject to price adjustment unless specified otherwise in the Bid Data Sheet.

In case the contract is subject to price adjustment, the Bidder shall furnish in the Schedule of Adjustment Data (under Appendix to Bid) for the purpose of Price Adjustment formulae, proposed weightings for various indices The Owner may require the Bidder to justify its proposed weightings and/or the source of indices.

(ii) The bidder shall furnish requirement of land that will be required for the proposed STP (considering the technology offered by the bidder), roads, drains and other appurtenant structures, in accordance with ITB 3.3 (c). The cost of such land requirement as determined on the basis of land price specified in the BDS ITB 3.3 (c) shall be indicated in the Price Schedule for determining the evaluated bid price.

The bidder should make a realistic assessment of land requirement. The bidder’s attention is also drawn to provision under SCC Clause 4.2 which will apply if the successful bidder finds at the time of construction of the facility that the requirement indicated in its bid is inadequate.

2) Part B - Annual O & M Prices of STP, for treatment of Threshold Sewage Flow indicated in the Bid Data Sheet,

The bidder shall quote annual O&M prices for treatment of threshold sewage flow rate for each of 15 years after commencement of the Operations Period. These prices should include costs of skilled and unskilled manpower, establishment, consumables, energy consumption, replacements, routine maintenance and periodic maintenance of the STP in compliance with the provisions of the Contract, etc.

While quoting O&M prices, the bidder shall assume that full requirements of power for operating the STP shall be met by supply from the Electricity Utility Company throughout the O&M period.

The actual Payment of O&M price to the Operator shall, however, be based on the actual quantities of sewage handled by the STP, subject to the condition that the price quoted for the Threshold Flow shall be the base (minimum) price which shall not be subject to adjustment in case actual sewage flow falls short of the Threshold Sewage Flow.

The Payment of O&M price shall also be subject to adjustment to compensate the Operator for the extra cost on account of Diesel consumption incurred by the Operator for using the power supply from the back-up power supply unit (DG set) when power from the Electricity Utility Company is not available.
The bidder is advised to refer to Schedule 6 of the Contract - Terms and Procedure of Payment and Schedule 8 of the Contract – Price Adjustment, while quoting the O&M prices.

3) **Part C – Additional O&M Prices for treatment of sewage flow in excess of Threshold Sewage Flow on a per MLD basis** for each of the 15 years after commencement of Operations Period and shall include all the fixed and variable costs such as costs of consumables, chemicals, energy consumption, etc. for treatment of the additional sewage flow in compliance with the provisions of the Contract.

**For Sewerage Network and/or Interception and Diversion works:**

4) **Part D - Bid Price for-BOQ items:** The Bidder shall quote rates and prices for all items of the Works described in the Bill of Quantities (BOQ). Items against which no rate or price is entered by the Bidder shall be deemed covered by the rates for other items in the Bill of Quantities and will not be paid for separately by the Owner. An item not listed in the priced Bill of Quantities shall be assumed to be not included in the Bid, and provided that the Bid is determined substantially responsive notwithstanding this omission, the average price of the item quoted by substantially responsive bidders will be added to the bid price and the equivalent total cost of the bid so determined will be used for price comparison. The bid prices shall remain firm and fixed and will not be subject to price adjustment, unless otherwise provided in the BDS and the Conditions of Contract.

5) **Part E - Annual O&M Price** for each of 15 years after commencement of the Operations Period including skilled and unskilled manpower, establishment costs, replacements, routine maintenance and periodic maintenance of the Sewerage Network and/or Interception & Diversion Works and Sewage Pumping Stations in compliance with the provisions of the Contract.

If O & M of the SPS(s) is included in the scope of work, the bidder shall for the purpose of quoting O&M prices assume that (a) the SPS(s) will be required to handle quantities of sewage in the respective years of the O&M period as per “Indicative Sewage Flow Rate for SPS” shown in the Appendix to Bid (Indicative Flow) and (b) full requirements of power for operating the SPS(s) shall be met by supply from the Electricity Utility Company throughout the O&M period. The actual Payment of O&M price to the Operator shall, however, be based on the actual quantities of sewage handled by the SPS(s) and will also be subject to adjustment to compensate the Operator for the extra cost on account of Diesel consumption incurred by the Operator for using the power supply from the back-up power supply unit (DG set) when power from the Electricity Utility Company is not available.

The bidder is advised to refer to Schedule 6 of the Contract - Terms and Procedure of Payment and Schedule 8 of the Contract – Price Adjustment, while quoting the O&M prices.
c. O&M Prices (Part B, Part C, and Part E) shall be subject to adjustment only on account of variation in electricity tariff evidenced by the electricity bills paid by the Operator for the Sewage Treatment Plant and the Sewage Pumping Station(s) to be operated and maintained by him as per Contract, with reference to the “Base Rate of Electricity” stipulated in BDS. The Bidder shall furnish with its Bid the Guaranteed Energy Consumption per MLD of the sewage handled by the Sewage Treatment Plant and the Pumping Station(s). Adjustment of O&M prices shall be applicable for the actual energy consumption evidenced by the electricity bills subject to the ceiling as per guaranteed energy consumption level as per provisions of Schedule 8 of the Contract.

d. For the purpose of submitting Bids, Bidders should note that the Bid Price shall include all kinds of taxes, duties, levies or charges of the Owner’s country in accordance with the Contract.

Note:
Bidders may like to ascertain availability of GST/excise/custom duty exemption benefits available in India for similar contracts. They are solely responsible for obtaining such benefits which they have considered in their bid and in case of failure to receive such benefits for reasons whatsoever, the Owner will not compensate the bidder (Operator). The bidder shall furnish along with his bid a declaration to this effect in the Declaration Format provided in Annexure A Part j of the bidding documents.

Where the bidder has quoted taking into account such benefits, he must give all information required for issue of certificates in terms of the Government of India Central Excise Notification and Customs Notification as per the form stipulated in Annexure A Part j of the Bidding Documents. In case the bidder has not provided the required information or has indicated to be furnished later on in the Declaration Format, the same shall be construed that the goods/equipment for which certificate is required is Nil.

To the extent the Owner determines the quantities indicated therein are reasonable keeping in view the work schedule, construction programme and methodology, the certificates will be issued and no subsequent changes will be permitted. The certificate will be issued within 60 days of signing of the contract for material, equipment and machinery.

If the bidder has considered the GST/customs/excise duty exemption for materials/construction equipment to be bought for the work, the bidder shall confirm and certify that the Owner will not be required to undertake any responsibilities of the Government of India Scheme or the said exemptions being available during the contract execution, except issuing the required certificate. Where such certificates are issued by the Owner, excise duty/GST will not be reimbursed separately.

The bids which do not conform to the above provisions or any condition by the bidder which makes the bid subject to availability of customs/excise duty exemption for materials/construction equipment or compensation on withdrawal of any variations to the said exemptions will be treated as non-responsive and rejected.

Any delay in procurement of the construction equipment/machinery/goods as a result of the above shall not be entertained as a reason for granting any extension of time.
e. Bidders are strongly encouraged to review GC Section 5.5, Terms and Procedures of Payment Schedule (Schedule 6 of the Contract) and Price Adjustment Schedule (Schedule 8 of the Contract) prior to completing their Price Schedules and submitting their Bid Prices.

3.12. Financial Section – Bid Currencies

Bidders shall quote their prices in Indian Rupees only.

3.13. Bidding of alternatives not to be considered

a. The Bidders shall base their Bids on the terms and conditions of the Bidding Documents and, without limiting the generality of the foregoing, shall,
   1. Submit their prices based on the terms and conditions in the Bidding Documents;
   2. submit their Bids based on the assumption that the final Contract will be the same as the Draft Contract and shall not base their Bids on the premise that they may be able to change the Draft Contract; and
   3. Include in their Bids a Form of Contract and Draft Contract initialled on each page in accordance with ITB Section 3.15(b) (3).

b. No Bidder shall submit a Bid that contains statements that are inconsistent with the Bidding Documents.

c. A Bidder shall not submit a Bid that proposes an arrangement between the Owner and the Bidder which, in the discretion of the Owner, is different than the arrangement set out in the Bidding Documents (an “Alternative Bid”). The Owner intends to enter into a contract to design, build and operate a Sewage Treatment Facility and a Sewerage Network and/or Interception & Diversion Works based on the terms and conditions of the Bidding Documents. If a Bidder submits an Alternative Bid it will be returned to the Bidder and will not be considered, in any way, by the Owner.

3.14. Period of Validity of Bid

a. Bids shall remain valid for the period named in the Bid Data Sheet after the Submission Deadline or any extension thereof prescribed by the Owner for the receipt of Bids, pursuant to ITB Section 3.14(b). A Bid valid for a shorter period shall be rejected by the Owner as being non-responsive.

b. In exceptional circumstances, the Owner may solicit the Bidders’ consent to an extension of the Bid Validity Period. The request and responses thereto shall be made in writing and sent by air mail, courier or fax. If a Bidder accepts to prolong the Bid Validity Period, the Bid Security shall also be suitably extended. A Bidder may refuse the request without forfeiting its Bid Security. A Bidder granting the request will not be required nor permitted to modify its Bid, except as provided in ITB Section 4.4.

3.15. Format and Signing of Bid

a. Each Bidder shall prepare one electronic copy of the Technical e-bid (Vol-I) and financial e-bid (Vol-II) each separately.

b. The documents designated to be uploaded shall be physically signed at all places indicated.
c. The e-bid document shall be digitally signed, at the time of loading, by the bidder or a person or persons duly authorized to bind the bidder to the contract. All the pages/documents of the e-bid that are to be uploaded shall be digitally signed by the person authorized to sign the e-bid.

d. The authority of the person or persons signing the Bid to bind the Bidder shall be demonstrated by a written and duly notarized power of attorney included in the Bid and submitted as Part V of the Technical Section of the Bid and which shall bind the Bidder for the full length of the Bid Validity Period.

e. The Bid shall contain no alterations, omissions or additions, unless such corrections are initialled by the person or persons signing the Bid.
Section 4. Submission of Bids

4.1. Sealing and Marking of Bids

a. The bidder shall download the bid document from the website: www._______________ and upload the softcopy/scanned copy of required documents together with filled up documents on the website:. ……………………….. The Bidder shall enclose the Technical Bid and the Financial Bid in separate covers. The contents of Technical and Financial Bids will be as per bid document.

b. Each Bidder shall submit a hard copy of the original Bid Security, Power of Attorney, the proof of payment of price of Bidding Document and processing fee to the …………. [Executing Agency] in a sealed envelope. It is clarified that the Bidder will not be required to submit a hard copy of its Technical and/or Financial Bid, and if a hard copy of the Technical and/or Financial Bid is submitted, then the Bid submitted by such Bidder shall be rejected as being non-responsive.

c. The hard copy of the Bid Security, Power of Attorney, joint bidding agreement, etc will be duly sealed in an envelope, which will be super-scribed as follows:

```
"---------------------------- [project name in short]
QUALIFICATION PROPOSAL
DO NOT OPEN BEFORE SPECIFIED TIME ON BID DUE DATE"
```

d. The hard copy of the Bid Security, Power of Attorney, etc will either be hand delivered or sent by registered post acknowledgement due or courier to the address specified in Bid Data Sheet.

4.2. Deadline for Submission of Bids

a. Bids must be uploaded on the Owner’s website specified in the Bid Data Sheet no later than the time and date stated in the Bid Data Sheet as the Submission Deadline.

b. The Owner may, at its discretion, extend the Submission Deadline by amending the Bidding Documents in accordance with ITB Sections 2.6 and 2.9(b), in which case all rights and obligations of Owner and Bidders will thereafter be subject to the Submission Deadline as extended.

4.3. Late Bids

Any Bid received by the Owner after the Submission Deadline prescribed by the Owner, pursuant to ITB Section 4.2, will be rejected.

4.4. Withdrawal, Substitution, and Modification of Bids

(1) Bidders may modify their bids by using the appropriate option for bid modification on e-Procurement Portal, before the deadline for submission of bids. For bid modification and consequential re-submission, the Bidder is not required to withdraw his bid submitted earlier. The last modified Bid submitted
by the Bidder within the Bid Due Date shall be considered as the Bid. For this purpose, modification/withdrawal by other means will not be accepted. In online system of bid submission, the modification and consequential re-submission of Bid is allowed any number of times. A bidder may withdraw his Bid by using the appropriate option for Bid withdrawal, before the deadline for submission of Bids. However, if the Bid is withdrawn, re-submission of the Bid is not allowed.

(2) Bids requested to be withdrawn in accordance with ITB Section 4.4 (1) shall not be opened.

(3) No Bid may be modified, substituted or withdrawn in the interval between the deadline for Bid Submission and the expiration of the Bid Validity Period. Withdrawal of a Bid during this interval may result in the Bidder’s forfeiture of its Bid Security, pursuant to ITB Section 3.4(f).

Section 5. Bid Opening and Evaluation

5.1. Opening of Bids by Owner

(a) The electronic Technical Bids shall be opened by the Owner at the time, date and place specified in the Bid Data Sheet in the presence of the Bidders or their authorized representatives, who choose to be present. The Bidders may choose to witness the electronic Bid opening procedure online.

If the bidder fails to submit a hard copy of the original Bid Security, Power of Attorney, the proof of payment of price of Bidding Document and processing fee or the bid security furnished does not conform to the amount, form and validity period as specified in the Bid, upon verification then its technical bid will not be opened.

(b) The Financial Proposals of the Bids shall remain unopened in the e-Procurement System, until the subsequent public opening following the evaluation of the Technical Proposals of the Bids.

(c) First, envelopes marked “WITHDRAWAL” shall be opened and read out and the envelope with the corresponding bid shall not be opened, but returned to the Bidder. If the withdrawal envelope does not contain a copy of the “power of attorney” confirming the signature as a person duly authorized to sign on behalf of the Bidder, the corresponding bid will be opened. No bid withdrawal shall be permitted unless the corresponding withdrawal notice contains a valid authorization to request the withdrawal and is read out at bid opening. Next, envelopes marked “SUBSTITUTION” shall be opened and read out and exchanged with the corresponding Bid being substituted, and the substituted Bid shall not be opened, but returned to the Bidder. No Bid substitution shall be permitted unless the corresponding substitution notice contains a valid authorization to request the substitution and is read out at bid opening. Envelopes marked “MODIFICATION” shall be opened and read out with the corresponding Bid. No Bid modification shall be permitted unless the corresponding modification notice contains a valid
authorization to request the modification and is read out at Bid opening. Only envelopes that are opened and read out at Bid opening shall be considered further.

(d) All other envelopes shall be opened one at a time, reading out: the name of the Bidder and whether there is a modification; the Bid Prices, including any discounts and alternative offers; the presence of a Bid Security or Bid-Securing Declaration, if required; and any other details as the Owner may consider appropriate. Only discounts and alternative offers read out at Bid opening shall be considered for evaluation. No Bid shall be rejected at Bid opening except for late bids, in accordance with ITB section 4.3.

(e) The Owner shall prepare a record of the Bid opening that shall include, as a minimum: the name of the Bidder and whether there is a withdrawal, substitution, or modification; and the presence or absence of a Bid Security. The Bidders’ representatives who are present shall be requested to sign the attendance sheet. A copy of the record shall be distributed to all Bidders who submitted bids in time.

(f) After the completion of Technical Evaluation, the bidders who have submitted substantially responsive technical bids and who have been determined as being technically qualified will be informed of a date, time and place for opening of their Financial Proposals. The Financial Proposals will be opened in the presence of the representatives of the qualified Bidders that choose to be present.

5.2. Clarification of Bids

During Bid evaluation, the Owner may, at its discretion, ask the Bidder for a clarification of its Bid. The request for clarification and the response shall be in writing, and no change in the price or substance of the Bid shall be sought, offered or permitted.

5.3. Preliminary Examination of Bids

a. The Owner will examine each Bid to determine whether it is complete, whether any computational errors have been made, whether required securities have been furnished, whether the documents have been properly signed, and whether the Bid is generally in order.

b. Arithmetical errors in the Bids will be rectified on the following basis:

1. If there is a discrepancy between subtotals and the total price, the unit or subtotal price shall prevail, and the total price shall be corrected; and

2. If there is a discrepancy between words and figures, the amount in words shall prevail.

If the Bidder does not accept the correction of arithmetical errors, its Bid shall be rejected.

c. The Owner may waive any minor informality, nonconformity or irregularity in a Bid that does not constitute a material deviation, and that does not prejudice or affect the relative ranking of any Bidder as a result of the technical and price evaluation pursuant to ITB Sections 5.4 and 5.5.

d. Prior to the detailed evaluation, the Owner will determine whether each Bid is of acceptable quality, is complete and is substantially responsive to the Bidding
Documents. For purposes of this determination, a substantially responsive Bid is one that conforms to all the terms, conditions and specifications of the Bidding Documents without material deviations, objections, conditions or reservations. A material deviation, objection, conditionality or reservation is one,

1. that affects in any substantial way the scope, quality or performance of the contract;

2. that limits in any substantial way, inconsistent with the Bidding documents, the Owner’s rights or the Successful Bidder’s obligations under the contract; or

3. whose rectification would unfairly affect the competitive position of other Bidders who are presenting substantially responsive Bids.

e. If a Bid is not substantially responsive, it will be rejected by the Owner, and may not subsequently be made responsive by the Bidder by correction of the nonconformity. The Owner’s determination of a Bid’s responsiveness is to be based on the contents of the Bid itself without recourse to extrinsic evidence.

5.4. Technical Evaluation

a. The Owner will carry out a detailed evaluation of the Technical Sections previously determined to be substantially responsive in order to determine on a pass/fail basis whether the technical aspects are in accordance with the requirements set forth in the Bidding Documents. Bidders acknowledge that, in order to reach such a determination, the Owner will examine and analyse the technical aspects of each Bid on the basis of the information supplied by Bidders, taking into account the completeness, consistency and level of detail of the following factors:

1. with respect to the Design-Build construction plan,
   
i. the Bidder’s ability to demonstrate how it will meet the Owner’s project objective and requirements, the technical standards and the Environmental Management Plan;
   
ii. the soundness of the proposed methodology and approach, and the extent to which the Design-Build Work plan demonstrates an understanding of the local conditions and specific Project requirements;

2. with respect to the Operation and Maintenance Work plan,
   
i. the extent to which the Operations Work plan addresses all of the Operations Services that are to be provided in accordance with the Contract;
   
ii. the soundness of the proposed methodology and approach, and the extent to which the Operations Work plan demonstrates an understanding of the local conditions and specific Project requirements; and the Bidder’s ability to demonstrate how it will meet the technical standards; and

3. with respect to the Staffing Plan,
   
i. the qualifications and competence of the Key Staff; and
ii. the overall quality of the Staffing Plan, including the depth and organisational strength demonstrated by the Plan and the extent to which it meets the expertise requirements set out in the BDS under ITB 3.3 (h) (4) and ITB 3.3 (h) (5).

b. For the purpose of ITB Section 0(a) (3)(ii), the evaluation of the overall quality of the Staffing Plan shall be based on,

1. the clarity, comprehensiveness and level of detail of the Staffing Plan;
2. the extent to which the expertise required by the Operator’s Key Staff as specified in the BDS under ITB 3.3 (h) (4) and ITB 3.3 (h) (5) is included in the Staffing Plan; and
3. the extent to which the Staffing Plan addresses the specific Services that are required by the Design-Build and Operations Services Schedules to the General Conditions.

5.5. Price Evaluation and Comparison of Bids

a. The Owner shall examine each Bidder’s Financial Section to determine whether such Financial Section is complete and substantially responsive to the Bidding Documents.

b. The Financial Sections, which are substantially responsive to the Bidding Documents, shall be evaluated to determine the lowest evaluated bid.

c. The Owner shall evaluate the bid prices by determining and adding various components of cost and prices as under:

i. Price adjustment for correction of arithmetic errors in accordance with Section 5.3(b); plus

ii. Cost of design, development, construction, testing and successful commissioning of STP; plus

iii. Cost of land requirement for STP indicated by the bidder and as determined in accordance with ITB Section 3.3(c); plus

iv. Bid Price for BOQ items and quantities, for Sewage Network; plus

v. NPV of the yearly payments due on account of O & M charges over 15 years of O & M in case of (a) STP assuming “Indicative Sewage Flow Rate for STP” reaching the STP during respective years of the Operation Period as indicated in the Appendix to Bid (Indicative Flow); (b) Sewerage Network and/or Interception & Diversion Works, and SPS(s) in line with the specified scope of work, without considering any price adjustment applicable in terms of Section 3.11c. For the purpose of determining the NPV discount factor of 10% per annum shall be applicable.

vi. For the purpose of evaluation, if operation of SPS is included in the scope of work, O&M charges referred to in v above will be determined on the basis of sewage flow projected by the Owner being pumped by SPS, as detailed year wise in the Appendix to Bid (Indicative Flow) and termed as “Indicative Sewage Flow Rate for SPS”.
d. The Owner shall compare the evaluated prices of all substantially responsive bids to determine the lowest evaluated bid.

5.6. Qualification of the Bidder

a. The Owner shall determine to its satisfaction whether the Bidder that is selected as having submitted the lowest evaluated and substantially responsive bid meets the Qualification Criteria specified in Annexure A Part h of bidding documents.

b. The determination shall be based upon an examination of the documentary evidence of the Bidder’s qualifications submitted by the Bidder, pursuant to Section 3.5 (b).

c. An affirmative determination shall be a prerequisite for award of the Contract to the Bidder. A negative determination shall result in disqualification of the bid, in which event the Owner shall proceed to the next lowest evaluated bid to make a similar determination of that Bidder’s qualifications to perform satisfactorily.

5.7. Contacting the Owner

a. From the time of bid opening to the time of Contract award, if any Bidder wishes to contact the Owner, it must do so in writing.

b. Any effort by a Bidder to influence the Owner, its advisors, employees, consultants or agents, in the Owner’s Bid evaluation, Bid comparison, or Contract award decision may, in the discretion of the Owner, result in rejection of the Bidder’s Bid.
Section 6. Award of Contract

6.1. Award Criteria

Subject to ITB Section 6.2, the Owner will award the Contract to the Bidder whose Bid has been determined, by the technical and price evaluation, to be substantially responsive, has received a “pass” in the technical evaluation, and has the lowest evaluated Bid Price, provided further that the Bidder is determined to be qualified to perform the contract satisfactorily.

6.2. Owner’s Right to Accept or Reject and Waive Irregularities

a. The Owner reserves the right to,
1. accept any Bid;
2. reject any Bid;
3. annul the bidding process and reject all Bids;
4. annul the bidding process and commence a new process; and
5. waive irregularities, minor informalities, or minor non-conformities which do not constitute material deviations in the submitted Bids from the Bidding Documents, at any time prior to the award of the Contract without incurring any liability to the affected Bidder or Bidders and without any obligation to inform the affected Bidder or Bidders of the grounds for the Owner’s actions.

b. Nothing in ITB Section 6.2(a) is intended to permit the Owner to refuse to provide reasons for rejection to an unsuccessful Bidder.

6.3. Notification of Award

Prior to the expiration of the Bid Validity Period, the Owner shall notify the Successful Bidder in writing by courier that its Bid has been accepted by the Owner (the “Notification of Award”). The effectiveness of the Contract shall be as of the date of the Owner’s signing of the Contract contingent on final approval by the NMCG.

6.4. Signing the Form of Contract

a. At the same time as the Owner sends the Successful Bidder the Notification of Award, the Owner shall send the Successful Bidder,
1. Form of Contract; and
2. the other Contract Documents.

b. Not later than 15 days after the Successful Bidder’s receipt of the Notification Award, the Form of Contract and the other Contract Documents pursuant to ITB Sections 6.3 and 6.4(a), the Successful Bidder shall sign and date the Form of Contract and initial each page of the Contract and return them to the Owner.

6.5. Performance Security

a. No later than 15 days after the Successful Bidder’s receipt of the Notification of Award, the Successful Bidder shall provide the Owner with the performance security ESHS Performance Security in the amount given in the Bid Data Sheet and in the
substance and form set out in Annexure A Part d or in another form approved by the Owner. The Performance Security and ESHS Performance Security Forms of a Joint Venture shall be in the name of Joint Venture.

b. In case if the Owner finds from the break-up of design build prices of STP and Network contained in Price Schedule Parts A and D, that the prices indicated therein are unbalanced, the successful bidder shall have to provide additional performance guarantee as may be required by the Owner for such unbalanced bid prices of value equal to 10% of such unbalanced amount.

6.6. Failure to Sign the Form of Contract or provide the Performance Security

If the Successful Bidder fails to comply with the provisions of ITB Sections 6.4(b) or 6.5, this failure shall constitute sufficient grounds for annulment of the award and forfeiture of the Bid Security and in which event the Owner may make the award to the next lowest evaluated Bidder or call for new bids.

6.7. Adjudicator

The Owner proposes that the person named in the Bid Data Sheet be appointed as Adjudicator under the contract, at a fee stated in the Bid Data Sheet. A résumé of the named person is attached to the Bid Data Sheet, as well as a description of the expenses that would be considered reimbursable. If a Bidder does not accept the Adjudicator proposed by the Owner, it should so state in its Bid Form and make a counterproposal of an Adjudicator and an hourly fee. If, on the day the Form of Contract is signed, the Owner and the Operator have not agreed on the appointment of the Adjudicator, the Adjudicator shall be appointed, at the request of either party, by the Appointing Authority specified in the Special Conditions of Contract.

6.8. Fraud and Corruption

NMCG, Owner, bidders, suppliers, Operators and their agents (whether declared or not), sub-contractor, sub-consultants, service providers or suppliers, and any personnel thereof, are required to observe the highest standard of ethics during the procurement and execution of contract.22

(a) For the purposes of this provision, the terms set forth below are defined as follows:

(i) “corrupt practice” is the offering, giving, receiving, or soliciting, directly or indirectly, of anything of value to influence improperly the actions of another party;23

(ii) “fraudulent practice” is any act or omission, including a misrepresentation, that knowingly or recklessly misleads, or attempts to mislead, a party to obtain a financial or other benefit or to avoid an obligation;24

---

22 In this context, any action to influence the procurement process or contract execution for undue advantage is improper.

23 For the purpose of this sub-paragraph, “another party” refers to a public official acting in relation to the procurement process or contract execution. In this context, “public official” includes employees of all organizations taking or reviewing procurement decisions.
(iii) “collusive practice” is an arrangement between two or more parties designed to achieve an improper purpose, including to influence improperly the actions of another party;25

(iv) “coercive practice” is impairing or harming, or threatening to impair or harm, directly or indirectly, any party or the property of the party to influence improperly the actions of a party;26

(v) "obstructive practice" is

(aa) deliberately destroying, falsifying, altering, or concealing of evidence material to the investigation or making false statements to investigators in order to materially impede an Owner’s investigation into allegations of a corrupt, fraudulent, coercive or collusive practice; and/or threatening, harassing or intimidating any party to prevent it from disclosing its knowledge of matters relevant to the investigation or from pursuing the investigation, or

(bb) acts intended to materially impede the exercise of the Owner’s inspection and audit rights provided for under ITB Section 1.4.

(vi) “restrictive practice” means forming a cartel or arriving at any understanding or arrangement among Bidders with the objective of restricting or manipulating full and fair competition in the Bid Process.

(b) The Owner will reject a proposal for award if it determines that the bidder recommended for award, or any of its personnel, or its agents, or its sub-consultants, sub-Operators, service providers, suppliers and/or their employees, has, directly or indirectly, engaged in corrupt, fraudulent, collusive, coercive, or obstructive practices in competing for the contract in question;

(c) Without prejudice to the rights of the Owner under Clause 6.8 (b) above, in the event that a Bidder is found by NMCG or the Owner to have directly or indirectly or through an officer, employee, agent or advisor engaged or indulged in any corrupt, fraudulent, collusive, coercive, undesirable or restrictive practice during the Bid Process, such Bidder will not be eligible to participate in any tender or request for qualification issued by NMCG or the Owner for 5 years, from the date such Bidder is found by NMCG or the Owner to have directly or indirectly or

24 For the purpose of this sub-paragraph, “party” refers to a public official; the terms “benefit” and “obligation” relate to the procurement process or contract execution; and the “act or omission” is intended to influence the procurement process or contract execution.

25 For the purpose of this sub-paragraph, “parties” refers to participants in the procurement process (including public officials) attempting either themselves, or through another person or entity not participating in the procurement or selection process, to simulate competition or to establish bid prices at artificial, non-competitive levels, or are privy to each other’s bid prices or other conditions.

26 For the purpose of this sub-paragraph, “party” refers to a participant in the procurement process or contract execution
through an officer, employee, agent or advisor engaged or indulged in any of the activities mentioned above.

6.9. Procurement Related Complaint

6.9.1. The procedures for making a Procurement-related Complaint are as specified in the BDS.
Bid Data Sheet

The following bid-specific data for the facility and services to be procured shall amend or supplement the provisions in the Instructions to Bidders (ITB). Whenever there is a conflict, the provisions herein shall prevail over those in the ITB.

*EA to specify the number as per requirement and quantum of work.

CVs of key staff shall be submitted along with the bid and shall be subject to approval of Owner. Bidder’s attention is drawn to Article 7.2 of Schedule 2 (Design Build Services Schedule) of the Contract which shall be applicable, if the Operator proposes to replace any Key Staff during Design & build services period.

For O&M services, qualifications and experience of the Key Staff have been specified in Article 2.6 of Schedule 3 (Operations and Maintenance Services Schedule) of Contract. The bidder shall take the same into account while submitting the Staffing Plan for O&M services with its bid.

ITB 3.3 (h)(6) Maximum percentage of sub-contracting the design-build services is 25%. However the nominated sub-contractor whose experience and qualification have been claimed for meeting the qualification criteria in accordance with stipulations in Annexure A part h shall be excluded while applying the ceiling of 25 %.

ITB 3.3 (i) The Bidder shall submit the following additional documents in its Bid:

**Code of Conduct (ESHS)**

The Bidder shall submit its Code of Conduct that will apply to Operator’s Personnel (as defined in Sub-clause 1.1.2.7 of the GC), to ensure compliance with its Environmental, Social, Health and Safety (ESHS) obligations under the contract. [Note: Complete and include the risks to be addressed by the Code in accordance with works’ requirements, e.g. risks associated with: labor influx, spread of communicable diseases, sexual harassment, gender based violence, illicit behavior and crime, and maintaining a safe environment etc.]

In addition, the Bidder shall detail how this Code of Conduct will be implemented. This will include: how it will be introduced into conditions of employment/engagement, what training will be provided, how it will be monitored and how the Operator proposes to deal with any breaches.

The Operator shall be required to implement the agreed Code of Conduct.

In addition, the Operator shall be required to submit for approval, and subsequently implement, the Operator’s Environment and Social Management Plan (O-ESMP) and management strategies and implementation plan to manage ESHS risks, in accordance with Appendix 1 to Schedule 2 (Design Build Services), that includes the agreed

BIDDER’S BID FORM

Date:
Contract No:

[Name of Contract]: (i) design and build sewage treatment plant of installed capacity …. Mld and all appurtenant structures and allied works; (ii) survey, review the designs, redesign where necessary, and build new underground sewerage network and/or diversion works with interception sewer of about …. km length including survey, design, construction of …. No. pumping stations and all appurtenant structures and allied works; and (iii) operation & maintenance of the complete works of sewage treatment plant, sewerage network and/or Interception & Diversion Works and pumping stations for a period of 15 years in ……., State of……., India.

To: [Name and address of Owner]

Gentlemen,

Having examined the Bidding Documents, including Addendum Numbers [insert numbers], the receipt of which is hereby acknowledged, we, the undersigned, offer to (i) Design, Build, Test, pre-commission and commission the STP; (ii) Review the Design, Build, Test, pre-commission and commission the Sewerage Network and/or Interception and Diversion works; and (iii) perform the subsequent Operation and Maintenance services under the above-named Contract in full conformity with the said Bidding Documents for the amounts specified in the Bidder’s Financial Bid.

We meet the eligibility requirements and have no conflict of interest in accordance with ITB 1.2.2.

We have not been suspended nor declared ineligible by the Employer based on execution of a Bid Securing Declaration in the Owner’s country in accordance with ITB 1.2.5.

We undertake, if our Bid is accepted, to commence the construction of STP and Sewerage Network and/or Interception & Diversion Works and to achieve Completion within the respective times stated in the Bidding Documents.

If our Bid is accepted, we undertake to provide an advance payment security and the Performance Security and an Environmental, Social, Health and Safety (ESHS) Performance Security in the form, in the amounts, and within the times specified in the Bidding Documents.

We are not participating, as a Bidder or as a subcontractor, in more than one bid in this bidding process in accordance with ITB 1.2.2 (e), other than alternative bids submitted in accordance with ITB 3.13;

We, including any of our subcontractors or suppliers for any part of the contract, have not been declared ineligible by the Owner, under the Owner’s country laws or official regulations;
We are not a government owned entity / We are a government owned entity but meet the requirements of ITB 1.2.4;

We have paid, or will pay the following commissions, gratuities, or fees with respect to the bidding process or execution of the Contract:

Appendix to Bid

Schedule of Adjustment Data

[Where the Contract Period (excluding the Operation and Maintenance Period) exceeds eighteen (18) months, it is normal procedure that prices payable to the Operator shall be subject to adjustment during the performance of the Contract to reflect changes occurring in the cost of labor and material components. In such cases the bidding documents shall include a formula for price adjustment in SCC 5.1.

Where Contracts are of a shorter duration than eighteen (18) months or in cases where there is to be no Price Adjustment, the following provision shall not be included.]

Bidders’ attention is drawn to the following definition provided in Schedule 8 of the Contract.

Base Date: For the purpose of Price Adjustment Clause, ‘Base Date’ shall be the date 28 days prior to the deadline for submission of bids for the contract.

In Tables “A (STP) and “B (Network and I & D)” below, the Bidder shall (a) indicate its amount of local currency payment, and (b) indicate its proposed source and base values of indices for the different foreign currency elements of cost.

**Total** | 1.00

Notes:

1. Source of Index for respective Indices shall be the same as indicated under Para 4.2 of “Schedule 8 - Price Adjustment” attached to the Contract.

2. The Bidder shall specify a value in the last column of the Table within the range indicated therein such that the total weighting = 1.00

---

<sup>40</sup> *The Owner should insert appropriate possible ranges for weighting of index [reference Schedule 8]*

<sup>41</sup> *The Owner may revise the Index and should indicate the source of index [reference Schedule 8]*
Indicative Flow Rate for STP and SPSs

Indicative Flow Rate for the purpose of evaluation of bids in accordance with ITB 5.6 (c) (v) & (vi) during the Operation Period shall be as follows:

For STP & MPS

<table>
<thead>
<tr>
<th>Year of Operations</th>
<th>Indicative Sewage Flow Rate for STP &amp; MPS (MLD)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Year One</td>
<td>...........</td>
</tr>
<tr>
<td>Year Two</td>
<td>...........</td>
</tr>
<tr>
<td>Year Three</td>
<td>...........</td>
</tr>
<tr>
<td>Year Four</td>
<td>...........</td>
</tr>
<tr>
<td>Year Five</td>
<td>...........</td>
</tr>
<tr>

</tr>
<tr>
<td>Year Thirteen</td>
<td>...........</td>
</tr>
<tr>
<td>Year Fourteen</td>
<td>...........</td>
</tr>
<tr>
<td>Year Fifteen</td>
<td>...........</td>
</tr>
</tbody>
</table>

“Indicative Flow Rate for STP” means the rate of sewage flow which is projected by the Owner to be available for treatment in the STP facility for each of the 15 years of the O&M period.

For Network

<table>
<thead>
<tr>
<th>Year of Operations</th>

</tbody>
</table>

**“Indicative Flow Rate for SPS”** means the rate of sewage flow which is projected by the Owner to be available for handling in the respective SPSs for each of the 15 years of the O&M period.
Annexure A – Part b

BIDDER’S PRICE SCHEDULES

1.1 The Price Schedules do not give a full description of the STP, Network, and O & M for 15 years and other services, to be supplied and the Services to be performed under each item. Bidders are deemed to have read the Draft Contract, including the Technical Specifications Schedule, consisting of the Design-Build Services Schedule, Operations Services Schedule and Technical Standards Schedule, and other sections of the Bidding Documents to ascertain the full scope of the requirements of the Contract included in each item prior to filling in the prices. The entered prices are deemed to include the full scope as aforesaid, including overheads and profit.

1.2 If Bidders are unclear or uncertain as to the scope of any item, they shall seek clarification in accordance with the Instructions to Bidders in the Bidding Documents prior to submitting their Bid.

1.3 Prices shall be filled in indelible ink, and any alterations necessary due to errors shall be initialled by the Bidder. As specified in the Bid Data Sheet, prices shall be fixed and firm for the duration of the Contract, except if as adjusted in accordance with the Contract.

1.4 The Bid Price shall be quoted in the manner indicated and in the currencies specified in the Instructions to Bidders in the Bidding Documents. For each item, Bidders shall complete each appropriate column in the respective Schedules, giving the price breakdown as indicated in the Schedules.

1.5 Bidder shall submit with its bid details evidencing that the cost claimed for the payment is based on a realistic assessment of setting up the STP and Sewerage Network and/or Interception & Diversion Works. The Owner shall have the option to seek further details including details of costs of similar contracts executed by the Bidder in the past.

1.6 Prices given in the Schedules Part A to Part E against each item shall be for the scope covered by that item as detailed in the Draft Contract or elsewhere in the Bidding Documents.

1.7 The Owner will make payments in INR only.

1.8 The Bidder shall provide separate table giving details of taxes, duties, levies and other applicable taxes considered by him and included in the prices offered under different Parts of the Price Schedules. Goods and Service Tax shall not be included in the prices and the same shall be paid separately by the Owner if applicable against proof of applicability and payment.

FORM OF BID SECURITY (BANK GUARANTEE)

WHEREAS, ...........................(name of Bidder including names of all Joint Venture Participants) (hereinafter called “the Bidder”) has submitted its Bid (hereinafter called the “Bid”) dated (date) for the performance of (name of Contract).

KNOW ALL PEOPLE by these presents that We .................... (name of Bank) of .................... (name of country) having our registered office at .................... (hereinafter called “the Bank”) are bound unto .................... (hereinafter called “the Owner”) in the sum of ....................for which payment well and truly to be made to the said Owner, the Bank binds itself, its successors, and assigns by these presents.

[The Bidder should insert the amount of the guarantee in words and in figures. This figure should be the same amount as set out in ITB Section 3.4 (a) and the Bid Data Sheet. The details related to the Bid Security are set out in the same ITB Section 3.4.]

The CONDITIONS of this obligation are:

a. if the Bidder withdraws its Bid during the Bid Validity Period; or

b. if the Bidder, having been notified of the acceptance of its Bid by the Owner during the period of Bid validity,
   1. fails to sign the Form of Contract in accordance with and when required by ITB Section 6.4; or
   2. fails to provide the performance security to the Owner in accordance with and when required by ITB Section 6.5.

We undertake to pay to the Owner up to the above amount upon receipt of its first written demand, without the Owner having to substantiate its demand, provided that in its demand the Owner will note that the amount claimed by it is due to it owing to the occurrence of one or more of the conditions set out above, specifying the occurred condition or conditions.

This Guarantee will remain in full force up to and including 45 days after the expiry of the Bid Validity Period and it may be extended by the Owner in accordance with the Bidding Documents, notice of which extension(s) to the Bank is hereby waived. Any demand in respect of this Guarantee should reach the Bank not later than the above date or the extended date.

This guarantee is subject to the Uniform Rules for Demand Guarantees (URDG) 2010 Revision, ICC Publication No. 758 except that the supporting statement under Article 15(a) is hereby excluded.

SEALED with the Common Seal of the said
Bank this ... day of .................., [Year].

FORM OF PERFORMANCE SECURITY

________________________ [Bank’s Name, and Address of Issuing Branch or Office]

Beneficiary: ____________________ [Name and Address of Owner]

Date: _________________________

PERFORMANCE GUARANTEE NO.: __________________

We have been informed that ______[name of Operator] (hereinafter called “the Operator”) has entered into Contract No. ______[reference number of the contract] dated _____ with you, concerning a contract to Design, build, operate and transfer STP, Sewerage Network, Pumping Stations, all appurtenant structures and allied works in ……….[city and State](hereinafter called “the Contract”).

Furthermore, we understand that, according to the conditions of the Contract, a performance guarantee is required.

At the request of the Operator, we ______[name of Bank] hereby irrevocably undertake to pay you any sum or sums not exceeding in total an amount of ______[amount in figures] (____) [amount in words], upon receipt by us of your first demand in writing accompanied by a written statement stating that the Operator is in breach of its obligations under the Contract, without your needing to prove or to show grounds for your demand or the sum specified therein.

This guarantee shall expire no later than the earlier of:

(a) six months after the End Date, as defined in the Contract; or
(b) six months after the date of termination of the Contract pursuant to its terms.

Consequently, any demand for payment under this guarantee must be received by us at this office on or before that date.

This guarantee is subject to the Uniform Rules for Demand Guarantees (URDG) 2010 Revision, ICC Publication No. 758 except that the supporting statement under Article 15(a) is hereby excluded.

Yours truly,

[Name of Bank]_______________________________

Annexure A – Part d1
Environmental, Social, Health and Safety (ESHS) Performance Security

ESHS Performance Security

[Guarantor letterhead or SWIFT identifier code]

Beneficiary: [insert name and Address of Employer]

Date: _ [Insert date of issue]

ESHS PERFORMANCE GUARANTEE No.: [Insert reference number]

Guarantor: [Insert name and address of place of issue, unless indicated in the letterhead]

We have been informed that ________________ (hereinafter called "the Applicant")
has entered into Contract No. _____________ dated ____________ with the
Beneficiary, for the execution of ____________________ (hereinafter called "the
Contract").

Furthermore, we understand that, according to the conditions of the Contract, a
performance guarantee is required.

At the request of the Applicant, we as Guarantor, hereby irrevocably undertake to pay
the Beneficiary any sum or sums not exceeding in total an amount of ___________ ( ),
such sum being payable in the types and proportions of currencies in which the
Contract Price is payable, upon receipt by us of the Beneficiary’s complying demand
supported by the Beneficiary’s statement, whether in the demand itself or in a separate
signed document accompanying or identifying the demand, stating that the Applicant is
in breach of its Environmental, Social, Health and/or Safety (ESHS) obligation(s) under
the Contract, without the Beneficiary needing to prove or to show grounds for your
demand or the sum specified therein.

This guarantee shall expire, no later than the …. Day of ……, 2…. , and any demand
for payment under it must be received by us at this office indicated above on or before
that date.

1 The Guarantor shall insert an amount representing the percentage of the Accepted Contract
   Amount specified in the Letter of Acceptance, less provisional sums, if any, and denominated
either in the currency (cies) of the Contract or a freely convertible currency acceptable to
the Beneficiary.

2 Insert the date twenty-eight days after the expected completion date as described in GC
   Clause 11.9. The Employer should note that in the event of an extension of this date for
completion of the Contract, the Employer would need to request an extension of this
guarantee from the Guarantor. Such request must be in writing and must be made prior to
the expiration date established in the guarantee. In preparing this guarantee, the Employer
might consider adding the following text to the form, at the end of the penultimate
paragraph: “The Guarantor agrees to a one-time extension of this guarantee for a period
This guarantee is subject to the Uniform Rules for Demand Guarantees (URDG) 2010 Revision, ICC Publication No. 758, except that the supporting statement under Article 15(a) is hereby excluded.

Annexure A – Part g

Eligible Countries

Eligibility for the Provision of Goods, Works and Non Consulting Services

In reference to ITB 1.3, for the information of the Bidders, at the present time firms, goods and services from the following countries are excluded from this bidding process:

Under 1.3: None
Annexure A – Part h

QUALIFICATION CRITERIA

Section 1. QUALIFICATION CRITERIA

1.1. General

a. Evaluation of the Bidders’ qualifications will be based on compliance with all the following minimum pass-fail criteria regarding their general Design, build, construct, operation and maintenance experience of Sewage Treatment Plant and Sewerage Network, and/or Interception & Diversion Works, financial strength, personnel and management capabilities, and other relevant information as demonstrated by the Bidders’ responses in the Information Forms that they submit as per the attached Bid Forms. Additional requirements for joint ventures are given in Section 2.

b. Bidders may submit the Bid either as,

1. A stand-alone firm, company, legal entity formed as per the applicable law; or

2. A joint venture of up to a maximum of 4 partners\(^\text{60}\)

provided that they meet the requirements of the Bidding Documents. For the purpose of assessing some qualification criteria, the qualifications and experience of Sub-Contractors may be included and the specific provisions in this regard are set out in Section 1.3.

1.2. Subcontracting

a. Bidders will be evaluated based on the qualifications of,

1. the Bidder; and

2. nominated Sub-Contractors and Sub-Consultants only with respect to the experience evaluation as set out in Section 1.3, and only if the Sub-Contractors and Sub-Consultants are nominated for the purpose of this bid.

For the purposes of Section 1.6, Bidders may nominate personnel of Sub-Contractors and Sub-Consultants to fill the key positions, during the Design-Build Period and O&M period, as listed/referred to in the BDS - ITB 3.3 (h) (4).

b. The Bidder shall provide a detailed list of all nominated Sub-Contractors and Sub-Consultants and a record of their experience and qualifications in the applicable Information Forms. The Operator under the Contract shall be prohibited from entering into a contract or contracts that will result in the Operator exceeding the maximum

\(^{60}\text{Maximum number of JV partners may be changed depending on specific requirements of the work and the figure should be consistent with BDS – ITB 1.2.1.}\)
percentage of subcontracting and sub-consulting permitted by the Owner, as set out in the BDS - ITB 3.3 (h) (6).

c. Bidders will not be permitted to change the Sub-Contractors and Sub-Consultants nominated in their Bid.

1.3. Operator’s Responsibility

After award of the Contract, the subcontracting of any part of the work, except for those Sub-Contractors and Sub-Consultants nominated in the Bid, shall require the prior written consent of the Owner. Notwithstanding such consent, the Operator shall remain responsible for the acts, defaults, and neglects of all Sub-Contractors and Sub-Consultants during Contract implementation.

1.4. Experience in Construction and Operation and Maintenance of Sewage Treatment Plant and Sewerage Network and/or Interception & Diversion Works

For the purpose of determining a bidder’s compliance with the qualification criteria specified in Annexure A – Part h, following definitions shall apply:

“Sewage Treatment Plant (STP) means a treatment facility designed, developed and constructed, and operated for primary and secondary treatment of sewage for its safe disposal complying with the regulatory norms. Waste stabilization pond / other pond process will not be covered under this definition”; and

“Sewerage Network” means the pipe line network laid for collecting the Sewage from consumer connections including ‘nallahs’, main, trunk, secondary lines from the individual take over points of the Consumers up to the Sewage Treatment Plant and including Sewage lifting and pumping stations and all appurtenant structures forming a part of both the New Sewerage Network and the Existing Sewerage Network”.

“Interception & Diversion Works” means the diversion structure across nallah/drain along with intercepting sewer laid for conveying the sewage from nallah/drains up to the Sewage Treatment Plant and including Sewage lifting and pumping stations and all appurtenant structures forming a part of both the New/Existing Sewerage Infrastructure.

(a) The Bidder shall provide evidence that

1. The Bidder shall provide evidence that it has Designed, developed, built, tested and commissioned during last 7 years preceding the month of publication of NIT, STPs as per following criteria:

1.a ) ≤50 MLD Capacity; [Nearest lower integer]

1. 1 STP – 80 % of Total capacity (MLD)
2. 2 STP – 60 % of Total capacity (MLD)
3. 3 STP – 40 % of Total capacity (MLD)
1.b) 51-100 MLD Capacity: \([\text{Nearest lower integer}]\)
1 STP – 60 % of Total capacity (MLD)
2 STP – 40 % of Total capacity (MLD)
3 STP – 30 % of Total capacity (MLD)

1.c) 100-150 MLD Capacity: \([\text{Nearest lower integer}]\)
1 STP – 50 % of Total capacity (MLD)
2 STP – 40 % of Total capacity (MLD)
3 STP – 25 % of Total capacity (MLD)

1.d) >150 MLD Capacity:
Case to Case basis

In case of special treatments, tertiary treatment etc. The Qualification Criteria maybe suitably modified on case to case basis

2. The bidder or his nominated sub-contractor has successfully commissioned at least one Sewage Treatment Plant with the same technology as proposed for this contract for the lowest STP capacity mentioned in clause 1.4 (a) 1. above, operating successfully for a period of 1 year during the last 7 years preceding the month of publication of NIT. In case of special treatments, tertiary treatment etc. The Qualification Criteria maybe suitably modified on case to case basis

3. The Bidder has the experience in operating and maintaining successfully STPs as per following criteria during 1 year over the last 7 years preceding the month of publication of NIT

1.a) <50 MLD Capacity: \([\text{Nearest lower integer}]\)
1 STP – 80 % of Total capacity (MLD)
2 STP – 60 % of Total capacity (MLD)
3 STP – 40 % of Total capacity (MLD)

1.b) 51-100 MLD Capacity: \([\text{Nearest lower integer}]\)
1 STP – 60 % of Total capacity (MLD)
2 STP – 40 % of Total capacity (MLD)
3 STP – 30 % of Total capacity (MLD)

1.c) 100-150 MLD Capacity: \([\text{Nearest lower integer}]\)
1 STP – 50 % of Total capacity (MLD)
2 STP – 40 % of Total capacity (MLD)
3 STP – 25 % of Total capacity (MLD)

1.d) >150 MLD Capacity:
Case to Case basis

In case of special treatments, tertiary treatment etc. The Qualification Criteria maybe suitably modified on case to case basis
4. The treatment technology proposed for this contract has been adopted (not necessarily built by the bidder) in at least 3 locations during last 7 years preceding the month of publication of NIT and that such STP has been operating successfully (meeting the required performance standards and environmental norms specified in the Contract) for a period of minimum 2 years over a period of last 7 years preceding the month of publication of NIT.

5. It has designed, developed, built, tested and commissioned Sewerage Network and Pumping Station(s) of 80% length of the total scope of sewerage network collectively from maximum 3 projects during the last 7 years preceding the month of publication of NIT; of which 50 % should be above the pipe diameter (mm) of the highest dimension as proposed in the project scope as per the following criteria:
   - Up to 500mm – same dia or any higher diameter
   - 500-1000mm – next lower dia (Maximum by 100mm) or higher diameter
   - 1000 – 1500mm – next to next lower dia (Maximum by 200 mm) or higher diameter
   - >1500mm- Case to case basis shall be decided

6. The bidder or his nominated sub-contractor has operated and maintained Sewerage Network and Pumping station of 80% length of the total scope of sewerage network collectively from maximum 3 projects during 1 year over the last 7 years preceding the month of publication of NIT.

7. The bidder or his nominated sub-contractor has designed, built and commissioned Sewerage Network using trenchless technology for a minimum of 50% of the proposed length of the network to be laid using trenchless technology, during the last 7 years preceding the month of publication of NIT.

1.5. **Financial Capabilities**

c. The Bidder shall demonstrate that it possesses a net worth equivalent to minimum of INR _____ Cr. or US$ .......in each of the last three financial years preceding the date of submission of bid.

d. The Bidder shall demonstrate by submitting along with its bid, a banker’s certificate that it has available cash credit facility equivalent

---

61 This clause 1.4(a) (3) is to be included only if trenchless technology is required to be used in the work.

62 Specify amounts in INR only in case of NCB

63 The net worth is recommended to be 25% of the estimated Capital Cost for which the bids are being invited.
to minimum INR ... million or US $ ..... million\textsuperscript{64} as on the date of submission of bid.

e. The Bidder’s audited balance sheets or, if not required by the laws of the Bidder’s country, other financial statements acceptable to the Owner, for the last five years shall be submitted and must demonstrate the current soundness of the Bidder’s financial position and indicate its prospective long-term profitability. If deemed necessary by the Owner, the Owner shall have the authority to make inquiries with the Bidder’s bankers.

1.6. **Personnel Capabilities**

The Bidder shall supply general information on the management structure of the firm, and shall make provision for suitably qualified personnel to fill the key positions listed/referred to in the BDS – ITB 3.3 (h) (4), as required during Contract implementation. The Bidder shall supply information on a candidate for each key position, who shall meet the experience requirements specified. The Bidder may nominate personnel of sub-contractors and sub consultants to fill key positions listed/referred to in the BDS – ITB 3.3 (h) (4).

1.7. **Litigation History, Legal Matters and ESHS Performance**

The Bidder shall provide accurate information on the “Historical Contract Non-Performance Form” and “Environmental Social Health and Safety (ESHS) Performance Declaration” about contract non-performance, pending litigation and ESHS performance with respect to contracts completed or ongoing under its execution over the last five years. A consistent history of awards against the Bidder or any Partner of a joint venture may result in rejection of the Bid.

1.8. **Right to Waive**

The Owner reserves the right to waive minor deviations in the qualification criteria if they do not materially affect the capability of a Bidder to perform the Contract.

**Section 2. JOINT VENTURES**

2.1. **Qualification Criteria**

a. The Joint Venture partners shall together satisfy the criteria specified in Sections 1.4 (a) (1), 1.4(a) (3) and 1.4 (a) (5).

b. The joint venture partners or nominated sub-contractor(s) shall satisfy the requirements specified in Sections 1.4(a) (2), 1.4 (a) (6) and 1.4 (a) (7).

\textsuperscript{64} This amount should be equivalent to estimated average cash flow for 3 months in construction period.
c. The Joint Venture partners shall jointly satisfy all the requirements specified in Section 1.4 of Qualification Criteria.

d. For the purpose of satisfying the qualification criteria set out in Section 1.5, Joint Venture partners must satisfy the following qualification criteria:

1. financial soundness
   a. as stated in Section 1.5(a) for all partners jointly
   b. as stated in Section 1.5 (c) in respect of each partner of the JV;

2. adequate sources to meet financial commitments as set out in Section 1.5 (b) for all partners jointly;

3. personnel capabilities as stated in Section 1.6 for all partners jointly; and

4. legal disclosure as stated in Section 1.7 for each partner of the JV.

e. Each partner of a joint venture Bidder shall provide the information to evidence compliance with the criteria set out in Sections 2.2(a) to (d).

2.2. (a) Lead Partner

One of the joint venture Partners who is responsible for performing a key function in contract management or in executing a major component of the proposed Contract shall be nominated as being in charge during the bidding process and, in the event of a successful bid, during Contract execution (the “Lead Partner”). The Lead Partner shall be authorized to incur liabilities and receive instructions for and on behalf of any and all partners of the joint venture. This authorization shall be evidenced by the submission of a power of attorney signed by legally authorized signatories of each of the joint venture Partners as per proforma enclosed in Annexure A - Part L, as part of the Bid.

(b) All Partners

All partners of the joint venture shall be liable jointly and severally for the execution of the Contract in accordance with the Contract terms and a copy of the undertaking as per format provided under Annexure A - Part M signed by the joint venture partners shall be submitted with the bid.
Annexure A – Part i

INFORMATION FORMS

Information Form (1)

General Information

All individual firms and each participant in a joint venture submitting the bids are required to complete the information in this form. Nationality information should be provided for all Bidders that are partnerships or individually owned firms.

If the Bidder proposes to use nominated sub-contractors or sub-consultants, the following information should also be supplied for the sub-contractor(s) and sub-consultant(s).

INFORMATION FORM (2A)
(Ref. Annexure A Part h Section 1.5)

Financial Capability Information*

Name of Bidder or participant of a joint venture

All individual firms and all participants of a joint venture are requested to complete the information in this form with regard to their experience in Designing, building, operating, managing and maintaining STPs and Sewerage Networks and/or Interception and Diversion Works. The information supplied should be the annual turnover of the Bidder (or each partner of a joint venture) in terms of the amounts billed to clients for each year for work in progress or completed, converted to INR at the rate of exchange at the end of the period reported. The annual periods should be calendar years, with partial accounting for the year up to the date of submission of Applications.

Use a separate sheet for each participant of a joint venture.

Bidders should not enclose testimonials, certificates, and publicity material with their Application as they will not be taken into account in the evaluation of qualifications.

Annual financial data (in the area of infrastructure development and engineering construction).

# Instructions and Applicable Conditions:

1. The applicant shall provide details of its own financial capacity;

2. The Applicant / its constituent Joint Venture Partners shall attach copies of balance sheets, financial statements and Annual report for 5 (five) years preceding the Application due date. The financial statements shall:
   a. Reflect the financial situation of the Bidder or Joint Venture Partners,
   b. Be audited by a statutory auditor
   c. Be complete including all notes to the Financial statements; and
   d. Correspond to accounting periods already completed and audited (no statements for partial periods shall be requested or accepted)

3. Net Worth (The definition of Net Worth shall be as follows: Based on the type of the Applicant whether a company, partnership firm, etc. the net worth is defined as follow:
   a. In case of a company registered under Companies Act, 1956: Net worth shall mean the sum of subscribed and paid up equity share capital and reserves from which shall be deducted the sum of revaluation reserves,
miscellaneous expenditure not written off and reserves not available for distribution to equity share holders.

For the company = (Subscribed and Paid-up Equity + Reserves) less (Revaluation reserves + miscellaneous expenditure not written off + reserves not available for distribution to equity share holders).

b. In case of a Partnership firm: Net worth shall mean the sum of Aggregate of partners' capital account and Reserves from which the aggregate of drawings by partners and aggregate of advances to partners shall be deducted.

For Partnership Firm = Aggregate of partners' capital account + Reserves - Aggregate of drawings by partners - Aggregate of advances to partners

c. In case of a Trust / Society: Net worth shall mean the sum of corpus and the returns not set aside for any particular purpose.

For Trust / Society = corpus + returns not set aside for any particular purpose

4. Net Cash Accruals shall be defined as follows: Net Cash Accruals = Profit after Tax + Depreciation;

5. Year 1 will be the latest completed financial year, preceding the bidding. Year 2 shall be immediately preceding year 1 and so on. In case the Bid Submission date falls within 3 (three) months of the close of the latest financial year of the applicant, it shall ignore such financial year for the purpose of its bid and furnish all its information and certification with reference to the 5 (five) years preceding its latest financial year. For the avoidance of doubt, financial year shall, for the purpose of the Bid hereunder, mean the accounting year followed by the Bidder in the course of its normal business.

6. The Bidder shall provide an Auditor's Certificate specifying the Net Worth and Net Cash Accruals of the Bidder and also specifying the methodology adopted for calculating such net worth in accordance with the formula mentioned in point 3 and 4 above.

7. The Bidder shall provide from its concerned client(s) or Statutory Auditor, certificate(s) stating the payments made / received or works commissioned, as the case may be, during the past 5 (five) years in respect of the Projects specified in Information Forms 2, 3A and 3B.

Declaration regarding customs/excise duty exemption for materials to be purchased for use in setting up the facility

(Bidder’s Name and Address)

To:

---------------------------------------------------------------

Dear Sir:

Ref: Setting up the Sewerage Network and/or Interception and Diversion Works and STP facility of …… MLD capacity at …………….. – Certificate for Import/Procurement of Goods and materials/Construction Equipment.

1. We confirm that we are solely responsible for obtaining GST/customs/excise duty waivers which we have considered in our bid and in case of failure to receive such waivers for reasons whatsoever, the Owner will not compensate us.

5. We agree that the certificate will be issued only to the extent considered reasonable by the Owner for the work, based on the bid submitted by us, construction programme and methodology furnished along with the bid.

6. We confirm that the goods will be exclusively used for the construction of the above work. We are aware that exemption will be issued to only goods/material/equipment which form part of the work on permanent basis but not for the goods/material/equipment which are used by the Operator for execution of project and after completion of the project, the goods remain with the Operator being Owners of such goods for further deployment in other projects.

FORM OF LETTER OF INTENT BY JV PARTNERS TO ENTER INTO JV AGREEMENT

THIS LETTER OF INTENT signed on this.......... day of........... Two Thousand and ...............by...... a company incorporated under the laws of ............ and having its Registered Office at ...................(hereinafter called the "Party No.1" which expression shall include its successors, executors and permitted assigns) and M/s ............. a company incorporated under the laws of ............ and having its Registered Office at ...........(hereinafter called the "Party No.2" which expression shall include its successors, executors and permitted assigns) and M/s ............. a Company incorporated under the laws of ............ and having its Registered Office at ............... (hereinafter called the "Party No.3" which expression shall include its successors, executors and permitted assigns) for the purpose of making a bid and entering into a contract [hereinafter called the "Contract" (in case of award) against the work for the design and build Sewage Treatment Plant and Sewerage Network and/or Interception and Diversion works and all Appurtenant Structures and Allied Works, and O & M of Complete Works associated with .................... .................(hereinafter called the "Owner").

WHEREAS the Party No.1, Party No.2 and Party No.3 intend to enter into a Joint Venture Agreement

AND WHEREAS the Owner invited bids as per the above mentioned Specification to design and build Sewage Treatment Plant and Sewerage Network and all Appurtenant Structures and Allied Works, and O & M of Complete Works stipulated in the bidding documents.

AND WHEREAS ITB Clause 3.6 and Annexure A Part h Qualification Criteria forming part of the bidding documents, inter-alia, stipulates that two or more qualified partners, meeting the requirements of 'Qualification Requirement of the Bidder', as applicable may bid, provided, they submit a Letter of Intent to enter into Joint Venture Agreement and the Joint Venture Partners fulfill all other requirements under ITB Clause 5.7 'Qualification of the Bidder’ and in such a case, the Letter of Bid (Bid Form) shall be signed by the Partner - In Charge so as to legally bind all the Partners of the Joint Venture, who will be jointly and severally liable to perform the Contract by entering into Joint Venture Agreement as per proforma submitted with the Bid in accordance with ITB 3.6 which will be legally binding on all partners and all obligations hereunder.

The above clause further states that this Letter of Intent shall be attached to the bid and the Contract performance guarantee will be as per the format enclosed with the bidding document without any restrictions or liability for either party.
AND WHEREAS the bid is being submitted to the Owner vide proposal No........dated...... by Party No.1 based on this letter of Intent between all the parties; under these presents and the bid has been signed by all the parties.

NOW THIS UNDERTAKING WITNESSETH
AS UNDER:

In consideration of the above premises and agreements all the parties of this letter of Intent do hereby declare and undertake:

1. In requirement of the award of the Contract by the Owner to the Joint Venture Partners, we, the Parties do hereby undertake that M/s........... the Party No.1, shall act as lead Partner and further declare and confirm that we the parties to the Joint Venture shall jointly and severally be bound unto the Owner for the successful performance of the Contract and shall be fully responsible for the design and build Sewage Treatment Plant and Sewerage Network and/or Interception and Diversion works and all Appurtenant Structures and Allied Works, and O & M of Complete Works accordance with the Contract for which we shall enter into Joint Venture Agreement as per proforma submitted with the Bid which will be legally binding on all partners:

2. If the Contract is awarded to Joint Venture then in case of any breach or default of the said Contract by any of the parties to the Joint Venture, the party(s) will be fully responsible for the successful performance of the Contract and to carry out all the obligations and responsibilities under the Contract in accordance with the requirements of the Contract.

3. Further, if the Owner suffers any loss or damage on account of any breach in the Contract or any shortfall in the performance of the equipment in meeting the performances guaranteed as per the specification in terms of the Contract, the Party(s) of these presents will promptly make good such loss or damages caused to the Owner, on its demand without any demur. It shall not be necessary or obligatory for the Owner to proceed against lead Partner to these presents before proceeding against or dealing with the other Party(s), the Owner can proceed against any of the parties who shall be jointly and severally liable for the performance and all other liabilities/obligations under the Contract to the Owner.

4. The financial liability of the Parties of the Deed of Undertaking to the Owner in the event of award of Contract on the Joint Venture, with respect to any of the claims a rising out of the performance or non-performance of the obligations set forth in the Deed of Undertaking, read in conjunction with the relevant conditions of the Contract shall, however not be limited in any way so as to restrict or limit the liabilities or obligations of any of the Parties of the Deed of Undertaking.

5. It is expressly understood and agreed between the Parties to this Letter of Intent that the responsibilities and obligations of each of the Parties shall be as delineated in Appendix- I (to be suitably appended by the Parties along with this Letter of Intent in its bid). It is further undertaken by the parties
that the above sharing of responsibilities and obligations shall not in any way be a limitation of joint and several responsibilities of the Parties under the Contract in the event of award on Joint Venture.

6. It is also understood that this Letter of Intent is provided for the purposes of undertaking joint and several liabilities of the partners to the Joint Venture for submission of the bid and performance of the Contract if awarded and that this Letter of Intent shall not be deemed to give rise to any additional liabilities or obligations, in any manner or any law, on any of the Parties to this Letter of Intent or on the Joint Venture, other than the express provisions of the Contract.

7. This Letter of Intent shall be construed and interpreted in accordance with the provisions of the Contract.

8. In case of an award of a Contract, we the parties to this Letter of Intent do hereby agree that we shall enter into Joint Venture Agreement as per proforma submitted with the Bid which will be legally binding on all partners and we shall be jointly and severally responsible for furnishing a Contract performance security from a bank in favor of the Owner in the currency/currencies of the Contract.

9. It is further agreed that this Letter of Intent shall be irrevocable and shall form an integral part of the bid. It shall be effective from the date first mentioned above for all purposes and intents.

IN WITNESS WHEREOF, the Parties to this Letter of Intent have through their authorized representatives executed these presents and affixed Common Seals of their companies, on the day, month and year first mentioned above.

(hereinafter called the "Owner").

WHEREAS the Party No.1, Party No.2 and Party No.3 have entered into an Agreement dated ..............

AND WHEREAS the Owner invited bids as per the above mentioned Specification to design and build Sewage Treatment Plant and Sewerage Network and/or Interception and Diversion works and all Appurtenant Structures and Allied Works, and O & M of Complete Works stipulated in the bidding documents.

AND WHEREAS ITB Clause 3.6 and Annexure A Part h Qualification Criteria forming part of the bidding documents, inter-alia, stipulate that an undertaking of two or more qualified partners, meeting the requirements of ‘Qualification Criteria of the Bidder’, as applicable may bid, provided, the Joint Venture fulfills all other requirements under Clause 5.7 ‘Qualification of the Bidder’ and in such a case, the Letter of Bid (Bid Form) shall be signed by the Partner - In Charge so as to legally bind all the Partners of the Joint Venture, who will be jointly and severally liable to perform the Contract and all obligations
The above clause further states that this Undertaking shall be attached to the bid and the Contract performance guarantee will be as per the format enclosed with the bidding document without any restrictions or liability for either party.

AND WHEREAS the bid is being submitted to the Owner vide proposal No........dated...... by Party No.1 based on this Undertaking between all the parties; under these presents and the bid in accordance with the requirements of ITB Clause 3.6 and Annexure A Part h Qualification Criteria, has been signed by all the parties.

NOW THIS UNDERTAKING WITNESSETH AS UNDER:

In consideration of the above premises and agreements all the parties of this Deed of Undertaking do hereby declare and undertake:

1. In requirement of the award of the Contract by the Owner to the Joint Venture Partners, we, the Parties do hereby undertake that M/s........ the Party No.1, shall act as Lead Partner and further declare and confirm that we the parties to the Joint Venture shall jointly and severally be bound unto the Owner for the successful performance of the Contract and shall be fully responsible to design and build Sewage Treatment Plant and Sewerage Network and/or Interception and Diversion works and all Appurtenant Structures and Allied Works, and O & M of Complete Works in accordance with the Contract.

2. In case of any breach or default of the said Contract by any of the parties to the Joint Venture, the parties do hereby undertake to be fully responsible for the successful performance of the Contract and to carry out all the obligations and responsibilities under the Contract in accordance with the requirements of the Contract.

3. Further, if the Owner suffers any loss or damage on account of any breach in the Contract or any shortfall in the performance of the equipment in meeting the performances guaranteed as per the specification in terms of the Contract, the Party(s) of these presents undertake to promptly make good such loss or damages caused to the Owner, on its demand without any demur. It shall not be necessary or obligatory for the Owner to proceed against Lead Partner to these presents before proceeding against or dealing with the other Party(s), the Owner can proceed against any of the parties who shall be jointly and severally liable for the performance and all other liabilities/obligations under the Contract to the Owner.

4. The financial liability of the Parties of this Deed of Undertaking to the Owner, with respect to any of the claims arising out of the performance or non-performance of the obligations set forth in this Deed of Undertaking, read in conjunction with the relevant conditions of the Contract shall, however not be limited in any way so as to restrict or limit the liabilities or obligations of any of the Parties of this Deed of Undertaking.

5. It is expressly understood and agreed between the Parties to this Undertaking that
the responsibilities and obligations of each of the Parties shall be as delineated in Appendix - I (to be suitably appended by the Parties along with this undertaking in its bid). It is further undertaken by the parties that the above sharing of responsibilities and obligations shall not in any way be a limitation of joint and several responsibilities of the Parties under the Contract.

6. It is also understood that this Undertaking is provided for the purposes of undertaking joint and several liabilities of the partners to the Joint Venture for submission of the bid and performance of the Contract if awarded and that this Undertaking shall not be deemed to give rise to any additional liabilities or obligations, in any manner or any law, on any of the Parties to this Undertaking or on the Joint Venture, other than the express provisions of the Contract.

7. This Undertaking shall be construed and interpreted in accordance with the provisions of the Contract. 

8. In case of an award of a Contract, we the parties to this Deed of Undertaking do hereby agree that we shall be jointly and severally responsible for furnishing a Contract performance security from a bank in favour of the Owner in the currency/currencies of the Contract.

9. It is further agreed that this Deed of Undertaking shall be irrevocable and shall form an integral part of the bid and shall continue to be enforceable till the Owner discharges the same or upon the completion of the Contract in accordance with its provisions, whichever is earlier. It shall be effective from the date first mentioned above for all purposes and intents.

IN WITNESS WHEREOF, the Parties to this Deed of Undertaking have through their authorized representatives executed these presents and affixed Common Seals of their companies, on the day, month and year first mentioned above.

GENERAL CONDITIONS OF CONTRACT

ARTICLE 1. CONTRACT AND INTERPRETATION

1.1. Definitions

Unless the context otherwise requires, the following terms wherever used in this Contract have the following meanings:

“Adjudicator” means the person that is named in the SCC;

“Applicable Law” means the laws and any other instruments having the force of law in the Country specified in the SCC, as they may be issued and in force from time to time, including any decree of the President or government of the Country;

“Appointing Authority” is the authority specified in the SCC;

“Authorities” means the Owner, ULB and the Country as specified in the SCC;

“Background Information Document” means the Background Information Document provided to the Operator by the Owner during the bidding process that preceded this Contract;

“Bidding Documents” means the documents issued by the Owner in respect of the bidding process for the selection of an operator to Design, build and operate the Project Facility and to perform the Services;

“Capital Investment Program” means the capital investment program of the Owner, if any, referred to in OSA Section 10.2(2);

“Change” is defined in GC Section 10.1.1(1);

“Change Order” is defined in GC Section 10.1.2(4);

“Completion” means that the Project Facility and all Design-Build Services have been completed operationally and structurally and put in a tight and clean condition in accordance with the Technical Standards Schedule, and the Operator is entitled to have an Operational Acceptance Certificate issued in respect of the Project Facility, or part thereof, in accordance with DBSS Section 6.3;

“Operational Acceptance Certificate” means a certificate issued by the Design-Build-Operations Engineer in accordance with DBSS Section 6.3;

“Contract” means the agreement between the Owner and the Operator which consists of the Contract Documents;

“Contract Documents” means the Form of Contract, General Conditions, and all appendices to the General Conditions as set out in GC Section 1.2;

“Contract Price” is defined in Section 2.1 of the Form of Contract;

“Contract Records” is defined in GC Section 1.8.1(1);
“Contract Term” means the term of the Contract, including any renewals approved by the Owner, commencing on the Effective Date and continuing to, and including, the End Date;

“Costs” means all expenditures reasonably incurred, or to be incurred, by the Operator including overhead but excluding profit;

“Country” means the country specified in the SCC;

“Customers” mean all persons to which the Operator provides services, including those customers in existence as of the Operations Starting Date and persons who become customers after the Operations Starting Date;

“Data Room” means the data room which may be established by the Owner in the bidding process as set out in the Bidding Documents;

“DBSS Section” means Design-Build Services Schedule Section;

“Design-Build Documents” means the plans, specifications, designs, models, electronic models and other documents and materials relating to the design and construction of the Site and Project Facility as may be set out or contemplated in the Design-Build Services Schedule or agreed to by the Parties from time to time during the Contract Term;

“Design-Build-Operations Engineer” means the Consultant or Owner’s representative retained by the Owner to supervise the Operator, in accordance with the Contract Documents, in carrying out the Design-Build and Operations Services;

“Design-Build Period” is defined in GC Section 2.2(a);

“Design-Build Services” means the Design-build services to be performed by the Operator as contemplated by the General Conditions and the Design-Build Services Schedule;

“Design-Build Starting Date” is defined in GC Section 2.1.3(1);

“Discharge Point” means the point at which the Residual Treated Water is discharged from the treatment plant, and where the sample of the Residual Treated Water shall be drawn periodically for the purpose of testing it for conformity with the Discharge Standards;

“Effective Date” means the date on which this Contract comes into force and effect pursuant to GC Section 2.1.1;

“End Date” is defined in GC Section 2.1.2;

“Environmental Management Plan (EMP)” – A set of mitigation measures to be implemented by the DBO Operator as indicated in [Please insert reference of the Schedule/Section of the bidding document where EMP have been specified] which shall be implemented by the Operator;

“Environmental, Social, Health and Safety Management Plan”– A set of mitigation and management measures to be implemented by the DBO operator as indicated in
Appendix 1 Schedule 2 (design Build Services) which shall be implemented by the Operator;

“Existing Sewerage Network” shall mean the existing Sewerage Network in location specified in SCC and of length indicated in SCC that is included in the scope of work for repair and refurbishment/integration with proposed network as a part of the Contract.

“Extension Date” is defined in GC Section 2.4.3;

“Force Majeure” is defined in GC Section 9.8(1);

“GC Section” means General Conditions of Contract Section;

“including” means including without limitation and “includes” means includes without limitation, unless expressly stated otherwise;

“Indicative Flow Rate for STP” means the rate of sewage flow which is projected by the Owner to be available for treatment in the STP facility for each of the 15 years of the O&M period.

“Indicative Flow Rate(s) for SPS” means the rate of sewage flow which is projected by the Owner to be available for handling in respective SPSs for each of the 15 years of the O&M period;

“Interception & Diversion Works” means the diversion structure across nallah/drain along with intercepting sewer laid for conveying the sewage from nallah/drains up to the Sewage Treatment Plant and including Sewage lifting and pumping stations and all appurtenant structures forming a part of both the New/Existing Sewerage Infrastructure.

“Liquidated Damages – Delay” is defined in GC Section 2.3.6(2);

“Liquidated Damages – Operations” is as defined in GCC Clause 5.4 read with SCC Clause 5.4;

“Manager” is defined in GC Section 8.2(3);

“Monthly Operations Payment” is defined in Para 4 of Schedule 6 of the Contract;

“New Sewerage Network” shall mean the new Sewerage Network in ..................[insert the name of the City] of approx. ................Km length including …..Number Sewage Pumping Station(s) of specified capacity and all appurtenant structures which shall be designed and built by the Operator as a part of the Contract.

“Operations Period” is defined in GC Section 2.2(b);

“Operations Starting Date” is defined in GC Section 2.1.3(2);

“Operational Acceptance” means the acceptance by the Owner of the Project Facility, or part thereof, in accordance with DBSS Section 6.3;

68 Retain this definition, if relevant.
“Operations Services” means the Operations Services to be performed by the Operator as contemplated by the General Conditions and the Operations Services Schedule;

“Operator” means the Sewerage Treatment Plant and Network Operator, and retained by the Owner to carry out the Services and is the Party named as the Operator in the Form of Contract;

“Operator’s Equipment (Design-Build)” means all machinery, apparatus, vehicles and other equipment required for the execution and completion of the Design-Build Services and the remedying of any defects, but does not include material, machinery, apparatus and other equipment forming part of the Plant and Equipment of the Project Facility;

“Operator’s Equipment (Operations)” means all things of any kind whatsoever, including the equipment, materials, supplies, vehicles and consumables required to operate, maintain and repair the Site and Project Facility;

“Operator’s Personnel” is defined in GC Section 8.3(1);

“Operator’s Representative” is defined in GC Section 8.1.2(1);

“OSA Section” means Operations Services Schedule Section;

“Owner” means the Party named as Owner in the Form of Contract;

“Owner’s Representative” is defined in GC Section 8.1.1(1);

“Party” means the Owner or the Operator, as the case may be, and “Parties” means both of them;

“Performance Security” is defined in GC Section 5.5.1(1);

“Plant and Equipment” means the permanent plant, equipment, machinery, apparatus, articles and things of all kinds to be provided and intended to permanently form or forming part of the Project Facility;

“Project Facility” means the Sewerage Treatment Plant, the Sewerage Network and Pumping Stations Designed, Built, refurbished, Operated and Maintained by the Operator pursuant to this Contract;

“Services” means the Design-Build Services and the Operations Services to be performed by the Operator as set out in the General Conditions and the Appendices to the General Conditions;

“Sewage” or “Wastewater” means the night soil and other discharges from water closets, latrines, privy, urinals, cesspools or drains and polluted water from sinks, bathroom, stables, cattle sheds and other like places and includes domestic sewage and wastewater effluents and discharges from manufacturers of all kinds;

“Sewage Treatment Plant” or “STP” means the new plant for treatment and processing including safe disposal of treated wastewater which shall be designed, built, operated and maintained by the Operator in accordance with the provisions of this Contract;
“Sewerage Network” shall mean the pipe line network laid for collecting the Sewage from consumer connections including ‘nallaha’, main, trunk, secondary lines from the individual take over points of the Consumers up to the Sewage Treatment Plant and including Sewage lifting and pumping stations and all appurtenant structures forming a part of both the New Sewerage Network and the Existing Sewerage Network;

“Site” means the physical area as set out in the Site Schedule identified for the location of the Project Facility;

“Site Information” is defined in GC Section 3.5(1);

“Subcontract” means any contract, whether written or verbal, entered into by the Operator and a Sub-contractor for the performance of any part of the Services;

“Sub-contractor” means any person or entity to which the Operator subcontracts or sub-consults any part of the Services in accordance with the provisions of GC Section 8.6, including any person or entity engaged for the supply of any Plant and Equipment, Operator's Equipment (Design-Build) or Operator's Equipment (Operations) or for the provision of any Services;

“Submission Deadline” means the last date for the submission of bids, as stated in the Bidding Documents;

“Subsequent Operator” means the operator that is to assume the provision of the Services upon termination or completion of the Contract and may include one of the Authorities;

“Taxes” is defined in GC Section 5.6;

“Technical Standards” is defined in the Technical Standards Schedule;

“Tests on Completion” means those tests set out in Attachment 1 to the Technical Standards Schedule as conducted pursuant to DBSS Section 6.2;

“Testing, Trial and Commissioning Period” shall have the meaning as defined in Clause 2.3.2 of Special Conditions of Contract, Schedule 2;

“Third Party” means any person or entity other than the Parties;

“Threshold Sewage Flow Rate” means the expected level of sewage flow available for treatment immediately on completion of the STP facility.

“Time for Completion” is defined in GC Section 2.3.2;

“Time Schedule” is defined in GC Section 2.3.3(1);

“Transition Assistance” is defined in GC Section 2.4.2;

“TSS Section” means Technical Standards Schedule Section;

“Unforeseeable” means not reasonably foreseeable on the Submission Deadline by an experienced operator that conducted or should have conducted the inspections and examinations or who knew or should have known the information described in GC Section 3.5; and
“War Risks” is defined in GC Section 9.9(1).

1.2. **Contract Documents**

Subject to the Form of Contract provisions, all documents forming part of the Contract, and all parts thereof, are intended to be correlative, complementary and mutually explanatory. The Contract shall be read as a whole. The following schedules which are incorporated by reference into the Contract shall be referred to as follows:

Schedule “1” – Special Conditions of Contract (the “SCC”)
Schedule “2” – Design Build Services (“the Design Build Services Schedule”)
Schedule “3” – Operations and Maintenance Services (“the Operations and Maintenance Services Schedule”)
Schedule “4” – Description of Site and Service Area
Schedule “5” – Operator’s Price Schedule
Schedule “6” – Terms and Procedure of Payment
Schedule “7” – Liquidated Damages – Operations
Schedule “8” – Price Adjustment
Schedule “9” - Schedule of Performance Guarantee & Advance Payment Guarantee
Schedule “10” – Technical Specifications
Schedule “11” – MoU between the Central Government, the State Government and the ULB [Deleted]
Schedule “11” – Allowed and Suggested alignments/ locations for design of the Sewerage Network

1.3. **Interpretation**

1.3.1. Language

(1) All Contract Documents, all correspondence and communications to be given, and all other documentation to be prepared and supplied under the Contract shall be written in the language specified in the SCC and the Contract shall be construed and interpreted in accordance with that language.

(2) If any of the Contract Documents, correspondence or communications are prepared in any language other than the governing language under GC Section 1.3.1(1), the translation of such documents, correspondence or communications into the governing language shall prevail in matters of interpretation.

1.3.2. Singular or Plural

The singular shall include the plural and the plural shall include the singular except where the context otherwise requires.
1.3.3. Headings

The headings in the Contract Documents are included for ease of reference and shall neither constitute a part of the Contract nor affect its interpretation.

1.3.4. Persons

Words importing persons or entities shall include firms, corporations and government entities.

1.3.5. Incoterms

Unless inconsistent with any provision of the Contract, the meaning of any trade term and the rights and obligations of the Parties there under shall be prescribed by Incoterms 2010. Incoterms means international rules for interpreting trade terms published by the International Chamber of Commerce, 38 Cours Albert 1er, 75008 Paris, France.

1.3.6. Entire Agreement

This Contract constitutes the entire agreement between the Owner and the Operator with respect to the subject matter of the Contract and supersedes all communications, negotiations and agreements, whether written or oral, made by the Parties with respect thereto made prior to the date of the Contract.

1.3.7. Amendment

No amendment or other variation of the Contract shall be effective unless it is in writing, is dated, expressly refers to the Contract and is signed by a duly authorised representative of each Party to the Contract.

1.3.8. Number of Days

Except as expressly stated to the contrary elsewhere herein, in computing the number of days for the purposes of the Contract all days shall be counted, including Saturdays, Sundays and legal holidays in the Country, provided, however, that if the final day of any period shall fall on a Saturday, Sunday, or legal holiday in the Country, then the final day shall be deemed to be the next day which is not a Saturday, Sunday or legal holiday in the Country.

1.3.9. Independent Operator

(1) The Operator shall be an independent Operator in its performance of the Contract. The Contract does not create any agency, partnership, joint venture or other joint relationship between the Owner and the Operator or its Shareholders.
(2) Subject to the provisions of the Contract, the Operator shall be solely responsible for the manner in which the Contract is performed. All employees, agents, representatives or Sub-contractors engaged by the Operator in connection with the performance of the Contract shall be under the complete control of the Operator and shall not be deemed to be employees of the Owner, and nothing contained in the Contract, or in any Subcontract awarded by the Operator, shall be construed to create any contractual relationship or legal obligation between the Operator’s employees, agents, representatives or Sub-contractors and the Owner.

1.3.10. Joint Venture

(1) If the Operator consists of a joint venture of more than one person, all the Partners hereby authorise the representative named in the SCC to act on their behalf in exercising all the Partner’s and Operator’s rights and obligations toward the Owner under this Contract, including the receiving of approvals, consents, orders, certificates, instructions and payments from the Owner, amendment of the Contract and in all other matters under the Contract, including the settlement of disputes.

(2) If the Operator is a joint venture of two or more Partners, each Partner of the joint venture, shall be jointly and severally bound to the Owner for the fulfilment of the provisions of the Contract by the Operator.

(3) The composition, control or constitution of the Operator shall be in accordance with the Operator’s Bid and shall not be altered without the prior consent of the Owner.

1.3.11. Non-waiver

(1) Subject to GC Section 1.3.11(2), no relaxation, waiver, forbearance, delay or indulgence by either Party in enforcing any of the terms and conditions of the Contract or the granting of time by either Party to the other shall prejudice, affect or restrict the rights of that Party under the Contract, nor shall any waiver by either Party of any breach of Contract operate as waiver of any subsequent or continuing breach of Contract.

(2) To be a valid waiver, any waiver of a Party’s rights, powers or remedies under the Contract shall,

(a) be in writing;

(b) be dated and signed by the Owner’s or Operator’s Representative, whichever is granting such waiver; and

(c) specify the right, power or remedy being waived and the extent to which it is being waived.

1.3.12. Severability

If any provision or condition of the Contract is prohibited or rendered invalid or unenforceable, such prohibition, invalidity or unenforceability
shall not affect the validity or enforceability of any other provisions and conditions of the Contract.

1.3.13. Country of Origin

“Origin” means the place where the materials, equipment and other supplies for the Project Facility are mined, grown, produced or manufactured, and from which the services are provided.

1.3.14. Survival of Obligations

Upon the termination or expiration of the Contract pursuant to the Contract, all rights and obligations of the Parties hereunder shall cease, except those noted in the SCC.

1.4. Notice

(1) All notices to be given under the Contract shall be in writing and shall be sent by personal delivery, courier or facsimile to the address for notice of the relevant Party as set out in the SCC and the following provisions apply:

(a) Any notice sent by facsimile shall be confirmed by the sender no later than two days after dispatch by a notice sent by courier;

(b) Any notice sent by courier shall be deemed to have been delivered 10 days after dispatch. In proving the fact of dispatch, it shall be sufficient to show that the envelope containing such notice was properly addressed, with proper payment for the courier, and conveyed to the courier service for transmission; and

(c) Any notice delivered personally or sent by facsimile shall be deemed to have been delivered on the date of dispatch.

(2) A Party may change its address for notice pursuant to this Contract by giving the other Party notice of change in accordance with this GC Section 1.4.

(3) The Operator’s address for the purpose of giving notice pursuant to this GC Section 1.4 shall be in the Country named in the SCC.

(4) Notices shall be deemed to include any approvals, consents, instructions, orders, certificates and similar communications to be given under the Contract.

1.5. Governing Law

This Contract, its meaning and interpretation, and the relation between the Parties shall be governed by the Applicable Law.

1.6. Settlement of Disputes

1.6.1. Adjudicator
(1) If any dispute of any kind whatsoever arises between the Owner and the Operator in connection with or arising out of the Contract including,

(a) any question regarding the existence, validity or termination of the Contract; and

(b) any matter related to the performance of the Services,

the Parties shall seek to resolve any such dispute or difference by mutual consultation. If the Parties fail to resolve such a dispute or difference by mutual consultation, the dispute shall be referred in writing, by either the Operator or the Owner, to the Adjudicator with a copy to the other Party or Parties.

(2) GC Section 1.6.1(1) shall apply,

(a) during the execution of the Services and after the completion of the Services; and

(b) before and after the termination, abandonment or breach of the Contract.

(3) The Adjudicator shall give its decision in writing to both Parties no later than 30 days after the referral of a dispute. If the Adjudicator has rendered its decision within the 30 day time limit, and no notice of intention to commence arbitration has been given by either the Owner or the Operator prior to the expiration of 60 days after the reference of the dispute to the Adjudicator, the Adjudicator’s decision shall become final and binding upon the Owner and the Operator. Any decision that has become final and binding shall be implemented by the Parties forthwith.

(4) The Adjudicator shall be paid a fee at the rate specified in the SCC plus reasonable expenditures incurred in the execution of its duties as Adjudicator, and these costs shall be divided equally between the Owner and the Operator.

(5) If the Adjudicator resigns or dies, or the Owner and the Operator agree that the Adjudicator is not fulfilling its functions in accordance with the provisions of the Contract, a new Adjudicator shall be jointly appointed by the Owner and the Operator. If the Owner and the Operator cannot agree on a new Adjudicator within 30 days after the resignation, death or removal of the existing Adjudicator, the new Adjudicator shall be appointed at the request of either Party by the Appointing Authority specified in the SCC.

1.6.2. Arbitration
(1) If either the Owner or the Operator is dissatisfied with the Adjudicator’s decision, or if the Adjudicator fails to give a decision within 30 days after a dispute being referred to it, then either the Owner or the Operator may, within 60 days after such reference, give notice to the other Party, with a copy for information to the Adjudicator, of its intention to commence arbitration, as hereinafter provided, as to the matter in dispute, and no arbitration in respect of this matter may be commenced unless such notice is given.

(2) Any dispute in respect of which a notice of intention to commence arbitration has been given, in accordance with GC Section 1.6.2(1), shall be finally settled by arbitration.

(3) Arbitration proceedings shall be conducted in accordance with the rules of procedure Designated in the SCC.

1.6.3. Obligations during Arbitration

Notwithstanding any reference to the Adjudicator or arbitration herein,

(a) the Parties shall continue to perform their respective obligations under the Contract unless they otherwise agreed; and

(b) the Owner shall pay the Operator any monies due to the Operator.

1.7. Assignment

(1) The Operator shall not assign to any Third Party the Contract, or any part thereof, or any right, benefit, obligation or interest therein or thereunder without the prior consent of the Owner, which consent may not be unreasonably withheld.

(2) The Operator may assign, absolutely or by way of charge, any monies due and payable to it or that may become due and payable to it under the Contract.

(3) To be a valid assignment which has been approved by the Owner pursuant to GC Section 1.7(1), the assignment must,

(a) be in writing;

(b) be dated and signed by the Owner’s Representative; and

(c) state the specific details of the assignment.

1.8. Contract Records, Accounting and Auditing

1.8.1. Contract Records
(1) Except as provided in GC Section 6.1, all data, information, documentation, account, plans, programs, reports, surveys and guidelines of any kind whatsoever (the “Contract Records”) prepared by the Operator in performing the Services shall become and remain the property of the Owner and the Operator shall deliver all Contract Records and a detailed inventory of those Contract Records to the Owner no later than the date of termination or expiration of the Contract, except in respect of such Contract Records that are required to be delivered at an earlier date.

(2) The Contract Records shall include,

(a) information of any kind whatsoever related to the finances, revenues or expenditures of the Owner’s operations;

(b) all files, documents, plans, drawings, specifications, notes, minutes of meetings and minutes of conversations;

(c) all the plans, programs, reports, surveys and guidelines prepared by the Operator in carrying out the Operations Services;

(d) the accounts of the Sewerage Treatment operations at the Project Facility;

(e) all manuals, reports, condition surveys, safety records, audit records, inventories, laboratory test results, procurement records, customer information, financial information, financial statements, invoices, accounting records, subcontracts and personnel records; and

(f) the Design-Build Documents, whether stored in hard copy or electronically.

(3) The Operator shall provide the Owner with unrestricted access to the Contract Records during the term of the Contract, including the right to make and retain copies.

(4) The Operator may retain a copy of the Contract Records but shall not use them for purposes unrelated to this Contract without the prior approval of the Owner. This GC Section 1.8.1(4) does not in any way relieve the Operator of its obligation of confidentiality pursuant to GC Section 6.2.

(5) Except as provided in GC Section 6.1, the Operator acknowledges that the Owner, as Owner of the Contract Records, may deal with the Contract Records in any way it determines, including making the Contract Records publicly available and making them available to prospective Bidders who may be involved in the process to select a Subsequent Operator.

1.8.2. Accounting
The Operator shall keep accurate and systematic accounts in respect of the Services and the Contract in accordance with internationally accepted accounting principles.

1.8.3. Auditing the Operator’s Own Accounts and the Contract Records

(1) The Owner may, in its sole discretion, audit,

(a) the Operator’s own accounts, financial information, financial statements and technical information at any reasonable time and with 24 hours’ notice to the Operator; and

(b) the Contract Records and Design-Build Documents at any reasonable time and without notice to the Operator,

in respect of any matters related to the Contract.

(2) The Owner may complete the audit or audits itself or may retain an independent auditor, at the Owner’s expense, to complete the audit or audits.

1.8.4. Operator’s Audited Accounts

The Operator shall submit to the Owner, no later than 90 days after the end of the Operator’s fiscal year, the annual audited accounts of its own finances for each of the Operator’s fiscal years that occur during the Contract Term.

1.8.5. Inspections and Audit by the NMCG

The Operator shall permit the NMCG and/or persons appointed by the NMCG to inspect the Site and/or the Owner’s accounts and records relating to the performance of the Contract and to have such accounts and records audited by auditors appointed by the NMCG if required by the NMCG.

1.9. Operator’s Claims during the Design-Build Period

(1) If the Operator considers itself to be entitled to any extension of the Time for Completion or any additional payment, under any section related to the Design-Build Services of these General Conditions, the Operator shall give notice to the Design-Build-Operations Engineer, describing the event or circumstance giving rise to the claim. The notice shall be given as soon as practicable, and no later than 30 days, after the Operator became aware, or should have become aware, of the event or circumstance.

(2) If the Operator fails to give notice of a claim within such period of 30 days, the Time for Completion shall not be extended, the Operator shall not be entitled to additional payment, and the Owner shall be discharged from all liability in connection with the claim. Otherwise, the following provisions of this GC Section 1.9 shall apply.
(3) The Operator shall also submit any other notices related to the Design-Build Services which are required by the Contract, and supporting particulars for the claim, that are relevant to such event or circumstance.

(4) The Operator shall keep such contemporary records as may be necessary to substantiate any claim related to the Design-Build Services, either on the Site or at another location acceptable to the Design-Build-Operations Engineer. Without admitting the Owner’s liability, the Design-Build-Operations Engineer may, after receiving any notice under this GC Section 1.9, monitor the record-keeping or instruct the Operator to keep further contemporary records. The Operator shall permit the Design-Build-Operations Engineer to inspect all these records, and shall, if instructed, submit copies to the Design-Build-Operations Engineer.

(5) No later than 42 days after the Operator became aware, or should have become aware, of the event or circumstance giving rise to the claim, or within such other period as may be proposed by the Operator and approved by the Design-Build-Operations Engineer, the Operator shall send to the Design-Build-Operations Engineer a fully detailed claim which includes full supporting particulars of the basis of the claim and of the extension of time or additional payment claimed. If the event or circumstance giving rise to the claim has a continuing effect,

(a) this fully detailed claim shall be considered as interim;

(b) the Operator shall send further interim claims at monthly intervals, giving the accumulated delay or amount claimed, and such further particulars as the Design-Build-Operations Engineer may reasonable require; and

(c) the Operator shall send a final claim no later than 30 days after the end of the effects resulting from the event or circumstance, or within such other period as may be proposed by the Operator and approved by the Design-Build-Operations Engineer.

(6) No later than 42 days after receiving a claim or any further particulars supporting a previous claim, or within such other period as may be proposed by the Design-Build-Operations Engineer and approved by the Operator, the Design-Build-Operations Engineer shall respond with approval, or with disapproval and detailed comments. The Design-Build-Operations Engineer may also request any necessary further particulars, but shall nevertheless give his response on the principles of the claim within such time.

(7) Each invoice sent by the Operator shall include such amounts for any claim as have been reasonably substantiated as due under the relevant provision of the Contract. Unless and until the particulars supplied are sufficient to substantiate the whole of the claim, the Operator shall only be entitled to payment for such part of the claim as it has been able to substantiate.
(8) The Operator shall proceed in accordance with GC Section 7.2.6 to request,

(a) an extension, if any, of the Time for Completion before or after its expiry in accordance with GC Section 2.3.4; or

(b) an additional payment, if any, to which the Operator believes it is entitled under the Contract.

(9) The requirements of this GC Section 1.9 are in addition to those of any other provision which may apply to a claim. If the Operator fails to comply with this or another provision in relation to any claim, any extension of or additional payment shall take account of the extent, if any, to which the failure has prevented or prejudiced proper investigation of the claim, unless the claim is excluded under GC Section 1.9(2).

(10) This GC Section 1.9 shall apply only in respect of the Design-Build Services excluding the Existing Operations Services.
ARTICLE 2. CONTRACT TERM, TIMING AND COMPLETION

2.1. General

2.1.1. Effectiveness of Contract

The Form of Contract shall be signed by the Operator, and all partners, if the Operator is a joint venture company, prior to its signing by the Owner. The Contract shall come into force and effect on the date the Form of Contract is signed by the Owner (the “Effective Date”).

2.1.2. Expiration of Contract

This Contract shall terminate on either,

(1) the specified number of months after the Operations Starting Date named in the SCC;

(2) the Extension Date pursuant to GC Section 2.4.3; or

(3) the date of Contract termination pursuant to GC Section 11.2, (the “End Date”), whichever is applicable.

2.1.3. Commencement of Services

(1) Unless otherwise stated in the SCC, the Design-Build Starting Date shall be no later than 30 days after the Effective Date and the Owner shall give the Operator at least seven days prior notice of the Design-Build Starting Date.

(2) The “Operations Starting Date” shall be the date of the Operational Acceptance Certificate.

2.2. Design-Build Period and Operations Period

The Contract Term shall be divided into two periods as follows:

(a) the period commencing on the Effective Date and ending on the day immediately prior to the Operations Starting Date (the “Design-Build Period”); and

(b) the period commencing on the Operations Starting Date and ending on the End Date (the “Operations Period”), namely the date of completion of the Operation and Maintenance period of 15 years, commencing from the date of Operational Acceptance of the STP, Network, Pumping Stations and all appurtenant and allied works.

2.3. Design-Build Period – Commencement, Delays and Suspension

2.3.1. Commencement of the Design-Build Services
The Operator shall commence the Design-Build Services no later than the Design-Build Starting Date, and shall then proceed with the Design-Build Services with due expedition and without delay.

2.3.2. Time for Completion

The Operator shall complete the whole of the Design-Build Services in accordance with the time for completion set out in the SCC (“Time for Completion”) for the Design-Build Services including,

(a) successfully completing the Tests on Commissioning; and

(b) completing all of the Design-Build Services such that the completed Project Facility can be used as a fully operational Project Facility in accordance with the Contract.

2.3.3. Design-Build Time Schedule

(1) The Operator shall submit a detailed time programme (the “Time Schedule”) to the Design-Build-Operations Engineer no later than 30 days after the Design-Build Starting Date. The Operator shall also submit a revised Time Schedule whenever the previous Time Schedule is inconsistent with actual progress or with the Operator’s obligations. Each Time Schedule shall include a description of,

(a) the order in which the Operator intends to carry out the Design-Build Services, including the anticipated timing of each stage of Design, Design-Build Documents, procurement, manufacture, inspection, delivery to the Site, construction, erection, testing and commissioning;

(b) the periods for review and any other submissions, approvals and consents specified in the Contract;

(c) the sequence and timing of inspections and tests specified in the Contract;

(d) the scheduled Time for Completion, the planned Time for Completion and the planned Operations Starting Date;

(e) all major events and activities in the production of Design-Build Documents; and

(f) all major phases and milestones of the Design-Build Services.
(2) The Design-Build-Operations Engineer shall review each Time Schedule and provide comments to the Operator as to whether the Time Schedule complies with the Contract. If the Design-Build-Operations Engineer fails to provide such comments prior to the expiration of 21 days after receiving a Time Schedule, the Operator shall proceed in accordance with the Time Schedule, subject to its other obligations under the Contract. The Operator shall be entitled to rely upon the Time Schedule when planning its activities.

(3) The Operator shall promptly give notice to the Design-Build-Operations Engineer of specific probable future events or circumstances which may adversely affect the Design-Build Services or delay the execution of the Design-Build Services. The Design-Build-Operations Engineer may require the Operator to submit an estimate of the anticipated effect of the future event or circumstances, or a proposal under GC Section 10.1.3.

(4) If, at any time, the Design-Build-Operations Engineer gives notice to the Operator that a Time Schedule fails, to the extent stated, to comply with the Contract or to be consistent with actual progress and the Operator’s stated intentions, the Operator shall submit a revised Time Schedule to the Design-Build-Operations Engineer in accordance with this GC Section 2.3.3.

2.3.4. Extension of the Time for Completion

(1) The Time for Completion shall be extended if the Operator is delayed or impeded in the performance of the Design-Build Services by reason of any of the following:

(a) a Change, unless the Parties have already agreed to an adjustment to the Time for Completion as part of the applicable Change;

(b) an occurrence of Force Majeure as provided in GC Section 9.8, Unforeseeable physical conditions as provided for in GC Section 9.7, or loss or damage as a result of the occurrences set out in GC Section 9.4(2);

(c) any suspension order given by the Owner pursuant to GC Section 11.1.1;

(d) any change in the Applicable Law in accordance with GC Section 9.10;

(e) any default or breach of the Contract by the Owner or any activity, act or omission of any other Operators employed by the Owner; or

(f) any other matter specifically mentioned in the Contract.

by such period as shall be fair and reasonable in all the circumstances and as shall fairly reflect the actual delay or impediment sustained by the Operator.
(2) The Operator shall submit, to the Design-Build-Operations Engineer, any notice of a claim for an extension of the Time for Completion in accordance with GC Section 10.1.3.

(3) The Operator shall, at all times, use reasonable efforts to minimize any delay in the performance of its obligations under the Contract.

2.3.5. Rate of Progress

(1) If, at any time, the Operator’s progress in respect of the Design-Build Services,

(a) is too slow to complete the Design-Build Services in accordance with the Time for Completion; or

(b) has fallen, or will fall, behind the current Time Schedule

other than as a result of a cause listed in GC Section 2.3.4, then the Design-Build-Operations Engineer may instruct the Operator to submit a revised Time Schedule and supporting report describing the revised methods which the Operator proposes to adopt in order to expedite progress and complete the Design-Build Services.

(2) Unless the Design-Build-Operations Engineer notifies otherwise, the Operator shall adopt the revised methods referred to in GC Section 2.3.5(2), which may require increases in,

(a) the working hours or in the numbers of Operator’s Personnel, or both; or

(b) Plant and Equipment,

at the risk and cost of the Operator. If these revised methods cause the Owner to incur additional costs, the Operator shall, subject to GC Section 1.9, pay these costs to the Owner, in addition to delay damages, if any, under GC Section 2.3.6.

2.3.6. Delay of Completion – Liquidated Damages - Delay

(1) The Operator guarantees that it shall attain Completion of the Project Facility in accordance with the Time for Completion specified in the SCC and GC Section 2.3.2 or in accordance with an extension of the Time for Completion granted to the Operator in accordance with GC Section 2.3.4.
If the Operator fails to attain Completion of the Project Facility within the Time for Completion, or any extension thereof in accordance with GC Section 2.3.4, the Operator shall pay to the Owner liquidated damages in the amount specified in the SCC (“Liquidated Damages-Delay”). The aggregate amount of Liquidated Damages - Delay shall in no event exceed the amount specified as “Maximum” in the SCC. The Owner may terminate the Contract pursuant to GC Section 11.2.3 if the Operator reaches the “Maximum” level for Liquidated Damages – Delay.

The payment or payments by the Operator of Liquidated Damages – Delay shall completely satisfy the Operator’s obligation to attain Completion of the Project Facility within the Time for Completion or any extension thereof pursuant to GC Section 2.3.4.

The payment or payments by the Operator of Liquidated Damages – Delay shall not in any way relieve the Operator of its obligations to complete the Project Facility or any other obligations and liabilities of the Operator under the Contract.

If the Operator attains Completion of the Project Facility before the Time for Completion or any extension thereof pursuant to GC Section 2.3.4, and if the Owner intends to pay a bonus to the Operator for early completion, the amount of the bonus is as set out in the SCC. The aggregate amount of such bonus shall in no event exceed the amount specified as “Maximum” in the SCC.

2.3.7. Design-Build Period –(Special operation requirements) Deleted

2.4. Operations Period

2.4.1. Commencement of the Operations - Services

The Operator shall commence the Operations Services no later than the Operations Starting Date and shall then proceed with the Operations Services with due exception and without delay.

2.4.2. Services after the End Date

The Operator, upon written request by the Owner no later than 60 days prior to the End Date, shall provide assistance to the Owner, at no cost to the Owner, during a transitional period of up to 60 days after the End Date (the “Transition Assistance”). The purpose of the Transition Assistance is to ensure a smooth transition between the Operator and a Subsequent Operator of the Project Facility. The Transition Assistance shall be related to only transition services and shall not be the full range of Services as set out in the Operations Services Schedule.

2.4.3. Extension of the Contract

If both Parties agree, this Contract may be extended for a period of up to 5 years after the End Date. The Owner shall notify the Operator no later
than 6 months prior to the End Date if it wishes to enter into negotiations in order to extend the duration of the Contract. The date on which the Contract is to expire as a result of an extension shall be the Extension Date.
ARTICLE 3.  OBLIGATIONS OF THE OPERATOR

3.1. General – Services and Standards of Performance

The Operator shall,

(a) perform the Design-Build Services set out in the Design-Build Services Schedule;

(b) perform the Operations Services set out in the Operations Services Schedule; and

(c) perform the Services in accordance with the Technical Standards set out in the Technical Standards Schedule,

3.2. Law Governing Services

The Operator shall comply with the Applicable Law and shall ensure that the Operator’s Personnel and Sub-contractors comply with the Applicable Law. The Operator shall indemnify and hold harmless the Owner from and against any and all liabilities, damages, claims, fines, penalties and expenses of whatever nature arising or resulting from violation of the Applicable Law by the Operator, the Operator’s Personnel the Sub-contractors and the Sub-contractors’ personnel.

3.3. Conflict of Interest

(1) The compensation of the Operator pursuant to GC Article 5 shall constitute the Operator’s sole compensation in connection with this Contract and, except as provided in GC Article 5, the Operator shall not accept for its own benefit any trade commission, discount or similar payment in connection with activities pursuant to this Contract or in the discharge of its obligations hereunder, and the Operator shall use its best efforts to ensure that the Operator’s Personnel, Sub-contractors, and the Sub-contractors’ employees and agents, similarly shall not receive any such additional remuneration.

(2) The Operator, Sub-contractors and any entity affiliated with the Operator or the Sub-contractors, shall be disqualified, during the Contract Term from providing goods, works or services, other than the Services, with respect to,

(a) the goods, works and services purchased from the Contingency Fund; and

(b) the Capital Investment Program.

(3) The Operator, Operator’s Personnel, Sub-contractors and the employees and affiliates of the Sub-contractors shall not engage, either directly or indirectly, in any business or professional activities which would conflict with the activities assigned to them under this Contract.
(4) The Operator and its Shareholders shall not participate in any discussions or work and shall not provide any services or advice to the Owner related to,

(a) except with respect to their responsibilities as set out in the Operations Services Schedule, institutional restructuring or reorganisation of the Owner or a utility or department of the Owner;

(b) the development or review of bidding documents to retain any Subsequent Operator; or

(c) the preparations for the procurement process to retain any Subsequent Operator.

(5) Failure of the Operator or the Shareholders to comply with this GC Section 3.3, in addition to constituting a breach of this Contract, may result in the disqualification of the Operator and the Shareholders from bidding in the procurement process to retain any Subsequent Operator.

3.4. Plant and Equipment, Operator’s Equipment (Design-Build) and Operations Equipment (Operations)

(1) Any Plant and Equipment, Operator's Equipment (Design-Build) and Operator's Equipment (Operations) that will be incorporated in or be required for the Site and Project Facility or the Operation Services shall have their origin as specified under GC Section 1.1 (“Country of Origin”).

(2) The Operator shall prepare a list of all Operator's Equipment (Design-Build) and Operator's Equipment (Operations) (the “Operator’s Equipment Lists”). The Operator shall update the Operator’s Equipment Lists on an annual basis and shall provide the updated Operator’s Equipment Lists to the Owner no later than 30 days after the end of each of the Operator’s fiscal years during the Contract Term.

3.5. Site Information and Investigation

(1) The Operator acknowledges that the Owner made available to the Operator, during the bidding process, either directly or by placing the data in the Data Room and Background Information Document, all available data on hydrological and sub-surface conditions of the Site, and studies on environmental impact that had been obtained by or on behalf of the Owner from investigations in anticipation of the Design-Build and Operations Services (the “Site Information”). The Operator shall be responsible for interpreting all data about the Site that is provided to it by the Owner.

(2) The Operator shall be deemed to have inspected and examined the Site, its surroundings, the Site Information and other available information, and to have satisfied itself before entering into the Contract, as to,
(a) the form and nature of the Site, including the sub-surface conditions;

(b) the applicable hydrological, hydro-geological and climatic conditions;

(c) the extent and nature of the work, Plant and Equipment, Operator's Equipment (Design-Build) and Operator's Equipment (Operations) necessary for the execution and completion of the Services, and theremedying of any defects; and

(d) the Operator’s requirements for access to the Site, accommodation, personnel, power, transport, water and other services.

(3) The Operator shall be deemed to have obtained all necessary information as to risks, contingencies and all other circumstances that may influence or affect the performance of its obligations under the Contract.

(4) “The Operator shall not commence any Works, including mobilization and/or pre-construction activities (e.g. limited clearance for haul roads, site accesses and work site establishment, geotechnical investigations or investigations to select ancillary features such as quarries and borrow pits), unless the Engineer is satisfied that appropriate measures are in place to address environmental, social, health and safety risks and impacts. At a minimum, the Operator shall apply the Management Strategies and Implementation Plans and Code of Conduct, submitted as part of the Bid and agreed as part of the Contract. The Operator shall submit, on a continuing basis, for the Engineer’s prior approval, such supplementary Management Strategies and Implementation Plans as are necessary to manage the ESHS risks and impacts of ongoing works. These Management Strategies and Implementation Plans collectively comprise the Operator’s Environmental and Social Management Plan (O-ESMP). The O-ESMP shall be approved prior to the commencement of construction activities (e.g. excavation, earth works, bridge and structure works, stream and road diversions, quarrying or extraction of materials, concrete batching and asphalt manufacture). The approved O-ESMP shall be reviewed, periodically (but not less than every six (6) months), and updated in a timely manner, as required, by the Operator to ensure that it contains measures appropriate to the Works activities to be undertaken. The updated O-ESMP shall be subject to prior approval by the Engineer.
(5) To the extent the Operator did not make any of the interpretations, investigations or examinations, or did not satisfy itself, or did not obtain such information as called for in this GC Section 3.5, the Operator represents and warrants that it is willing to assume and does hereby assume responsibility for any and all loss and damage from any cause whatsoever which the Operator’s interpretations, investigations, examinations and obtaining of information may have avoided and agrees to indemnify the Owner from all risk thereof and from conditions arising or developing in the course of performing the Services which may make the performance of the Services more onerous and more expensive to fulfil or perform than was contemplated on the Effective Date. Notwithstanding anything in the Contract to the contrary, the Operator acknowledges and declares that in entering into the Contract it did not and does not rely upon any information or report provided by or on behalf of the Owner or its agents, representatives or employees.

3.6. Access to the Site and Project Facility

(1) The Operator shall, during both the Design-Build Period and the Operations Period, provide free and open access to the Site and the Project Facility at the Owner’s request. The Owner shall make reasonable efforts to provide reasonable notice to the Operator prior to the Owner’s access but such notice is not mandatory. The Owner’s representative on the Site, or at the Project Facility shall observe all safety and health regulations and reasonable instructions of the Operator.

(2) The Operator shall give all reasonable access to any other Operators employed by the Owner on or near the Site to carry out their work.

(3) If the Operator makes available to other Operators any roads or ways the maintenance for which the Operator is responsible, permits the use by such other Operators of the Operator’s Equipment (Design-Build) and Operator’s Equipment (Operations), or provides any other service of whatsoever nature for such other Operators, the Owner shall fully compensate the Operator for any loss or damage caused or occasioned by such other Operators in respect of any such use or service, and shall pay to the Operator reasonable remuneration for the use of such equipment or the provision of such services.

(4) The Operator shall also arrange to perform its work so as to minimize, to the extent possible, interference with the work of other Operators. The Design-Build-Operations Engineer shall determine the resolution of any difference or conflict that may arise between the Operator and other Operators and the workers of the Owner in regard to their work.
(5) The Operator shall notify the Design-Build-Operations Engineer, as applicable, promptly of any defects in the other Operators’ work that come to its notice, and that could affect the performance of the Services by the Operator. The Design-Build-Operations Engineer, as applicable, shall determine the corrective measures, if any, required to rectify the situation after inspection of the Site, the STP and the Network. Decisions made by the Design-Build-Operations Engineer, as applicable, shall be binding on the Operator.

3.7. Safety Procedures

The operator shall:

(a) comply with all applicable safety regulations,

(b) take care for the safety of all persons entitled to be on the Site,

(c) use reasonable efforts to keep the Site and Works clear of unnecessary obstruction so as to avoid danger to these persons,

(d) provide fencing, lighting, guarding and watching of the Works until completion and taking over under Clause 10 [Employer’s Taking Over], and

(e) provide any Temporary Works (including roadways, footways, guards and fences) which may be necessary, because of the execution of the Works, for the use and protection of the public and of owners and occupiers of adjacent land.
3.8. Fossils

All fossils, coins, articles of value or antiquity, and structures and other remains or items of geological or archaeological interest found on the Site shall be placed under the care and authority of the Employer. The Operator shall take reasonable precautions to prevent Operator’s Personnel or other persons from removing or damaging any of these findings.

The Operator shall, upon discovery of any such finding, promptly give notice to the Engineer, who shall issue instructions for dealing with it. If the Operator suffers delay and/or incurs Cost from complying with the instructions, the Operator shall give a further notice to the Engineer and shall be entitled subject to Sub-Clause 1.9 [Contractor’s Claims] to:

(a) an extension of time for any such delay, if completion is or will be delayed, under GCC clause 2.3.4 [Extension of Time for Completion], and

(b) payment of any such Cost, which shall be included in the Contract Price.

After receiving this further notice, the Engineer shall proceed in accordance with GC Section 7.2.6 to agree or determine these matters.
ARTICLE 4. OBLIGATIONS OF THE OWNER

4.1. Owner’s Assistance to the Operator

Owner shall obtain consent from the respective pollution control board/authority and all other requisite clearances to establish and operate the STP unless the same have been obtained already.

The Owner shall use reasonable efforts to,

(a) provide the Operator, Sub-contractors and Operator’s Personnel with work permits and such other documents as shall be necessary to enable the Operator, Sub-contractors or Operator’s Personnel to perform the Services;

(b) arrange for Operator’s Personnel and, if appropriate, their eligible dependants to obtain promptly all necessary entry and exit visas, residence permits, exchange permits and any other documents required for their stay in the Country;

(c) facilitate the prompt clearance through customs of any property required for the Services and of the personal effects of the Operator’s Personnel and their eligible dependants; and

(d) issue to officials, agents and representatives of the Owner all such instructions as may be necessary or appropriate for the prompt and effective implementation of the Services.

4.2. Access to the Site and Project Facility

the Owner shall be responsible for acquiring and providing legal and physical possession of the Site and access thereto and for providing possession and access to all other areas reasonably required for the proper execution of the Contract including all requisite rights of way. The Owner shall provide the Operator, free of charge, full possession of the Site and the Project Facility during the term of the Contract.

4.3. Reviews and Approvals of Submissions

(1) Except as otherwise provided in the Contract, if the Operator submits a plan, report or other documentation to the Owner in writing, and the Owner, or the Design-Build-Operations Engineer, is required to approve that submission, the Design-Build-Operations Engineer as applicable, shall review and either approve or provide written comment on the Operator’s submission no later than 14 days after the day of submission by the Operator to the Design-Build-Operations Engineer.

(2) If the Design-Build-Operations Engineer, as applicable, fails to approve or refuses to approve the Operator’s submission in accordance with GC Section 4.3(1), the Operator shall notify the Owner in writing that it has not received a response to its submission.
(3) If the Design-Build-Operations Engineer, as applicable, fails to respond to the Operator’s written notification pursuant to GC Section 4.3(2) within 14 days after the receipt by the Design-Build-Operations Engineer, as applicable, of the Operator’s written notification, the Operator’s submission shall be deemed to be approved.
ARTICLE 5. CONTRACT PRICE AND PAYMENT

5.1. Contract Price

(1) The Contract Price shall be as specified in the Price Schedules offered by the Operator and accepted by the Owner while awarding the Contract. These prices have been incorporated in Schedule 5 of the Contract.

(2) Subject to GC Section 9.7, the Operator shall be deemed to have satisfied itself as to the correctness and sufficiency of the Contract Price, which shall, except as otherwise provided for in the Contract, cover all its obligations under the Contract, including all costs and expenses for the Design, Building, Successful Commissioning, Operation & Maintenance of the Project Facility in accordance with the provisions of this Contract.

(3) Unless indicted in the SCC, the contract price shall not be subject to any alteration except in the event of a change to the design build services in accordance with GC section 10.1 or a change to the operations services in accordance with GC Section 10.2 and 10.3.

5.2. Terms of Payment

(1) The Contract Price shall be paid as specified in the SCC.

(2) No payment made by the Owner herein shall be deemed to constitute acceptance by the Owner of the Project Facility or any part thereof.

(3) In the event that the Owner fails to make any payment by its respective due date or within the period of 60 days, the Owner shall pay to the Operator interest on the amount of such delayed payment at the rate shown in the SCC and as specified in the SCC for the period of delay until payment has been made in full.

(4) The currency or currencies in which payments are made to the Operator under this Contract shall be specified in the SCC, subject to the general principle that payments will be made in the currency or currencies in which the Contract Price has been stated in the Operator’s Bid.

(5) All payments shall be made in the currency or currencies specified in the Article 2 of the Contract.

(6) if the Operator was, or is, failing to perform any ESHS obligations or work under the Contract, the value of this work or obligation, as determined by the Engineer, may be withheld until the work or obligation has been performed, and/or the cost of rectification or replacement, as determined by the Engineer, may be withheld until rectification or replacement has been completed. Failure to perform includes, but is not limited to the following:
(i) failure to comply with any ESHS obligations or work described in the Works’ Requirements which may include: working outside site boundaries, excessive dust, failure to keep public roads in a safe usable condition, damage to offsite vegetation, pollution of water courses from oils or sedimentation, contamination of land e.g. from oils, human waste, damage to archeology or cultural heritage features, air pollution as a result of unauthorized and/or inefficient combustion;

(ii) failure to regularly review C-ESMP and/or update it in a timely manner to address emerging ESHS issues, or anticipated risks or impacts;

(iii) failure to implement the C-ESMP;

(iv) failing to have appropriate consents/permits prior to undertaking Works or related activities;

(v) failure to submit ESHS report/s (as described in Appendix 1 of Schedule 2 (Design Build Services), or failure to submit such reports in a timely manner;

(vi) failure to implement remediation as instructed by the Engineer within the specified timeframe (e.g. remediation addressing non-compliance/s).

5.3. Performance Incentive Compensation

If the Owner intends to pay the Operator performance incentive compensation, the Owner will pay such compensation at the end of the Operations Period and in accordance with the Performance Incentive Compensation Schedule.

5.4. Liquidated Damages - Operations

The Operator shall pay the Owner liquidated damages for failure to meet Technical and Operational Standards as set out in SCC.

5.5. Securities

5.5.1. Performance Security

(1) The Operator shall provide a security for the Operator’s proper performance of the Contract to the Owner no later than the date specified in the Bidding Documents (the “Performance Security”).

(2) The Performance Security shall be,

(a) in the amount specified in the SCC;

(b) denominated in the currency or currencies of the Contract, or in a freely convertible currency acceptable to the Owner; and
(c) shall be in the form specified in the Bidding Documents or in another form approved by the Owner.

(3) The Performance Security is a bank guarantee and shall be issued by either,

(a) a bank or insurance company located in the Country; or

(b) a foreign bank or insurance company through a correspondent bank or insurance company located in the Country.

(4) The Performance Security shall be valid until 180 days after the End Date, or any extension to the End Date.

(5) The Owner shall release the Performance Security for the Design and Build Part after 3 years of completion of Design and Build work certified by the Owner and submission of the first 3 years O&M performance security.

(6) The cost of complying with this GC Section 5.5.1 shall be borne by the Operator.

5.5.2. Advance Payment Security

(1) The Operator shall provide a security in an amount equal to the advance payment calculated in accordance with the Terms and Procedures of Payment Schedule and in the same currency or currencies.

(2) The mobilization advance paid to the Operator by the Owner shall be recovered commencing from the date on which the payment to the Operator has reached 25% of the part A and Part D price and shall be fully recovered by completion of 90% of the time for completing the works under part A and Part D.

5.6. Taxes and Duties

(1) Except as otherwise specifically provided in the Contract, the Operator shall bear and pay all taxes, duties, levies and charges (the “Taxes”) assessed on the Operator, its Sub-contractors or their employees by all municipal, state or national government authorities in connection with the Services in and outside of the Country.

(2) Service Tax if applicable shall be reimbursed by the Owner against evidence of applicability and payment.

(3) If any tax exemptions, reductions, allowances or privileges and benefits may be available to the Operator in the Country, the same shall be passed on by the operator to the Owner.
ARTICLE 6. COPYRIGHT : DESIGN-BUILD DOCUMENTS

6.1. Copyright – Design-Build Documents

(1) As between the Parties, the Operator shall retain the copyright and other intellectual property rights in the Design-Build Documents made by or on behalf of the Operator.

(2) The Operator shall be deemed, by signing the Contract, to give the Owner a non-terminable, transferable, non-exclusive, royalty-free licence to copy, use and communicate the Design-Build Documents, including making and using modifications of them. This licence shall,

(a) apply throughout the actual or intended working life, whichever is longer, of the relevant parts of the Site or Project Facility;

(b) entitle any person in proper possession of the relevant part of the Site or Project Facility to copy, use and communicate the Design-Build Documents for the purposes of completing, managing, operating, maintaining, altering, adjusting, and repairing the Project Facility;

(c) in the case of Design-Build Documents which are in the form of computer programs and other software, permit their use on any computer on the Site or at the Project Facility and other places as envisaged by the Contract, including replacements of any computers supplied by the Operator; and

(d) entitle the Owner to make the Design-Build Documents available for inspection by a prospective Bidder who may be involved in the process to select a Subsequent Operator.

(3) The Owner shall not, without the Operator’s consent, use, copy or communicate the Design-Build Documents to a Third Party by, or on behalf of, the Owner for purposes other than those permitted under GC Section 6.1(2).

6.2. Confidentiality

(1) The Operator shall keep confidential and shall not, without the written consent of the Owner, divulge to any Third Party any documents, data or other information arising directly or indirectly from the performance of Services under the Contract, whether such information has been furnished prior to, during or following termination of the Contract. Notwithstanding this GC Section 6.2(1), the Operator may furnish to its Sub-contractors such documents, data and other information to the extent required for the Sub-contractors to perform their work under the Contract, in which event the Operator shall obtain from such Sub-contractors an undertaking of confidentiality similar to that imposed on the Operator under this GC Section 6.2(1).
(2) The Operator shall not use such documents, data and other information received from the Owner for any purpose other than the Services as are required for the performance of the Contract. The Operator shall not publish, permit to be published, or disclose any particulars of the Services, Site or Project Facility in any trade or technical paper or advertising materials without the prior written consent of the Owner.

(3) The obligations of the Operator under GC Sections 6.2(1) and 6.2(2), shall not apply to that information which,

(a) now or hereafter enters the public domain through no fault of the Operator;

(b) can be proven to have been possessed by the Operator at the time of disclosure and which was not previously obtained, directly or indirectly, from the Owner; or

(c) otherwise lawfully becomes available to the Operator from a Third Party that has no obligation of confidentiality.
ARTICLE 7. CONTRACT ADMINISTRATION AND SUPERVISION DURING THE DESIGN-BUILD AND OPERATIONS PERIODS

7.1. General

The Parties acknowledge that two separate approaches to contract administration and supervision will be in place during the Contract Term as follows:

(a) from the Effective Date until the Operations Starting Date, the Design-Build Supervision approach will be put in place by the Owner; and

(b) from the Operations Starting Date until the End Date, the Operations Supervision approach will be put in place by the Owner.

7.2. Design-Build Supervision

7.2.1. Supervision during the Design-Build Period

GC Section 7.2 shall apply only during the Design-Build Period.

7.2.2. Design-Build-Operations Engineer’s Duties and Authority (Design-Build Period)

(1) The Owner shall appoint the Design-Build-Operations Engineer who shall be responsible for day to day contract management and supervision during the Design-Build Period. The Design-Build-Operations Engineer’s staff shall include suitably qualified engineers and other professionals who are competent to carry out these duties.

(2) The Design-Build-Operations Engineer shall have no authority to amend the Contract.

(3) Except, as specifically provided otherwise in the Contract, the Design-Build-Operations Engineer may exercise the authority attributable to the Design-Build-Operations Engineer as specified in or necessarily to be implied from the Contract. The Owner undertakes not to impose further constraints on the Design-Build-Operations Engineer’s authority, except as agreed with the Operator.

(4) If the Design-Build-Operations Engineer is obligated to obtain the approval of the Owner before exercising a specific authority, these restrictions shall be shall be set out in the SCC. If the Design-Build-Operations Engineer exercises a specified authority for which the Owner’s approval is required then, for the purposes of the Contract, the Owner shall be deemed to have given approval.

(5) Except as otherwise stated in the Contract,
(a) if the Design-Build-Operations Engineer carries out duties or exercises authority, specified in or implied by the Contract, the Design-Build-Operations Engineer shall be deemed to act for the Owner;

(b) the Design-Build-Operations Engineer has no authority to relieve any Party of any duties, obligations or responsibilities under the Contract; and

(c) any approval, check, certificate, consent, examination, inspection, instruction, notice, proposal, request, test or similar act by the Design-Build-Operations Engineer, including absence of disapproval, shall not relieve the Operator from any responsibility it has under the Contract, including responsibility for errors, omissions, discrepancies and non-compliances.

7.2.3. Delegation by the Design-Build-Operations Engineer

(1) The Design-Build-Operations Engineer may from time to time assign duties and delegate authority to assistants, and may also revoke such assignment or delegation. These assistants may include a resident engineer, or independent inspectors appointed to inspect or test items of Plant or Equipment. The assignment, delegation or revocation shall be in writing and shall not take effect until copies have been received by both Parties. Unless otherwise agreed by both Parties, the Design-Build-Operations Engineer shall not delegate the authority to determine any matter in accordance with GC Section 7.2.6.

(2) Assistants shall be suitably qualified persons, who are competent to carry out these duties and exercise this authority, and who are fluent in the language for communications defined in GC Section 1.3.1.

(3) Each assistant, to whom duties have been assigned or authority has been delegated, shall only be authorized to issue instructions to the Operator to the extent defined by the delegation. Any approval, check, certificate, consent, examination, inspection, instruction, notice, proposal, request, test, or similar act by an assistant, in accordance with the delegation, shall have the same effect as though the act had been an act of the Design-Build-Operations Engineer. However,

(a) any failure to disapprove any work or Plant and Equipment shall not constitute approval, and shall therefore not prejudice the right of the Design-Build-Operations Engineer to reject the work or the Plant and Equipment; and

(b) if the Operator questions any determination or instruction of an assistant, the Operator may refer the matter to the Design-Build-Operations Engineer, who shall promptly confirm, reverse or vary the determination or instruction.

7.2.4. Instructions of the Design-Build-Operations Engineer
(1) The Design-Build-Operations Engineer may issue to the Operator, at any time during the Design-Build Period, instructions which may be necessary for the execution of the Design-Build Services and the remediating of any defects, all in accordance with the Contract. The Operator shall only take instructions from the Design-Build-Operations Engineer, or from an assistant to whom the appropriate authority has been delegated under GC Section 10.1.

(2) The Operator shall comply with the instructions given by the Design-Build-Operations Engineer or delegated assistant, on any matter related to the Contract. These instructions shall be given in writing.

7.2.5. Replacement of the Design-Build-Operations Engineer

If the Owner intends to replace the Design-Build-Operations Engineer, the Owner shall, not less than 42 days before the intended date of replacement, give notice to the Operator of the name, address and relevant experience of the intended replacement Design-Build-Operations Engineer. The Owner shall not replace the Design-Build-Operations Engineer with a person against whom the Operator raises reasonable objection by notice to the Owner, with supporting particulars.

7.2.6. Determinations by the Design-Build-Operations Engineer

(1) Whenever the Contract provides that the Design-Build-Operations Engineer shall proceed in accordance with this GC Section 7.2.6 to agree or determine any matter, the Design-Build-Operations Engineer shall consult with each Party in an endeavour to reach agreement. If agreement is not achieved, the Design-Build-Operations Engineer shall make a fair determination in accordance with the Contract, taking due regard of all relevant circumstances.

(2) The Design-Build-Operations Engineer shall give notice to the Parties of each agreement or determination, with supporting particulars. Each Party shall give effect to each agreement or determination unless and until revised under GC Section 1.9.

7.3. Operations Supervision

7.3.1. Supervision during the Operations Period

This GC Section 7.3 shall apply only during the Operations Period and the period of time immediately after the End Date solely for the purpose of resolving transition issues and any outstanding issues arising during the Operations Period.

7.3.2. The Owner shall appoint its Representative for supervision of the “Operations” during the O & M period of 15 years in accordance with SCC clause 8.1.1 (1) (b).
ARTICLE 8. REPRESENTATIVES, STAFF AND SUBCONTRACTING

8.1. Representatives

8.1.1. Owner’s Representative

(1) The Owner’s representative (the “Owner’s Representative”) shall be as follows:

(a) during the Design-Build Period, the Owner’s Representative shall be the Design-Build-Operations Engineer; and

(b) during the Operations Period, the Owner’s Representative shall be as mentioned in SCC

(2) The Owner shall name its representative,

(a) no later than 14 days after the Effective Date for the Design-Build-Operations Engineer; and

(3) The Owner may change its representative from time to time and shall give notice of the change without delay. The Owner shall not change its representative at a time and in such a manner as to impede the progress of either the Design-Build Services or the Operations Services.

(4) The Owner’s Representative shall represent and act for the Owner at all times during the performance of the Contract. All notices, instructions, orders, certificates, approvals and all other communications under the Contract by the Owner shall be given by the Design-Build-Operations Engineer as applicable, except as herein otherwise provided.

(5) All notices, instructions, information and other communications given by the Operator to the Owner under the Contract shall be given to the Design-Build-Operations Engineer as applicable, except as herein otherwise provided.

8.1.2. Operator’s Representative

(1) If the Operator’s representative is not named in the SCC, the Operator shall name its representative (the “Operator’s Representative”) no later than 14 days after the Effective Date and shall request the Owner to approve the proposed Operator’s Representative. If the Owner makes no objection to the proposed Operator’s Representative, the Operator’s Representative shall be deemed to have been approved.

(2) If the Owner objects to the proposed Operator’s Representative before the expiration of 14 days after the proposal, the Operator shall propose a replacement no later than 14 days after receiving the Owner’s objection and reasons for the objection and GC Section 8.1.2(1) shall apply to the proposed replacement.
(3) The Operator’s Representative shall represent and act for the Operator at all times during the performance of the Contract. All notices, instructions, orders, certificates, approvals and all other communications under the Contract by the Operator shall be given by the Operator’s Representative, except as herein otherwise provided.

(4) All notices, instructions, information, and other communications given by the Owner to the Operator under the Contract shall be given to the Operator’s Representative as established pursuant to this GC Section 8.1.2.

(5) The Operator shall not revoke the appointment of the Operator’s Representative without the Owner’s prior written consent, which shall not be unreasonably withheld. If the Owner consents thereto, the Operator shall appoint some other person as the Operator’s Representative, pursuant to the procedure set out in this GC Section 8.1.2.

(6) The Operator’s Representative may, subject to the approval of the Owner, which shall not be unreasonably withheld, at any time delegate to any person any of the powers, functions and authorities vested in him or her. Any such delegation may be revoked at any time. Any such delegation or revocation shall be subject to a prior notice signed by the Operator’s Representative, and shall specify the powers, functions and authorities thereby delegated or revoked. No such delegation or revocation shall take effect unless and until a copy thereof has been delivered to the Owner and the Design-Build-Operations Engineer.

(7) Any act or exercise by any person of powers, functions and authorities so delegated to him or her in accordance with GC Section 8.1.2(6) shall be deemed to be an act or exercise by the Operator’s Representative.

8.2. Operator’s Superintendence

(1) Throughout the term of the Contract, the Operator shall provide all necessary superintendence to plan, arrange, direct, manage, inspect and test the Services.

(2) Superintendence shall be given by a sufficient number of persons having adequate knowledge of the language for communications as set out in the SCC and of the operations to be carried out, including the methods and techniques required, the hazards likely to be encountered and methods of preventing accidents, for the satisfactory and safe execution of the Services.
(3) The Operator’s Representative shall appoint a suitable person as construction or operations manager as applicable (the “Manager”). The Manager shall supervise all work done at the Site and Project Facility by the Operator and shall be present at the Site or Project Facility through normal working hours except when on leave, sick or absence connected with the proper performance of the Contract. Whenever the Manager is absent from the Site Project Facility, a suitable person shall be appointed to act as his or her deputy.

8.3. **Operator’s Personnel**

(1) The Operator shall provide and employ on the Site for the performance of the Services such skilled, semi-skilled and unskilled labour as is necessary for the proper and timely execution of the Contract (the “Operator’s Personnel”). The Operator is encouraged to use local labour that has the necessary skills. The Operator shall provide all expertise needed to carry out the Services including the Key Staff with the expertise specified in the SCC for the design build services.

(2) Unless otherwise provided in the Contract, the Operator shall be responsible for the recruitment, employment, transportation, accommodation and catering of all labour, local or expatriate, required for the execution of the Contract and for all payments in connection therewith.

(3) The Operator shall be responsible for obtaining all necessary permits and visas from the appropriate authorities for the entry of all labour and personnel to be employed on the Site into the Country.

(4) The Operator shall at its own expense provide the means of repatriation to all of its and its Sub-contractor’s personnel employed on the Contract at the Site to their various home countries. It shall also provide suitable temporary maintenance of all such persons from the cessation of their employment on the Contract to the date programmed for their departure. In the event that the Operator defaults in providing such means of transportation and temporary maintenance, the Owner may provide the same to such personnel and recover the cost of doing so from the Operator.

(5) The Operator shall at all times during the progress of the Contract use its best endeavours to prevent any unlawful, riotous or disorderly conduct or behaviour by or amongst its employees and the labour of its Sub-contractors.

(6) The Operator shall, in all dealings with its labour and the labour of its Sub-contractors currently employed on or connected with the Contract, pay due regard to all recognized festivals, official holidays, religious or other customs and all local laws and regulations pertaining to the employment of labour.
8.4. **Replacement of Operator’s Personnel**

The Owner or Design-Build-Operations Engineer may require the Operator to remove and replace any member of the Operator’s Personnel who,

(a) persists in any misconduct or lack of care;

(b) carries out duties incompetently or negligently;

(c) fails to comply with any provision of the Contract; or

(d) persists in any conduct which gives the Owner reasonable cause to be dissatisfied with him or her. Or undertakes behavior which breaches the Code of Conduct (ESHS) (e.g. spreading communicable diseases, sexual harassment, gender based violence, illicit activity or crime)."

“If appropriate, the Contractor shall then appoint (or cause to be appointed) a suitable replacement person.”

“The Contractor’s Personnel includes Key Personnel. If the Contractor intends to replace a Key Personnel, the Contractor shall, not less than 30 days before the intended date of replacement, give notice to the Engineer, the name, address, academic qualifications and relevant experience of the intended replacement Key Personnel. The Contractor shall not, without the prior consent of the Engineer, revoke the appointment of the Key Personnel or appoint a replacement.”

8.5. **Existing Staff**

If the Operator is obliged to retain staff employed by the Owner as stated in the SCC, it shall do so in accordance with the Existing Staff Schedule.

8.6. **Sub-contractors**

(1) The Operator shall not enter into any contract or contracts that will result in the Operator exceeding the maximum percentage of subcontracting permitted by the Owner in respect of the Design-Build Services and the Operations Services, as set out in the Bidding Documents.

(2) Except with respect to the Sub-contractors named in the Operator’s Bid, the Operator shall not enter into a contract with any Sub-contractor without the prior consent of the Owner.

(3) The Operator shall be responsible for the observance by Sub-contractors of the terms and conditions of the Contract and shall ensure that all relevant terms of the Contract are included in the Operator’s contracts with Sub-contractors.
(4) Subcontracting by the Operator shall not relieve the Operator of any of its obligations under the Contract and the Operator shall be responsible for the acts, omissions and defaults of all Sub-contractors, and the Sub-contractors, employees, agents and sub-sub-contractors, as fully as if they were acts, omissions or defaults of the Operator or the Operator’s Personnel.
ARTICLE 9. LIABILITY AND RISK DISTRIBUTION

9.1. Defect Liability -

(1) The Operator warrants that the Site and Project Facility or any part thereof shall be free from defects in the Design, engineering, materials and workmanship of the Plant and Equipment supplied and of the work executed.

(2) The Defect Liability Period shall be 24 months after the date of Completion of the STP and successful completion of three months trial run of the Project Facility, whichever first occurs, unless specified otherwise in the SCC.

(3) If during the Defect Liability Period any defect should be found in the Design, engineering, materials and workmanship of the Site, Project Facility or Plant and Equipment supplied or of the work executed by the Operator, the Operator shall promptly, in consultation and agreement with the Owner regarding appropriate remedying of the defects, and at its cost, repair, replace or otherwise make good, as the Operator shall, at its discretion, determine, such defect as well as any damage to the Project Facility caused by such defect. The Operator shall not be responsible for the repair, replacement or making good of any defect or of any damage to the Project Facility arising out of or resulting from normal wear and tear.

(4) The Operator’s obligations under this GC Section 9.1 shall not apply to,

(a) any Designs, specifications or other data Designed, supplied or specified by or on behalf of the Owner; and

(b) any other materials supplied or any other work executed by or on behalf of the Owner, except for the work executed by the Owner under GC Section 9.1(10).

(5) The Owner shall give the Operator a notice stating the nature of any such defect together with all available evidence thereof, promptly following the discovery thereof. The Owner shall give all reasonable opportunity for the Operator to inspect any such defect.

(6) The Owner shall give the Operator all necessary access to the Project Facility and the Site to enable the Operator to perform its obligations under this GC Section 9.1.

(7) The Operator may, with the consent of the Owner, remove from the Site any Plant and Equipment, Operator's Equipment (Design-Build) and Operator's Equipment (Operations) or any part of the Project Facility that are defective if the nature of the defect, or any damage to the Project Facility caused by the defect, is such that repairs cannot be expeditiously carried out at the Site.
(8) If the repair, replacement or making good is of such a character that it may affect the efficiency of the Project Facility or any part thereof, the Owner may give to the Operator a notice requiring that tests of the defective part of the Project Facility shall be made by the Operator immediately upon completion of such remedial work, whereupon the Operator shall carry out such tests.

(9) If such part fails the tests, the Operator shall carry out further repair, replacement or making good, as the case may be, until that part of the Project Facility passes such tests. The tests shall be agreed upon by the Owner and the Operator.

(10) If the Operator fails to commence the work necessary to remedy such defect or any damage to the Project Facility caused by such defect within a reasonable time, which shall in no event be considered to be less than 15 days, the Owner may, following notice to the Operator, proceed to do such work, and the reasonable costs incurred by the Owner in connection therewith shall be paid to the Owner by the Operator or may be deducted by the Owner from any monies due the Operator or claimed under the Performance Security.

(11) If the Project Facility or any part thereof cannot be used by reason of such defect or making good of such defect, the Defect Liability Period of the Project Facility or such part, as the case may be, shall be extended by a period equal to the period during which the Project Facility or such part cannot be used by the Owner because of any of the aforesaid reasons.

(12) Except as provided in GC Sections 9.1 and 9.5, the Operator shall be under no liability whatsoever and howsoever arising, and whether under the Contract or at law, in respect of defects in the Project Facility or any part thereof, the Plant and Equipment, Design or engineering or work executed that appear after Completion of the Site, the Project Facility or any part thereof, except where such defects are the result of the gross negligence, fraud, criminal or wilful action of the Operator.

(13) The Operator shall also provide an extended warranty for any such component of the Project Facility and during the period of time as may be specified in the SCC. Such obligation shall be in addition to the Defect Liability Period specified under GC Section 9.1(2).

9.2. Limitation of Liability

Except in cases of criminal negligence or wilful misconduct,

(a) the Operator shall not be liable to the Owner in contract, tort, or otherwise, for any indirect or consequential loss or damage, loss of use, loss of production, or loss of profits of interest costs, provided that this exclusion shall not apply to any obligation of the Operator to pay liquidated damages to the Owner; and
(b) the aggregate liability of the Operator to the Owner, whether under the Contract, in tort or otherwise, shall not exceed the aggregate of the total Contract Price (including the Monthly payment during the Operations Period) and the total available Performance Incentive Compensation, provided that this limitation shall not apply to any obligation of the Operator to indemnify the Owner with respect to patent infringement.

9.3. Transfer of Ownership and Existing Equipment and Materials

9.3.1. Transfer of Ownership

(1) Ownership of the Plant and Equipment, including spare parts, to be imported into the Country shall be transferred to the Owner upon delivery at the Site.

(2) Ownership of the Plant and Equipment procured in the Country shall be transferred to the Owner when the Plant and Equipment are brought on to the Site.

(3) Ownership of any Plant and Equipment in excess of the requirements of the Project Facility shall revert to the Operator upon Completion of the Project Facility or such earlier time if the Owner and the Operator agree that the Plant and Equipment in question are no longer required for the Project Facility.

(4) Subject to GC Section 9.3.1(5), Ownership of the Operator's Equipment (Design-Build) and Operator's Equipment (Operations), including spare parts, shall remain with the Operator or its Subcontractors.

(5) The Owner may, in its sole discretion, purchase as of the End Date any of the Operator’s Equipment (Operations), including spare parts, at the fair market value of such Operator’s Equipment (Operations) as determined by an independent valuator and the Operator shall transfer Ownership and possession of such Operator’s Equipment (Operations) to the Owner as of the End Date.

(6) Notwithstanding the transfer of Ownership of the Plant and Equipment, the responsibility for care and custody of the Plant and Equipment, Operator's Equipment (Design-Build) and Operator's Equipment (Operations), together with the risk of loss or damage thereto, shall remain with the Operator pursuant to GC Section 9.4 until the End Date.

9.3.2. (Existing Equipment and Materials) Deleted
9.4. Care of the Site and Project Facility

(1) Except as provided in GC Sections 9.9 and 9.4(2), the Operator shall be responsible for the care and custody of the Site and Project Facility or any part thereof until the End Date and shall make good at its own cost any loss or damage that may occur to the Site or Project Facility from any cause whatsoever during such period. The Operator shall also be responsible for any loss or damage to the Site or Project Facility caused by the Operator or its Sub-contractors in the course of any work carried out, pursuant to GC Section 9.1.

(2) If any loss or damage occurs to the Site or Project Facility or any part thereof by reason of,

(a) insofar as they relate to the Country, nuclear reaction, nuclear radiation, radioactive contamination, pressure wave caused by aircraft or other aerial objects, or any other occurrences that an experienced Operator or operator could not reasonably foresee, or if reasonably foreseeable could not reasonably make provision for or insure against, insofar as such risks are not normally insurable on the insurance market and are mentioned in the general exclusions of the policy of insurance, including War Risks, taken out under GC Section 9.6;

(b) any use or occupation by the Owner or any Third Party, other than a Sub-contractor, authorized by the Owner of any part of the Site or Project Facility; or

(c) any use of or reliance upon any Design, data or specification provided or Designated by or on behalf of the Owner, or any such matter for which the Operator has disclaimed responsibility herein,

the Owner shall pay to the Operator all sums payable in respect of the Site executed, notwithstanding that the same be lost, destroyed or damaged. If the Owner requests the Operator in writing to make good any loss or damage to the Plant thereby occasioned, the Operator shall make good the same at the cost of the Owner in accordance with GC Section 10.1. If the Owner does not request the Operator in writing to make good any loss or damage to the Project Facility thereby occasioned, the Owner shall either request a change in accordance with GC Section 10.1, excluding the performance of that part of the Project Facility thereby lost, destroyed or damaged, or, where the loss or damage affects a substantial part of the Project Facility, the Owner shall terminate the Contract pursuant to GC Section 11.2.1.

(3) The Operator shall be liable for any loss of or damage to any Operator's Equipment (Design-Build), Operator's Equipment (Operations) or any other property of the Operator used or intended to be used for purposes of the Site or the Project Facility, except where such loss or damage arises by reason of any of the matters specified in GC Sections 9.4(2)(b) and 9.9.
9.5. **Indemnification**

(1) Subject to GC Section 9.5(5), the Operator shall indemnify and hold harmless the Owner and its employees and officers from and against any and all suits, actions or administrative proceedings, claims, demands, losses, damages, costs, and expenses of whatsoever nature, including attorney’s fees and expenses, in respect of the death or injury of any person or loss of or damage to any property, arising in connection with the Operator’s performance of the Services and by reason of the negligence of the Operator or its Sub-contractors, or their employees, officers or agents, except any injury, death or property damage caused by the negligence of the Owner, its Operators, employees, officers or agents.

(2) If any proceedings are brought or any claim is made against the Owner that might subject the Operator to liability under GC Section 9.5(1), the Owner shall promptly give the Operator a notice thereof and the Operator may at its own expense and in the Owner’s name conduct such proceedings or claim and any negotiations for the settlement of any such proceedings or claim.

(3) If the Operator fails to notify the Owner prior to the expiration of 30 days after receipt of a notice given pursuant to GC Section 9.5(2) that it intends to conduct any such proceedings or claim, then the Owner shall be free to conduct the same on its own behalf. Unless the Operator has so failed to notify the Owner within the 30 day period, the Owner shall make no admission that may be prejudicial to the defence of any such proceedings or claim.

(4) The Owner shall, at the Operator’s request, provide all available assistance to the Operator in conducting such proceedings or claim, and shall be reimbursed by the Operator for all reasonable expenses incurred in so doing.

(5) The Owner shall indemnify and hold harmless the Operator and its employees, officers and Sub-contractors from any liability for loss of or damage to property of the Owner that is caused by fire, explosion or any other perils, in excess of the amount recoverable from insurances procured under GC Section 9.6, provided that such fire, explosion or other perils were not caused by any act or omission of the Operator.

(6) The Party entitled to the benefit of an indemnity under this GC Section 9.5 shall take all reasonable measures to mitigate any loss or damage which has occurred. If the Party fails to take such measures, the other Party’s liabilities shall be correspondingly reduced.
9.6. **Insurance**

The Insurance to be provided by the operator during his entire duration of Contract Term has been specified in SCC.

9.7. **Unforeseeable Physical Conditions**

(1) In this GC Section 9.7, “physical conditions” means natural physical conditions and man-made and other physical obstructions and pollutants, which the Operator encounters at the Site when performing of the Design-Build Services, including sub-surface and hydrological conditions but excluding climatic conditions.

(2) If the Operator encounters adverse physical conditions which it considers to have been Unforeseeable, the Operator shall give notice to the Design-Build-Operations Engineer as soon as practicable.

(3) The Operator’s Notice pursuant to GC Section 9.7(2) shall describe the physical conditions, so that they can be inspected by the Design-Build-Operations Engineer, and shall set out the reasons why the Operator considers them to be Unforeseeable. The Operator shall continue performing the Design-Build Services, using such proper and reasonable measures as are appropriate for the physical conditions, and shall comply with any instructions which the Design-Build-Operations Engineer may give. If an instruction constitutes a Change GC Section 10.1.3 shall apply.

(4) If and to the extent that the Operator encounters physical conditions which are Unforeseeable, gives the notice required by GC Section 9.7(2), and suffers delay or incurs Cost due to these conditions, the Operator shall be entitled subject to GC Section 1.9 to,

(a) an extension of time for any such delay, if completion is or will be delayed, under GC Section 2.3.4; and

(b) payment of any such Cost, which shall be included in the Contract Price.

(5) After receiving such notice and inspecting or investigating these physical conditions, the Design-Build-Operations Engineer shall proceed in accordance with GC Section 7.2.6 to agree or determine,

(a) whether and to what extent these physical conditions were Unforeseeable; and

(b) the amount of delay or Cost, if any, pursuant to GC Section 9.7(4).
(6) Before additional Cost is finally agreed or determined under GC Section 9.7(5), the Design-Build-Operations Engineer, pursuant to GC Section 7.2.6, may also review whether other physical conditions were more favourable than could reasonably have been foreseen when the Operator submitted the Bid. If and to the extent that these more favourable conditions were encountered, the Design-Build-Operations Engineer may proceed in accordance with GC Section 7.2.6 to agree or determine the reductions in Cost which were due to these conditions, which may be included, as deductions, in the Contract Price. The net effect of all adjustments under GC Section 9.7(4)(b) and all these reductions, for all the physical conditions encountered on the Site, shall not result in a net reduction in the Contract Price.

(7) The Design-Build-Operations Engineer may take account of any evidence of the physical conditions foreseen by the Operator when submitting the Bid, which may be made available by the Operator, but shall not be bound by any such evidence.

9.8. Force Majeure

(1) “Force Majeure” shall mean any event,

(a) beyond the reasonable control of the Owner or of the Operator, as the case may be; and

(b) which is unavoidable notwithstanding the reasonable care of the Party affected.

(2) Force Majeure shall include the events listed below in this GC Section 9.8(2) if the conditions set out in GC Section 9.8(1)(a) and (b) are satisfied:

(a) war, hostilities or warlike operations, whether a state of war be declared or not, invasion, act of foreign enemy and civil war;

(b) rebellion, revolution, insurrection, mutiny, usurpation of civil or military government, conspiracy, riot, civil commotion and terrorist acts;

(c) confiscation, nationalization, mobilization, commandeering or requisition by or under the order of any government or de jure or de facto authority or ruler or any other act or failure to act of any local state or national government authority;

(d) strike, sabotage, lockout, embargo, import restriction, port congestion, lack of usual means of public transportation and communication, industrial dispute, shipwreck, shortage or restriction of power supply, epidemics, quarantine and plague;

(e) earthquake, landslide, volcanic activity, fire, flood or inundation, tidal wave, typhoon or cyclone, hurricane, storm, lightning, or other inclement weather condition, nuclear and pressure waves or other natural or physical disaster; and
(f) shortage of labour, materials or utilities where caused by circumstances that are themselves Force Majeure.

(3) If the Parties are prevented, hindered or delayed from or in performing any of their obligations under the Contract by an event of Force Majeure, then it shall notify the other in writing of the occurrence of such event and the circumstances thereof within 14 days after the occurrence of such event.

(4) The Party who has given such notice shall be excused from the performance or punctual performance of its obligations under the Contract for so long as the relevant event of Force Majeure continues and to the extent that such Party’s performance is prevented, hindered or delayed. The Time for Completion shall be extended in accordance with GC Section 2.3.4(1) for events of Force Majeure during the Design-Build Period. If the Time for Completion is extended in accordance with GC Section 2.3.4(1), the End Date shall be extended for a period of time equal to the period of time during which the relevant event of Force Majeure continued.

(5) The Party or Parties affected by the event of Force Majeure shall use reasonable efforts to mitigate the effect thereof upon its or their performance of the Contract and to fulfil its or their obligations under the Contract, but without prejudice to either Party’s right to terminate the Contract under GC Sections 9.8(7) and 9.9(6).

(6) No delay or non-performance by either Party hereto caused by the occurrence of any event of Force Majeure shall,

(a) constitute a default or breach of the Contract; or

(b) subject to GC Sections 9.4(2), 9.9(3) and 9.9(5), give rise to any claim for damages or additional Cost occasioned thereby,

if and to the extent that such delay or non-performance is caused by the occurrence of an event of Force Majeure.

(7) If the performance of the Contract is substantially prevented, hindered or delayed for a single period of more than 60 days or an aggregate period of more than 120 days on account of one or more events of Force Majeure during the term of the Contract, the Parties will attempt to develop a mutually satisfactory solution, failing which either Party may terminate the Contract by giving a notice to the other, but without prejudice to either Party’s right to terminate the Contract under GC Section 9.9(6).

(8) In the event of termination pursuant to GC Section 9.8(7), the rights and obligations of the Owner and the Operator shall be as specified in GC Sections 11.2.1(2) and 11.2.2(1).

(9) Notwithstanding GC Section 9.8(6), Force Majeure shall not apply to any obligation of the Owner to make payments to the Operator herein.
9.9. War Risks

(1) “War Risks” shall mean any event specified in GC Section 9.8(2)(a) and (b) and any explosion or impact of any mine, bomb, shell, grenade or other Projectile, missile, munitions or explosive of war, occurring or existing in or near the Country.

(2) Notwithstanding anything contained in the Contract, the Operator shall have no liability whatsoever for or with respect to,

(a) destruction of or damage to the Site and Plant and Equipment or any part thereof;

(b) destruction of or damage to property of the Owner or any Third Party; or

(c) injury or loss of life,

if such destruction, damage, injury or loss of life is caused by any War Risks, and the Owner shall indemnify and hold the Operator harmless from and against any and all claims, liabilities, actions, lawsuits, damages, costs, charges or expenses arising in consequence of or in connection with the same.

(3) If the Site, Project Facility or any Plant and Equipment, Operator's Equipment (Design-Build), Operator's Equipment (Operations) or any other property of the Operator used or intended to be used for the purposes of the Services sustains destruction or damage by reason of any War Risks, the Owner shall pay the Operator for,

(a) any part of the Project Facility or the Plant and Equipment so destroyed or damaged, to the extent not already paid for by the Owner;

(b) replacing or making good any Operator's Equipment (Design-Build), Operator's Equipment (Operations) or other property of the Operator so destroyed or damaged; and

(c) so far as may be required by the Owner, and as may be necessary for completion of the Services, replacing or making good any such destruction or damage to the Site, Project Facility or the Plant and Equipment or any part thereof.

(4) If the Owner does not require the Operator to replace or make good any such destruction or damage to the Site or Project Facility, the Owner shall either request a Change in accordance with GC Section 10.1 excluding the performance of that part of the Project Facility thereby destroyed or damaged or, where the loss, destruction or damage affects a substantial part of the Site or Project Facility, shall terminate the Contract, pursuant to GC Section 11.2.1.
(5) Notwithstanding anything contained in the Contract, the Owner shall pay the Operator for any increased Costs that are in any way attributable to, consequent on, resulting from, or in any way connected with any War Risks, if the Operator notifies the Owner in writing of any such increased Cost as soon as practicable.

(6) If, during the term of the Contract, any War Risks occur that financially or otherwise materially affect the execution of the Contract by the Operator, the Operator shall use its reasonable efforts to execute the Contract with due and proper consideration given to the safety of its and its Sub-contractors’ personnel engaged in the work on the Services. If the execution of the Services becomes impossible or is substantially prevented for a single period of more than 60 days or an aggregate period of more than 120 days on account of any War Risks, the Parties will attempt to develop a mutually satisfactory solution, failing which either Party may terminate the Contract by giving a notice to the other.

(7) In the event of termination pursuant to GC Section 9.9(4) or 9.9(6), the rights and obligations of the Owner and the Operator shall be as specified in GC Section 11.2.1(2) and 11.2.2(1).

9.10. Change in Laws and Regulations

If, after a date which is 30 days prior to the Submission Deadline in the Bidding Documents, in the Country, any law, regulation, ordinance, order or by-law having the force of law is enacted, promulgated, abrogated or changed, which shall be deemed to include any change in interpretation or application by the competent authorities, that subsequently affects the costs and expenses of the Operator or the Time for Completion, the Contract Price shall be correspondingly increased or decreased, or the Time for Completion shall be reasonably adjusted to the extent that the Operator has thereby been affected in the performance of any of its obligations under the Contract. Notwithstanding the foregoing, such additional or reduced costs shall not be separately paid or credited if the same has already been accounted for in the Contract Price adjustment provisions where applicable, in accordance with the SCC if so provided.

9.11. Patent Indemnity

9.11.1. Indemnity by Operator

The Operator shall indemnify and hold harmless the Owner and its employees and officers from and against any and all suits, actions or administrative proceedings, claims, demands, losses, damages, costs, and expenses of whatsoever nature, including attorney’s fees and expenses, which the Owner may suffer as a result of any infringement or alleged infringement by the Operator, Sub-contractors, or their employees, agents, or representatives, of any patent, utility model, registered Design,
9.11.2. Notice of Claim

(1) If any proceedings are brought or any claim is made against the Owner arising out of the matters referred to in GC Section 9.11.1, the Owner shall promptly give the Operator a notice thereof, and the Operator may at its own expense and in the Owner’s name conduct such proceedings or claim and any negotiations for the settlement of any such proceedings or claim.

(2) If the Operator fails to notify the Owner no later than 30 days after receipt of such notice that it intends to conduct any such proceedings or claim, then the Owner shall be free to conduct the same on its own behalf. Unless the Operator has so failed to notify the Owner no later than the 30 day period, the Owner shall make no admission that may be prejudicial to the defence of any such proceedings or claim.

(3) The Owner shall, at the Operator’s request, give all available assistance to the Operator in conducting such proceedings or claim, and shall be reimbursed by the Operator for all reasonable expenses incurred in so doing.

9.11.3. Indemnity by Owner

The Owner shall indemnify and hold harmless the Operator and its employees, officers and Sub-contractors from and against any and all suits, actions or administrative proceedings, claims, demands, losses, damages, costs, and expenses of whatsoever nature, including attorney’s fees and expenses, which the Operator may suffer as a result of any infringement or alleged infringement by the Owner of any patent, utility model, registered Design, trademark, copyright or other intellectual property right registered or otherwise existing at the Effective Date arising out of or in connection with any Design, data, drawing, specification, or other documents or materials provided or Designed by or on behalf of the Owner.

9.12. Functional Guarantees

(1) The Operator guarantees that during the Tests and Inspection set out in DBSS Article 5, the Project Facility and all parts thereof shall attain the Functional Guarantees as required.
(2) If, for reasons attributable to the Operator, the minimum level of the Functional Guarantees are not met either in whole or in part, the Operator shall at its cost and expense make any such changes, modifications or additions to the Project Facility or any part thereof as may be necessary to meet at least the minimum level of the Functional Guarantees. The Operator shall notify the Owner upon completion of the necessary changes, modifications or additions, and shall request the Owner to repeat the applicable Tests and Inspection until the minimum level of the Functional Guarantees has been met. If the Operator eventually fails to meet the minimum level of Functional Guarantees, the Owner may consider termination of the Contract, pursuant to GC Section 11.2.3.

(3) If, for any reasons attributable to the Operator, the Functional Guarantees are not attained either in whole or in part, but the minimum level of the Functional Guarantees is met, the Operator shall, at the Operator’s option, either

(a) make such changes, modifications or additions to the Project Facility or any part thereof that are necessary to attain the Functional Guarantees at its cost and expense, and shall request the Owner to repeat the Tests and Inspection; or

(b) pay liquidated damages to the Owner in respect of the failure to meet the Functional Guarantees in accordance with the provisions of the Liquidated Damages.

The payment of liquidated damages under GC Section 9.12(3) up to the limitation of liability specified in the SCC, shall completely satisfy the Operator’s guarantees under GC Section 9.12(3), and the Operator shall have no further liability whatsoever to the Owner in respect thereof.
ARTICLE 10. CHANGE IN CONTRACT ELEMENTS

10.1. Change to the Design-Build Services

10.1.1. Introducing a Change

(1) Subject to GC Sections 10.1.2(6) and 10.1.2(10), the Owner shall have the right to propose, and subsequently require, that the Design-Build-Operations Engineer order the Operator from time to time during the performance of the Contract to make any change, modification, addition or deletion to, in or from the Design-Build Services (the “Change”), provided that such Change falls within the general scope of the Design-Build Services and does not constitute unrelated work and that it is technically practicable, taking into account both the state of advancement of the Design-Build Services and the technical compatibility of the Change envisaged with the nature of the Design-Build Services as specified in the Contract and any changes suggested by the statutory pollution control authority while giving consent to establish or operate the STP..

(2) The Operator may from time to time during its performance of the Contract propose to the Owner, with a copy to the Design-Build-Operations Engineer, any Change that the Operator considers necessary or desirable to improve the quality, efficiency or safety of the Design-Build Services. The Owner may at its discretion approve or reject any Change proposed by the Operator.

(3) Notwithstanding GC Section 10.1.1(1) and 10.1.1(2), no change made necessary because of any default of the Operator in the performance of its obligations under the Contract shall be deemed to be a Change, and such change shall not result in any adjustment of the Contract Price or the Time for Completion.

(4) The procedure on how to proceed with and execute Changes is specified in GC Section 10.1.2 and 10.1.3, and the Design-Build-Operations Engineer shall provide Operator with further details and sample forms on the Change procedures prior to the Design-Build Starting Date.

10.1.2. Changes Originating from Owner

(1) If the Owner proposes a Change pursuant to GC Section 10.1.1(1), it shall send to the Operator a “Request for Change Proposal,” requiring the Operator to prepare and furnish to the Design-Build-Operations Engineer as soon as reasonably practicable a “Change Proposal,” which shall include the following:

(a) brief description of the Change;

(b) effect on the Time for Completion;

(c) estimated cost of the Change; and
(d) effect on any other provisions of the Contract.

(2) Prior to preparing and submitting the Change Proposal, the Operator shall submit to the Design-Build-Operations Engineer an “Estimate for Change Proposal,” which shall be an estimate of the cost of preparing and submitting the Change Proposal.

(3) Upon receipt of the Operator’s Estimate for Change Proposal, the Owner shall,

(a) accept the Operator’s estimate with instructions to the Operator to proceed with the preparation of the Change Proposal;

(b) advise the Operator of any part of its Estimate for Change Proposal that is unacceptable and request the Operator to review its estimate; or

(c) advise the Operator that the Owner does not intend to proceed with the Change.

(4) Upon receipt of the Owner’s instruction to proceed under GC Section 10.1.2(3)(a) (the “Change Order”), the Operator shall, with proper expedition, proceed with the preparation of the Change Proposal, in accordance with GC Section 10.1.2(1).

(5) The pricing of any Change shall, as far as practicable, be calculated in accordance with the prices included in the Contract. If such prices are inequitable, the Parties thereto shall agree on specific rates for the valuation of the Change.

(6) If, before or during the preparation of the Change Proposal, it becomes apparent that the aggregate effect of compliance therewith and with all other Change Orders that have already become binding upon the Operator under this GC Section 10.1 would be to increase or decrease the Contract Price by more than 15 per cent, the Operator may give a written notice of objection thereto prior to furnishing the Change Proposal. If the Owner accepts the Operator’s objection, the Owner shall withdraw the proposed Change and shall notify the Operator in writing thereof.

(7) The Operator’s failure to object pursuant to GC Section 10.1.2(6) shall neither affect its right to object to any subsequent requested Changes or Change Orders herein, nor affect its right to take into account, when making such subsequent objection, the percentage increase or decrease in the Contract Price that any Change not objected to by the Operator represents.

(8) Upon receipt of the Change Proposal, the Owner and the Operator shall mutually agree upon all matters therein contained. No later than 14 days after such agreement, the Owner shall, if it intends to proceed with the Change, issue the Operator with a Change Order.
(9) If the Owner decides not to proceed with the Change for whatever reason, it shall notify the Operator prior to the expiration of 14 days after the agreement on the Change. Under such circumstances, the Operator shall be entitled to reimbursement of all costs reasonably incurred by it in the preparation of the Change Proposal, provided that these do not exceed the amount given by the Operator in its Estimate for Change Proposal submitted in accordance with GC Section 10.1.2(2).

(10) If the Owner and the Operator cannot reach agreement on the price for the Change, an equitable adjustment to the Time for Completion, or any other matters identified in the Change Proposal, the Owner may nevertheless instruct the Operator to proceed with the Change by issue of a “Pending Agreement Change Order.”

(11) Upon receipt of a Pending Agreement Change Order, the Operator shall immediately proceed with effecting the Changes covered by such Order. The parties shall thereafter attempt to reach agreement on the outstanding issues under the Change Proposal.

(12) If the Parties cannot reach agreement prior to the expiration of 60 days after the date of issue of the Pending Agreement Change Order, then the matter may be referred to the Adjudicator in accordance with the provisions of GC Section 1.6.1.

10.1.3. Changes Originating from Operator

(1) If the Operator proposes a Change pursuant to GC Section 10.1.1(2), the Operator shall submit to the Design-Build-Operations Engineer a written “Application for Change Proposal,” giving reasons for the proposed Change and including the information specified in GC Section 10.1.2(1).

(2) Upon receipt of the Application for Change Proposal, the Parties shall follow the procedures outlined in GC Sections 10.1.2(8) and 10.1.2(10). If the Owner chooses not to proceed, the Operator shall not be entitled to recover the costs of preparing the Application for Change Proposal.

10.1.4. Payment in Applicable Currencies

If the Contract provides for payment of the Contract Price in more than one currency, then whenever a Change is agreed, approved or determined pursuant to GC Section 10.1.2 or 10.1.3, the amount payable in each of the applicable currencies shall be specified. For this purpose, reference shall be made to the actual or expected currency proportions of the Cost of the Change, and to the proportions of various currencies specified for payment of the Contract Price.

10.1.5. Design-Build Period
GC Sections 10.1.1 to 10.1.4 shall apply during only the Design-Build Period.

10.2. **Change to the Operations Services**

(1) Except as specifically provided in GC Section 10.2(2) or elsewhere in the Contract, the Operator shall make no claim whatsoever for any adjustment to the Contract Price during the Operations Period.

(2) The Operator or the Owner may request an adjustment to the Monthly O & M Payment if the quantity of sewage delivered to the Site changes in accordance with the SCC. In the event of such a change to the volume of sewage, the Operator or the Owner, as applicable, shall be entitled to receive an increase or decrease equal to the actual increase or decrease in Cost demonstrated by the Operator.

(3) The Operator or the Owner may request an adjustment to the Monthly O & M Payment if the total sewer length to be maintained exceeds by more than 2% of the total sewer length included originally in accordance with the Contract.
ARTICLE 11.  SUSPENSION AND TERMINATION

11.1.  Suspension

11.1.1.  Suspension by the Owner

(1) The Owner may request the Design-Build-Operations Engineer, as applicable, by notice to the Operator, to order the Operator to suspend performance of any or all of its obligations under the Contract. Such notice shall specify the obligation of which performance is to be suspended, the effective date of the suspension and the reasons therefore. The Operator shall thereupon suspend performance of such obligation, except those obligations necessary for the care or preservation of the Site or Project Facility, until ordered in writing to resume such performance by the Design-Build-Operations Engineer as applicable.

(2) If, by virtue of a suspension order given by the Design-Build-Operations Engineer, as applicable, other than by reason of the Operator’s default or breach of the Contract, the Operator’s performance of any of its obligations is suspended for an aggregate period of more than 90 days, then at any time thereafter and provided that at that time such performance is still suspended, the Operator may give a notice to the Design-Build-Operations Engineer as applicable, requiring that the Owner shall, no later than 30 days after the Owner’s receipt of the notice, order the resumption of such performance or request and subsequently order a Change in accordance with GC Section 10.1, excluding the performance of the suspended obligations from the Contract.

(3) If the Owner fails to order the resumption of performance in accordance with GC Section 11.1.1(2), the Operator may, by a further notice to the Design-Build-Operations Engineer, elect to treat the suspension, where it affects a part only of the Services, as a deletion of such part in accordance with GC Section 10.1 or, where it affects the whole of the Services, as termination of the Contract pursuant to GC Section 11.2.1.

11.1.2.  Suspension by the Operator

(1) If, the Owner has,

(a) failed to pay the Operator any sum due under the Contract within the period specified in the Contract;

(b) failed to approve any invoice or supporting documents without just cause under the Contract; or

(c) has committed a substantial breach of the Contract,

the Operator may give a notice to the Owner that requires payment of such sum, with interest thereon as stipulated in GC Section 5.2(3) requires
approval of an invoice or supporting documents, or specifies a breach & requires the Owner to remedy the same, as the case may be.

(2) If the Owner fails to pay the sums required by the Operator in accordance with GC Section 11.1.2(1) or fails to remedy the breach or take steps to remedy the breach no later than 14 days after receipt of the Operator’s notice, then the Operator may, upon giving 14 days’ notice to the Owner, suspend performance of all or any of its obligations under the Contract, or, in the case of the Design-Build Services, reduce the Operator’s rate of progress.

(3) If the Operator is unable to carry out any of its obligations under the Contract for any reason attributable to the Owner, including the Owner’s failure to provide possession of or access to the Site or other areas in accordance with GC Section 4.2, then the Operator may, upon giving 14 days’ notice to the Owner, suspend performance of all or any of its obligations under the Contract, or, in the case of the Design-Build Services, reduce the Operator’s rate of progress.

(4) If the Operator’s performance of its obligations is suspended or the rate of progress is reduced pursuant to this GC Section 11.1.2, then the Time for Completion shall be extended in accordance with GC Section 2.3.4, and additional Costs incurred by the Operator as a result of such suspension or reduction shall be paid by the Owner to the Operator in addition to the Contract Price, except in the case of suspension order or reduction in the rate of progress by reason of the Operator’s default or breach of the Contract.

(5) During the period of suspension, the Operator shall not remove from the Site or Project Facility any Plant and Equipment, Operator's Equipment (Design-Build), Operator's Equipment (Operations), or any part of the Project Facility, without the prior written consent of the Owner.

11.2. Termination

11.2.1. Termination for Owner’s Convenience

(1) The Owner may at any time terminate the Contract for any reason by giving the Operator a notice of termination that refers to this GC Section 11.2.1(1).

(2) Upon receipt of the notice of termination under GC Section 11.2.1(1),

(a) the Operator shall, either immediately or upon the date specified in the notice of termination,

(i) cease all further work, except for such work as the Owner may specify in the notice of termination for the sole purpose of protecting that part of the Facility already
executed, or any work required to leave the Site in a clean and safe condition;

(ii) terminate all Subcontracts; and

(iii) remove all Operator’s Equipment (Design-Build) and, except if the Owner asserts its rights pursuant to GC Section 9.3.1(5), Operator’s Equipment (Operations) from the Site, repatriate the Operator’s Personnel and its Sub-contractors’ personnel from the Site, remove from the Site any wreckage, rubbish and debris of any kind, and leave the whole of the Site in a clean and safe condition; and

(b) the Operator, subject to the payment specified in GC Section 11.2.2, shall,

(i) deliver to the Owner the parts of the Project Facility executed by the Operator and all materials which have been paid for by the owner up to the date of termination; and

(ii) deliver to the Owner all the Contract Records, including the Design-Build Documents, prepared by the Operator or its Sub-contractors as at the date of termination.

11.2.2. Payment upon Termination by the Owner for Convenience

(1) Upon termination of this Contract pursuant to GC Section 11.2.1, the Owner shall make only the following payments to the Operator,

(a) any portion of the Contract Price payable to the Operator for Services satisfactorily performed prior to the date of termination and calculated as set out in GC Section 5.2;

(b) the Costs reasonably incurred by the Operator in the removal of the Operator’s Equipment (Design-Build) and, except if the Owner asserts its rights pursuant to GC Section 9.3.1(5), Operator’s Equipment (Operations) from the Site and in the repatriation of the Operator’s Personnel and its Sub-contractors’ personnel;

(c) any amounts required to be paid by the Operator to its Sub-contractors in connection with the termination of any Subcontracts, including any reasonable cancellation charges;

(d) the reasonable Costs incurred by the Operator in protecting the Site, Existing Facility and Project Facility and leaving the Site in a clean and safe condition pursuant to GC Section 11.2.1(2)(a)(i); and

(e) the reasonable Cost of satisfying all other obligations, commitments and claims that the Operator may in good faith have undertaken with Third Parties in connection with the Contract and that are not covered by GC Section 11.2.2(1).
(2) The Operator acknowledges that the only payments to be made to the Operator on termination by the Owner are set out in this GC Section 11.2.2. The Operator shall not make a claim for lost or foregone profits, revenues, consequential damages or any other costs, damages, expenses or losses of any kind as a result of or in connection with the termination of this Contract.

11.2.3. Termination for Operator’s Default

(1) The Owner, without prejudice to any other rights or remedies it may possess, may terminate the Contract forthwith in the following circumstances, by giving a notice of termination and its reasons therefore to the Operator, referring to this GC Section 11.2.3(1):

(a) If the Operator becomes bankrupt or insolvent, has a receiving order issued against it, compounds with its creditors, or, if the Operator is a corporation, a resolution is passed or order is made for its winding up, other than a voluntary liquidation for the purposes of amalgamation or reconstruction, a receiver is appointed over any part of its undertaking or assets, or if the Operator takes or suffers any other analogous action in consequence of debt;

(b) If the Operator assigns or transfers the Contract or any right or interest therein in violation of the provision of GC Section 1.7; or

(2) If the Operator,

(a) has abandoned or repudiated the Contract;

(b) has without valid reason failed to commence work on the Site or Project Facility promptly or has suspended, other than pursuant to GC Section 11.1.1(2), the progress of Contract performance for more than 30 days after receiving a written instruction from the Owner to proceed;

(c) persistently fails to carry out the Services in accordance with the Contract or persistently neglects to carry out its obligations under the Contract without just cause; or

(d) refuses or is unable to provide sufficient materials, services, labour or personnel to perform the Services,

then the Owner may, without prejudice to any other rights it may possess under the Contract, give a notice to the Operator stating the nature of the default and requiring the Operator to remedy the same. If the Operator fails to remedy or to take steps to remedy the same within 14 days after its receipt of such notice, then the Owner may terminate the Contract forthwith by giving a notice of termination to the Operator that refers to this GC Section 11.2.3(2).
Upon receipt of the notice of termination under GC Sections 11.2.3(1) or 11.2.3(2) the Operator shall, either immediately or upon such date as is specified in the notice of termination,

(a) cease all further work, except for such work as the Owner may specify in the notice of termination for the sole purpose of protecting that part of the Site and Project Facility already executed, or any work required to leave the Site and Project Facility in a clean and safe condition;

(b) terminate all Subcontracts;

(c) deliver to the Owner the parts of the Project Facility executed by the Operator up to the date of termination; and

(d) deliver to the Owner all Contract Records, including the Design-Build Documents, prepared by the Operator or its Subcontractors as of the date of termination.

The Owner may enter the Project Facility and upon the Site, expel the Operator, and, if the Project Facility is not completed, the Owner may complete the Facility itself or by employing any Third Party. The Owner may, to the exclusion of any right of the Operator over the same, take over and use with the payment of a fair rental rate to the Operator, with all the maintenance costs to the account of the Owner and with an indemnification by the Owner for all liability including damage or injury to persons arising out of the Owner’s use of such equipment, any Operator's Equipment (Design-Build) and Operator’s Equipment (Operations) owned by the Operator and on the Site in connection with the Project Facility for such reasonable period as the Owner considers expedient for the completion of the Project Facility. Upon completion of the Project Facility or at such earlier date as the Owner thinks appropriate, the Owner shall give notice to the Operator that such Operator’s Equipment (Design-Build) and, except if the Owner asserts its rights pursuant to GC Section 9.3.1(5), Operator’s Equipment (Operations) will be returned to the Operator at or near the Site and shall return such Operator’s Equipment (Design-Build) and Operator’s Equipment (Operations) to the Operator in accordance with such notice. The Operator shall thereafter without delay and at its cost remove or arrange removal of the same from the Site.

11.2.3.1. Corrupt or Fraudulent Practices

If the Owner determines, based on reasonable evidence, that the Operator has engaged in corrupt, fraudulent, collusive or coercive practices, in competing for or in executing the Contract, then the Owner may, after giving 14 days’ notice to the Operator, terminate the Contract and expel him from the Site, and the provisions of Section 11.2 shall apply as if such termination had been made under Section 11.2.3 [Termination for Operator’s Default].
Should any employee of the Operator be determined, based on reasonable evidence, to have engaged in corrupt, fraudulent or coercive practice during the execution of the work, then that employee shall be removed in accordance with Section 8.4 [Replacement of Operator’s Personnel].

For the purposes of this Sub-Clause:

(i) “corrupt practice” is the offering, giving, receiving or soliciting, directly or indirectly, of anything of value to influence improperly the actions of another party;

(ii) “fraudulent practice” is any act or omission, including a misrepresentation, that knowingly or recklessly misleads, or attempts to mislead, a party to obtain a financial or other benefit or to avoid an obligation;

(iii) “collusive practice” is an arrangement between two or more parties Designed to achieve an improper purpose, including to influence improperly the actions of another party;

(iv) “coercive practice” is impairing or harming, or threatening to impair or harm, directly or indirectly, any party or the property of the party to influence improperly the actions of a party;

(v) “obstructive practice” is

   (i) deliberately destroying, falsifying, altering or concealing of evidence material to the investigation or making false statements to investigators in order to materially impede an Owner’s investigation into allegations of a corrupt, fraudulent, coercive or collusive practice; and/or threatening, harassing or intimidating any party to prevent it from disclosing its knowledge of matters relevant to the investigation or from pursuing the investigation, or

   (ii) acts intended to materially impede the exercise of the Owner’s inspection and audit rights provided for under Section 1.8.5 [Inspections and Audits].

69 “Another party” refers to a public official acting in relation to the procurement process or contract execution. In this context, “public official” includes employees of all organizations taking or reviewing procurement decisions.

70 “Party” refers to a public official; the terms “benefit” and “obligation” relate to the procurement process or contract execution; and the “act or omission” is intended to influence the procurement process or contract execution.

71 “Parties” refers to participants in the procurement process (including public officials) attempting to establish bid prices at artificial, non competitive levels.

72 “Party” refers to a participant in the procurement process or contract execution.
(vi) “restrictive practice” means forming a cartel or arriving at any understanding or arrangement among Bidders with the objective of restricting or manipulating full and fair competition in the Bid Process.

11.2.4. Payment upon Termination for Operator’s Default

(1) If the Contract is terminated pursuant to GC Section 11.2.3 and, subject to GC Section 11.2.4(2), the Operator shall be entitled to be paid,

(a) any portion of the Contract Price payable to the Operator for Services satisfactorily performed prior to the date of termination;

(b) the value of any unused or partially used Plant and Equipment on the Site, except to the extent that such Plant and Equipment have already been paid for by the Owner; and

(c) the Costs, if any, incurred by the Operator in protecting the Site and Project Facility and in leaving the Site in a clean and safe condition pursuant to GC Section 11.2.3(3)(a).

Any sums due the Owner from the Operator accruing prior to the date of termination shall be deducted from the amount to be paid to the Operator under this Contract.

(2) If the Owner completes the Project Facility pursuant to GC Section 11.2.3(4), the cost of completing the Project Facility by the Owner shall be determined, and, if the sum that the Operator is entitled to be paid, pursuant to GC Section 11.2.4(1), plus the reasonable costs incurred by the Owner in completing the Project Facility, exceeds the Contract Price, the Operator shall be liable for such excess as follows;

(a) if such excess is greater than the sums due the Operator under GC Section 11.2.4(1), the Operator shall pay the balance to the Owner; or

(b) if such excess is less than the sums due the Operator under GC Section 11.2.4(1), the Owner shall pay the balance to the Operator.

(3) The Parties shall agree in writing on the computation described in GC Section 11.2.4(2) and the manner in which any sums shall be paid.

11.2.5. Termination by Operator

(1) If,

(a) the Owner has,
(i) failed to pay the Operator any sum due under the Contract within the specified period, has failed to approve any invoice or supporting documents without just cause pursuant to the corresponding Terms and Procedures of Payment Schedule, or commits a substantial breach of the Contract, the Operator may give a notice to the Owner that requires payment of such sum, with interest thereon as stipulated in GC Section 5.2(3), requires approval of such invoice or supporting documents, or specifies the breach and requires the Owner to remedy the same, as the case may be; and

(ii) failed to pay such sum together with such interest, failed to approve such invoice or supporting documents or give its reasons for withholding such approval, failed to remedy the breach or take steps to remedy the breach no later than 14 days after receipt of the Operator’s notice; or

(b) the Operator is unable to carry out any of its obligations under the Contract for any reason attributable to the Owner, including the Owner’s failure to provide possession of or access to the Site or other areas,

then the Operator may give a notice to the Owner thereof, and if the Owner has failed to pay the outstanding sum, to approve the invoice or supporting documents, to give its reasons for withholding such approval, or to remedy the breach no later than 30 days after receipt of such notice, or if the Operator is still unable to carry out any of its obligations under the Contract for any reason attributable to the Owner no later than 30 days after receipt of the notice, the Operator may, by a further notice to the Owner referring to this GC Section 11.2.5(1), forthwith terminate the Contract.

(2) The Operator may terminate the Contract forthwith by giving a notice to the Owner to that effect, referring to this GC Section 11.2.5(2),

(a) if the Owner becomes bankrupt or insolvent;

(b) has a receiving order issued against it, or compounds with its creditors;

(c) being a corporation, if a resolution is passed or order is made for its winding up, other than a voluntary liquidation for the purposes of amalgamation or reconstruction; or

(d) a receiver is appointed over any part of its undertaking or assets, or if the Owner takes or suffers any other analogous action in consequence of debt.

(3) If the Contract is terminated under GC Section 11.2.5(1) or 11.2.5(2), then,
(a) the Operator shall immediately,

(i) cease all further work, except for such work as may be necessary for the purpose of protecting that part of the Site and Project Facility already executed, or any work required to leave the Site in a clean and safe condition; and

(ii) terminate all Subcontracts; and

(b) the Operator, subject to the payment specified in GC Section 11.2.6, shall

(i) deliver to the Owner the parts of the Project Facility executed by the Operator up to the date of termination; and

(ii) deliver to the Owner all Contract Records, including the Design-Build Documents, in existence as of the date of termination.

(4) Termination by the Operator pursuant to this GC Section 11.2.5 is without prejudice to any other rights or remedies of the Operator that may be exercised in lieu of or in addition to rights conferred by this GC Section 11.2.5.

11.2.6. Payment upon Termination by Operator

If the Contract is terminated under GC Sections 11.2.5(1) or 11.2.5(2), the Owner shall pay to the Operator all payments specified in GC Section 11.2.2(1), and reasonable compensation for all loss, except for loss of profit, or damage sustained by the Operator arising out of, in connection with or in consequence of such termination.

11.2.7. General Provisions - Termination

(1) In this GC Section 11.2, the expression “Project Facility executed” shall include all work executed, Services provided, and all Plant and Equipment acquired, or subject to a legally binding obligation to purchase by the Operator and used or intended to be used for the purpose of the performing the Services, up to and including the date of termination.

(2) In this GC Section 11.2, in calculating any monies due from the Owner to the Operator, account shall be taken of,

(a) any sum previously paid by the Owner to the Operator under the Contract, including any advance payment paid pursuant to the Terms and Procedures of Payment Schedule;

(b) any sum owing by the Operator to the Owner under the Contract, including Liquidated Damages – Delay or liquidated damages calculated pursuant to GC Section 5.4.
FOR A CONTRACT

TO (i) DESIGN AND BUILD SEWAGE TREATMENT PLANT OF INSTALLED CAPACITY .... MLD AND ALL APPURtenANT STRUCTURES AND ALLIED WORKS; (ii) SURVEY, REVIEW THE DESIGNS, REDESIGN WHERE NECESSARY, AND BUILD NEW UNDERGROUND SEWERAGE NETWORK AND/OR DIVERSION WORKS WITH INTERCEPTION SEWER OF ABOUT .... KM LENGTH INCLUDING SURVEY, DESIGN, CONSTRUCTION OF .... No. PUMPING STATIONS AND ALL APPURTenANT STRUCTURES AND ALLIED WORKS; AND (iii) OPERATION & MAINTENANCE OF THE COMPLETE WORKS OF SEWAGE TREATMENT PLANT, SEWERAGE NETWORK AND/OR INTERCEPTION & DIVERSION WORKS AND PUMPING STATIONS FOR A PERIOD OF 15 YEARS IN .......
SPECIAL CONDITIONS OF CONTRACT

The following Special Conditions of Contract (SCC) shall supplement the General Conditions. Whenever there is a conflict, the provisions herein shall prevail over those in the General Conditions of Contract (GCC). The corresponding article and section numbers of the General Conditions are indicated in parentheses.

Article 1: Contract and interpretation

1. Definitions (GC Section 1.1) No change

2. Clause 1.3.1 – Language

The language shall be “English”

3. Clause 1.3.14 – Survival of Obligations

Upon termination or expiration of the Contract, the following rights and obligations of the Parties survive:

(a) Such rights and obligations as may have accrued or to which the Parties may be entitled on the date of termination, and any rights which a Party may have under Applicable Law;

(b) On termination or expiration of the contract, the rights and obligations of the parties towards settlement of disputes through arbitration in the form of an arbitration clause / agreement.

(c) The Operator’s obligations with respect to Contract Records, accounting and auditing set out in GC Section 1.8;

(d) The Operator’s obligations with respect to Transition Assistance set out in GC Section 2.4.2;

(e) The Parties’ rights and obligations with respect to copyright set out in GC Section 6.1;

(f) The Operator’s obligations of confidentiality as set out in GC Section Error! Reference source not found.;

(g) The Parties’ rights and obligations with respect to defect liability set out in GC Section Error! Reference source not found.; and

(h) The Parties’ rights and obligations with respect to indemnification set out in GC Section Error! Reference source not found.5.

4. Clause 1.4 – Notice

All notices to the relevant party shall be sent to the following address:

a. Operator

________________________________________

________________________________________
5. **Clause 1.5– Governing Law**

The Applicable Law will be the Laws of India as well as the laws prevailing in the State of _____.

6. **Clause 1.6.1 (4) - Adjudicator**

The Adjudicator is:  
[To be added at the time of signing of Contract]

[Name, address, telephone and facsimile numbers]

The adjudicator shall be paid a fee @ Rs. _____/- per day of effective hearing plus actual expenditure towards travel, transportation, lodging, and boarding. The fees and expenditure shall be shared equally by the operator and the Owner.

7. **Clause 1.6.1 (5) - Adjudicator**

The authority to appoint new adjudicator shall be with _____.

8. **Clause 1.6.2 – Arbitration**

All disputes arising in connection with this contract shall be finally settled under the arbitration rules of the United Nations Commission on International Trade Law (UNICITRAL) by one or more arbitrators appointed in accordance with the rules. However, if the contract is with the domestic Operator arbitration shall be conducted in accordance with the Arbitration & Conciliation Act 1996.

The place of arbitration shall be (i) the location from where the Contract has been issued if the contract is with a domestic Operator, or (ii) a neutral location if the contract is with a foreign Operator. The arbitration shall be conducted in the language for communications defined in GC Clause 1.3.1 [Language].

**Article 2: Contract Term, Timing and Completion**

9. **Clause 2.1.2 (1) – Expiration of Contract**

The Contract shall terminate 15 years after Operations Starting Date.

10. **Clause 2.3.2 and Clause 2.3.6 (1) Time for Completion**

The Time for completion of the Design – Build Services shall be .......months from the Effective Date.

11. **Clause 2.3.6 (2) – Maximum Liquidated Damages – Delay**

The Maximum Liquidated Damages – Delay shall be 10% of the Design-Build price of the Contract.

73 Specify an independent officer such as Chairman, Institution of Engineers of the State Chapter.
12. Clause 2.3.6 (2) Delay in Completion - Liquidated Damages

The Operator shall be liable to pay Liquidated Damages to the Owner in accordance with GCC clause 2.3.6 (2) if the Operator fails to achieve various activities/milestones as tabulated below.

<table>
<thead>
<tr>
<th>S.N</th>
<th>Activity/Milestone</th>
<th>Target Completion Time</th>
<th>Completion delay in completion of activity/Milestone</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Completion of works of 10% of Contract value of Design Build Services stipulated in the signed contract</td>
<td>[Insert period equivalent to 15% of specified Completion Time]</td>
<td>[Insert amount equivalent to 0.05% of 10% of estimated value of Design-Build Services - rounded off to thousands of INR]</td>
</tr>
<tr>
<td>2</td>
<td>Completion of works of 20% (cumulative) of Contract value of Design Build Services stipulated in the signed contract</td>
<td>[Insert period equivalent to 30% of specified Completion Time]</td>
<td>[Insert amount equivalent to 0.05% of 10% of estimated value of Design-Build Services - rounded off to thousands of INR]</td>
</tr>
<tr>

<td>Completion of works of contracted Design-Build Services in all respects</td>
<td>[Insert specified Completion Time]</td>
<td>0.05 % (Zero point zero five Percent) of the Value of the Design Build Services stipulated in the signed contract for each day of delay beyond the Completion Time.</td>
</tr>
</tbody>
</table>

Note

(1) The value of works stipulated in column 2 of the table above excludes the value of materials intended for the works but not used or incorporated in the works.
(2) The target time for completion stipulated in column 3 will be subject to revision, if justified, in the event of extension of time for completion agreed under GCC clause 2.3.4.

Liquidated Damages recovered on account of delay in completion of an activity/activities listed in serial number 1 to 5 of the table above, will qualify for refund to the Operator, if the contracted works of the design-build services part of the contract are completed in all respects within the stipulated period or the revised completion period if so agreed to by the parties in accordance GCC clause 2.3.4.

13. Clause 2.3.6 (5)

This sub-paragraph is deleted.

Article 4: Obligations of the Owner

14. Clause 4.2 – Access to the Site and Project Facility

Add the following

(1) The Owner shall be responsible for acquiring and providing legal and physical possession of land as per requirement indicated by the Operator in his bid (as incorporated in Schedule 5 of the Contract), subject to a ceiling of ______ Sq. M approximately for setting up the STP facility and allied works at the site of proposed STP and shall provide access thereto and all other areas reasonably required for the proper execution of the contract including all rights of way.

(2) If the Operator requests for additional land for setting up the STP facility over the above the requirement indicated by him in his bid, he shall furnish a justification for the same.

The Owner will examine the request from feasibility angle as also the supporting justification. Based on the justification, if the Owner decides to allocate additional land, such allocation will be subject to the Operator bearing and depositing with the Owner, the cost of additional land worked out at twice the rate specified in the BDS ITB 3.3 (c), namely twice the rate of INR __________ per square metre [EA should insert the same rate as given in the BDS] or a higher rate at the option of the Owner, in case the Owner incurs higher cost for acquiring the additional land.

(3) The Owner shall be responsible for acquiring and providing legal and physical access to land at ______ located at a distance of ____ km from the STP site, for disposal of treated Sludge and providing legal and physical access to [please indicate the name of the nullah/ river/ sea] ______ located at a distance of ___ Km from the STP site for disposal of treated Wastewater.

---

74 Specify the size of the land parcel to be made available to the Operator for development of the STP.
75 Specify the location and size of the land parcel identified by the Owner for disposal of the treated Sludge.
76 Specify the location and size of the land parcel identified by the Owner for disposal of the treated Sludge.
(4) The Owner shall provide the operator free of charge full possession and access of the above mentioned sites and right of way for the Project Facility only during the Contract Term.

(5) The Owner shall be responsible for acquiring and providing legal and physical possession of approximately ___Sq. M for Sewage Pumping Station(s) and/or diversion works at the site(s) of proposed Sewage Pumping Station(s) and/or diversion works and shall provide access thereto and all other areas along the selected alignment for the Sewerage Network and/or interception sewers, reasonably required for the proper execution of the contract including all rights of way.

(6) The Owner shall provide the operator free of charge possession and access of the above mentioned sites and right of way for the Sewerage Network and/or interception sewers during the Contract Period, so as to ensure that the Operator shall achieve progress of work consistent with the milestones, if laid down in Para 12 above under SCC clause 2.3.6 (2).

(7) The Operator shall complete the work on the sites handed over to him from time to time within in the specified time, as and when so instructed by the Design-Build-Operations Engineer or advised by the Owner, so as to minimize the inconvenience to the households and the public over prolonged durations of time.

Article 5: Contract Price and Payment

15. Clause 5.1 (3)– Contract Price

(a) Price Adjustment for Design Build Price

The prices for the Design Build works and services shall/shall not be subject to price adjustment during the performance of the contract. If price adjustment is applicable, details stipulated in Schedule 8 shall apply.

*Delete the words that are not applicable.

(b) Price Adjustment for O&M Price

Price adjustment for the O&M price payable during the O&M period will be determined in accordance with Schedule 8.

16. Clause 5.2 – Terms of Payment

Provisions in Clause 5.2 (1), (3) and (4) shall be replaced with the following clauses:

(1) The Contract Price shall be paid in accordance with the provisions in Schedule 5 – Operator’s Price Schedule and Schedule 6 – Terms and procedures of Payment of the Contract.

(3) In the event that the Owner fails to make any payment by its respective due date or within the period of 60 days from the date of submission of monthly statement of claim submitted in accordance with Schedule 6, the Owner shall pay to the Operator interest on the amount of such delayed payment at the rate of 8 % annually, for the period of delay until payment has been made in full.
17. **Performance Incentive Compensation**

This clause is deleted.

18. **Clause 5.4 – Liquidated Damages - Operations**

The Operator shall pay to the Owner liquidated damages for failure to meet Performance Standards as set out in the Liquidated Damages – Operations Schedule, i.e. Schedule 7 of the Contract.

19. **Clause 5.5.1 (2) (a) – Performance Security**

The Operator shall provide a Performance Security of 9% (Nine Percent) and ESHS Performance Security of 1% (One Percent) of the total Contract Price as defined in the sub-paragraphs below. Total Contract Price shall be determined as under on the basis of Operator’s Bid Prices quoted in various Parts of the Price Schedule and incorporated in Schedule 5 of the Contract:

**Total Contract Price**

1) à Design Build Price for STP as per Part A + Total price of BOQ items for I&D Works as per Part D + (plus)

2) à Total O & M Price for STP for the … year period as per Parts B & C, assuming indicative sewage flow rate reaching the STP during respective years of the O&M period as indicated in Appendix to Bid (Indicative Flow) Total O & M Price for Sewerage Network and/or Interception and Diversion Works and SPSs for the … year period as per Part E. (As per Scope, Years)

5.5.1 (4)

Performance Securities can be submitted by the Operator separately:

(i) for the Contract Price of Design and Build part as per BOQ Prices for STP + BOQ Prices for New/Replace Outfall/Interceptor sewer Line & SPSs, and

(ii) for the Contract Price of O&M part for O&M for STP for … years + O&M for the Network and/or Interception and Diversion Works & SPSs for … year.

Performance Security for Design and Build Part shall cover the period for design and build plus the first 3 years of O&M after completion of construction work.

Performance Security for the O&M Part shall be in three years intervals to be extended/renewed up to the entire O&M period. Each O&M performance security shall be extended/renew within 120 days prior to the expiry of the previous performance security.

It shall be the responsibility of the Operator to furnish the renewed the Performance Securities within 120 days prior to the expiry of the original Performance Securities. In case the renewed Performance Securities are not received by the Owner within 120 days prior to the expiry date of the original Performance Securities, the Owner will be
entitled to take measures for enforcement/forfeiture of the Performance Securities in hand without any further notice to the Operator.

20. Clause 5.5.2 (2) – Advance Payment Security

Provisions in Clause 5.5.2 (2) shall be replaced with the following clause

(2) The Mobilization Advance paid to the Operator by the Owner shall be recovered commencing from the date on which the payment to the Operator has reached 20% of the value of Design, Build and Commissioning Services and shall be recovered at the rate of 15% from each bill submitted by the Operator for the payment. The entire amount of mobilization advance shall be recovered latest by the time 90% of the value of Design Build and Commissioning services has been claimed by the Operator.

Article 7: Contract administration and supervision during the Design-Build and Operations Periods

21. Clause 7.2 - Design-Build Supervision

Provisions in Clause 7.2 shall be replaced with the following clauses.

7.2.1 Supervision during the Design-Build Period

GC Section 7.2 shall apply during the Design-Build Period and Operations Period and immediately after the End date solely for the purpose of resolving transition issues and any outstanding issues arising during the Operations Period.

7.2.2 Design-Build-Operations Engineer’s Duties and Authority (Design-Build and Operations Period)

(1) The Owner shall appoint the Design-Build-Operations Engineer who shall be responsible for day to day contract management and supervision during the Design-Build Period and the Operations Period. The Design-Build-Operations Engineer’s staff shall include suitably qualified engineers and other professionals who are competent to carry out these duties.

(2) The Design-Build-Operations Engineer shall have no authority to amend the Contract.

(3) Except, as specifically provided otherwise in the Contract, the Design-Build-Operations Engineer may exercise the authority attributable to the Design-Build-Operations Engineer as specified in or necessarily to be implied from the Contract. The Owner undertakes not to impose further constraints on the Design-Build-Operations Engineer’s authority, except as agreed with the Operator.
(4) The Design-Build-Operations Engineer is obligated to obtain the approval of the Owner for matters specified in the sub-clause 7.2.2 (5) (d) of the SCC. If the Design-Build-Operations Engineer exercises a specified authority for which the Owner’s approval is required then, for the purposes of the Contract, the Owner shall be deemed to have given approval.

(5) Except as otherwise stated in the Contract,

(a) if the Design-Build-Operations Engineer carries out duties or exercises authority, specified in or implied by the Contract, the Design-Build-Operations Engineer shall be deemed to act for the Owner;

(b) the Design-Build-Operations Engineer has no authority to relieve any Party of any duties, obligations or responsibilities under the Contract; and

(c) any approval, check, certificate, consent, examination, inspection, instruction, notice, proposal, request, test or similar act by the Design-Build-Operations Engineer, including absence of disapproval, shall not relieve the Operator from any responsibility it has under the Contract, including responsibility for errors, omissions, discrepancies and non-compliances.

(d) The Design Build Operations Engineer shall obtain the approval of the Owner before exercising its authority in the following circumstances:

   (a) approving assignment of the Contract, or any part thereof;
   (b) determining an extension of the Time for Completion;
   (c) certifying additional costs determined under GCC 1.9(8)(b);
   and
   (d) issuing a Change Order, except:
       a. in an emergency situation, as reasonably determined by the Design-Build-Operations Engineer; or
       b. if such Change Order would increase the Contract Price by less than 1%.

7.2.3 Delegation by the Design-Build-Operations Engineer

(1) The Design-Build-Operations Engineer may from time to time assign duties and delegate authority to assistants, and may also revoke such assignment or delegation. These assistants may include a resident engineer, or independent inspectors appointed to inspect or test items of Plant or Equipment. The assignment, delegation or revocation shall be in writing and shall not take effect until copies have been received by both Parties. Unless otherwise agreed by both Parties, the Design-Build-Operations Engineer shall not delegate the authority to determine any matter in accordance with GC Section 7.2.6.
(2) Assistants shall be suitably qualified persons, who are competent to carry out these duties and exercise this authority, and who are fluent in the language for communications defined in GC Section 1.3.1.

(3) Each assistant, to whom duties have been assigned or authority has been delegated, shall only be authorized to issue instructions to the Operator to the extent defined by the delegation. Any approval, check, certificate, consent, examination, inspection, instruction, notice, proposal, request, test, or similar act by an assistant, in accordance with the delegation, shall have the same effect as though the act had been an act of the Design-Build-Operations Engineer. However,

(a) any failure to disapprove any work or Plant and Equipment shall not constitute approval, and shall therefore not prejudice the right of the Design-Build-Operations Engineer to reject the work or the Plant and Equipment; and

(b) if the Operator questions any determination or instruction of an assistant, the Operator may refer the matter to the Design-Build-Operations Engineer, who shall promptly confirm, reverse or vary the determination or instruction.

7.2.4 Instructions of the Design-Build-Operations Engineer

(1) The Design-Build-Operations Engineer may issue to the Operator, at any time during the Design-Build Period, instructions which may be necessary for the execution of the Design-Build Services and the remedying of any defects, all in accordance with the Contract. The Operator shall only take instructions from the Design-Build-Operations Engineer, or from an assistant to whom the appropriate authority has been delegated under GC Section 7.2.3. If an instruction constitutes a Change, GC Section 10.1 shall apply.

(2) The Operator shall comply with the instructions given by the Design-Build-Operations Engineer or delegated assistant, on any matter related to the Contract. These instructions shall be given in writing.

7.2.5 Replacement of the Design-Build-Operations Engineer

If the Owner intends to replace the Design-Build-Operations Engineer, the Owner shall, not less than 42 days before the intended date of replacement, give notice to the Operator of the name, address and relevant experience of the intended replacement Design-Build-Operations Engineer. The Owner shall not replace the Design-Build-Operations Engineer with a person against whom the Operator raises reasonable objection by notice to the Owner, with supporting particulars.

7.2.6 Determinations by the Design-Build-Operations Engineer
(1) Whenever the Contract provides that the Design-Build-Operations Engineer shall proceed in accordance with this GC Section 7.2.6 to agree or determine any matter, the Design-Build-Operations Engineer shall consult with each Party in an endeavour to reach agreement. If agreement is not achieved, the Design-Build-Operations Engineer shall make a fair determination in accordance with the Contract, taking due regard of all relevant circumstances.

(2) The Design-Build-Operations Engineer shall give notice to the Parties of each agreement or determination, with supporting particulars. Each Party shall give effect to each agreement or determination unless and until revised under GC Section 1.9.

22. Clause 7.3 Operations Supervision

*This clause stands deleted*

Article 8: Representatives Staff and Sub-contracting

23. Clause 8.1.2 (1) Operator’s Representative

The Operator’s Representative is: ______________________

24. Clause 8.1 Existing Staff

The Operator is not obliged to retain staff employed by the Owner.

25. Clause 8.3 Operator’s Personnel

The Operator’s Key Staff employed during the design build services shall have the expertise and qualifications specified in the Table below.

<table>
<thead>
<tr>
<th>SN</th>

26. **Clause 8.6 (1) Maximum Percentage of Sub contracting**

Sub-contracting shall not exceed 25% percent. However, the nominated Sub-contractor whose experience and qualification have been claimed for meeting the qualification criteria in accordance with stipulations in annexure A part h shall be excluded while applying the ceiling of 25%.

**Article 9: Liability and Risk Distribution**

27. **Clause 9.1 Defect Liability Period**

Clause 9.1 is hereby deleted. The Operator shall be responsible for the repair and maintenance of the STP, Sewerage Network and/or Interception and Diversion Works, SPSs and other facilities at his own cost during the O&M period of 15 years as stipulated in Schedule 3 – Operation and Maintenance Services Schedule.

28. **Clause 9.6 - Insurance**

Delete the existing clause and replace it with the following clause:

In this Clause, “insuring Party” means, for each type of insurance, the Party responsible for effecting and maintaining the insurance specified in the relevant Sub-Clause. Wherever the Operator is the insuring Party, each insurance shall be affected with insurers and in terms approved by the Owner. These terms shall be consistent with any terms agreed by both Parties before the date of the Letter of Acceptance. This agreement of terms shall take precedence over the provisions of this Clause.

Wherever the Owner is the insuring Party, each insurance shall be affected with insurers and in terms consistent with the details contained under this.
contract. If a policy is required to indemnify joint insured, the cover shall apply separately to each insured as though a separate policy had been issued for each of the joint insured. If a policy indemnifies additional joint insured, namely in addition to the insured specified in this Clause, (i) the Operator shall act under the policy on behalf of these additional joint insured except that the Owner shall act for Owner’s Personnel, (ii) additional joint insured shall not be entitled to receive payments directly from the insurer or to have any other direct dealings with the insurer, and (iii) the insuring Party shall require all additional joint insured to comply with the conditions stipulated in the policy.

Each policy insuring against loss or damage shall provide for payments to be made in the currencies required to rectify the loss or damage. Payments received from insurers shall be used for the rectification of the loss or damage.

The relevant insuring Party shall, within 28 days from the Effective Date submit to the other Party:

a) evidence that the insurances described in this Clause have been effected, and

b) copies of the policies for the insurances described in Sub-Clause 9.6.2 (Insurance for works and Operator’s Equipment) and Sub-Clause 9.6.3 (Insurance against Injury to Persons and Damage to Property).

When each premium is paid, the insuring Party shall submit evidence of payment to the other Party. Whenever evidence or policies are submitted, the insuring Party shall also give notice to the Design Build Operations Engineer.

Each Party shall comply with the conditions stipulated in each of the insurance policies. The insuring Party shall keep the insurers informed of any relevant changes to the execution of the Project and ensure that insurance is maintained in accordance with this Clause. Neither Party shall make any material alteration to the terms of any insurance without the prior approval of the other Party. If an insurer makes (or attempts to make) any alteration, the Party first notified by the insurer shall promptly give notice to the other Party.

If the insuring Party fails to effect and keep in force any of the insurances it is required to effect and maintain under the Contract, or fails to provide satisfactory evidence and copies of policies in accordance with this Sub-Clause, the other Party may (at its option and without prejudice to any other right or remedy) effect insurance for the relevant coverage and pay the premiums due. The insuring Party shall pay the amount of these premiums to the other Party, and the Contract Price shall be adjusted accordingly.

Nothing in this Clause limits the obligations, liabilities or responsibilities of the Operator or the Owner, under the other terms of the Contract or otherwise. Any amounts not insured or not recovered from the insurers shall be borne by the Operator and/or the Owner in accordance with these obligations, liabilities or responsibilities. However, if the insuring Party fails to effect and keep in force
an insurance which is available and which it is required to effect and maintain under the Contract, and the other Party neither approves the omission nor effects insurance for the coverage relevant to this default, any moneys which should have been recoverable under this insurance shall be paid by the insuring Party.

Payments by one Party to the other Party shall be subject to the provisions of GCC & SCC as contained in this contract as applicable. The Operator shall be entitled to place all insurance relating to the Contract (including, but not limited to the insurance referred to Clause 9.6) with insurers from any eligible source country.

9.6(2) Insurance for Works and Operator’s Equipment

The insuring Party shall insure the Works, Plant, Materials and Operator’s Documents for not less than the full reinstatement cost including the costs of demolition, removal of debris and professional fees and profit. This insurance shall be effective from the date by which the evidence is to be submitted under sub-paragraph (a) of Sub-Clause 9.6.1 (General Requirements for Insurances), until the End Date.

The insuring Party shall maintain this insurance to provide cover until the End Date, for loss or damage for which the Operator is liable arising from a cause occurring prior to the End Date, and for loss or damage caused by the Operator in the course of any other operations.

The insuring Party shall insure the Operator’s Equipment for not less than the full replacement value, including delivery to Site. For each item of Operator’s Equipment, the insurance shall be effective while it is being transported to the Site and until it is no longer required as Operator’s Equipment.

Unless otherwise stated in the Particular Conditions, insurances under this Sub-Clause:

a) shall be effected and maintained by the Operator as insuring Party,

b) shall be in the joint names of the Parties, who shall be jointly entitled to receive payments from the insurers, payments being held or allocated between the Parties for the sole purpose of rectifying the loss or damage,

c) shall cover all loss and damage from any cause not listed in the GCC / SCC of this contract.

d) shall also cover loss or damage to a part of the Projects which is attributable to the use or occupation by the Owner of another part of the Works, and loss or damage from the Owner’s risks listed in the GCC / SCC excluding (in each case) risks which are not insurable at commercially reasonable terms, with deductibles per occurrence of not
more than the amount stated in the Contract Data (if an amount is not so stated, this sub-paragraph (d) shall not apply), and

e) may however exclude loss of, damage to, and reinstatement of: (i) a part of the Works which is in a defective condition due to a defect in its design, materials or workmanship (but cover shall include any other parts which are lost or damaged as a direct result of this defective condition and not as described in sub-paragraph (ii) below), (ii) a part of the Works which is lost or damaged in order to reinstate any other part of the Works if this other part is in a defective condition due to a defect in its design, materials or workmanship, (iii) a part of the Works which has been taken over by the Owner, except to the extent that the Operator is liable for the loss or damage, and (iv) Goods while they are not in the Country, subject to the provisions of GCC / SCC contained in this contract as applicable.

If, more than one year after the Base Date, the cover described in sub-paragraph (d) above ceases to be available at commercially reasonable terms, the Operator shall (as insuring Party) give notice to the Owner, with supporting particulars. The Owner shall then (i) be entitled subject to provisions of GCC / SCC contained in this contract as applicable, to payment of an amount equivalent to such commercially reasonable terms as the Operator should have expected to have paid for such cover, and (ii) be deemed, unless he obtains the cover at commercially reasonable terms, to have approved the omission under Sub-Clause 9.6.1 [General Requirements for Insurances].

9.6.(3) Insurance against Injury to Persons and Damage to Property

The insuring Party shall insure against each Party’s liability for any loss, damage, death or bodily injury which may occur to any physical property {except things insured under Clause 9.6.(2) [Insurance for Works and Operator’s Equipment]} or to any person {except persons insured under Sub-Clause 9.6.(2) [Insurance for Operator’s Personnel]}, which may arise out of the Operator’s performance of the Contract and occurring before the issue of the Performance Certificate.

The Insurance cover under this clause shall be as under and to be borne by the Operator:

1. Loss of human life – Rs. _______ million or equivalent amount in convertible currency and to be recouped as and when it is used.
2. Permanent Disability of human beings - Rs. ________ million or equivalent amount in convertible currency and to be recouped as and when it is used.

78 In case of NCB specify INR only
3. Human Body Injury not resulting into permanent disability - Rs. ________ million or equivalent amount in convertible currency and to be recouped as and when it is used.

Unless otherwise stated in the Particular Conditions, the insurances specified in this Sub-Clause:

a) shall be effected and maintained by the Operator as insuring Party,

b) shall be in the joint names of the Parties,

c) shall be extended to cover liability for all loss and damage to the Owner’s property (except things insured under Sub-Clause 18.2) arising out of the Operator’s performance of the Contract, and

d) may however exclude liability to the extent that it arises from:

i. the Owner’s right to have the Project executed on, over, under, in or through any land, and to occupy this land for the Project,

ii. damage which is an unavoidable result of the Operator’s obligations to execute the Works and remedy any defects, and

iii. a cause listed as Owner’s Risks as contained in GCC / SCC, except to the extent that cover is available at commercially reasonable terms.

9.6. (4) Insurance for Operator’s Personnel

The Operator shall effect and maintain insurance against liability for claims, damages, losses and expenses (including legal fees and expenses) arising from injury, sickness, disease or death of any person employed by the Operator or any other of the Operator’s Personnel. The Owner and the Design Build Operate Engineer shall also be indemnified under the policy of insurance, except that this insurance may exclude losses and claims to the extent that they arise from any act or neglect of the Owner or of the Owner’s Personnel.

The insurance shall be maintained in full force and effect during the whole time that these personnel are assisting in the execution of the Works. For Sub-contractor’s employees, the insurance may be affected by the Sub-contractors, but the Operator shall be responsible for compliance with this Clause

Article 10: Change in Contract Elements

29. Clause 10.2 - Change to Operations Services

(a) GCC sub-clause 10.2 (1) is amended to read as under:

“Except as specifically provided in Schedule 6 of the Contract (Terms and Procedure of Payment), Schedule 8 of the Contract – Price Adjustment or elsewhere in the Contract, the Operator shall make no claim whatsoever for any adjustment to the Contract Price during the Operations Period.”

Page 233 of 520
(b) GCC sub-clause 10.2 (2) and 10.2 (3) shall stand deleted.
Schedule 2
Design Build Services Schedule (DBSS)

TO (i) DESIGN AND BUILD SEWAGE TREATMENT PLANT OF INSTALLED CAPACITY .... MLD AND ALL APPURTEANANT STRUCTURES AND ALLIED WORKS; (ii) SURVEY, REVIEW THE DESIGNS, REDESIGN WHERE NECESSARY, AND BUILD NEW UNDERGROUND SEWERAGE NETWORK AND/OR DIVERSION WORKS WITH INTERCEPTION SEWER OF ABOUT .... KM LENGTH INCLUDING SURVEY, DESIGN, CONSTRUCTION OF .... No. PUMPING STATIONS AND ALL APPURTEANANT STRUCTURES AND ALLIED WORKS; AND (iii) OPERATION & MAINTENANCE OF THE COMPLETE WORKS OF SEWAGE TREATMENT PLANT, SEWERAGE NETWORK AND/OR INTERCEPTION AND DIVERSION WORKS AND PUMPING STATIONS FOR A PERIOD OF 15 YEARS IN ........, STATE OF ........, INDIA.
ARTICLE 12. General

12.1. Description of Design-Build Services:

For STP

The Operator shall carry out and be responsible for the Design and construction of the STP and all allied appurtenant structures. The Operator’s work and services as part of the “Design-Build Services” shall cover all necessary or desirable services / activities for the Design and construction of the STP and all allied works in accordance with and as contemplated by the Design-Build Documents and the Technical Standards including,

a. the Design services in respect of the STP and all allied works including treatment process, hydraulic, structural, electrical, instrumentation, mechanical and piping Design, and all civil, mechanical, electrical and piping drawing including architectural & construction drawings and environmental assessment with necessary mitigation measures, as set out in DBSS.

b. the building and construction work and services in respect of the STP and all allied works as set out in DBSS;

For Network

The Operator shall carry out and be responsible for the review of owner’s design and redesign where necessary; and construction of the Sewerage Network including pipe network, Sewage pumping stations and all allied appurtenant structures and be responsible for its performance. The Operator’s work and services as part of the “Design-Build Services” shall cover all necessary or desirable services / activities for the design and construction of the Sewerage Network and all allied works in accordance with and as contemplated by the Design-Build Documents and the Technical Standards including,

a) The redesign services in respect of Sewerage Network and allied appurtenant structures such as manholes, vent shafts etc., including design, alignment, layout, installation, all civil works, construction drawings and environmental and social assessments; social, safety and environmental safeguards; as set out in DBSS.

b) the design services in respect of the Sewage pumping stations and all allied works including operations process, hydraulic, electrical, instrumentation, mechanical and piping design, all civil, mechanical, electrical and piping drawing including architectural & construction drawings and environmental assessment with necessary mitigation measures, as set out in DBSS.
The Operator shall propose its own structural design and configuration for SPS and the design will be subject to approval of the owner. The electromechanical components for the SPS will be adopted as the BOQ in the contract unless otherwise mandated by redesign of network and approved by owner.

c) the building and construction work and services in respect of the Sewerage Network and all allied works such as Pump stations, road restoration etc. as set out in DBSS;

d) Refurbishment or replacement of existing sewerage network in compliance to the conditions as set out in the DBSS.

e) Supervising connections to household or any other connections to the network approved by the Owner to ensure such connections are technically complied with necessary requirements for operations and performance.

For Interception & Diversion Works

The Operator shall carry out and be responsible for the review of owner’s design and redesign where necessary; and construction of the diversion structure across nallah/drain along with intercepting sewer laid for conveying the sewage from nallah/drains up to the Sewage Treatment Plant and including Sewage lifting and pumping stations and all appurtenant structures forming a part of both the New/Existing Sewerage Infrastructure and be responsible for its performance. The Operator’s work and services as part of the “Design-Build Services” shall cover all necessary or desirable services / activities for the design and construction of the Interception & Diversion Works and all allied works in accordance with and as contemplated by the Design-Build Documents and the Technical Standards including,

a) The redesign services in respect of I&D works and allied appurtenant structures such as manholes, vent shafts etc., including design, alignment, layout, installation, all civil works, construction drawings and environmental and social assessments; social, safety and environmental safeguards; as set out in DBSS the design services in respect of the Sewage pumping stations and all allied works including operations process, hydraulic, electrical, instrumentation, mechanical and piping design, all civil, mechanical, electrical and piping drawing including architectural & construction drawings and environmental assessment with necessary mitigation measures, as set out in DBSS.

The Operator shall propose its own structural design and configuration for SPS and the design will be subject to approval of the owner. The electromechanical components for the SPS will be adopted as the BOQ in the contract unless otherwise mandated by redesign of network and approved by owner.
b) the building and construction work and services in respect of the Sewerage Network and all allied works such as Pump stations, road restoration etc. as set out in DBSS;

12.2. **Supplementing the General Conditions**

The provisions contained in this Design-Build Services Schedule are to be read in conjunction with the General Conditions of Contract and Special Conditions of Contract as contained in this bid document for the purpose of providing greater specificity of the Design-Build Services that the Operator shall perform.
ARTICLE 13. DESIGN SERVICES

For STP

13.1. General

13.1.1. Design and Engineering

a. The Operator shall execute the basic and detailed Design of STP and allied structures and its execution in compliance with the technical specifications and requirements contained in the contract, codes of practices as published by the Bureau of Indian Standard (BIS) or its equivalent standard as well as the latest version of “Manual on Sewerage and Sewage Treatment” as published by the Central Public Health Engineering Organization (CPHEEO) of the Ministry of Urban Development, Government of India. Wherever, the codes, standards and manual do not provide for the Design and execution of some component i.e. required to be Designed and executed, the operator shall follow the standard engineering practices as approved by Design-Build-Operations Engineer.

13.1.2. Proposed treatment scheme

The treatment scheme shall include facilities (complete in all respects) for receiving sewage, screening, degritting, any proven treatment unit, flow measurement, disinfection and sludge management. Provision of exact components shall depend on the proposed technology. In addition, the following units shall be provided:

i. Electrical substation

ii. Adequate lighting to all the units.

iii. Fire-fighting equipment as per state Government department of Fire services

iv. Environmental, Social, Health and Safety Plan (ESHS) management Plan must be incorporated for the management of all staff and activities undertaken in construction and O&M of the STP.

v. Provisions for power generation units (if power generation is found feasible), engine rooms with gas engines and accessories.

13.1.3. The following general rules shall be followed in arranging the Plant:

i. Minimum clear distance of 6 m shall be allowed between adjacent units of treatment or fixed structures to permit safe and convenient access for operation and maintenance;

ii. Open area with necessary pavement, adjacent to all mechanical Plant shall be provided as a maintenance lay down area;
iii. Fixed runways, lifting eyes or other means shall be provided to
permit the removal of Plant equipment that may logically be required
to be removed during the course of its normal operational life for
maintenance or any other purpose;

iv. Areas where leakage is likely to occur whether in normal use or
during maintenance, shall be provided with covered drainage
channels which shall direct the spillage either to a suitable drain or
to a sump from where it can be pumped;

v. Provided acoustic coverings where necessary to limit the noise
produced during normal operation to the limits detailed in these
documents;

vi. Plant shall be arranged and the building designed to permit
convenient maintenance and removal of equipment whenever
deemed necessary;

vii. Management of environmental impacts during construction and
installation/erection works and O&M shall be carried out as per
the Environmental Management Plan provided in Appendix 1 of
Schedule 2 (Design Build Services), recommendations of
Environmental and Social Impact Assessment Report of the project
/shared as part of the information to the bidders), ESHS
implementation plan in line with the ESHS code of Practice
submitted.

viii. Provide adequate supports and restraints for process piping,
valves and appurtenances.

ix. Connect pipework to equipment with flexible connections or
make other provisions to avoid transfer of pipe loads to devices.

x. All electro mechanical equipment, electronic instrumentation and Air
conditioning facilities shall be designed to withstand the corrosive
environment that will be prevailing in the STP.

xi. All sluice gates, valves, piping, Screens, degritting equipment,
aerators and air piping, sludge handling equipment, etc., which will
be submerged in or in contact with sewage or sludge and stairs or
ladders and hand railings for access and platforms and walkways
shall be designed with Corrosive resistant material.

xii. Chemical piping for supply and feed of chlorine and polymer shall
be of corrosion resistant material and shall be secured to racks or
trays to be fixed to duct walls or walls of tanks and buildings as
necessary. The method of securing the pipes to the racks and / or
trays shall be by clips or similar devices and shall be of corrosion –
resistant material facilitating ease of
xiii. removal in such a way that individual runs can be changed without
dismantling adjacent pipes.

xiv. All chemical piping shall be colour banded and suitably labeled to
enable individual lines to be identified throughout their run.

xv. Particular attention shall be paid to the layout of the chemical piping,
which shall be functional and neat in appearance. Generally, where
pipework is installed in ducts, it shall be supported not less than 150
mm clear of the floor.

xvi. Where materials subject to UV degradation are employed, they
shall be shielded from direct sunlight.

xvii. Provide necessary platforms and walkways at all levels for operation
of valves, gates and

xviii. mechanical equipment with stairs or ladders and hand railings for
access.

xix. Human contact with the sewage or sludge during O&M of STP shall
be strictly avoided

13.1.4. Provision of Modular Construction for Sewage Treatment Plants

All the treatment units shall be designed and constructed for their
respective flows / capacities mentioned in these technical specifications
and shall be constructed in suitable modular or treatment train capacities.
The minimum number of modules or treatment trains and the minimum
number of each unit process component required shall be provided to
facilitate O&M. Wherever no modular approach and stand by equipment is
being proposed, the Operator will provide proper justification and certify
that the proposed system will fulfill effluent design standards and other
safeguards in all possible flow fluctuations.

13.1.5. Receiving of Sewage

Raw Sewage will be delivered through …. mm dia with invert level of xx
m at the ground level of …. m. into a Receiving Chamber to be
constructed in this contract and from where it will be taken into
downstream screens. Receiving Chamber shall be of adequate size to
meet the working space requirements. The flow from the receiving
chamber will lead to further units such as screening/ grit chamber/
secondary treatment unit etc. based on the technology and process flow
being proposed by the bidder.

13.1.6. Flow Measurement:

Flow meters with transmitters shall be provided on all the common header
of the raw sewage pumps.

13.1.7. Disinfection:
The Treated Sewage from the Secondary treatment units will be disinfected using suitable cost effective process/technology. The treated and disinfected sewage is to be disposed into the water stream by suitable outfall arrangements.

13.1.8. Sludge Handling System – meet the relevant disposal standards:

Efforts shall be made to reduce the sludge volume to the extent possible in a cost-effective manner. Sludge should be stabilised before disposal. Human contact with sludge shall be avoided.

13.1.9. Design criteria:

a. The Tenderers are to adopt the same nomenclature as mentioned in the bid document (to the extent possible) used for various treatment units in their design report. Wherever new/proprietary terms are being used, they shall be explained in sufficient detail.

b. The STP shall be designed for ___ mld capacity. The land provided is for augmenting the capacity to the ultimate flow of _____ mld. The General Arrangement Drawing (GAD) supported by hydraulic sizing calculation for ultimate flow of ___ mld shall be provided. However the detailed design shall be furnished for only ___ mld.

c. To the extent possible, the plant must be designed in modules so as to augment the capacity as and when the plant reaches its designed capacity. It is also informed that the expected sewage flows cannot be generated immediately after construction and that the sewage flows are likely to increase gradually and that the STP should be able to perform at the designed levels even with these low flows.

d. The process design of various units shall be done as per the norms prescribed in the CPHEEO Sewerage Manual (Latest Edition). If no guidelines are mandated by CPHEEO for a certain component, the bidder shall demonstrate that the guidelines being adopted are based on past successful experiences in similar situations and conform to best engineering practices.

e. The Designs and drawings as formulated by the operator shall be subject to approval by the owner or its authorized representative.

f. The Operator shall be responsible for any discrepancies, errors or omissions in the specifications, drawings and other technical documents, desired output / performance of the STP, whether specifications, drawings and other documents have been approved by the Owner or its representative or not, provided that such discrepancies, errors or omissions are not because of inaccurate
information furnished in writing to the Operator by or on behalf of the Owner.

13.1.10. Codes and Standards

Wherever references are made in the Contract to codes and standards, in accordance with which the Contract shall be executed, the edition or the revised version of such codes and standards 30 days prior to the Submission Deadline shall apply unless otherwise specified. During Contract execution, any changes in such codes and standards shall be applied after approval by the Owner/Owner’s Representative and shall be treated in accordance with GC Section 10.1.

13.1.11. Design Responsibilities

a. The Operator’s Design and Design-related services shall include, but not limited to the following:

1. Site investigation and data collection including geotechnical assessment and soil analysis for the Design and construction of the structures required for the STP and allied works;

2. Selection, adoption and detailed engineering Designs for the most appropriate techno economically feasible cost effective treatment process technology for the treatment of the sewage ensuring that the treated sewage meets with the stringent of the disposal standards prescribed by the MOEF / CPCB and in the contract as may be applicable. These standards are prescribed below:

3. the acquisition of all data and information necessary to prepare the Design and that are required to demonstrate that the __ MLD STP meets or exceeds the Technical Standards;

4. Preparation of Design development documents, based on the approved HFD /schematic Design documents accepted by the Owner, consisting of drawings and other documents appropriate to the size of the __ MLD STP to describe the units and character of the entire proposed plant including architectural, mechanical, civil works, and electrical systems, materials, operations, landscaping, and such other elements as may be appropriate;

5. the preparation of Design-Build Documents setting forth in detail the requirements for construction based on the Design development documents accepted by the Owner;

6. obtaining all approvals, permits, including building permits, and licenses for the Design-Build Services, necessary compliances with environmental management plan and ESHS Management requirements as specified in Appendix 1 of the Schedule 2 (Design Build services) except for those approvals, permits or licenses that the Owner is explicitly required to obtain itself under the Applicable Law in which case the Operator shall prepare all documentation and provide assistance to the Owner in obtaining such approval, permits or licenses;

7. the conducting of general reviews of the progress of the Design process, to the extent necessary, in order to determine to the Operator’s satisfaction that the Design services are performed in compliance with the requirements of the Contract and Applicable Laws.
13.1.12. Design-Build Documents

a. The Operator shall prepare all the Design-Build Documents. The Design Build Documents shall include the plans, Designs, drawings, as-built documents, operations manuals, specifications, schematic Design documents, Design development documents, and all modifications thereto required in order to properly and fully test for, analyses for, plan, Design and build the STP and all allied works as contemplated in the Technical Standards and the remaining provisions of the Contract.

b. The Operator shall prepare any other document, as may be requested by the Design-Build-Operations Engineer, that the Owner considers necessary to monitor the progress of the Design-Build Services and assess the Operator’s compliance with the Contract.

c. The Operator shall provide the Owner with three sets of all of the Design-Build Documents in reproducible form and shall modify them to keep them up-to-date as requested by the Owner acting in a professionally reasonable manner. The Design-Build Documents, with the exception of the as-built documents, shall be subject to the review and approval of the Owner prior to performing any of the services set out in DBSS in respect of any Design-Build Document.

d. When the Operator notifies the Owner in accordance with DBSS, the Operator shall provide to the Owner one copy of the “as built Designs, Drawings/Documents” in reproducible form showing the exact as built locations, sizes and details of the STP. The STP shall not be considered to have reached Completion for the purposes of DBSS until such Design-Build Documents have been provided. The Operator shall update the as built Designs, Build Drawings/Documents as necessary for the correction of defects or deficiencies contemplated by DBSS.

13.1.13. Design Considerations

In preparing the Design for the STP and allied works and the Design-Build Documents, the Operator shall,

a. Protect public health and safety, including by the means set out in DBSS

b. maximize the protection of the environment and minimize any adverse environmental impacts caused by the construction of STP throughout the Service Area and Country, including as may be required, recommended or advisable pursuant to any technical standard or environmental assessments conducted on, at or near the STP site and by the means set out in DBSS;
c. Consider the existing infrastructure and the Sewage Treatment Plant to be connected with the Trunk infrastructure.

d. Ensure the STP and allied works has the capacity to accommodate the anticipated sewage based upon the verifications prepared by the Operator pursuant to DBSS;

13.2. Design Responsibilities – On Site Issues

In preparing the Design for the STP and the Design-Build Documents, the Operator shall ensure that the Design,

a. makes adequate preparation and plans to ensure traffic movement and safety during the laying of the network.

b. makes adequate preparation and plans and takes adequate measures for controlling access to the STP site by animals and humans and vehicular traffic at the perimeter of the site, including plans for plantings and vegetation, fencing, lockable gates at vehicular access points, and the creation of an internal (perimeter access corridor inside or, with appropriate local and other approvals, surrounding the Site;

c. provides for allied works like control valves chambers, anchor /thrust /pedestal blocks, internal access roads within the site and proposed units within the STP site;

d. provides for ancillary works like new approach road that lead to or will be used to access the Plant, culverts, compound wall with gates, fencing etc.;

e. provides for all utility services required for all of the Services

f. provides utilities services at the STP site such as electricity, telephone, potable water, non-potable water and sewage collection and disposal.

13.3. Sewage Treatment Plant Layout and operation sequence

a. The Operator shall be responsible for the planning and Designing of the area of the Site for ___ MLD STP, including,

b. Design and Construction of ___ MLD STP and all allied /ancillary works with an approach road to enter the facility and then carry out STP Operation & Maintenance for 15 years by way of other services. Operator shall verify these details as per site condition.

c. The STP shall comprise treatment process, as may be techno economically feasible and cost effective, leading to stringent of the effluent quality as prescribed by MoEF / CPCB/ NRCD/ contract as may be applicable.

d. The Operator shall have responsibility to dispose the treated sewage at the designated location under the Contract. The Operator shall have no
right over the use of treated wastewater and sludge except for
generation of power (if found feasible) from sludge for use in the STP.

e. On completion of the 15 years O & M period, the operator shall have
to handover the STP to the Owner in full working condition, with
necessary replacements of the components towards the end of their
economic life as suggested by the manufacturers / operations manuals
etc.

f. Landscaping of plant area, internal roads with access to all units,
illumination of the entire STP site, pathways, storm water drainage,
compound wall all around & gates, administrative building including
store house for tools and spares, laboratory with water supply and
waste water disposal arrangements, access road of 7 m carriageway,
O&M manual and as-built drawings for all civil, electrical &
mechanical works. All units shall be provided with draining
arrangements with suitable valves/gates with chambers.

g. Supply and providing safety equipment namely gas mask, breathing
apparatus, Air hose respirator, portable lighting equipment, non-
sparking lighting equipment, portable air blowers, safety belts,
inhalators and diver suit at the commencement of O & M.

h. The operator shall train the Owner’s selected staff for on job training
during the specified 6 months of O & M period. A Maximum of
Fifteen (15) staff of Owner will be trained for a total period of 45 days
during the last year of the Operations Period.

i. Handing over of the Plant in good working condition with all relevant
documents such as as-built drawings, physical & operational condition
of the assets, rights on proprietary technologies, software, systems,
O&M manual, periodical reports along with soft copy to Owner.

j. Design shall be such that the plant requires minimum land foot print
within the total land made available under this contract and also lesser
energy and less manpower requirement with full automation for its
sustainable and efficient operation & maintenance.

k. Proposed STP shall include but not be limited to the following criteria:

i. The disinfected effluent shall be discharged in to the receiving
water body through a suitable outlet channel and should be
designed for the appropriate peak flow from the STP (. A suitable
flow meter preferably ultrasonic electromagnetic shall be
provided for measuring the flow through the outlet channel

ii. Sludge Handling and disposal System shall form an integral part
of the treatment system. This should include stabilization of
sludge before disposal and reuse for beneficial purposes including
gas recovery and power generation to run the STP, agriculture manure, making stabilized clay bricks, etc.

iii. Characteristics and properties of the stabilized sludge before disposal shall be in conformance with the applicable environmental norms and CPHEEO guidelines.

iv. For the disposal of Grit and screening materials, solid waste etc., the same shall be disposed of by the operator at his own cost at the site Designated by the Owner

13.4. Designation of ____MLD STP on Site Areas for Other Uses

a. In preparing the Design and layout for the STP, the Operator shall Designate areas of the STP site for use in,
   
i. Sewage Treatment Units including receiving well/equalisation chamber, pumping arrangement and other electro-mechanical units/equipment;
   
ii. Sludge handling facilities;
   
iii. Ancillary works;
   
iv. Site administration and Lab building;
   
v. Perimeter buffer zones;
   
vi. Staff quarters etc.

13.5. Surface and Ground Water Management

In preparing the Design for the STP and all allied works and the Design-Build Documents, the Operator shall,

a. plan and Design the surface drainage at the Site of STP with adequate water drainage channels, pipes, sewers, structures and appurtenances, adequate to manage the highest seasonal levels and volumes of storm water; and

b. plan and Design the STP site with adequate protection from flooding whether from rain, groundwater, high rivers, storms or any other source.

13.6. Site Administrative Facility

a. The Operator shall be responsible for the administration of the STP and all allied works during the Design-Build Period and the Operator shall Design,

b. temporary office facilities for use by the Operator and its Sub Operators in the administration and execution of the Design-Build Services;
c. Project Facility for use in the administration of the Operations Services to accommodate personnel, furniture, utility services, a lunch room, washrooms and public toilets adequate or the Operations staff;

d. appropriate signage for the Site and the STP, including signs that,
   i. identify the STP and its units;
   ii. provide warning and hazard notification in Designated areas where warranted; and
   iii. identify areas of the STP that are restricted to visitors and are accessible to only Designated employees of the Operator;

e. the landscaping for the Facility as per the Design-Build Documents;

For Network and/or I&D Works

2.1 General

2.1.1 Design and Engineering

a) The Operator shall execute the basic and detailed design of Sewerage Network and/or I&D Works and allied structures and its execution in compliance with the technical specifications and requirements contained in the contract, codes of practices as published by the Bureau of Indian Standard (BIS) or its equivalent standard as well as the latest version of “Manual on Sewerage and Sewage Treatment” as published by the Central Public Health Engineering Organization (CPHEEO) of the Ministry of Urban Development, Government of India, New Delhi (draft or approved but whichever is latest). Wherever, the codes, standards and manual do not provide for the design and execution of some component i.e. required to be designed and executed, the operator shall follow the standard engineering practices as approved by Design Build Operations Engineer.

b) Where the Owner provides detailed designs. The Operator shall review owner’s designs and come up with its own designs for the Sewerage Network and/or I&D Works based on the alignment suggested/allowed by the Owner under Schedule 13 (Allowed alignments/locations). The changes in the suggested that include technical; allowed alignments etc shall be considered only due to compelling site conditions or unforeseen technical reasons, subject to the approval of the Owner or its authorised representative.

c) The designs and drawings as formulated by the operator shall be subject to approval by the Owner or its authorized representative.
d) The Operator shall be responsible for any discrepancies, errors or omissions in the specifications, drawings and other technical documents, desired output / performance of the Sewerage Network and/or I&D Works, whether specifications, drawings and other documents have been approved by the Owner or its representative or not, provided that such discrepancies, errors or omissions are not because of inaccurate information furnished in writing to the Operator by or on behalf of the Owner. Normally it is expected that Operator will not deviate from the specifications prescribed by the Owner unless the proposed changes will result in better performance and cost effectiveness.

2.1.2 Codes and Standards

Wherever references are made in the Contract to codes and standards, in accordance with which the Contract shall be executed, the edition or the revised version of such codes and standards 30 days prior to the Submission Deadline shall apply unless otherwise specified. During Contract execution, any changes in such codes and standards shall be applied after approval by the Owner/Owner’s Representative and shall be treated in accordance with GC Section 10.1.

2.1.3 Design Responsibilities

a) The Operator’s design and design-related services shall include, but not limited to the following:

i. A confirmatory topographical study covering the proposed sites and the network alignment. Survey drawings are to be submitted in hard and soft copy to the owner;

ii. [Investigation and assessment of the design requirements taking into cognizance of the indicative results of the Asset Condition Assessment Study]

iii. Site investigation and data collection including geotechnical assessment and soil analysis for the design and construction of the structures required for the Sewerage Network and/or I&D Works;

iv. Operator uses the population data/ projections for future supplied; and per capita wastewater production assumptions by the Owner. Selection, adoption and detailed engineering designs for the most appropriate technoeconomically feasible cost effective pumping configuration, network alignment and network installation process ensuring that the sewerage system meets with the standards prescribed by the MOEF / CPHEEO / CPCB as may be applicable. The hydraulic designs use computer based approved/ proven software.
v. Selection, adoption and detailed engineering design for the sections of the Existing Sewerage Network and/or I&D Works, wherever required, to integrate with the new network system and/or I&D Works. Usefulness of existing network will be conducted through a conditional assessment where Design-Build engineer’s team will also participate. Decision regarding the condition assessment shall be communicated by owner within 15 days after submitting complete condition assessment report by the contractor.

vi. the preparation of Hydraulic Flow Diagram (HFD)/schematic/preliminary design documents to illustrate the scale and character of the Design-Build Services and how the units of the process-adopted functionally relate to each other;

vii. Preparation of design development documents, based on the approved HFD /schematic design documents accepted by the Owner, consisting of drawings and other documents appropriate to the size of the Pumping Stations to describe the units and character of the entire proposed plant including architectural, mechanical, civil works, and electrical systems, materials, operations, landscaping, and such other elements as may be appropriate;

viii. the preparation of Design-Build Documents setting forth in detail the requirements for construction based on the design development documents accepted by the Owner;

ix. obtaining all approvals, permits, including building permits, and licenses for the Design-Build Services, necessary compliances with occupational health and safety requirements, except for those approvals, permits or licenses that the Owner is explicitly required to obtain itself under the Applicable Law in which case the Operator shall prepare all documentation and provide assistance to the Owner in obtaining such approval, permits or licenses;

x. the coordination required to integrate all parts of the Design-Build Services; such other Design-Build Services that may be required from time to time that are agreed to by the Operator and the Owner in writing; and

xi. the conducting of general reviews of the progress of the design process, to the extent necessary, in order to determine to the Operator’s satisfaction that the design services are performed in compliance with the requirements of the Contract and Applicable Laws.
2.1.4 Design-Build Documents

a) The Operator shall prepare all the Design-Build Documents. The Design Build Documents shall include the plans, designs, drawings, as-built documents, operations manuals, specifications, schematic design documents, design development documents, and all modifications thereto required in order to properly and fully test for, analyses for, plan, design and build the Sewerage Network and/or I&D Works and all allied works as contemplated in the Technical Standards and the remaining provisions of the Contract.

b) The Operator shall prepare all the Refurbishment / Replacement drawings including sections and plans of the Sewerage Network and/or I&D Works to be replaced / refurbished including schematic/detailed drawings, engineering drawings, construction drawings, design basis documents, construction methodology and technical standards adopted. The network and other systems built will be placed on a GI based system at the end of construction and handed over to the owner before operations commences. It also includes hydraulic design system to help monitor and for future upgrades.

c) The Operator shall prepare any other document, as may be requested by the Design-Build Engineer, that the Owner considers necessary to monitor the progress of the Design-Build Services and assess the Operator’s compliance with the Contract.

d) The Operator shall provide the Owner with three sets of all of the Design-Build Documents in reproducible form and shall modify them to keep them up-to-date as requested by the owner acting in a professionally reasonable manner. The Design-Build Documents, with the exception of the as-built documents, shall be subject to the review and approval of the owner prior to performing any of the services set out in DBSS in respect of any Design-Build Document.

e) When the Operator notifies the Owner in accordance with DBSS, the Operator shall provide to the owner one copy of the “as built Designs, Drawings/Documents” in reproducible form showing the exact as built locations, sizes and details of the Sewerage Network and/or I&D Works and the Design-Build Services as executed. The Sewerage Network and/or I&D Works shall not be considered to have reached Completion for the purposes of DBSS until such Design-Build Documents have been provided. The Operator shall update the as built Designs, Build Drawings/Documents as necessary for the correction of defects or deficiencies contemplated by DBSS.

2.1.5 Design Considerations

In preparing the design for the Sewerage System and all allied works and the Design-Build Documents, the Operator shall,
i. Protect public health and safety, including by the means set out in DBSS

ii. Consider the existing infrastructure and the Sewerage Network to be connected with the Trunk infrastructure.

iii. Consider the existing structures and Pumping facility at the proposed SPS site (if any).

iv. Ensure the Sewerage Network and/or I&D Works and all allied works has the capacity to accommodate the anticipated sewage based upon the verifications prepared by the Operator pursuant to DBSS;

2.2 Implementation Responsibilities – On Site Issues

In preparing the design for the Sewerage Network and/or I&D Works and the Design-Build Documents, the Operator shall ensure that the design,

i. makes adequate preparation and plans to ensure traffic movement and safety during the laying of the network, connecting service connections and construction of pump stations.

ii. makes adequate preparation and plans and takes adequate measures for controlling access to the Sewage Pumping Station(SPS) site by animals and humans and vehicular traffic at the perimeter of the SPS site, including plans for plantings and vegetation, fencing, lockable gates at vehicular access points, and the creation of an internal (perimeter access corridor inside or, with appropriate local and other approvals, surrounding the Site;

iii. allied works like control valves chambers, anchor /thrust /pedestal blocks, internal access roads within the site and proposed units within the SPS site;

iv. provides utilities services at the SPS site such as electricity, telephone, potable water, non- potable water and sewage collection and disposal.

2.3 Sewerage Network and/or I&D Works Layout and operation sequence

The Operator shall be responsible for the planning and designing of the area along the Sewerage Network and/or I&D Works and the Sewage Pumping Stations (SPS), including,

a) Design and Construction of ..No. SPSs and specified allied works and redesign and construction of___ Km long Sewerage Network and/or I&D Works, and all allied /ancillary works and then carry out
Operation & Maintenance of the Sewerage Network and/or I&D Works, Sewage Pumping Stations and all allied / ancillary works for 15 years by way of other services. Operator shall verify these details as per site condition.

b) Selection, adoption and detailed engineering designs for the most appropriate techno economically feasible cost effective pumping configuration, network alignment and network installation process ensuring that the sewerage system meets with the standards prescribed by the MOEF / CPHEEO / CPCB as may be applicable.

c) On completion of the 15 years O & M period, the operator shall have to handover the facilities to the Owner in full working condition, as it was on the date of commissioning of the Sewerage Network and/or I&D Works.

d) Design and construction including getting necessary approvals from the concerned public authorities for installation of sewerage network on road crossings, railway line crossings etc.; the Owner shall assist in facilitating such approvals as and when so requested by the Operator.

e) Plans for disposal of excavated earth in a safe and environmentally compliant manner.

f) Relocation of services within the network layout and restoration of roads, including approvals for relocation of the services from respective Authorities,

g) Plans for rehabilitation of excavated area / roads to its original condition,

h) Plans for the traffic diversion, clearing and excavation of land, disposal of excavated soil, dewatering, debris and other material at the SPS area; Site clearance, site surveys, topographical surveys, soil investigation, submission of process design and hydraulic design calculations, network alignment and SPS lay outs, hydraulic flow diagram (Process & Instrumentation diagram), preparation and submission of specific detailed Environmental Management Plan for the contract (C-ESMP) that complies to the requirements of Environmental Management Plan provided in Appendix 1of Schedule 2 (Design Build Services), recommendations of Environmental and Social Impact Assessment Report of the project (shared as part of the information to the bidders) and ESHS implementation plan in line with the ESHS code of Practice submitted, preparation & submission of civil, architectural, General arrangement drawings & structural design of all civil works, electrical & mechanical equipment drawings including equipment installation drawings, supporting calculations & technical information, instrumentation & control system, construction and laying of Sewerage Network and/or I&D Works and all allied /ancillary works of required capacity
as per approved designs, testing, commissioning, performance testing of process units & trial run.

i) landscaping of SPS area, internal roads with access to all units, illumination of the entire SPS site, pathways, storm water drainage, compound wall all around & gates, administrative building including store house for tools and spares.

j) Preparation of BOQ in accordance with Schedule 6 of this Contract to the satisfaction of the Owner.

k) O&M manual and as-built drawings for all civil, electrical & mechanical works.

l) Supply and providing safety equipment namely gas mask, breathing apparatus, Air hose respirator, portable lighting equipment, non-sparking lighting equipment, portable air blowers, safety belts, inhalators and diver suit at the commencement of O & M.

m) Mobilising necessary sewer cleaning equipment and maintaining such equipment for timely maintenance of sewer network.

n) The operator shall train the Owner’s selected staff for on job training during the specified 6 months of O & M period. A Maximum of Fifteen (15) staff of Owner will be trained for a total period of 45 days.

o) Handing over of the Plant in good working condition with all relevant documents such as as-built drawings, physical & operational condition of the assets, rights on proprietary technologies, software, systems, O&M manual, periodical reports along with soft copy to Owner.

For Both STP and Network and/or Interception and Diversion Works

13.7. Other Design Responsibilities

[EA to include specific requirements if any advised by NMCG in its Administrative Approval and Expenditure Sanction (AA&ES).]

The Operator shall carry out the following Design or Design-related responsibilities:

a. the Operator shall prepare plans and Designs for all temporary works as required by the Operator’s Design and as required by the Contract

b. the Operators shall prepare plans and Designs for landscaping of the site;

c. the Operator shall prepare plans and Designs for the acquisition of all data and information necessary to prepare the Design, including, but not limited to, any intrusive site investigations, off-site surveys and
environmental baseline monitoring required or contemplated under the Contract; and

d. the Operator shall prepare detailed plans and methodologies for the testing and inspection of the Plant and Equipment.
ARTICLE 14. BUILDING AND CONSTRUCTION SERVICES

14.1. General

a. The Operator shall carry out all building, refurbishment and construction of STP and Sewerage Network and/or I&D Works pursuant to Articles of DBSS

b. The Operator shall provide all of the demolition, excavation, building, co-ordination, repair, warranty, review, inspection, testing, quality assurance and control, monitoring, scheduling, clean-up etc. for connecting incoming sewage network, construction of the STP and the Sewerage Network and/or I&D Works and all appurtenant structures and allied works as contemplated by Design-Build Documents.

c. The Operator shall effectively direct and supervise these services so as to ensure conformity with the Design-Build Documents.

d. The Operator shall be solely responsible for installation methodology, construction means, methods, techniques, sequences, and procedures and for co-ordinating the various parts of the Design-Build Services under the Contract.

e. Unless agreed with Owner, the operator has to establish casting RCC pipes; preferably using vertical casting method within the vicinity of the site of construction. Generally, procurement of RCC sewer lines from outside manufacturers is discouraged. Owner will only consider request for procurement from outside only on cases where quantity required is not viable for setting up a plant.

14.2. Procurement and Transportation

a. Subject to GC Section 3.4, the Operator shall procure and transport all the equipment in an expeditious and orderly manner to the Site.

b. The Operators shall at its own risk and expense for transport all equipment, to the site.

c. The Operator shall be responsible for obtaining, if necessary, approvals from the authorities for transportation of Equipment, to the Site. The Operator shall indemnify and hold harmless the Owner from and against any claim for damage to roads, bridges or any other traffic facilities that may be caused by the transport of the to the Site.

d. The Operator shall, at its own expense, handle all imported Equipment, at the point(s) of import and shall handle any formalities for customs clearance. If the Applicable Law requires any application or act to be
made by or in the name of the Owner, the Owner shall take all necessary steps to comply with such Applicable Law. In the event of delays in customs clearance that are not the fault of the Operator, the Operator shall be entitled to an extension in the Time for Completion, pursuant to GC Section 2.3.4.

14.2.1. Temporary Supports, Structures and Utility Services

a. The Operator shall have the sole responsibility for the Design, erection, operation, maintenance, and removal of temporary supports, structures and utility services and the Design and execution of construction methods required in their use.

b. The Operator shall engage and pay for registered professional engineering personnel skilled in the appropriate disciplines to perform those functions referred to in DBSS where required by law or by the Design-Build Documents and in all cases where such temporary supports, structures and utility services and their Designs and method of construction are of such a nature that professional engineering skill is required to produce safe and satisfactory results.

14.2.2. Document Review

The Operator shall review the Design-Build Documents and shall report promptly to the Owner any error, inconsistency or omission the Operator may discover. If the Operator does discover any error, inconsistency or omission in the Design-Build Documents, the Operator shall not proceed with the work affected until the Operator has corrected any such errors or inconsistency or supplied any missing information and these corrections have been approved in writing by the Owner.

14.2.3. Plant and Equipment

a. The Operator shall provide and pay for labor, Plant and Equipment, tools, construction and maintenance machinery and equipment, materials and supplies, water, heat, light, power, transportation, and all other facilities and services necessary for the performance of the Design-Build Services in accordance with the Design-Build Documents.

b. The Operator shall ensure that all Plant and Equipment provided are new. Plant and Equipment which are not specified shall be of a quality consistent with those specified and their use shall be acceptable to the Owner.

14.2.4. Documents at the Site

The Operator shall keep one copy of the Design-Build Documents as updated, submittals, reports and records of meetings at the Site, in good order.
and shall make them available to the Owner upon request and at any reasonable time.

### 14.2.5. For STP

**Use of the ____ MLD STP site**

a. The Operator shall confine construction machinery and equipment, storage of Plant and Equipment, Operator’s Equipment (Design-Build) and Operator’s Equipment (Operations), and operations of Operator’s Personnel to limits indicated by laws, ordinances, permits or the Design-Build Documents and shall not unreasonably encumber the Site with Plant and Equipment, Operator’s Equipment (Design-Build) or Operator’s Equipment (Operations).

b. The Operator shall not store Plant and Equipment, Operator’s Equipment (Design-Build) or Operator’s Equipment (Operations) at the Site which are not necessary for the construction of the STP.

**For Network and/or I&D Works**

**Alignment and Setting Out**

a) The Operator shall be responsible for the true and appropriate alignment of the network and setting-out of the Site and the Sewage pumping Station in relation to benchmarks, reference marks, existing Infrastructure and lines specified in the Design-Build Documents.

b) If, at any time during the construction of the Sewerage Network and/or I&D Works / pumping stations etc., any error shall appear in the position, level or alignment of the network or any of its components, the Operator shall forthwith notify the Owner of such error and, at its own expense, immediately rectify such error to the reasonable satisfaction of the Owner.

### 14.2.6. Quality Assurance

a. The Operator shall institute a quality assurance system to ensure compliance with the requirements of the DBSS. Compliance with the quality assurance system shall not relieve the Operator of its duties, obligations or responsibilities.

b. The Operator shall submit for approval details of all quality assurance procedures and documents relating to Operator’s compliance with the quality assurance system to the Owner before each stage of the Design-Build Services is commenced as set out in the Time Schedule. When any document is issued to the Owner, it shall be accompanied by the signed quality statements for such document, if any. The Owner may
audit any aspect of the quality assurance system and the Operator shall take any corrective action as the Owner may deem appropriate.

14.2.7. Operator’s Access Routes and Rights of Way during the Design-Build Period

a. The Operator shall satisfy itself as to the suitability and availability of the access routes it chooses to use during the Design-Build Period for access to and from the Site. He shall, as between the Parties, be responsible for the maintenance of access routes during the Design-Build Period. The Owner will not be responsible for any claims which may arise from the use or otherwise of any access route. The Owner does not guarantee the suitability or availability of any particular access route, and will not entertain any claim for any non-suitability or non-availability for continuous use, during the Design-Build Period, of any such route.

b. The Operator shall bear all costs and charges for special or temporary rights-of-way required by it for access to the Site. The Operator shall also provide, at its own cost, any additional facilities outside the Site if required by it for the purposes of the Design-Build Services.

14.2.8. Site Regulations and Safety

a. The Operator shall establish Site regulations setting out the rules to be observed in the execution of the Contract at the Site and shall comply therewith. He shall prepare and submit to the Owner, proposed Site regulations for the Owner’s approval, which approval shall not be unreasonably withheld. Such Site regulations shall include rules in respect of security, safety of Plant, gate control, sanitation, medical care, emergency preparedness, emergency response, on-site safety training of employees and fire prevention.

b. The Operator shall comply with all applicable safety regulations in providing the Design-Build Services and in occupying any part of the Site, Unless otherwise stated in the Design-Build Documents, the Operator shall, during the Design-Build Period, provide secure fencing, lighting, guarding and watching; provide temporary roadways, footways, guards and fences which may be necessary for the accommodation and protection of its employees, Site visitors, Owners and occupiers of adjacent land, the public and others; carry out safety briefings of applicable site regulations to all employees, Sub-contractors, agents, representatives and visitors to the Site prior to permitting first access of the applicable person to the and at regular intervals thereafter.
c. During the Design-Build Period, the Operator shall develop and implement a comprehensive occupational health and safety program for the protection of the Operator’s Personnel and all other persons who may attend at the site. The program shall include a description of how the Operator will,

i. carry out all occupational health and safety responsibilities in respect of construction of STP and the laying of sewerage network and/or I&D Works as required under the Applicable Law;

ii. develop and manage all required occupational health and safety reporting procedures; and

iii. manage all occupational health and safety claims.

14.2.9. Operator’s Equipment (Design-Build) and Site Clearance

a. All Operator’s Equipment (Design-Build) brought by the Operator onto the Site shall be deemed to be intended to be used exclusively for the execution of the Contract. The Operator shall not remove the same from the Site without the Owner’s consent that such Operator’s Equipment (Design-Build) is no longer required for the execution of the Contract.

b. The Operator shall maintain the site of construction and installation in a tidy condition and free from the accumulation of waste products and debris. The Operator shall remove waste products and debris resulting from the construction / laying and shall leave the Facility clean and suitable for occupancy and performance of the Operations Services before attainment of Substantial Completion. The Operator shall remove products, tools, construction machinery, and equipment, including the Operator’s Equipment (Design-Build), not required for the performance of the remaining Design-Build Services.

c. Prior to notifying the Owner pursuant to DBSS 6.2(1), the Operator shall remove products, tools, construction machinery and equipment, and waste products and debris, including the Operator’s Equipment (Design-Build).

d. Upon the issue of any Completion Certificate, the Operator shall clear away and remove, from the site, all Operators’ Equipment (Design-Build), surplus material, wreckage, rubbish and temporary work or structures. The Operator shall ensure that the site is in a clean and safe condition to the satisfaction of the Owner.

e. If the Operator fails to remove, no later than 30 days after the issue of the Completion Certificate, any remaining Operator’s Equipment
(Design-Build), surplus material, wreckage, rubbish and temporary work or structures, the Owner may sell or otherwise dispose of such items. The Owner shall be entitled to retain, from the proceeds of such sale, a sum sufficient to meet the costs incurred in connection with the sale or disposal, and in restoring the area around the STP, Sewerage Network and/or I&D Works and SPS sites. Any balance of the proceeds shall be paid to the Operator. If the proceeds of the sale are insufficient to meet the Owner’s costs, the outstanding balance shall be recoverable from the Operator by the Owner.

f. The Owner will, if requested, use reasonable efforts to assist the Operator in obtaining any local, state or national government permission required by the Operator for the export of the Operator’s Equipment (Design-Build) imported by the Operator solely for use in the execution of the Contract that is no longer required for the execution of the Contract.

14.2.10. Protection of the Environment

a. The Operator shall take all reasonable steps to protect the environment, both on and off the Site, and to limit damage and nuisance to people and property resulting from pollution, noise, dust and other results of its Services, including,

1. adopting working practices that prevent or minimize the transfer of any pollutant off-site; maintaining the access roads in good repair;

2. using appropriate dust suppressant methods;

3. restricting trucking and loud machinery and equipment use to daylight hours;

4. using mufflers, silencers and other appropriate methods to minimize the noise of the construction;

5. Maintaining clean STP and SPS sites, that are free of garbage.

b. The Operator shall, at all times during building and construction, ensure that the Environmental Management Plan specified in Appendix 1 of Schedule 2 (Design Build Services) is fully complied and measures recommended in Environmental and Social Impact Assessment Study for the project (shared with the bidders as part of the information to the bidders) and ESHS implementation plans are implemented as per the ESHS code of practice.

c. The Operator shall monitor water quality upstream and downstream of the ___ MLD STP site, prior to and throughout the process of construction.
14.2.11. Emergency Work

a. If, by reason of an emergency arising in connection with and during the execution of the Design-Build Services, any protective or remedial work is necessary as a matter of urgency to prevent damage to the STP and Sewerage Network and/or I&D Works infrastructure, the Operator shall immediately carry out such work.

b. If the Operator is unable or unwilling to do such work immediately, the Owner may do or cause such work to be done as the Owner may determine is necessary in order to prevent damage to the Sewerage Infrastructure. In such event the Owner shall, as soon as practicable after the occurrence of any such emergency, notify the Operator in writing of such emergency, the work done and the reasons therefore. If the work done or caused to be done by the Owner is work that the Operator was liable to do at its own expense under the Contract, the reasonable costs incurred by the Owner in connection therewith shall be paid by the Operator to the Owner. Otherwise, the cost of such remedial work shall be borne by the Owner.
ARTICLE 15. TEST AND INSPECTION

15.1. Tests and Inspection

a. The Operator shall at its own expense carry out at the place of manufacture or on the Site all such tests and inspections of the Plant & Equipment. The Operator shall, in addition to those tests and inspections set out in the Contract, develop a plan for all testing and inspection of the equipment that is required in order to complete the STP and Sewerage Network and/or I&D Works in accordance with the Technical Standards Schedule and implement such quality assurance plan.

b. The Operator shall undertake such tests towards the Sewerage Network and/or Interception Sewer (sewers, man-holes etc.) so as to ascertain the attainment of self-cleansing velocity, leakage and completeness of the Sewerage Network and/or Interception Sewer.

c. The Owner or their Designated representatives shall be entitled to attend any test or inspection, provided that the Operator shall bear all costs and expenses incurred in connection with such attendance including, but not limited to, all traveling and board and lodging expenses.

d. Whenever the Operator is ready to carry out any test or inspection, the Operator shall give a reasonable advance notice of such test or inspection and of the place and time thereof to the Owner. The Operator shall obtain from any relevant third party or manufacturer any necessary permission or consent to enable the Owner or their Designated representatives to attend the test or inspection.

e. The Operator shall provide the Owner with a certified report of the results of any test or inspection. The Operator will also maintain photographic records with coordinates of all construction activities and use it in support of quality of construction and to support payments – more importantly shoring, bedding, bailing of water etc have to be supported by photographic evidence with proper referencing.

f. If the Owner, or their Designated representatives, fails to attend the test or inspection, or if it is agreed between the Parties that such persons shall not do so, then the Operator may proceed with the test or inspection in the absence of such persons, and shall provide the Owner with a certified report of the results thereof.

g. The Owner may require the Operator to carry out any test or inspection not required by the Contract, provided that the Operator’s reasonable costs and expenses incurred in the carrying out of such test or inspection shall be added to the Contract Price. Further, if such test or
inspection impedes the progress of work on the STP and Sewerage Network and/or I&D Works or the Operator’s performance of its other obligations under the Contract, due allowance will be made in respect of the Time for Completion and the other obligations so affected.

h. If any Plant and Equipment or any part of the STP and Sewerage Network and/or I&D Works fails to pass any test or inspection, the Operator shall either rectify or replace such Plant and Equipment or part of the STP and Sewerage Network and/or I&D Works and shall repeat the test or inspection upon giving a notice under DBSS Section 5.1(3).

i. If any dispute or difference of opinion arises between the Parties in connection with or arising out of the test or inspection of the Plant and Equipment or part of the STP and Sewerage Network and/or I&D Works that cannot be settled between the parties within a reasonable period of time, it may be referred to an Adjudicator for determination in accordance with GC Section 1.6.1(1).

j. The Operator shall give the Owner, at the Owner’s expense, access at any reasonable time to any part of the STP and Sewerage Network and/or I&D Works or any place where the Plant and Equipment are being manufactured or installed in the STP and Sewerage Network and/or I&D Works, in order to inspect the progress of the work and the manner of manufacture or installation, provided that the Owner shall give the Operator a reasonable prior notice.

k. The Operator agrees that neither the execution of a test or inspection of Plant and Equipment or any part of the Site, STP and Sewerage Network and/or I&D Works, nor the attendance by the Owner, nor the issue of any test certificate pursuant to DBSS, shall release the Operator from any other responsibilities under the Contract.

l. No part of the STP, Sewerage Network and/or I&D Works and Pumping Stations and foundations shall be covered up on the Site without the Operator carrying out any test or inspection required under the Contract. The Operator shall give a reasonable notice to the Owner whenever any such part of the plant or foundations is ready or about to be ready for test or inspection; such test or inspection and notice thereof shall be subject to the requirements of the Contract.
ARTICLE 16. COMPLETION OF THE STP AND SEWERAGE NETWORK AND/OR I&D WORKS

16.1. Monthly Progress Notice

a. The Operator shall submit to the Owner after the end of each month six copies, each signed by the Operator’s Representative named in accordance with GC Section 8.1.2, a notice (the “Monthly Progress Notice”) in such form as the Owner may from time to time prescribe, showing the percentage of completion that the Operator considers it has effected in the preceding month, in respect of the Design-Build Services.

b. The Owner shall, no later than 30 days after receipt of the Monthly Progress Notice, deliver to the Owner a statement (the “Design-Build-Operations Engineer’s Statement”) indicating, separately, the percentage of completion of the Design-Build Services with documentary evidence such as photographs etc. that the Owner considers the Operator has effected in the applicable month.

c. If the Owner notifies the Operator of any defects or deficiencies, or both, in any of the Design-Build Services, the Operator shall then correct the defects or deficiencies, and shall repeat the procedure described in DBSS Section 5.1(a).

16.2. Completion

a) As soon as the Design-Build Services have, in the opinion of the Operator, been completed in accordance with the Technical Standards Schedule (including restoration of services and roads cut to lay sewer lines), excluding minor items not materially affecting the operation or safety of the STP and Sewerage Network and/or I&D Works, has satisfactorily passed all Tests on Completion as set out in DBSS and Technical Standards Schedule, the Operator shall so notify the Owner in writing (the “Notice of Completion”) and provide the as-built Design-Build Documents referred to in DBSS. It may be true that at times, parts of the networks are commissioned and hence such completion should be notified to Owner. However, final completion has to cover all such part commissioned networks. Operation of such commissioned sub-networks shall be the responsibility of the Operator.

b) The Owner shall, no later than 30 days after receipt of the Operator’s notice under DBSS Section 5.2(a) either issue a Completion Certificate stating that the STP and Sewerage Network and/or I&D Works has reached Completion as of the date of the Operator’s notice under
DBSS Section 5.2(a), or notify the Operator in writing of any defects or deficiencies or both.

c) If the Owner is not satisfied that the Design-Build Services are complete, the Owner shall notify the Operator in writing of any defects or deficiencies no later than 14 days after receipt of the Notice of Completion.

d) If the Owner notifies the Operator of any defects or deficiencies or both, the Operator shall then correct such defects or deficiencies, and shall repeat the procedure described in DBSS Section 5.2(a).

e) If the Owner is satisfied that the Design-Build Services have reached Completion, the Owner shall, no later than 7 days after receipt of the Operator’s repeated Notice of Completion, issue a Completion Certificate stating that the Design-Build Services have reached Completion as of the date of the Operator’s repeated Notice of Completion.

f) If the Owner fails to issue the Completion Certificate and fails to inform the Operator of any defects or deficiencies 14 days after receipt of the Notice of Completion or 7 days after receipt of the Operator’s repeated Notice of Completion, then the Design-Build Services shall be deemed to have reached Completion as of the date of the Notice of Completion or repeated Notice of Completion as the case may be.

g) As soon as possible after Completion, the Operator shall complete all outstanding minor items so that the STP and Sewerage Network and/or I&D Works are fully in accordance with the requirements of the Contract, failing which the Owner will undertake such completion and deduct the costs thereof from any monies owing to the Operator.
ARTICLE 17. COMMISSIONING AND OPERATIONAL ACCEPTANCE

17.1. Commissioning

Commissioning of the STP and Sewerage Network and/or I&D Works shall be commenced by the Operator immediately after issue of the Completion Certificate by the Design-Build-Operations Engineer, pursuant to DBSS Section 5.2 (b) or immediately after issue of the deemed Completion, under DBSS Section 5.2 (f).

17.2. Tests on Commissioning

a. The Tests on Commissioning as set out the Technical Standards Schedule, and repeats thereof, shall be conducted by the Operator during Commissioning of the STP and Sewerage Network and/or I&D Works and all allied works to ascertain whether the STP and Sewerage Network and/or I&D Works or the relevant part can attain the technical standards as required in the contract. The Operator’s and Design-Build-Operations Engineer’s advisory personnel shall attend the Tests on Commissioning, and shall advise and assist the Owner. The Owner shall promptly provide the Operator with such information as the Operator may reasonably require in relation to the conduct and results of the Tests on Commissioning, and any repeats thereof.

b. If for reasons not attributable to the Operator, the Tests on Commissioning of the STP and Sewerage Network and/or I&D Works cannot be successfully completed within 21 days after the period from the date of Completion specified in the SCC or any other period agreed upon by the Owner and the Operator, the Operator shall be deemed to have fulfilled its obligations with respect to the Tests on Commissioning.

17.3. Operational Acceptance

a. Operational Acceptance shall occur in respect of the STP and Sewerage Network and/or I&D Works when the Tests on Commissioning have been successfully completed.

b. The operator shall be responsible to obtain consent to operate in compliance to consent to establish from UPPCB / CPCB.

c. At any time after the successful completion of the Tests on Commissioning, the Operator may give a notice to the Owner requesting the issue of an Operational Acceptance Certificate in respect of the STP and Sewerage Network and/or I&D Works.
d. The Owner shall, after consultation with the Owner, and no later than 7 days after receipt of the Operator’s notice, issue an Operational Acceptance Certificate.

e. If within 7 days after receipt of the Operator’s notice, the Owner fails to issue the Operational Acceptance Certificate or fails to inform the Operator in writing of the justifiable reasons why the Owner has not issued the Operational Acceptance Certificate, the STP and Sewerage Network and/or I&D Works shall be deemed to have been accepted as of the date of the Operator’s said notice.
ARTICLE 18. REPORTING DURING THE DESIGN-BUILD PERIOD

18.1. Design-Build Progress Reports

a. The Operator shall prepare monthly progress reports of the Design-Build Services during the Design-Build Period and submit six copies of the reports to the Design-Build-Operations Engineer. The first report shall cover the period up to the end of the calendar month after that in which the Design-Build Starting Date occurred and reports shall be submitted monthly thereafter, each no later than 14 days after the last day of the month to which it applies.

b. The Design-Build Services monthly reports shall include the following information:

1. photographs and detailed descriptions of progress, including each stage of design, procurement, manufacture, delivery to the STP and Sewerage Network and/or I&D Works site, construction, laying, erection, testing and commissioning;

2. charts showing the status of Design-Build Documents, purchase orders, manufacture and construction;

3. for the manufacture of each main item, equipment, machinery, floor or component of the STP and Sewerage Network and/or I&D Works, the name of manufacturer, manufacture location, percentage progress, and the actual or expected dates of commencement of manufacture, Operator’s inspections, tests and delivery relating thereto;

4. detailed records of the Operator’s Personnel and Operator’s Equipment (Design-Build) on the STP site, Sewerage Network and/or I&D Works and the actual usage of the Operator’s Equipment (Design-Build) during the reporting period and the tasks performed by the Operator’s Personnel;

5. copies of quality assurance documents, test results and certificates of the Plant and Equipment;

6. all monitoring results;

7. the Environmental, Social, Health and Safety (ESHS) metrics set out in Appendix 1 of Schedule 2 (Design Build Services) Part 3”;

8. percentage completion achieved compared with the planned percentage completion for each activity; and
9. Where any activity is behind in the scheduled completion, comments and likely consequences and a description of the corrective action being taken.

“The Contractor shall provide immediate notification to the Engineer of incidents in the following categories. Full details of such incidents shall be provided to the Engineer within the timeframe agreed with the Engineer.

(a) confirmed or likely violation of any law or international agreement;
(b) any fatality or serious (lost time) injury;
(c) significant adverse effects or damage to private property (e.g. vehicle accident, damage from fly rock, working beyond the boundary)
(d) major pollution of drinking water aquifer or damage or destruction of rare or endangered habitat (including protected areas) or species; or
(e) any allegation of sexual harassment or sexual misbehavior, child abuse, defilement, or other violations involving children.

18.2. **Replacement of Key Staff to be deployed by the Operator during the Design build period.**

If replacement of any Key Staff during design & build services period becomes necessary, the Operator shall submit a proposal for Owner’s approval, advising therein the name of the replacement staff of equivalent or higher qualifications duly supported by his CV.

The overlap period of the new key staff and the staff to be replaced shall be minimum of one month.
Appendix 1

Environmental Management Plan (EMP) and Environmental, Social, Health and Safety Management Implementation Plan (ESHS-MSIP)

Part 1: Environmental Management Plan

*Please include EMP chapter of ESMP Report (without cost details of the EMP) here*

Part 2: Environmental, Social, Health and Safety Management Implementation Plan (ESHS-MSIP)

The operator shall submit Management Strategies and Implementation Plans (MSIP) to manage the following key Environmental, Social, Health and Safety (ESHS) risks, specific to the detailed design of the contract.

*The plan should integrate environmental protection, occupational and community health and safety, gender, equality, child protection, vulnerable people (including those with disabilities), gender-based violence (GBV), HIV/AIDS awareness and prevention and specific to the activities involved in the execution of the Works. The plan should also include mechanisms for monitoring, continuously improving processes and activities and for reporting on the compliance with the policy.*

As a minimum, the plan should, include:

1. traffic management plan to ensure safety of local communities from construction traffic;
2. water resource protection plan to prevent contamination of drinking water;
3. boundary marking and protection strategy for mobilization and construction to prevent offsite adverse impacts;
4. strategy for obtaining Consents/Permits prior to the start of relevant works such as opening a quarry or borrow pit;
5. apply good international industry practice to protect and conserve the natural environment and to minimize unavoidable impacts;
6. provide and maintain a healthy and safe work environment and safe systems of work;
7. protect the health and safety of local communities and users, with particular concern for those who are disabled, elderly, or otherwise vulnerable;
8. ensure that terms of employment and working conditions of all workers engaged in the Works meet the requirements of the ILO labour conventions to which the host country is a signatory;
9. be intolerant of, and enforce disciplinary measures for illegal activities. To be intolerant of, and enforce disciplinary measures for GBV, child sacrifice, child defilement, and sexual harassment;
10. incorporate a gender perspective and provide an enabling environment where women and men have equal opportunity to participate in, and benefit from, planning and development of the
Works;

11. work co-operatively, including with end users of the Works, relevant authorities, contractors and local communities;

12. engage with and listen to affected persons and organizations and be responsive to their concerns, with special regard for vulnerable, disabled, and elderly people;

13. provide an environment that fosters the exchange of information, views, and ideas that is free of any fear of retaliation;

14. minimize the risk of HIV transmission and to mitigate the effects of HIV/AIDS associated with the execution of the Works;

Part 3: Environmental, Social, Health and Safety (ESHS) - Content of Progress Report

Contents for regular reporting:

a. environmental incidents or non-compliances with contract requirements, including contamination, pollution or damage to ground or water supplies;

b. health and safety incidents, accidents, injuries and all fatalities that require treatment;

c. interactions with regulators: identify agency, dates, subjects, outcomes (report the negative if none);

d. status of all permits and agreements:

i. work permits: number required, number received, actions taken for those not received;

ii. status of permits and consents:

- list areas/facilities with permits required (quarries, asphalt & batch plants), dates of application, dates issued (actions to follow up if not issued), dates submitted to resident engineer (or equivalent), status of area (waiting for permits, working, abandoned without reclamation, decommissioning plan being implemented, etc.);

- list areas with landowner agreements required (borrow and spoil areas, camp sites), dates of agreements, dates submitted to resident engineer (or equivalent);

- identify major activities undertaken in each area this month and highlights of environmental and social protection (land clearing, boundary marking, topsoil salvage, traffic management, decommissioning planning, decommissioning implementation);

- for quarries: status of relocation and compensation (completed, or details of monthly activities and current status).

e. health and safety supervision:

i. safety officer: number days worked, number of full inspections & partial inspections, reports to construction/project management;

ii. number of workers, work hours, metric of PPE use (percentage of workers with full personal protection equipment (PPE), partial, etc.), worker violations observed (by type of violation, PPE or otherwise), warnings given, repeat warnings given, follow-up actions taken (if any);
f. worker accommodations:
   iii. number of expats housed in accommodations, number of locals;

   iv. date of last inspection, and highlights of inspection including status of accommodations’
       compliance with national and local law and good practice, including sanitation, space, etc.;

   v. actions taken to recommend/require improved conditions, or to improve conditions.

   g. HIV/AIDS: provider of health services, information and/or training, location of clinic, number of
       non-safety disease or illness treatments and diagnoses (no names to be provided);

   h. gender (for expats and locals separately): number of female workers, percentage of workforce,
      gender issues raised and dealt with (cross-reference grievances or other sections as needed);

   i. training:

      vi. number of new workers, number receiving induction training, dates of induction training;

      vii. number and dates of toolbox talks, number of workers receiving Occupational Health and
           Safety (OHS), environmental and social training;

      viii. number and dates of HIV/AIDS sensitization training, no. workers receiving training (this
            month and in the past); same questions for gender sensitization, flaglady/flagman training.

   j. environmental and social supervision:

      ix. environmentalist: days worked, areas inspected and numbers of inspections of each (road
          section, work camp, accommodations, quarries, borrow areas, spoil areas, swamps, forest
          crossings, etc.), highlights of activities/findings (including violations of environmental and/or
          social best practices, actions taken), reports to environmental and/or social
          specialist/construction/site management;

      x. sociologist: days worked, number of partial and full site inspections (by area: road section,
         work camp, accommodations, quarries, borrow areas, spoil areas, clinic, HIV/AIDS center,
         community centers, etc.), highlights of activities (including violations of environmental
         and/or social requirements observed, actions taken), reports to environmental and/or social
         specialist/construction/site management; and

      xi. community liaison person(s): days worked (hours community center open), number of people
          met, highlights of activities (issues raised, etc.), reports to environmental and/or social
          specialist/construction/site management.

   k. Grievances: list this month’s and unresolved past grievances by date received, complainant, how
      received, to whom referred to for action, resolution and date (if completed), data resolution
      reported to complainant, any required follow-up(Cross-reference other sections as needed):

      xii. Worker grievances;

            xiii. Community grievances

   l. Traffic and vehicles/equipment:

      xiv. traffic accidents involving project vehicles & equipment: provide date, location, damage,
           cause, follow-up;
xv. accidents involving non-project vehicles or property (also reported under immediate metrics): provide date, location, damage, cause, follow-up;

xvi. overall condition of vehicles/equipment (subjective judgment by environmentalist); non-routine repairs and maintenance needed to improve safety and/or environmental performance (to control smoke, etc.).

m. Environmental mitigations and issues (what has been done):

xvii. dust: number of working bowsers, number of waterings/day, number of complaints, warnings given by environmentalist, actions taken to resolve; highlights of quarry dust control (covers, sprays, operational status); % of rock/muram/spoil lorries with covers, actions taken for uncovered vehicles;

xviii. erosion control: controls implemented by location, status of water crossings, environmentalist inspections and results, actions taken to resolve issues, emergency repairs needed to control erosion/sedimentation;

xix. quarries, borrow areas, spoil areas, asphalt plants, batch plants: identify major activities undertaken this month at each, and highlights of environmental and social protection: land clearing, boundary marking, topsoil salvage, traffic management, decommissioning planning, decommissioning implementation;

xx. blasting: number of blasts (and locations), status of implementation of blasting plan (including notices, evacuations, etc.), incidents of off-site damage or complaints (cross-reference other sections as needed);

xxi. spill cleanups, if any: material spilled, location, amount, actions taken, material disposal (report all spills that result in water or soil contamination);

xxii. waste management: types and quantities generated and managed, including amount taken offsite (and by whom) or reused/recycled/disposed on-site;

xxiii. details of tree plantings and other mitigations required undertaken this month;

xxiv. details of water and swamp protection mitigations required undertaken this month.

n. compliance:

xxv. compliance status for conditions of all relevant consents/permits, for the Work, including quarries, etc.: statement of compliance or listing of issues and actions taken (or to be taken) to reach compliance;

xxvi. compliance status of ESMP/ESIP requirements: statement of compliance or listing of issues and actions taken (or to be taken) to reach compliance;

xxvii. other unresolved issues from previous months related to environmental and social: continued violations, continued failure of equipment, continued lack of vehicle covers, spills not dealt with, continued compensation or blasting issues, etc. Cross-reference other sections as needed.
Schedule 3

Operation and Maintenance Services Schedule

TO (i) DESIGN AND BUILD SEWAGE TREATMENT PLANT OF INSTALLED CAPACITY .... MLD AND ALL APPURTEANANT STRUCTURES AND ALLIED WORKS; (ii) SURVEY, REVIEW THE DESIGNS, REDESIGN WHERE NECESSARY, AND BUILD NEW UNDERGROUND SEWERAGE NETWORK DIVERSION WORKS WITH INTERCEPTION SEWER OF ABOUT .... KM LENGTH INCLUDING SURVEY, DESIGN, CONSTRUCTION OF .... No. PUMPING STATIONS AND ALL APPURTEANANT STRUCTURES AND ALLIED WORKS; AND (iii) OPERATION & MAINTENANCE OF THE COMPLETE WORKS OF SEWAGE TREATMENT PLANT, SEWERAGE NETWORK AND/OR INTERCEPTION AND DIVERSION WORKS AND PUMPING STATIONS FOR A PERIOD OF 15 YEARS IN ........, STATE OF ........, INDIA.
ARTICLE 1. Introduction

The Operator shall ensure the Operation and Maintenance of the STP, Sewerage Network and/or I&D Works, Pumping Stations and other allied works in compliance to the guidelines contained in the Manual on “Sewerage & Sewage Treatment”, latest edition as published by the Central Public Health Environmental Engineering Organization (CPHEEO), Ministry of Urban Development, Government of India, New Delhi and the prescription laid down hereunder.

ARTICLE 2. Scope of Work

For STP

2.1. Operate the STP, for a period of 15 years as specified below:

2.1.1. General Scope

a. The Operator shall operate and maintain the STP under the Contract complete including the road works, landscaping, civil/structural, mechanical components, instrumentation system, Electrical System, all utility and ancillary buildings for the period of ten (10) years from the date of successful completion of “Tests after Completion of the Works”.

b. The Operator shall make his own arrangements at his own cost for Works operation personnel, lubricants, diesel, spares, tools and tackles, routine maintenance, screenings collection, desilted material collection, transportation and disposal, co-ordination with respective pollution control board, agency supplying power to the STP, and any other activity required for the operation and maintenance of the constructed Works in full compliance with all applicable rules, regulations, laws, codes, effluent quality requirements and any other limitations.

c. Carrying out continuous flow measurements and recording of treated & untreated sewage at outlet and inlet of STP, regular calibration, cleaning, maintenance and replacement when required of measuring devices;

d. Collecting samples of influent and effluent and analyzing & testing them on a daily basis (inhouse) and getting tests done at weekly basis from [The EA should specify here the independent laboratory like the one under the control of State PCB, etc.] to determine the quality of sewage and performance of the treatment plant. Minimum 3 grab samples representative of different flow conditions (quantum and quality wise) in the day of the treated effluent shall be drawn every week jointly by the Owner and the Operator and the results of the test report shall be binding on both the parties.;
e. Take all necessary measures to minimize the power consumption in carrying out its operations.

f. Operate electrical equipment during power failures by making appropriate alternative arrangements.

g. Store or dispose: (i) the Residual Matter obtained after the processing and treatment of the Sewage such as sludge, grit, waste screens etc.; and (ii) the Residual Treated Water obtained from treatment of Sewage in a manner which is compliant to all applicable environmental laws and rules;

h. The Operator shall submit a weekly report to the Owner detailing the Operation and Maintenance indicating the labour hours expended, Electrical Power Consumed and other Consumables consumed and also problems faced and rectified.

i. The Operator shall submit detailed schedule/manual of all O&M activities with references of equipment manufacturers’ maintenance schedules/manuals to the Owner for review and approval.

j. The Operator shall submit Guidelines and Instructions manual for the maintenance staff of all levels for all the tools, plants and equipment and Operating STP to maintain the service levels within the standards prescribed within the contract;

k. The Operator shall carry out all O&M activities as per the approved Operation and Maintenance Manuals.

l. During the Operation and Maintenance period, the Operator shall ensure that the sewage detention time in wet well not exceeds 30 min. and there is no backflow of sewage.

m. The Operator’s responsibility shall also include the safety and security of the Works during the course of Operation and Maintenance.

n. Acquire and maintain sufficient stock of consumables such as chemicals, algal nutrients, safety gear, grit screens etc. and procure necessary electrical and mechanical equipment required for operations and maintenance of STP to ensure continuous operations.

o. Establish a Project office to manage the Project. The Project office can be located at the sewage treatment plant campus or at any other appropriate location where land is made available by the Owner.

p. All Project sites shall be well secured and kept in a clean and hygienic condition with sufficient measures for safety and security of man-power, built structures, equipment and other system components.

q. During Operation and Maintenance period, the Operator shall appoint an Operator and Electrical/Mechanical Technician. In addition, the Operator shall appoint suitable
number of operators, drivers, cleaners, fitters, electricians, helpers, gardeners, office peons, security guards, labourers as required for the operation and maintenance of complete proposed STP for three shifts and adequate other staff / supporting personnel during general Shift. Security of man-power, built structures, equipment and other system components

2.1.2. General Scope

a. To Operate and maintain the sewage treatment plant, all instruments and mechanical, electrical equipment in accordance with the aim and purpose of treatment. The plant & equipment covered under the above contract will be totally attended to, by the Operator including any “Troubleshooting” to ensure smooth and trouble free operation.

b. The Operator will monitor the performance of the sewage treatment plant; conduct the analysis of the inlet sewage and water quality after treatment. Operator shall initiate and take adequate actions to ensure smooth and satisfactory performance / running of the plants on a 24 hours / round the clock basis.

c. The Operator shall prepare and implement an effective plant maintenance programme in consultation with the Owner. It is an absolutely operator’s responsibility to look after all sorts of maintenance whether preventive, Minor, Major, or breakdown

d. The Operator will determine operating parameters, select settling (Chemical doses etc.) and generally optimize the process, and working of the treatment plant. Excessive chemical dozing i.e. dose more than normal should be avoided otherwise penalty shall be levied and recovered from the Operator.

e. The Operator should plan & procure all spares, Polyelectrolyte and all consumables including chemicals, grease, lubricating oil, cleaning agents, laboratory reagents etc. Further the Operator will plan about the requirement well in advance (At least 4 months) and procure the material from the market.

f. The Operator will be responsible for keeping up-to-date record of documents including History Card for equipment and maintaining every day log book relating to various analysis performed.

g. The Operator shall maintain and update logbook, in which details of operational parameters are recorded in every shift and at regular interval say hourly or as decided mutually.

h. The Operator will prepare and submit a daily report of plant performance and will assist the Owner in preparing the necessary documents for their purpose and records.
i. The Operator will be responsible to carry out day to day periodic maintenance, necessary to ensure to smooth and efficient performance / running of all equipment / instruments comprising the sewage treatment plant and maintaining the record of the same.

j. The Operator shall have to issue identity cards with photographs to all the staff employed for Operation and Maintenance. The list of the same shall be submitted to the Owner mentioning qualification & experience.

k. The Operator will also be responsible to carry out day to day Maintenance of the rising main inside the STP premises.

l. The Operator will employ minimum staff for operation and maintenance of the Plant as per the list mentioned in the detailed scope of work.

m. The above staff shall be distributed in three shifts as per mutual agreement between Operator and Owner. As per agreement the number of staff in each shift should always remain present otherwise penalty towards absence of any staff shall be recovered from the Operator as per Volume-I GCC. The Operator shall make the arrangement of reliever for weekly off/holiday etc. Absence on any ground like weekly off or holiday shall not be considered. The presence of staff in each shift should be marked in muster to be maintained at office of shift in charge at Sewage Treatment Plant that shall be considered as final. The Operator’s staff must mark their presence in this muster. The Operator may maintain a separate register for his own purpose.

n. The staff of Operator will always remain in contact with the Junior Engineer, Assistance Engineer/Electrical Supervisor, in charge of the Plant deployed by the Owner and follow their instruction.

o. Unsatisfactory and inefficient running of the plant and unnecessary and excessive usage of spare, consumable, etc. supported by the reasons which are under control of Operator will be highly objected. In such cases Engineer-in-charge’s decision will be final and binding to the Operator.

p. It is required that at least once in every one month a technical expert other than the Monthly Staff of the Operator will visit the plant and will suggest if required, to improve the efficiency and working of the plant etc. No separate payment will be made for such visits. The visit must be recorded and outcome of the visit/minutes of the meeting should be got signed by Owner authorities without which the visit shall not be considered.

q. Operator will comply with all safety rules and regulations as followed by the Owner.
r. The Owner will not be responsible for any accident /injury to the staff of the Operator. 
Further the Owner will not provide any insurance or medical facility to the staff of Operator. The responsibility lies with the Operator.

s. All Central/State Government / Semi-Government / Local Body’s Rules and Regulations pertaining to this contract shall be followed and observed by the Operator without any extra cost to the Owner.

t. No accommodation / guesthouse / transportation facility will be provided by the to the Operator. Operation & maintenance staff will not be allowed any accommodation facility inside the plant premises.

u. The duration of the O&M shall be 120 months from the date of successful commissioning of the STP. The same can be extended for the further period if the Owner so desires. The Operator should employ all the staff within two days of successful commissioning. The Operator will provide the necessary tools and tackles required for day-to-day maintenance.

v. The scope of work also includes cleaning of complete plant area including floor, toilet block railing, door, windows, light fixtures and ceiling etc. The entire premises of the plant area shall also be cleaned and maintain by the Operator regularly.

w. This work is inclusive of but not limited to operation, maintenance, housekeeping, cleaning, removing sludge by its own carrier arrangement & disposes it off as per Owner’s instructions. Preparing data recording, correspondence work to Owner and Government Departments, etc. All this work should be done as per standard practices and by following labour, factory, electrical, STATE PCB, and all other latest updated regulations, Indian standards etc. as applied of Local, State and Central Government of India.

x. The Operator will not employ persons who are , pronounced guilty or charged with 
indiscipline.

y. Right is reserved by Owner of suspension, dismiss ion, termination of any officer / staff employed by Operator. He shall have taken prior permission to employ or to terminate his personals.

z. No watch and ward, safety insurance, security, storage, housing accommodation etc. will be provided by Owner. This will be responsibility of Operator.

aa. Consumable items like rubber bush, graphite packing, rubber sheet, nut-bolts, material required for cleaning and housekeeping etc. are to be brought by the Operator.

bb. Monitoring should be done as per guideline given by Engineer-in-charge. Operator has to maintain all the parameter of effluent within stipulated limit or he will be penalized for not maintaining the parameters given by STATE PCB and Owner. All expenditure incurred for the same like, suite fee, court fee, case fee, or
the penalty as decided by Engineer of Owner and penalty charged by STATE PCB will be charged to Operator and deducted from his bills, S.D etc.

cc. Operator shall have to test the effluent / influent at his own cost at the plant lab on daily basis. The same be verified by and checked by Owner whenever required. The Operator shall also have to test the effluent / influent at STATE PCB lab for different parameter on weekly basis at his own cost.

dd. No equipment shall remain ideal or un-attended or damaged for the period of 3 days..

e. The payment of O & M charges will be made as per the tender conditions. The other terms and condition described in these complete tender documents, wherever applicable shall remain unchanged. In case of any discrepancy the decision of Engineer-In-Charge will remain final & binding on the Operator.

ff. During Operation & Maintenance period, Operator has to supply all the spares, at his cost during preventive, major-minor breakdown, replacement and maintenance work. No extra payment will be made for such maintenance on any ground. The payment for the same will be made strictly as per tender document irrespective of the number of break down / minor, major repairs replacements. During the O & M Operator will have to enter annual maintenance agreement with Manufacturers of all major Mechanical Equipments like Centrifuge, Air Blowers, Screens, Decanters etc.

gg. Operator will have to maintain required Power Factor as per STATE EB rules and regulations. In case penalty is levied by STATE EB for not maintaining the Power Factor the same will be recovered from the Operator.

hh. Maintenance of Garden, Lawns, Plants, Bushes, Plantation of new Plants, Lawns etc. and feeding, gardening, cleaning etc. is in the scope of the Operator. No separate payment will be made for the same.

ii. The Operator during his O&M period will have to follow all the guidelines set by STATE PCB for Operation & Maintenance of STP.

jj. Operation and maintenance of all General facilities and utility services including all other components of work done under this contract.

kk. Operation and maintenance of PLC based automation system and all instruments installed in the STP including all repairs, replacements towards the entire instrumentation works during the O & M period shall be in the scope of Operator.

ll. Any other services required for smooth running of the scheme.

mm. The Operator shall also dispose off the sludge, screenings, grit and any other material, as per specifications and to the satisfaction of the Engineer-in-Charge. It
is to be noted that all costs during the O&M period, excluding the cost of power and chlorine are to be borne by the Operator. The Operator is to ensure that the following guarantees are maintained during the operation & maintenance period:

i. for quality of treated effluent
ii. for consumption of chemicals
iii. for automation

nn. The Operator shall provide on job training to the Local body staff as per specifications.

oo. At the end of every 2(1/2) year of operation & maintenance period, an assessment of the condition of the plant has to be done by the Owner through third party inspection at Owner’s cost and based on that assessment the Operator shall, at no extra cost to the Owner, repair and re-condition all the mechanical equipment in the concluding year of the O&M contract to a condition so that they are in running condition with regular preventive and recommended maintenance as per manufacturer's recommendations or as per CPHEEO manual.

pp. Variability of through output: If the quantity of treated sewage from the Facility can be increased in the existing system without impacting the annual fixed costs to the Operator, the Operator shall comply with such requirements. For a sustained requirement of higher throughout from the Facility, the Operator may be required to frame and submit a proposal that shall be implemented if mutually acceptable.

2.1.3. Treated Sludge Disposal

The Operator shall operate the Sewage Treatment Plant such that the sludge produced is of a spreadable consistency and the volume of sludge produced after necessary process is minimum. The sludge generated from the STP shall be disposed of through proper approved means of transport to the Compost yard site as designated by the Owner.

2.1.4. Chemical Requirements

All chemicals consumed to operate the Sewage Treatment Plant and other facilities under this contract will be borne by the Operator.

2.2. Adverse Operating Condition

During which the raw sewage quality deteriorates beyond the Specifications in Volume I, the following provisions will be applicable:

a. If the raw sewage can still be treated to meet the Output Standards, the Operator shall comply with such specifications.
b. In the event it is not possible to meet the Output Standards, the Operator shall immediately inform the Owner.

c. In the event it is possible to meet the Output Standards, but an increase in fixed and variable costs is unavoidable, the Operator shall, as soon as practically possible, inform the Owner.

2.2.1. Alternate Output Standards;

The treated effluent output BOD, shall be maximum 7% of the influent BOD, the maximum period of adverse condition is 30 days.

2.3. Output and Operational Guarantees

The Operator is fully responsible for treating all the Sewage reaching the Receiving chamber. The performance of the Operator shall be treated as unsatisfactory if he fails to treat the complete sewage or does not maintain the guarantees listed in this clause excepting in force majeure condition or fails to fulfill other conditions of the contract.

2.4. Treated Effluent Quality

The Operator shall operate the Sewage Treatment Plant in such a way that the treated effluent quality attains the following parameters:-

</table>

The work shall be carried out on a 24 hr. basis, without intermission and the staff deployed by the Operator shall be in accordance with this contract.

a. The Operator shall give or provide all necessary superintendence during the O&M and as long thereafter as the Owner may consider necessary. Such superintendence shall be given by a competent person having adequate knowledge of the operation and Maintenance to be carried out (including the methods and techniques required),
the hazards likely to be encountered and methods of preventing accident) as may be 
required for the satisfactory working of the entire plant.

b. No labor below the age to 18 years shall be employed on the work. List of staff is to 
be given by the agency to the Owner and advance intimation to be given before 
deputing/removing any staff from site during the period of contract. Not more than 
one of the Operator's key staff shall be absent from the Project site at any given time. 
In case it is necessary for more than one of the key personnel to be absent at a given 
time, the Operator shall provide replacement of equivalent or better qualifications. 
The CVs of such key staff replacements shall be got approved from Owner in 
advance.

c. Owner shall be authorized to direct the contracting agency to remove any or all staff 
employed on O&M of the STP if in his opinion continued presence of such staff is 
detrimental to safety or proper O&M of the STP. The Operator shall comply with 
such directions & post suitable substitute(s) thereof. Whenever the Engineer has to 
inform the Operator in writing that any person on the work is in his opinion 
unsatisfactory or/incompetent or unfaithful or dishonest, untruthful or disorderly or 
to be otherwise unsuitable/such person shall be discharged by the Operator from the 
work and shall not be employed again on it.

2.7. Reporting and Record Keeping:

a. Maintain a periodical reporting system to provide access and retrieval of Sewage 
Treatment Plant operating data including all such information which is necessary to 
verify costs and expenses incurred and otherwise to confirm that the Operator is in 
compliance with its obligations under the terms and conditions of this Contract;

b. The Operator will prepare daily and monthly reports (in Owner format) of 
pumping/treatment and project performance and submit to the Engineer-in-Charge 
and will assist the department in preparing the necessary documents for their purpose 
and record as per proforma given from time to time. The reports shall contain, inter-
alia, the following:

c. Raw Sewage quantity and quality and effluent quality as per the on-line monitoring 
programme and other tests as specified in Clause 3.0 of this section and print outs of 
online monitoring shall be submitted to Engineer-in-charge.

d. A description of the maintenance work carried out in the reporting period.

e. A report on major failures, if any, their causes and remedial actions taken.

f. Sludge quality and quantity (daily basis) in the reporting period.

g. Power and chemicals consumed in the reporting period.
h. An inventory of the chemicals and spare parts available at the end of the reporting period.

i. O&M staff deployed by the Operator during the reporting period. Any major repair works, if any.

a. Operator shall maintain separate register/computerized records at all sites of following information:
   1. Pumping register
   2. Quantity of sewage treatment and performance register
   3. Working hours register
   4. Electric break down register
   5. Maintenance register
   6. Staff attendance register
   7. Equipment breakdown, repair record and extent of repair
   8. Chlorination equipment and chlorine toner operating and using register

b. The Operator shall maintain a record for the entire Term of the following:
   1. Status or progress report of the operation and maintenance of each of the Sewage Treatment Plant components;
   2. Record of all consumables, tools, equipment’s manhole covers, etc. used / replaced towards operations and maintenance of the STP;
   3. Report certifying that the quality and quantity of the Residual Treated Water at the Discharge Point;
   4. Daily readings of the meters at the Receipt Point;
   5. Daily readings of the meters at the Discharge Point;
   6. Methods of disposal used for Residual Matter; and
   7. Nature and scope of any ancillary activities being carried out in accordance with the terms and conditions of this Contract.
   8. Provide reports on accidents in respect of the Sewage Treatment Plant, if any
   9. Daily readings of the meters at the inlet of the STP;
   10. Nature and scope of any ancillary activities being carried out in accordance with the terms and conditions of this Contract; and
   11. Provide reports on accidents in respect of the Sewage Treatment Plant, if any.
c. The Operator shall provide an accurate, complete and up-to-date record, report or document in relation to any aspect of modernization, expansion, operation, maintenance and management of the Sewage Treatment Plant to Owner as and when a request is made as soon as reasonably practicable and in any event within any time limit prescribed by Owner for the production of such record, report or other document.

d. Provide a copy to Owner of its annual audited accounts of expenditure by the Operator in the implementation of the Project as at the end of and for that accounting period.

e. Report to Owner regarding any litigation or material claims, disputes or actions, threatened or filed, concerning the Sewage Treatment Plant or the obligations to be performed by the Operator under this Contract;

f. Report to Owner any refusal or threatened refusal to grant, renew or extend or any action pending or threatened that might affect the granting, renewal or extension of any Applicable Approval;

g. Report to Owner any material information concerning new or significant aspects of the operations, maintenance and management of the Sewage Treatment Plant, any material complaint about the Sewage Treatment Plant from any person or any other information received by the Operator which is material to the Operation and Maintenance of the Sewage Treatment Plant

h. Hourly record of Flow as measured / recorded through the Notch / Weir / Flow meter:

2.8. SAFETY/SECURITY

The Operator shall take all safety precautions under various Acts/Rules under central/State Govt. from time to time and he shall be responsible for safety of its staff and the consequences thereof. The Operator shall deploy round the clock security personnel
at entrance of plant’s premises and in the compound for the safety of the plant and premises for the safety of the plant, equipment and personnel during this period.

2.8.1. Responsibility for damages

a. The care of the whole of the permanent works shall remain with the Operator who shall be responsible for all accidents or damages from whatever cause arising and chargeable for anything that may be stolen, removed destroyed or damaged to whomsoever belonging and also for making good all defects and damages to the said works or to any property adjoining or any cause whatever, whether such damage or defects were occasioned by the negligence of the Operator or not or may be or might have been discovered during the progress to be known after the completion whereof or whether payment may wholly or partially have been made or the works approved as supposed to have been properly done and no certificate of approval of any works by any officers or members of the Board shall affect or prejudice the right of the STATE PCB against the Operator or be considered or held as at all conclusive as to the sufficiency of any work materials.

b. Adequate safety precautions against fire, flooding, lightening, electrical shocks, accident due to moving/non-moving heavy/light equipments shall be strictly observed by the Operator at his own cost. Suitable safety measures like gumboots, gloves, safety belts, ladders, safety lamps, gas masks, Oxygen apparatus, insulated tools, alarms etc. shall be provided by the Operator. Necessary medical first aid kit shall be made available all the time. In absence of observance of above safety precautions, the Operator shall be responsible for any unforeseen loss of the equipments or persons dealing with it. Special care shall be taken by the Operator while carrying out the work in sewage gas zone. Any incidence of human life or accident will be totally Operator’s responsibility.

c. The Operator shall ensure that the staff employed takes all necessary precautions while carrying out the work either in shift duties or any general shift as per Indian Electricity Rules/Factory Act/CPHEEO Manual, or manufacturer's special instruction for safety / gas handling. The staff should use Gas masks, Oxygen apparatus, Gum Boots, Safety Belts and Safety Lamps, etc. while carrying out the work in Bar Screens, sumps etc.

d. The Operator will make arrangement for all necessary safety equipments for persons working at STP as per Factory Act/Safety Rules. In the event of any accident on or off site, in which the Operator or his personnel are involved, in which an injury occurs to any person whether directly concerned with the project or a third party, the Operator shall inform Owner within 24 hrs. of the occurrence of the event. The plant
will be open to local/state/central agencies for verification of safety/emission/acts compliance.

e. During night hours, the main gate should be locked. However, shift duty staff should be alert and open the gate during surprise checking of Owner staff or any other Government Authorities or his nominee without any wait. Only bona-fide persons be allowed in the plant premises being a prohibited area. Smoking and drinking are prohibited in the plant. The staff engaged shall wear common uniform with name plate indicating name and designation during duty hours.

2.9. Operation and maintenance manual

a. The Operator shall prepare a detailed program (referred to as O&M Manual) covering the operation and maintenance of the treatment plants as a whole. This program shall include the work and activities described in this Chapter, as relevant to the specific items and technology.

b. The Operator shall provide 6 copies of draft O&M Manual to the Owner, at the time of the commissioning of the Project and on approval of draft, 10 copies of operation & maintenance manual shall be supplied by the Operator.

c. The O&M Manual shall include the daily, weekly, monthly, quarterly, half yearly and annual checks and remedies if necessary to be performed for effective operation of the plant, elaborate detail, all operating and maintenance procedures and policies which are required, advisable and / or necessary for the Facility to achieve full compliance with the operational guarantees and to achieve maintenance and repair standard for the Facility which will ensure compliance with the maintenance specifications. The O&M manual shall include interalia full explanation of all plant procedures and processes.

d. Without limiting the generality of the foregoing the O&M Manual shall include descriptions, procedures and shall comply with the requirements, set forth in the provisions of the Bid Documents.

e. The draft of the O&M Manual shall be subject to the review and approval of Owner, which shall have the right to make any changes and revisions to the O&M Manual as it may deem appropriate. The Operator shall revise such draft O&M Manual prior to the commencement of the O&M period.

f. At the end of the construction period, the Operator shall revise the draft O&M Manual to reflect any updates, changes or revisions it deems appropriate, inter-alia based on its experience and as necessary to reflect any modifications or adjustments to the plant. Without limiting the above, the Operator shall annually fully review, revise, update and modify the draft O&M Manual as may be necessary or
appropriate. Any revision to the draft O&M Manual shall be subject to the review and approval of Owner.

g. Owner shall have the right to require revisions to the draft O&M Manual as it may deem appropriate. The Operator shall prepare and submit to Owner, for its review and approval, 30 days prior to the proposed date of commencement of O&M, a revised draft O&M Manual which reflects all changes, revisions and modifications. The Operator shall prepare the O&M Manual, as approved by the Owner, prior to the start of O&M.

h. During the term of this Agreement, the Operator shall promptly notify Owner of any revisions, additions or modifications which he, in his professional opinion, believes should be made to the O&M Manual, whether as a result of additional experience in operating and maintaining the Facility, changes in influent quality or volume, changes or modifications to any equipment part, component or structure incorporated in the Facility.

i. Such notification shall set forth the reason for the proposed revision. Any proposed revision shall be subject to the approval of the Owner. In addition, during the term of this Agreement, Owner shall have the right to require relevant changes, revisions, or additions to the O&M Manual as it, shall deem appropriate to ensure full compliance with the O&M Standards.

j. The Operator shall submit 10 copies of the final O & M manual along with a soft copy in Microsoft Word Format.

2.10. Technical Audit

a. The Owner has the right to conduct a technical audit of the Facility and to perform any analysis or inspection he deems necessary. The Operator shall at his cost provide all assistance the Owner required to complete these inspections. Such audits may cover all or any of the obligations of the Operator, including without limitation,

a. Verification of the system capacity and save for normal wear and tear during the O&M Period

b. Verification of the performance standards and useful life of the individual assets of the Facility, save for normal wear and tear during the O&M Period

c. Verification of the capacity of the Facility to meet Output Standards during the residual life of the Facility and save for normal deterioration expected during such residual life

d. Sampling, testing and verification of the Output Standards for treated sewage, sewage losses
2.11. Facility Visits

a. At any time or at the end of each twelve month period, or at the initiative of the STATE PCB, a visit shall be organized so that both parties can check the condition of the installations at the facility.

b. A report shall be drawn up to record the opinions of the both parties. The STATE PCB reserves the right to call the equipment manufacturers or specialized technicians for these visits. All expenses are to be borne by the Operator for the purpose.

2.12. Maintenance schedules

a. The Operator shall prepare and follow a Maintenance plan, detailing the maintenance activities scheduled for each of the component of the STP on a periodic approved by Design-Build-Operations Engineer and/or the Owner.

b. Every part of the works and all the materials to be used therein shall be subjected to such tests from time to time during the execution of the work as the Owner may direct and the whole of such tests shall in all cases be made at the Operator’s sole expense.

c. The work shall be carried on and completed under the exclusive control direction and supervision and to the satisfaction of the Owner. The Owner shall likewise have full power to reject or condemn any work or material that he may deem unsuitable. In case of any work or material being rejected by the Engineer in-charge, the Operator shall immediately remove and replace the same to the satisfaction of the Owner or the Owner shall have full powers to get the same removed and replaced and deduct the expenditure incurred in the process from any amount due or that may become due to the Operator.

d. The Operator shall use only the original and genuine spares of the original equipment as per recommendations given in the maintenance booklet of the manufactures/as per directions of the Owner. Adequate stock of such spares is to be maintained by the Operator. Test certificate of manufacturer is required for bearings along with supplies. Test certificate of all major equipment will be submitted from the manufacturer.

e. The Operator shall also be responsible to maintain cleanliness in around the plant including machineries, disposal of floating removed from the Bar Screens/reactors, etc. Grit and other unwanted material.

f. If any material brought to the site of works, be in the judgment of the Engineer, found inferior or improper & not as per described standards, the said materials or workmanship shall where required by the Owner shall be removed or amended by
the Operator forthwith or within such period for every breach by the Operator in this clause.

g. All leakages should be attended promptly to avoid any nuisance etc. Chokages should be removed at once. All the valves/gates which are not used regularly should be operated at least once a week and make sure that they are properly lubricated/greased.

h. All safety valves should be checked daily and ensure that they are working properly. In case of any fault the same should be attended immediately without any wait. The maintenance of the plant shall be as per maintenance manuals of the manufacturer for all equipment. Operator shall keep all the safety devices in working order.

i. All the steel structures and machines installed in open areas should be painted after every monsoon period after cleaning the surface as per the instructions of the Engineer-in-charge. Entire plant including all civil structures, mechanical equipment, HT panel and Transformers etc. shall be repainted after every 2(1/2) years as per original painting specifications.

j. All safety valves should be checked daily and ensure that they are working properly. In case of any fault the same should be attended immediately without any wait. The maintenance of the plant shall be as per maintenance manuals of the manufacturer for all equipment. Operator shall keep all the safety devices in working order.

k. The Operator should make sure that no unwanted material should float/grow in and around different units. In case it is found the same shall be removed/cleaned immediately. He shall also be responsible for cleaning/sweeping the plant buildings inside and outside, roads, foot path etc.

l. Launders/Weirs etc. of reactors etc. to be maintained clean round the clock. During preventive/breakdown maintenance, the Operator has to visit the unit/units as and when needed. The pumping units or other machineries required if any shall have to be arranged by the Operator at his own costs for completing the work. In case of battery operated auto system panels and also system alarm etc., batteries are required to be maintained and replaced as and when needed by the Operator.

m. Consumables such as POL (petrol/Diesel Oil & Lubricants) etc. has to be arranged by the Operator as and when needed as per manufactures recommendations for periodical maintenance of entire Network. The Owner shall not provide such items.

n. In case of major repair due to normal wear and tear/break down, the Operator should bring the same to the notice of the Owner immediately and necessary measures for its repair should be taken simultaneously. Breakdown, all repairs of any kind are to be attended by the Operator. Any unit/equipment being irreparable in the opinion of the Owner will be replaced by the Operator at no cost to Owner.
o. The Operator shall give his telephone no., contact addresses, etc. to the Owner as well as shift duty shift to contact him during emergency/odd hours etc.

p. The Operator will be responsible to carry day to day as well as periodic maintenance, necessary to ensure smooth and efficient performance/running of all equipment instruments installed at the STP. He shall be responsible for maintenance/replacement of street light poles and light etc. also. All the plant, building land, Sewage treated/untreated/sludge, etc. shall remain the property of Owner.

2.12.1. Oil & Grease Schedule

a. Routine & preventive maintenance of electrical /Mechanical/ hydraulic/ machines & equipments is to be carried out as per the operation & maintenance manual. Minimum oil & grease requirement for one year Operation & maintenance of the Plant to be procured by the Operator well in advance

2.13. Routine, Preventive, Minor & Major maintenance of all Civil, Electrical, Mechanical, hydraulic machines & Equipment of the plant

a. The Operator should prepare schedule of daily maintenance & preventive maintenance of all the equipment & machineries operated & run by him in the premises of the plant. The schedule should be as per the guidelines mentioned in the tender &as per the O& M manual. The scope covers Routine, Preventive, Minor & Major maintenance of all major minor equipment and machines in the Plant like Submersible pumps, Coarse &Fine screens Grit Removal Mechanism, Channel gates, Decanters, Sludge pumps, Centrifuge feed pumps, Centrifuges, All dosing systems including Chlorine Dosing equipment, etc.

b. The scope also covers Routine, Preventive, Minor & Major maintenance of all the instrumentation system installed like PLC, Actuators, Flow meters level indicators etc. The Operator should also carry out Routine, Preventive, Minor & Major maintenance of all major minor electrical equipment like Electrical Panels, Switch Gears, Power Cables, Control cables, Changeover switches DG set etc. so as to ensure uninterrupted round the clock operation of the Plant.

c. The Operator should maintain all civil structures including Administrative building, Store room, Storm Drains, fencing etc. in a neat manner. He should maintain all civil structures of the plant sturdy to complete the natural/Designed lifetime.

d. The Operator should carry out the safety audit of the plant & necessary certificate from the competent authorities. This item includes all types of Routine, Preventive, Minor & Major maintenance of all Civil, Electrical, Mechanical, hydraulic machines & equipment of the plant covering supply erection test &trial run of the part/machine to be repaired/ replaced with material &labor expenses, necessary
hardware’s, sundry materials, lubricant oils, power oils, grease other materials plus machining charges etc.

e. The Operator should procure all the spares required for all types of maintenances in advance. The part/equipment/machine to be repaired/replaced should be as per the Owner approved list & as per the O&M manual or as per the existing manufacturer’s brand.

f. The Operator, after first notifying the UPCB shall be responsible for fulfilling all requirements associated with any release of any substance into the environment (from the facility or the site) as required by Applicable law or by any Legal Entitlement including but not limit to the notification or reporting of releases /

g. Hazardous substances or Hazardous Waste. The Operator shall prepare a memorandum evidence such notification or reporting and provide copies thereof to the Owner, along with any documents provided to the relevant regulatory agency regarding such release.

h. The Operator shall process and obtain the clearance of all such agencies as required for the purpose, including all clearances during O&M period. He shall be fully responsible to comply with all requirements of Laws including hazardous substances, emission standards for air, discharge standards for effluent oil, sub-soil pollution. The contracting agency shall not release any hazardous/toxic materials inside the premises.

2.14. Site Order Book

Site order Book shall be kept by the Engineer-in-charge at the plant site. Orders entered in this Book by the Engineer-in-Charge or his authorised representative shall be held to have been formally communicated to the Operator. The Engineer-in-Charge or his authorised representative shall sign each order as it is entered and will hand over the duplicate to the Operator or his agent, who shall sign the original in acknowledgment of having received the order

FOR SEWERAGE NETWORK AND/OR I&D WORKS AND SPS

2.15. Operate the Sewerage System, for a period of 15 years from the date of commissioning as specified below:

1. The Operator shall operate and maintain the Sewage Pumping Station (SPS), Lift Stations and Sewer networks under the Contract complete including the road
works (liability of restored portions of roads is limited to 3 years only, however the
operator will not be held responsible for road restoration required on account of
damage done by other agencies/ utilities), landscaping, civil/structural, mechanical
components, instrumentation system, Electrical System, all utility and ancillary
buildings, SPS premises area, lift station, for the period of Fifteen (15) years from the
date of successful completion of "Tests after Completion of the Works".

2. The Operator shall make his own arrangements at his own cost for staff required for
operation and maintenance of networks and other assets, lubricants, diesel, spares,
tools and tackles, sewer cleaning vehicles and other equipment maintenance of all
types such as routine, breakdown, periodic and repair maintenance, replacement of
damaged/ unserviceable sewers, maintenance of house service connections after
building lanes, screenings collection; desilted material collection, transportation and
disposal; co-ordination with State Pollution Control Board (SPCB), State Power
Supply Utilities\(^79\) authorities and any other activity required for the operation and
maintenance of the constructed Works in full compliance with all applicable rules,
regulations, laws, codes, effluent quality requirements and any other limitations. The
operator will also maintain a Customer grievance redressal centre and ensure that
O&M services meet the standards of services/ service levels maintained as follows:

**Charter of Services**

<table>
<thead>

\(^{79}\) Modify for appropriate SPCBs and Power Supply Utilities

3. The operator ensures that there is a steady and uninterrupted flow of waste
water/sewage to STPs.

4. Identify and inform the Owner about the illegal connections on the Sewerage Network
within seven days of its being detected.
5. The Operator shall submit a weekly report to the Owner detailing the Operation and Maintenance indicating the labour hours expended, Electrical Power Consumed and other Consumables consumed and also problems faced and rectified.

6. The Operator shall submit detailed schedule/manual of all O&M activities with references of equipment manufacturers’ maintenance schedules/manuals to the Owner for review and approval.

7. The Operator shall submit Guidelines and Instructions manual for the maintenance staff of all levels for all the tools, plants and equipment and Operating Sewerage Network and/or I&D Works to maintain the service levels within the standards prescribed within the contract;

8. The Operator shall carry out all O&M activities as per the approved Operation and Maintenance Manuals.

9. If any consumer connection needs extension of sewer line during O&M period, from an existing line, the same will be designed and estimated by the operator using prevailing schedule of rates and market rates. Such costs will also include 15% towards supervision charges. The owner will collect the same and pays to the Operator for executing the same after the connection is formally approved. However, Owner will retain connection fee/charges.

10. During the Operation and Maintenance period, the Operator shall ensure that the sewage detention time in wet well not exceeds 30 min. and there is no backflow of sewage. The operator is responsible for maintaining back up power arrangements at his cost to ensure that the O&M services are not affected due to failure of power supply from the Public Utility Company.

11. The Operator’s responsibility shall also include the safety and security of the Works during the course of Operation and Maintenance.

12. During Operation and Maintenance period, the Operator shall appoint an Operator and Electrical/Mechanical Technician. In addition, the Operator shall appoint suitable number of operators, drivers, cleaners, fitters, electricians, helpers, gardeners, office peons, security guards, laborers as required for the operation and maintenance of complete proposed sewerage system for three shifts and adequate other staff / supporting personnel during general Shift. Security of man-power, built structures, equipment and other system components.

a. **Undertaking capacity building measures:**

Conduct a training and handholding assistance programme for six months in aspects of Operation and Maintenance of the Project Facilities for maximum fifteen employees of the ULB.
**b. Staff**

1. The minimum personnel required for O & M is as given below. However, the Operator shall mention the personnel required for O&M in his bid. The work shall be carried out on a 24 hour basis without intermission and the staff deployed by the Operator shall be in accordance with this contract.

*The staff requirement shown in the Table below is only indicative. The EA should review and modify the same according to the size of the network to be maintained.*
2. The Operator shall give or provide all necessary superintendence during the O&M and as long thereafter as the Owner may consider necessary. Such superintendence shall be given by a competent person having adequate knowledge of the operation and Maintenance to be carried out (including the methods and techniques required), the hazards likely to be encountered and methods of preventing accident) as may be required for the satisfactory working of the entire plant.

3. No labor below the age to 18 years shall be employed on the work. List of staff is to be
given by the agency to the Owner and advance intimation to be given before
deputing/removing any staff from site during the period of contract. Not more than one
of the Operator's key staff shall be absent from the project site at any given time. In
case it is necessary for more than one of the key personnel to be absent at a given time,
the Operator shall provide replacement of equivalent or better qualifications. The CVs
of such key staff replacements shall be got approved from Owner in advance.

4. Owner shall be authorized to direct the contracting agency to remove any or all staff
employed on O&M of the sewerage network and/or I&D Works if in his opinion
continued presence of such staff is detrimental to safety or proper O&M of the
sewerage network and/or I&D Works. The Operator shall comply with such directions
& post suitable substitute(s) thereof. Whenever the Engineer has to inform the
Operator in writing that any person on the work is in his opinion unsatisfactory
or/incompetent or unfaithful or dishonest, untruthful or disorderly or to be otherwise
unsuitable/such person shall be discharged by the Operator from the work and shall not
be employed again on it.

c. Reporting and Record Keeping:

1. Maintain a periodical reporting system to provide access and retrieval of Project
Facilities operating data including all such information which is necessary to verify
costs and expenses incurred and otherwise to confirm that the Operator is in
compliance with its obligations under the terms and conditions of this Contract;

2. The Operator shall maintain a record for the entire Term of the following:

   a. status or progress report of the operation and maintenance of each of the
      Project Facilities;

   b. record of all consumables, tools, equipment’s manhole covers, etc. used /
      replaced towards operations and maintenance of the Sewerage Network
      and/or I&D Works;

   c. Daily readings of the meters at the Sewage pumping stations;

   d. identification and reporting of illegal connections on the sewerage
      network;

   e. Nature and scope of any ancillary activities being carried out in
      accordance with the terms and conditions of this Contract; and

   f. Provide reports on accidents in respect of the Project Facilities, if any.

3. The Operator shall provide an accurate, complete and up-to-date record, report or
document in relation to any aspect of modernization, expansion, operation,
maintenance and management of the Project Facilities to Owner as and when a
request is made as soon as reasonably practicable and in any event within any time
limit prescribed by Owner for the production of such record, report or other
document.

4. Provide a copy to Owner of its annual audited accounts of expenditure by the
Operator in the implementation of the Project as at the end of and for that accounting
period.

5. Report to Owner regarding any litigation or material claims, disputes or actions,
threatened or filed, concerning the Project Facilities or the obligations to be performed
by the Operator under this Contract;

6. Report to Owner any refusal or threatened refusal to grant, renew or extend or any
action pending or threatened that might affect the granting, renewal or extension of
any Applicable Approval;

7. Report to Owner any material information concerning new or significant aspects of
the operations, maintenance and management of the Project Facilities, any material
complaint about the Project Facilities from any person or any other information
received by the Operator which is material to the Operation and Maintenance of the
Project Facilities

a. Operation and maintenance manual

1. The Operator shall prepare a detailed program (referred to as O&M Manual)
covering the operation and maintenance of the Sewerage Network and/or I&D Works
as a whole. This program shall include the work and activities described in this
Chapter, as relevant to the specific items and technology.

2. The Operator shall provide 6 copies of draft O&M Manual to the Owner, at the time
of the commissioning of the project and on approval of draft, 10 copies of operation
& maintenance manual shall be supplied by the Operator.

3. The O&M Manual shall include the daily, weekly, monthly, quarterly, half yearly and
annual checks and remedies if necessary to be performed for effective operation
of the plant, elaborate detail, all operating and maintenance procedures and policies
which are required, advisable and / or necessary for the Facility to achieve full
compliance with the operational guarantees and to achieve maintenance and
repair standard for the Facility which will ensure compliance with the maintenance
specifications. The O&M manual shall include interalia full explanation of all plant
procedures and processes.

4. Without limiting the generality of the foregoing the O&M Manual shall include
descriptions, procedures; schedule of maintenance, and shall comply with the
requirements, set forth in the provisions of the Bid Documents.

5. The draft of the O&M Manual shall be subject to the review and approval of Owner,
which shall have the right to make any changes and revisions to the O&M Manual as
it may deem appropriate. The Operator shall revise such draft O&M Manual prior to the commencement of the O&M period.

6. At the end of the construction period, the Operator shall revise the draft O&M Manual to reflect any updates, changes or revisions it deems appropriate, inter-alia based on its experience and as necessary to reflect any modifications or adjustments to the plant. Without limiting the above, the Operator shall annually fully review, revise, update and modify the draft O&M Manual as may be necessary or appropriate. Any revision to the draft O&M Manual shall be subject to the review and approval of Owner.

7. Owner shall have the right to require revisions to the draft O&M Manual as it may deem appropriate. The Operator shall prepare and submit to Owner, for its review and approval, 30 days prior to the proposed date of commencement of O&M, a revised draft O&M Manual which reflects all changes, revisions and modifications. The Operator shall prepare the O&M Manual, as approved by the Owner, prior to the start of O&M.

8. During the term of this Agreement, the Operator shall promptly notify Owner of any revisions, additions or modifications which he, in his professional opinion, believes should be made to the O&M Manual, whether as a result of additional experience in operating and maintaining the Facility, changes in influent quality or volume, changes or modifications to any equipment part, component or structure incorporated in the Facility.

9. Such notification shall set forth the reason for the proposed revision. Any proposed revision shall be subject to the approval of the Owner. In addition, during the term of this Agreement, Owner shall have the right to require relevant changes, revisions, or additions to the O&M Manual as it, shall deem appropriate to ensure full compliance with the O&M Standards.

10. The Operator shall submit 10 copies of the final O & M manual along with a soft copy in Microsoft Word Format.

b. Maintenance schedules

1. The Operator shall prepare and follow a Maintenance plan, detailing the maintenance activities scheduled for each of the component of the Sewerage Network and/or I&D Works on a periodic approved by Design Build Operations Engineer and / or the Owner.

2. Every part of the works and all the materials to be used therein shall be subjected to such tests from time to time during the execution of the work as the Owner may direct and the whole of such tests shall in all cases be made at the Operator’s sole expense.
3. The work shall be carried on and completed under the exclusive control direction and supervision and to the satisfaction of the Owner. The Owner shall likewise have full power to reject or condemn any work or material that he may deem unsuitable. In case of any work or material being rejected by the Engineer in-charge, the Operator shall immediately remove and replace the same to the satisfaction of the Owner or the Owner shall have full powers to get the same removed and replaced and deduct the expenditure incurred in the process from any amount due or that may become due to the Operator.

4. The Operator shall use only the original and genuine spares of the original equipment as per recommendations given in the maintenance booklet of the manufactures/as per directions of the Owner. Adequate stock of such spares is to be maintained by the Operator. Test certificate of manufacturer is required for bearings along with supplies. Test certificate of all major equipment will be submitted from the manufacturer.

5. If any material brought to the site of works, be in the judgment of the Engineer, found inferior or improper & not as per described standards, the said materials or workmanship shall where required by the Owner shall be removed or amended by the Operator forthwith or within such period for every breach by the Operator in this clause.

6. All the steel structures and machines, if installed in open areas, should be painted after every monsoon period after cleaning the surface as per the instructions of the Engineer- in-charge. Entire plant including all civil structures, mechanical equipment, HT panel and Transformers etc. shall be repainted after every 2(1/2) years as per original painting specifications.

7. All leakages should be attended and all network blockages shall be removed within three days of them being identified and reported. All the valves/gates which are not used regularly should be operated at least once a week and make sure that they are properly lubricated /greased.

8. All safety valves should be checked daily and ensure that they are working properly. In case of any fault the same should be attended immediately without any wait. The maintenance of the plant shall be as per maintenance manuals of the manufacturer for all equipment. Operator shall keep all the safety devices in working order.

9. The Operator should make sure that no unwanted material should float/grow in and around different units. In case it is found the same shall be removed /cleaned immediately. He shall also be responsible for cleaning/sweeping the plant buildings inside and outside, roads, foot path etc.

10. Launderers/Weirs etc. of reactors etc. to be maintained clean round the clock. During preventive/ breakdown maintenance, the Operator has to visit the unit/units as and when needed. The pumping units or other machineries required if any shall have to be arranged by the Operator at his own costs for completing the work. In case of battery
operated auto system panels and also system alarm etc., batteries are required to be maintained and replaced as and when needed by the Operator.

11. The Operator shall maintain the Supervision, Control and Data Acquisition System (SCADA) in working condition for the 10 years of O & M period. The Operator shall not remove/shift any equipment/machinery even temporarily without written permission of the Owner or authorized representative. Though the Operator has to operate and maintain all the equipment/machineries, lighting (plant area, boundary walls, gate lightening etc.) but the machine of the equipment under warranty should not be dismantled without prior permission of the Owner. The list of such equipment (Under warranty), if any, will be given by the Operator.

12. Consumables such as Manhole covers, POL (petrol/Diesel Oil & Lubricants) etc. has to be arranged by the Operator as and when needed as per manufactures recommendations for periodical maintenance of entire Network. The Owner shall not provide such items.

13. The Operator shall carry out biannual cleaning of network before and after the monsoon season including cleaning of all manhole chambers and collection network.

14. In case of major repair due to normal wear and tear/break down, the Operator should bring the same to the notice of the Owner immediately and necessary measures for its repair should be taken simultaneously. Breakdown, all repairs of any kind are to be attended by the Operator. Any unit/equipment being irreparable in the opinion of the Owner will be replaced by the Operator at no cost to Owner. However, if there is any unexpected population growth/high flows are observed due to urban growth, which warrants replacement of sewer with higher diameters, such cases will be brought to the attention of the owner. Upon owner’s approval, at owner’s cost, the same shall be executed and commissioned by the Operator. In these cases no supervision or design and estimation charges will be paid by the owner.

15. The Operator shall give his telephone no., contact addresses, etc. to the Owner as well as shift duty shift to contact him during emergency/odd hours etc.

16. The Operator will be responsible to carry day to day as well as periodic maintenance, necessary to ensure smooth and efficient performance/running of all equipment instruments installed at the Sewage Pumping Stations. He shall be responsible for maintenance/replacement of street light poles and light etc. also. All the plant, building, land, etc. shall remain the property of Owner.

**ARTICLE 3. Taking Over**
3.1. TRANSITION PLAN

(1) At least two years prior to the End Date, the Operator shall develop a plan to hand-over the STP, Sewerage Network and/or I&D Works and all appurtenant structures and allied works to the Subsequent Operator at the end of the term of the Contract (the “Transition Plan”).

(2) The Transition Plan shall include,

(a) plans to transfer the STP and Sewerage Network and/or I&D Works to the Subsequent Operator;

(b) transition plans with respect to the Operator’s Personnel including a plan for transition of the Operator’s Personnel to a Subsequent Operator;

(c) a proposed process for the transfer of all Contract Records to the Owner;

(d) plans to transfer operations and maintenance functions to the Subsequent Operator; and

(e) a program to train staff of the Owner in all aspects of the operation and maintenance of the New Facility.

3.2. TAKING OVER

(a) The STP, Sewerage Network and/or I&D Works and all appurtenant structures and allied works will be taken over by Owner on satisfactory completion of the Operation & Maintenance of the plant provided that

   i. The plant /equipment are in good, smooth running condition.

   ii. The result of the treated wastewater quality for last three months of operation of the plant is within the limits specified.

   iii. In case of major repairs /replacement of equipment, the performance guarantee is extended by six months from the date of putting back into satisfactory operation of such unit/equipment, in case such putting back is at the end of completion of operation & maintenance period.

   iv. All records of operation & maintenance are handed over to Owner in proper condition.

   v. The Third Party Inspection of the STP, Sewerage Network and/or I&D Works and all appurtenant structures and allied works viz: Civil units, Mechanical units/equipment, Electrical units/equipment, instruments, & all other Major & minor units/machines has to be carried out & the defects unsatisfactory working performances of the equipment/ machines are to be corrected by the Operator at his own cost. The necessary Third Party inspection Charges shall be borne by the Owner.
vi. The Operator should repaint the STP, SPSs and all appurtenant structures and allied works including all civil structures, mechanical, electrical equipment/units/structures as per the tender specifications

(b) In case taking over is delayed on account of Operator's failure to meet the requirement specified in sub clause (a) above, the operation & maintenance period will be extended further till it meets the requirement without any additional cost to Owner.

ARTICLE 1. Terms And Procedure of Payment

1.1 Mobilisation Advance:

Advance payment as an interest free loan for mobilisation and cash flow support for an amount equal to 10% of the Design-Build Price as stipulated in the contract shall be paid to the Operator against ‘Bank Guarantee for Advance Payment’ for the same amount in two instalments as under subject to the provisions of this Contract.

   (i) 5% within 30 days of effective date of contract; and
   (ii) 5% on mobilization at the site including setting up of the Operator’s office, deployment of manpower and machinery & equipments for construction.

Repayment of Mobilisation advance:

The Mobilization Advance paid to the Operator by the Owner shall be recovered commencing from the date on which the payment to the Operator has reached 20% of the Value of Design, Build and Commissioning Services and shall be recovered at the rate of 15% from each bill submitted by the Operator for payment. The entire amount of mobilization advance shall be recovered latest by the time payments up to 90% of the Value of Design, Build and Commissioning Services have been claimed by the Operator.

1.2 Secured Advance:

Secured Advance for the following non-perishable materials\textsuperscript{81} brought to site:

   a. Network and/or I&D Works – pipes, transformers, motor, starters, and DG Set;

   b. STP – DG Set, pumps, motors, and transformers subject to acceptance of the rate by the Design, Build Operations Engineer; and

   c. SPS - DG Set, pumps, and motors subject to acceptance of the rate by the Design, Build Operations Engineer.

Secured advance will be limited to 75% of invoice value or market value whichever is lower and will be subject to following conditions:

   a. The quantities of materials are not excessive and shall be used within a reasonable time (not exceeding 3 months) as determined by the Owner.

   b. The materials are in accordance with the specifications.

   c. The materials have been delivered to site and are properly stored and protected against damage or deterioration to the satisfaction of the Owner.

\textsuperscript{81} The list of item is indicative and the EA may modify as appropriate
d. The Operator’s records of the requirement, orders, receipt and use of materials are kept in a form approved by the Owner and such records shall be available for inspection by the Owner.

e. The Operator has submitted with his monthly statement, the estimated value of the materials on site together with such documents as may be required by the Owner, for the purpose of valuation of material and providing evidence of ownership and payment thereof.

f. Ownership of such materials shall be deemed to vest in the Owner for which the Operator has submitted an indemnity bond in an acceptable format.

**Repayment of Secured advance:**

The secured advance shall be repaid from each succeeding monthly payments to the extent the materials (for which advance was previously paid) have been incorporated into the works.

2. **Payment of Design-Build Price (STP)**

Subject to the provisions of this Contract Agreement and in consideration of the Operator undertaking the implementation of the Project, the Operator shall be paid as per the terms of payment contained hereunder:

Design-Build Price shall be paid in monthly amounts equal to the percentage of the Design-Build Services that the **Design-Build-Operations Engineer** indicates in the Design-Build Engineer’s Statement were completed or supplied, as applicable, in the preceding month. The amount of payments for completion of each stage of works shall not exceed the amounts indicated below.

2.1 The Operator shall submit his claim for the price adjustment, if applicable to this contract as per SCC 5.1(3), along with his claim for payment for the work done during the month, and price adjustment will be paid as per formulae stipulated in Schedule 8 of the Contract.

3. **Payment of Design-Build Price (Network and/or I&D Works)**

   a. The Operator shall submit to the Design Build Operations Engineer monthly statements of the value of the work completed less the cumulative amount certified previously along with
details of measurement of the quantity of works executed in a tabulated form as approved by
the Design Build Operations Engineer. The Design Build Engineer will follow respective
State’s Public Works Department procedures such as measurement, check measurements,
approving deviations etc and certify such invoices for payment. Further, a third party QA
Consultants will also review invoices, photographic evidence for all the works, more
importantly for shuttering, bedding, manholes, depth of cutting etc. that are not visible for
future verification; conduct tests where required and certify the invoices.

The Operator shall include in the Monthly Statements only such items of works which are
described in the ‘Payment Break-up Schedule’ appended at the end of this Schedule 6,
provided such items have been completed during the month.

b. The Design Build Operations Engineer shall check the details given in the Operator's
monthly statement and within 14 days certify the amounts to be paid to the Operator after
taking into account any credit or debit for the month in question in respect of materials for
the works in the relevant amount and under conditions set forth in para 1.2 above, deductions
for advance payments, secured advance, other recoveries, adjustment on account of
Liquidated Damages - Operations, and other adjustments in terms of the contract and
deduction of taxes at source, as applicable under the law.

c. The value of work executed shall be determined by the Design Build Operations Engineer
after due check measurement of the quantities claimed as executed by the Operator, and only
such items of works included in the Monthly Statement will qualify for verification/payment
if these have been identified as such in the ‘Payment Break-up Schedule’ appended at the
end of this Schedule 6. For items of works not covered in the said ‘Break-up Schedule’,
payment as per rate quoted and quantity executed shall be verified for payment.

d. The value of work executed shall comprise the value of the quantities of the items in the Bill
of Quantities completed.

e. The value of work executed shall include the valuation of Variations.

f. The Design Build Operations Engineer may exclude any item certified in a previous
certificate or reduce the proportion of any item previously certified in any certificate in the
light of later information.

g. The Operator shall submit his claim for the price adjustment, if applicable to this contract as
per SCC 5.1(3) (a) and 5.1(3) (b) along with his claim for payment for the work done during
the month, and price adjustment will be allowed as per formulae stipulated in Schedule 8 of
the Contract.

4. Payment of Annual Operations and Maintenance Price for treatment of sewage up to the
Threshold Sewage Flow (Part B of price schedule) (For STP):

a. Subject to deduction of Liquidated damages for Operation determined in accordance with SCC
5.4, and other provisions of this Contract Agreement and in consideration of the Operator
undertaking the implementation of the Project, Owner shall pay, from the Operations Starting
Date to the Operator, Annual O&M Price in equal monthly instalments, as determined in
accordance with the provisions of this Clause and other relevant provisions of this Contract Agreement. The O&M Prices in respect of Operation and Maintenance services shall be paid for a period of 15 years as monthly amounts. The monthly payments shall be taken as one twelfth of the Annual Operations and Maintenance Price payable by the Owner to the Operator.

b. In the event that the occurrence of the Operations Starting Date is delayed due to Owner or Force Majeure events, the Annual O&M Price shall be paid from the date of delayed Operations Start Date till the end of the Term (which shall be extended by the numbers of days of delay) so as to achieve total O&M period of 15 years.

5. Payment of Additional Operations and Maintenance Price per MLD (for STP):
   a. Additional Operation and Maintenance Prices shall be paid only in the event the amount of sewage treated by the STP exceeds the specified Threshold Sewage Flow as per the provisions of this Contract.
   b. Subject to the provisions of this Contract Agreement and in the event of the Operator treating sewage in excess of the Threshold Sewage Flow, Owner shall pay on a quarterly basis, Additional O&M Prices for each MLD of sewage above the Threshold Sewage Flow level treated and disposed in an environmentally compliant manner, as determined in accordance with the provisions of this Clause and other relevant provisions of this Contract Agreement. The Additional Operation and Maintenance Price stipulated in the contract for the relevant year shall be multiplied with the additional quantity of the Sewage treated and measured at the outfall point for that particular quarter.

6. Payment of O&M Prices for Operations and Maintenance of Sewerage Network and/or I&D Works
   a. Owner shall pay O&M prices on a Monthly basis, from the Operations Starting Date to the Operator, as determined in accordance with the provisions of this Clause and other relevant provisions of this Contract Agreement. The Monthly prices in respect of Operations and Maintenance services shall be paid for a period of 15 years as one twelfth of the quoted annual O&M prices for the relevant year of operation.
   b. If the scope of O&M services is varied by the Owner owing to variation in the lengths of sewerage lines and number of pumping stations to be operated and maintained by the Operator during any part of the contract period, the Monthly O&M charges payable to the Operator shall be subject to adjustment on the basis of unit O&M prices provided in the Operator’s Price Schedule incorporated in Schedule 5 of the Contract.
   c. In the event that the occurrence of the Operations Starting Date is delayed for any reasons, O&M prices shall be paid from the date of commencement of the Operations till the end of the O&M period of 15 years.
   d. O & M price for operation of the SPSs quoted in the Operator’s Price Schedule comprises fixed and variable components. The said variable component shall be adjusted on the basis of actual quantity of sewage handled by the respective SPS. The adjusted variable component will be
computed by multiplying the quoted Cost of Energy per MLD of sewage pumped (Variable Price) with the actual quantity of sewage handled.

7. **Payment of Electricity Dues**

   a. Owner shall assist the Operator on best effort basis in obtaining electricity required for the implementation of the Contract (covering Construction Period and Operation Period) and such assistance shall be subject to the terms and conditions as provided in this Clause.

   b. The Parties hereby agree that the Bill for electricity usage by the Sewage Treatment Plant and SPSs (if applicable) during the Operations Period (the “Electricity Dues”), shall be paid by the Operator to the relevant utility.

8. **Right to withhold:**

   The Design-Build-Operations Engineer / Owner may refuse to approve any such payment, because of subsequently discovered evidence as a result of subsequent inspections or tests, nullify any such payment previously approved and pay to such extent as may be necessary in the opinion of the Design Build Engineer because (a) the work is defective (b) third party claims have been filed or there is reasonable evidence indicating probability of such claims (c) of the Operator’s failure to make payment properly to sub-contractors or for labor, materials or equipment (d) of damage to another Operator or to the property of others caused by the Operator (e) of the Operator’s neglect or unsatisfactory proceeding of the work (f) Operator owes a liability or a sum to Owner.

   When the grounds for withholding payments are removed, payments shall be made for amounts withheld to the extent the Operator is entitled to payment.

No. PUMPING STATIONS AND ALL APPUR TENANT STRUCTURES AND ALLIED WORKS; AND (iii) OPERATION & MAINTENANCE OF THE COMPLETE WORKS OF SEWAGE TREATMENT PLANT, SEWERAGE NETWORK AND/OR INTERCE PTION AND DIVERSION WORKS AND PUMPING STATIONS FOR A PERIOD OF 15 YEARS IN ......., STATE OF ......., INDIA.
ARTICLE 1. Liquidated Damages (Operations) for STP

Liquidated Damages (GC Section 5.4)

1) In case the Operator fails to meet the technical standards more specifically towards the quality of the treated sewage, the Operator shall pay to the owner Liquidated Damages amounting to INR......... [Please insert the amount as appropriate for the STP involved.] per day of occurrence, over and above the costs and compensation that might be required by the Owner to pay to the affected people and parties in the effluent discharge area.

2) Applicability of the Liquidated Damages shall be determined based on the weekly monitoring report of the quality of the treated effluent, submitted by the nominated Laboratory, namely.............. [The EA should specify here the independent laboratory like the one under the control of State PCB, etc.]. The said Laboratory will test the samples [minimum 3 grab samples representative of different flow conditions (quantum and quality wise) in the day] of the treated effluent drawn every week jointly by the Owner and the Operator and the results of the test report shall be binding on both the parties.

3) If any of the grab samples of the effluent so tested fails to meet with the CPCB /State PCB standards stipulated in the Contract, Liquidated Damages as stated herein above shall be deducted from the O & M payments due to the Operator for all the seven days of the week.

4) The Operator shall maintain the STP for treating the sewage without any interruption by ensuring timely measures for preventive maintenance. However, if the STP is unavailable for treating the sewage for a period exceeding ..... hours for reasons attributable to the Operator, Liquidated Damages shall be levied by the Owner at the rate of INR ............ ...........[Please insert the amount as appropriate for the STP involved.] per day or part of the day for the period the STP is not available beyond the allowed time of ...... hours as referred to above for repair/rectification. The Liquidate Damages shall apply over and above the costs and compensation which shall be reimbursed by the Operator in case such costs/compensations are required to be paid by the Owner to the affected people and parties in the effluent discharge area.
ARTICLE 2. Liquidated Damages (Operations) for Network and/or I&D Works

1. Liquidated Damages (GC Section 5.4)

In case the Operator fails to meet the Performance Standards listed in the Table below, payments due to the Operator shall be subject to deduction on account of liquidated damages for defaults exceeding the Acceptable Limits. Such deductions shall be over and above the costs and compensation that might be required by the Owner to pay to the affected people and parties in the area where O&M of the sewerage network and/or I&D Works and Pumping Stations has been entrusted to the Operator.

“Acceptable Limit” is the permissible number of instances of defaults or non-adherence to a particular Set of Performance Standards during the Quarter for which payment has been claimed by the Operator.

The Operator shall be required to meet all of the Performance Standards as specified herein below. He shall ensure that defaults from compliance with the said Standards shall not exceed the Acceptable Limit; otherwise Liquidated damages as specified herein shall be applicable.

Schedule 8

Price Adjustment

TO (i) DESIGN AND BUILD SEWAGE TREATMENT PLANT OF INSTALLED CAPACITY .... MLD AND ALL APPURtenANT STRUCTURES AND ALLIED WORKS; (ii) SURVEY, REVIEW THE DESIGNS, REDESIGN WHERE NECESSARY, AND BUILD NEW UNDERGROUND SEWERAGE NETWORK AND/OR DIVERSION WORKS WITH INTERCEPTION SEWER OF ABOUT .... KM LENGTH INCLUDING SURVEY, DESIGN, CONSTRUCTION OF .... No. PUMPING STATIONS AND ALL APPURTENANT STRUCTURES AND ALLIED WORKS; AND (iii) OPERATION & MAINTENANCE OF THE COMPLETE WORKS OF SEWAGE TREATMENT PLANT, SEWERAGE NETWORK AND/OR INTERCEPTION AND DIVERSION WORKS AND PUMPING STATIONS FOR A PERIOD OF 15 YEARS IN ......., STATE OF ......., INDIA.
SCHEDULE 8

1. GENERAL

1.1 This Schedule lays down the procedure for determining the price adjustment to be applied to the following components of the contract price:

(i) Design-Build Price for the STP and Network, if SCC 5.1 (3) stipulates that price adjustment will apply to Design-Build Price.

(ii) Price for Operation & Maintenance of the STP and Network.

1.2 For the purpose of Price Adjustment, ‘Base Date’ shall be the date 28 days prior to the deadline for submission of bids for the contract. Thus Base date for this contract is............... [EA should insert the date at the time of signing the contract.]

1.3 Weightings for labor and various materials to be used in the Price Adjustment formulas laid down in the Tables under paragraphs 3 and 4 of this Schedule shall be based on the figures quoted by the Operator as a part of its bid under the Schedule of Adjustment Data (in the Appendix to Bid), and as accepted by the Owner.

2. PRICE ADJUSTMENT FOR DESIGN BUILD PRICE

2.1 If this Clause applies, the amounts payable to the Operator shall be adjusted for rises or falls in the cost of labour, Goods and other inputs to the Design-Build Services, by the addition or deduction of the amounts determined by the formulae prescribed in this Clause. To the extent that full compensation for any rise or fall in Costs is not covered by the provisions of this or other Clauses, the Accepted Contract Amount shall be deemed to have included amounts to cover the contingency of other rises and falls in costs.

2.2 The adjustment to be applied to the amount otherwise payable to the Operator, as valued in accordance with the Contract prices incorporated in Schedule 5, and certified by the Design-Build-Operations Engineer in Payment Certificates (referred to as ‘Interim Payment Certificates’) after examining the statements of monthly claims, shall be determined from formulae for each of the currencies in which the Contract Price is payable. No adjustment is to be applied to work valued on the basis of Cost or current prices. The formulae shall be of the following general type:

\[ P_n = a + b \frac{L_n}{L_0} + c \frac{E_n}{E_0} + d \frac{M_n}{M_0} + \ldots \]

where:

“\( P_n \)” is the adjustment multiplier to be applied to the estimated contract value in the relevant currency of the work carried out in period “\( n \)”, this period being a month;
“a” is a fixed coefficient, stated in the relevant table of adjustment data, representing the non-adjustable portion in contractual payments;

“b”, “c”, “d”, … are coefficients representing the estimated proportion of each cost element related to the execution of the Design-Build Services, as stated in the relevant table of adjustment data; such tabulated cost elements may be indicative of resources such as labour, equipment and materials;

“Ln”, “En”, “Mn”, … are the current cost indices or reference prices for period “n”, expressed in the relevant currency of payment, each of which is applicable to the relevant tabulated cost element on the date 49 days prior to the last day of the period (to which the particular Payment Certificate relates); and

“Lo”, “Eo”, “Mo”, … are the base cost indices or reference prices, expressed in the relevant currency of payment, each of which is applicable to the relevant tabulated cost element on the Base Date.

2.3 The cost indices or reference prices stated in the table of adjustment data shall be used. If their source is in doubt, it shall be determined by the Design-Build-Operations Engineer.

2.4 Until such time as each current cost index is available, the Design-Build-Operations Engineer shall determine a provisional index for the issue of Interim Payment Certificates. When a current cost index is available, the adjustment shall be recalculated accordingly.

2.5 If the Operator fails to complete the Design-Build Services within the stipulated Time for Completion, adjustment of prices thereafter shall be made using either (i) each index or price applicable on the date 49 days prior to the expiry of the specified Time for Completion, or (ii) the current index or price, whichever is more favorable to the Owner.

2.6 The weightings (coefficients) for each of the factors of cost stated in the table(s) of adjustment data shall only be adjusted if they have been rendered unreasonable, unbalanced or inapplicable, as a result of Variations.

3. Determination of Price Adjustment Multiplier for Design Build Price of STP

3.1 The Price adjustment multiplier “Pn” to be applied to the estimated value of work done in a month, as certified in the Interim Payment Certificates shall be determined using the coefficients/weightings and cost indices etc. for local currency as provided in paragraphs 3.2.

3.2 Local currency

4. Determination of Price Adjustment Multiplier for Design-Build Price of Sewerage Network

4.1 The Price adjustment multiplier “Pn” to be applied to the estimated value of work done in a month, as certified in the Interim Payment Certificates shall be determined using the coefficients/weightings and cost indices etc. for local currency as provided in paragraphs 4.2.

|             | Total | 1.00 |

* The weightings for various cost indices will be inserted based on the Owner’s decision on the relevant details provided by the selected bidder in the Appendix to the Bid.

The Operator shall note that Paragraphs 5, 5.1, 5.2, 5.3 & 5.4 of this Schedule shall be applicable in respect of payment of O&M prices for Sewerage Network only if operation of an SPS is included in the scope of work.
5. PRICE ADJUSTMENT FOR O&M PRICES

5.1 Owner shall pay O&M prices to the Operator subject to adjustments as per following sub-paragraphs. 5.2 Adjustment for Variation in Electricity Tariff

O&M prices shall be subject to adjustment on account of variation in the Electricity Tariff during the O&M period with reference to ‘Base Rate of Electricity Tariff’ specified at the time of invitation of bids, namely INR ............ per KWh. [EA should insert the same rate as stipulated in BDS ITB 3.11 c.] The said adjustment shall be determined on the basis of the actual electricity consumption and the Tariff evidenced by the Electricity bills paid by the Operator to the Electricity Utility Company, subject to the following provisions:

(a) Variation shall be limited to the Guaranteed Energy Consumption applicable for the level of effluent treated by STP, and for the level of effluent pumped by the respective SPSs during the quarter.

(b) Guaranteed Energy Consumption for the actual level of effluent handled by the STP and by the SPS(s) if any will be calculated based on the energy consumption/MLD for the relevant year of the O&M period as quoted in the Operator’s Price Schedule incorporated in Schedule 5 of the Contract.

The variation applicable as per this sub-paragraph 5.2 shall be claimed by the Operator on Quarterly basis.

5.3 Determination of cost of Diesel used in DG set

The Operator shall use back-up power supply from the DG set during the period power supply from the Electricity Utility Company is not available. The DG set equipped with standard accessories will record inter alia (i) energy supplied/generated by it and (ii) total period for which it was operated in a month/quarter. Cost of Diesel for which Operator will be entitled to compensation on account of energy obtained from the back-up power supply unit shall be determined as under:

a. Operator’s representative and the Design Build Operations Engineer shall jointly take the readings from the meters and gauges (sealed jointly by them at the commencement of the O&M period) of DG set every month to arrive at the total number of energy units (kWh) = E₁ obtained from the back-up power supply unit.

b. Number of energy units (kWh) obtained from the back-up power supply unit during the month for which Operator shall be entitled to compensation (referred to as ‘adjusted units of back-up energy supply’) shall be determined in a series of steps that follow.

The Owner will first determine the short-fall in supply from the Electricity Utility Company.

Short-fall in supply from the Electricity Utility Company (E₂)

= Energy Requirement as per Guaranteed Energy Consumption applicable for the level of effluent treated by STP, and for the level of effluent pumped by the respective SPSs during the month
(-) Units of energy (kWh) available/obtained during the month from the Electricity Utility Company as evidenced by the Bill of the Utility Company for the corresponding month

If the ‘Short-fall in supply from the Electricity Utility Company’ \( (E_2) \) works out to be a negative figure, Operator shall not be entitled to compensation for using the energy supply from the back-up power supply unit.

If \( E_2 \) is a positive figure, compensation shall be based on \( E_1 \) or \( E_2 \) whichever is lower and this lower figure shall be termed as **‘adjusted units of back-up energy supply’**.

c. Rated specific fuel consumption of the DG set specified by the Manufacturer in its Specifications will then be used for determining the estimated diesel consumption during the month for producing the ‘adjusted units of back-up energy supply’.

d. Cost of estimated Diesel consumption in a month shall then be calculated on the basis of price of diesel prevailing at mid-point of the month in IOC or HPCL’s retail outlets in the city where STP and the SPS are installed. Cost figures of three months shall be added to arrive at the Cost of Diesel consumption in a quarter.

5.4 Adjustment in O&M Price for energy taken from the back-up power supply unit

O&M prices quoted in the Operator’s Price Schedule incorporated in Schedule 5 take into account energy requirements of the STP and SPSs being met fully by power from the Electricity Utility Company. Hence compensation payable to the Operator for Energy supply taken from an alternate source, namely the back-up power supply Unit shall be corrected as under:

**Adjustment in quarterly O&M price** = Cost of Diesel consumption in a quarter determined in accordance with sub-paragraph 5.3 (d) above **minus** ‘adjusted units of back-up energy supply’ determined as per sub-paragraph 5.3 (b) as applicable for the quarter multiplied by the ‘Base Rate of Electricity Tariff’.

The variation in O&M price applicable as per sub-paragraphs 5.3 and 5.4 shall be claimed by the Operator on Quarterly basis.
Schedule 9

SCHEDULE OF PERFORMANCE GUARANTEE
& ADVANCE PAYMENT GUARANTEE

TO (i) DESIGN AND BUILD SEWAGE TREATMENT PLANT OF INSTALLED CAPACITY .... MLD AND ALL APPURtenANT STRUCTURES AND ALLIED WORKS; (ii) SURVEY, REVIEW THE DESIGNS, REDESIGN WHERE NECESSARY, AND BUILD NEW UNDERGROUND SEWERAGE NETWORK AND/OR DIVERSION WORKS WITH INTERCEPTION SEWER OF ABOUT .... KM LENGTH INCLUDING SURVEY, DESIGN, CONSTRUCTION OF .... No. PUMPING STATIONS AND ALL APPURtenANT STRUCTURES AND ALLIED WORKS; AND (iii) OPERATION & MAINTENANCE OF THE COMPLETE WORKS OF SEWAGE TREATMENT PLANT, SEWERAGE NETWORK AND/OR INTERCEPTION AND DIVERSION WORKS AND PUMPING STATIONS FOR A PERIOD OF 15 YEARS IN ........, STATE OF........., INDIA.
FORM OF PERFORMANCE GUARANTEE

__________________________ [Bank’s Name, and Address of Issuing Branch or Office]

Beneficiary: ________________ [Name and Address of Owner]

Date: ______________________

PERFORMANCE GUARANTEE NO.: ______________

We have been informed that ______ [name of Bidder] (hereinafter called “the Bidder”) has entered into Contract No. ______ [reference number of the contract] dated ______ with you, concerning a contract to design, build, refurbish and operate a Sewerage Treatment Plant and Sewerage Network and/or Interception and Diversion Works in [Name of Location] (hereinafter called “the Contract”).

Furthermore, we understand that, according to the conditions of the Contract, a performance guarantee is required.

At the request of the Operator, we ______ [name of Bank] hereby irrevocably undertake to pay you any sum or sums not exceeding in total an amount of ______ [amount in figures] (____) [amount in words], upon receipt by us of your first demand in writing accompanied by a written statement stating that the Contract is in breach of its obligations under the Contract, without your needing to prove or to show grounds for your demand or the sum specified therein.

This guarantee shall expire no later than the earlier of:

(a) six months after the End Date, as defined in the Contract; or

(b) six months after the date of termination of the Contract pursuant to its terms.

Consequently, any demand for payment under this guarantee must be received by us at this office on or before that date.

This guarantee is subject to the Uniform Rules for Demand Guarantees, (URDG) 2010 Revision, ICC Publication No. 758 except that the supporting statement under Article 15(a) is hereby excluded.

Yours truly,

[Name of Bank]

__________________________

Authorised Signature
FORM OF BANK GUARANTEE – ADVANCE PAYMENT

[Name of Contract]
To:   [Name and address of Owner]

Dear Ladies and/or Gentlemen,

We refer to the Contract Agreement (“the Contract”) signed on [date] between you and [name of Operator] (“the Operator”) concerning the Services set out in the Contract to Design, Build, Refurbish and Operate a Sewage Treatment Plant and a Sewerage Network and/or Interception and Diversion Works.

Whereas, in accordance with the terms of the Contract, the Owner agreed to pay or cause to be paid to the Operator an advance payment in the amount of [number] percent (____%) of the Contract Price for the Design-Build, Refurbish, Commission, Operate and Maintaining STP and Sewerage Network and/or Interception and Diversion Works for 15 years, namely a payment of: [amount of foreign currency in words], [amount in figures], and [amount of local currency in words], [amount in figures].

By this letter we, the undersigned, [name of Bank], a Bank (or company) organised under the laws of [country of Bank] and having its registered/principal office at [address of Bank], do hereby jointly and severally with the bidder irrevocably guarantee repayment of the amounts upon the first demand of the Owner without cavil or argument in the event that the bidder fails to commence or fulfil its obligations under the terms of the Contract, and in the event of such failure, refuses to repay all or part (as the case may be) of the advance payment to the Owner.

Provided always that the Bank’s obligation shall be limited to an amount equal to the outstanding balance of the advance payment, taking into account such amounts that have been repaid by the Bidder from time to time in accordance with the terms of payment of the Contract as evidenced by appropriate shipping documents or payments certificates.

This Guarantee shall remain in full force from the date upon which the advance payment is received by the bidder until the date upon which the bidder has fully repaid the amount is advanced to the Owner in accordance with the terms of the Contract. At the time at which the outstanding amount is nil, this Guarantee shall become null and void, whether the original is returned to us or not.

Any claims to be made under this Guarantee must be received by the Bank during its period of validity.

This guarantee is subject to the Uniform Rules for Demand Guarantees (URDG) 2010 Revision, ICC Publication No. 758, except that the supporting statement under Article 15(a) is hereby excluded.

Yours truly,

[Name of the Bank] & Authorized Signature
Schedule 10

TECHNICAL SPECIFICATIONS FOR CONSTRUCTION AND OPERATION AND MAINTENANCE PHASE\(^{84}\)

TO (i) DESIGN AND BUILD SEWAGE TREATMENT PLANT OF INSTALLED CAPACITY .... MLD AND ALL APPURTENANT STRUCTURES AND ALLIED WORKS; (ii) SURVEY, REVIEW THE DESIGNS, REDESIGN WHERE NECESSARY, AND BUILD NEW UNDERGROUND SEWERAGE NETWORK AND/OR DIVERSION WORKS WITH INTERCEPTION SEWER OF ABOUT .... KM LENGTH INCLUDING SURVEY, DESIGN, CONSTRUCTION OF .... No. PUMPING STATIONS AND ALL APPURTENANT STRUCTURES AND ALLIED WORKS; AND (iii) OPERATION & MAINTENANCE OF THE COMPLETE WORKS OF SEWAGE TREATMENT PLANT, SEWERAGE NETWORK AND/OR INTERCEPTION AND DIVERSION WORKS AND PUMPING STATIONS FOR A PERIOD OF 15 YEARS IN ......., STATE OF......., INDIA.

\(^{84}\) Specifications pertaining to general civil works and the material requirements have been specified herewith. However the specifications and the testing requirements shall be specified in accordance with the technology being selected by the bidder and the detailed design submitted.
FOR STP
GENERAL

The ____ MLD capacity sewage treatment plant to be Designed, Build, , Tested and Commissioned by the Operator / Operator shall comply with the guidelines contained in “Manual on Sewerage and Sewage Treatment” Latest Edition published by the Central Public Health & Environmental Engineering Organization (CPHEEO), Ministry of Urban Development, Government of India. The Technical Standards and Specifications contained in this contract shall be read along with the following standard specifications (latest versions) published by the Bureau of Indian Standard listed below:

The list is not exclusive and the operator shall be responsible to follow the appropriate standards:

i) IS 6280 – 1971 – Sewage Screens

ii) IS 8413 – 1982 – Biological Treatment Equipment – Part II and its modifications

iv) IS 10261 – Requirements for settling tank for waste water

v) IS 105533 – Part I, II, III – Chlorination Plants

vi) IS 5600 – 1970 - Sewage and Drainage Pumps

vii) IS 6279 – 1971 – Grit Removal devices

Documents Comprising the Technical Standards Appendix

The Technical Standards Appendix consists of Technical Specification to be followed for during Construction of Sewage treatment Plant and other ancillary/ allied works for all Civil, Mechanical, Electrical, Instrumentation required to be executed under this Contract. Notwithstanding to the said specification, the bidder is instructed the adopt and follow necessary standard and approved Codes /specification wherever required for fulfillment of all the works under this contract.

Supplementing the General Conditions and Design-Build or Operating Services Appendix

The Technical Standards Appendix shall be read along with the GCC / SCC and Design-Build and Operations Services Appendices for the purpose of providing greater specificity of the technical standards which the Bidder is required to meet.
Design-Build or Operations Services Appendix Description

The descriptions contained in the Technical Standards Appendix Chart entitled, “Description of Service” are for the convenience of the Bidder and do not supersede the actual wording of the Design-Build and Operations Services Appendices.

General Quality Standards

The term “General Quality Standard” means a standard of performance which,

(a) is competent, efficient, economical and in accordance with internationally accepted techniques used in the sewer disposal and civil works construction industries;

(b) is in accordance with professional engineering, accounting and consulting standards, as applicable, recognized by national or international professional bodies;

(c) is in accordance with sound management, commercial, technical, design and engineering practices;

(d) employs appropriate technology and safe and effective equipment, machinery and methods;

(e) is in accordance with national and local standards and codes in the Owner’s Country;

(f) protects the interests of the Authorities;

(g) is in accordance with the Applicable Law;

(h) is in accordance with the technical specifications and design standards of the Owner as provided to the Bidder;

(i) is in accordance with the applicable Environmental Assessment and Environmental Management and Mitigation Plan; and

(j) is in accordance with the Design-Build Documents as approved by the Owner.

In the event of any conflict or inconsistency between any standards that comprise the General Quality Standard, local and national standards in the Owner’s Country shall prevail over international standards.

The Operator shall, at all times, carry out the Services in accordance with the Technical Standards as specified and, where a specific technical standard of quality of performance has not been specified, the Bidder shall perform the Services to the standard of “General Quality Standards” set out in Section 2.2(1) of the Technical Standards Appendix.

If the Owner is subjected to fines or penalties as a result of the operator’s breach of these Technical Standards, such fines or penalties shall be paid by the Bidder.
**Design-Build Services**

In respect of the Design-Build Services, the operator shall ensure that the design of the STP is prepared by qualified designers who are professionally recognized to design the Sewage Treatment Plant and allied services.

The Operator warrants that the operator and its designers have the experience and capability necessary for the design.

The offers shall be based on the operator’s own design and operating philosophy which is to be based on the selected modern treatment technologies and should be within the overall framework and guidelines specified in the bid document and its specifications. The bidder’s design for the entire facility shall be such that the project shall

- Require minimum land space
- Require minimum energy for treatment of sewage
- Generates treated effluent that can be recycled

Planning of the entire system should be done in such a manner so as to optimize capital and operational costs of treatment of sewage and maintenance of the Plant on whole on sustainable basis.
Section 3. CIVIL WORKS

1 Specific Civil/Structural Work Requirement

1.1 Design Submissions:
Complete detailed design /hydraulic calculations & drawings of foundations and superstructure together with general arrangement drawings and explanatory sketches shall be submitted to the Owner. Separate calculations for foundations or superstructures submitted independent of each other shall be deemed to be incomplete and will not be accepted. Though no GA drawings of all units are required along with the bid, a schematic layout /GAD shall be submitted along with the bid. The design considerations described herewith establish the minimum basic requirements of plain and reinforcement concrete structures, masonry structures and structural steel works. However, any particular structure shall be designed for the satisfactory performance of the functions for which the same is being constructed. The Operator shall also take care to check the stability of partly.

1.2 Design Standards
All designs shall be based on the latest International or Indian Standard (IS) Specifications or Codes of Practice. The design standards adopted shall follow the best modern engineering practice in the field based on any other international standard or specialist literature subject to such standard reference or extract of such literature in the English language being supplied to and approved by the Owner or Owner’s Representative. In case of any variation or contradiction between the provision of the IS Standards or Code and the specifications given with the submitted bid document, the provision given in the Specification shall be followed.

1.3 Design Loadings
All buildings and structures / underground structures shall be designed to resist the worst combination of the following loads/stresses under test and working conditions these include dead load, live load, wind load, seismic load, stresses due to temperature changes, shrinkage and creep in materials, dynamic loads and uplift pressure.

i. Dead Load: This shall comprise all permanent construction including walls, floors, roofs, partitions, stairways, fixed service equipment and other items of machinery. In estimating the loads of process equipment all fixtures and attached piping shall be included, but excluding contents shall be considered. The following minimum loads shall be considered in design of structures:

<table>
<thead>
<tr>
<th>S.No</th>
<th>Parameter</th>
<th>Load</th>
</tr>
</thead>
</table>

Page 342 of 520
1. **Weight of water**: 10.0 KN/m³

2. **Weight of soil (irrespective of strata available at site and type of soil used for filling etc)**: However, for checking stability against uplift, actual weight of soil as determined by field test shall be considered 20.0 KN/m³

3. **Weight of plain concrete**: 24.0 KN/m³

4. **Weight of reinforced concrete**: 25.0 KN/m³

5. **Weight of brickwork (exclusive of plaster)**: 22.0 KN/m³

6. **Weight of plaster to masonry surface**: 18.0 KN/m³

7. **Weight of granolithic terrazzo finish or rendering screed, etc**: 24.0 KN/m³

8. **Weight of sand (filter media)**: 25.0 KN/m³

### ii. Live Load:
Live loads shall be in general as per IS 875. However, the following minimum loads shall be considered in the design of structures.

<table>
<thead>
<tr>
<th>S.No</th>
<th>Location</th>
<th>Live Load</th>
</tr>
</thead>
<tbody>

</table>

In the absence of any suitable provisions for live loads in IS Codes or as given above for any particular type of floor or structure, assumptions made must receive the approval of the Owner’s Representative prior to starting the design work. Apart from the specified live loads or any other
loads due to material stored any other equipment load or possible overloading during maintenance or erection/construction shall be considered and shall be partial or full whichever causes the most critical condition.

iii. **Wind Load:** Wind loads shall be as per IS: 875-2002 Part-III.

iv. **Dynamic Load:** Dynamic loads due to working of plant items such as pumps, blowers, compressors, switchgears, traveling cranes, etc shall be considered in the design of structures.

v. **Other Loads:** In addition to earth pressure and water pressure etc., the surcharge of 1 Ton/sq.m shall be taken into account in the design for channels, tanks, pit etc.

vi. **Earthquake Load:** This shall be computed as per IS: 1893 – 2000.

### 1.4 Joints

Movement joints such as expansion joints, complete contraction joints, partial contraction joints and sliding joints shall be designed to suit the structure as per relevant IS code provisions. Expansion joints of suitable gap at intervals not more than 30 m shall be provided in walls, floors and roof slabs of water retaining structures.

Construction joints shall be provided at right angles to the general direction of the member. The locations of construction joints shall be decided on convenience of construction. To avoid segregation of concrete in walls, horizontal construction joints are normally to be provided at every 2 m height, GI 18 gauge/PVC water stops of suitable type and minimum 230 mm width, 6 m thick shall be used for walls and base slabs.

### 1.5 Water Retaining Structures

Liquid retaining/conveying structures including the members covering the same (such as roof of a chamber, channel etc.) shall be designed by uncracked method of design as per BIS: 3370 and 6494. Basement RC walls and slabs below ground shall also be designed by uncracked method of design as liquid retaining structures. Shear shall be checked by working stress method as per BIS: 456. Minimum temperature and shrinkage reinforcement shall be 0.3% in each direction.

All underground or partly underground liquid containing structures shall be designed for the following conditions:

- Liquid depth up to full height of wall: no relief due to soil pressure from outside to be considered.
- Structure empty (i.e. empty of liquid, any material, etc) full earth pressure including saturated condition and surcharge pressure wherever applicable to be considered.
- Structures shall be designed for uplift in empty conditions as per water table indicated in the geotechnical report or high flood level, whichever is maximum. No reduction factor for the uplift force shall be considered.
- The dead weight of the empty structures should provide a safety factor of not less than 1.2 against uplift pressures during construction and in service.
• Wall shall be designed under operating conditions to resist earthquake forces from earth pressure mobilization and dynamic water loads;
• Underground or partially underground structures shall be checked against stresses developed due to any combination of full and empty compartments with appropriate ground/uplift pressures from below to base slab
• The walls and base slabs shall be designed for saturated earth/water pressure corresponding to high flood level or finished plot level whichever is higher.
• For design purpose, sub soil water level is to be considered as 2 meter below the average natural ground level. (Uplift pressure on the foundation shall be considered as per water table at site, in the rainy season. However, for design purpose, minimum water table shall be considered at 2 m below the average ground level

1.6 Foundation
• The minimum depth of foundations for all structures, equipment’s buildings and frame foundations and load bearing walls shall be as per IS: 1094.
• The earth fill above virgin ground level till formation level shall be taken as a surcharge load and shall be added in the loads coming on foundations appropriately
• Care shall be taken to avoid the foundations of adjacent buildings or structure foundations, either existing or not within the scope of this Contract. Suitable adjustments in depth, location and sizes may have to be made depending on site conditions. No extra claims for such adjustments shall be accepted by the Owner.
• Special attention is drawn to danger of uplift being caused by the ground water table
• Plinth level of all structures/top of tanks shall be at least (1000) mm above high flood level.

1.7 Design Requirements
The following are the design requirements for all reinforced or plain concrete structures:
• All blinding and leveling concrete shall be minimum 100 mm thick in concrete grade M15 for Building & 150 mm thick in concrete grade M20 for Water Retaining Structures as per IS -3370 (Part- 1)-2009 latest version..
• All structural reinforced concrete shall be with a maximum 25 mm aggregate size for footings and base slabs and with a maximum 20 mm aggregate size for all the Water Retaining Structures & other structural members.
• All liquid retaining structures shall be designed as per IS: 3370. The minimum grade of concrete shall be M30 using Sulphate resistant Cement.
• All Buildings, Pipe Pedestals, Thrust Block, Pump Foundation & other structures shall be designed as per IS-456. The minimum grade of concrete shall be M20.
• The maximum free water cement ratio shall not exceed 0.5 for all liquid retaining structures.
- The amount of reinforcement in each of the two directions at right angles within each surface zone should not be less than the minimum specified as IS:3370 or IS:456 which ever is applicable for the type of structure.
- Use of pressure relief valves to reduce uplift pressure due to ground water table shall not be allowed.
- All buildings shall have a minimum 1.0 m wide, 100mm thick plinth protection paving in M15 grade concrete or stone slabs/tiles. All plinth protection shall be supported on well-compacted strata.

The following minimum thickness shall be used for different reinforced concrete members irrespective of design thickness.

• Bar spacing shall be provided in multiple of 25 mm.

The design submitted by the operator shall be proof checked from the nearest IIT / Engineering college (Approved by the competent authority), for which the scrutiny charges shall be borne by the operator. The delay in checking designs by the third party as above shall be treated as the delay on the part of the operator for operation of the tender clause.

2 MATERIALS IN GENERAL

The term “materials” shall mean all materials, goods and articles of every kind whether raw, processed or manufactured and equipment and plant of every kind to be supplied by the Bidder for incorporation in the Works.

Expect as may be otherwise specified for particular parts of the works the provision of clauses in “Materials and Workmanship” shall apply to materials and workmanship for any part of the works. All materials shall be new and of the kinds and qualities described in the Contract and shall be at least equal to approved samples.

As soon as practicable after receiving the order to commence the works, the Bidder shall inform the Owner’s Representative of the names of the suppliers from whom he proposes to obtain any materials but he shall not place any order without the approval of the Owner’s Representative which may be
withheld until samples have been submitted and satisfactorily tested. The Bidder shall thereafter keep the Owner’s Representative informed of orders for and delivery dates of all materials.

Materials shall be transported handled and stored in such a manner as to prevent deterioration damage or contamination failing which such damaged materials will be rejected and shall not be used on any part of the Works under this contract.

2.1 **Cement**

The Cement shall be Sulphate Resistant Cement grade - 43 in all water retaining structures and SRC 43 grade cement for other structures, confirming to the relevant B.I.S. codes and approved by the Owner’s Representative. Manufacturers Test Certificate shall have to be furnished. Minimum cement consumption for RCC M20 shall be considered as 350 kg/cum and for RCC M25 shall be 380 kg/cum. Mixing of fly ash in the concrete shall not be considered. Approved Manufacturers of Cement of reputed firm with ISO certification shall be used.

2.2 **Reinforcement Steel**

Reinforcement Steel shall confirm to BIS Specification 432-1966 (with up to date revision) and B.I.S. Specification 1786-1985 (with up to date revision). All Reinforcement Steel will be TMT Grade approved by the Owner.

2.3 **Minimum Cement Content**

The minimum cement content for each grade of concrete shall be as per table below.

Please refer clause no. 8.2.4 Table no: 5 for reinforced concrete of IS code 456 – 2000 (latest version)

3 **SAMPLES AND TESTS OF MATERIALS**

The operator shall submit samples of such materials as may be required by the Owner and shall carry out the specified tests directed at the site or at the supplier’s premises or at the laboratory approved by the Owner or the Owner’s Representative. Samples shall be submitted and tests carried out sufficiently early to enable further samples to be submitted and tested if required by the Owner.

The operator shall give the Owner seven days’ notice in writing of the date on which any of the materials will be ready for testing or inspection at the supplier’s premises or at a laboratory approved
by the Owner. Owner or the Owner’s Representative shall attend the test at the appointed place within seven days of the said date on which the materials are expected to be ready for testing or inspection according to the Bidder, failing which the test may proceed in his absence unless instructed by the Owner’s Representative to carry out such a test on a mutually agreed date in his presence.

The operator shall in any case submit to Owner within seven days of every test such number of certified copies (3) of the test results as the Owner’s Representative may require.

Approval by the Owner’s Representative as to the placing of orders for materials or as to samples or tests shall not prejudice any of the Owner’s Representative powers under the Contract. The provisions of this clause shall also apply to materials supplied under any nominated sub-contract.

4 ORIENTATION

The works shall be laid out within the confines of the site in order to be compatible with the existing infrastructural facilities, inlet and outlet pipe work/channels and nearby water bodies. Underground services requiring to be relocated in order to accommodate the proposed site layout shall be relocated by the operator to alignments approved by the Owners Representative.

4.1 Buildings and Structures

All the building and structure works shall generally comply with the following Owner’s Requirements unless otherwise specified elsewhere:

All building works shall be of reinforced concrete framework.

All external walls shall be in 230 mm thick brick masonry built in cement mortar (1:5). Transoms and mullions of 115 mm x 230 mm size with four numbers 6 mm bars and 6 mm links at 150 mm c/c shall be provided to form panels not exceeding 3,500 mm x 3,500 mm in size. All internal partition walls except for toilets shall be in 230 mm thick brick masonry built in cement mortar 1:5 with transoms and mullions as in (b) above. Toilet partition walls shall be in 115 mm thick brick masonry built in cement mortar 1:4 and shall have transoms and mullions as in (b) above and shall form panels not exceeding 1,200 mm x 1,200 mm in size.

Finishes to concrete liquid retaining structures shall be:

a. F1 - External surfaces, buried
b. F2 - External surfaces exposed and up to 300 mm below ground level
c. F2 - Internal surfaces

Finishes to other concrete structures shall be:

a. F1 – Buried
b. F1 - Exposed, where plastering is specified
c. F2 – Exposed

All internal masonry surfaces finish shall have 12 mm thick plain faced cement plaster in cement mortar (1:4) with neat cement finish on top. Over this, one coat of primer and two coats of plastic emulsion paint of approved quality and shade shall be provided.

All external masonry and concrete with rough board finish shall have 20 mm thick sand faced cement plaster in two coats, base coat 12 mm thick in cement mortar 1:4 and finishing coat 8 mm thick in cement mortar 1:4. Waterproofing compound of approved make and quality shall be added to the cement mortar in proportions as specified by the manufacturer.

All external surfaces above ground level shall have one coat of primer and two coats of waterproof cement based paint of approved quality and shade. A coat of silicone water repellent paint shall also be applied thereon.

Toilet areas, walls and ceilings, shall have one coat of primer and two coats of plastic emulsion paint. Toilet floor slab shall be filled with brick bat coba (broken bricks in lime) and provided with waterproofing as per the specifications of an approved specialist waterproofing company. The finished floor level in toilet areas shall be 25 mm below general finished floor level elsewhere in the building.

The flooring in all areas except toilets and staircases, pumping stations, chlorination building, centrifuge building, workshop, store room D.G. room shall be in 250 mm x 250 mm x 20 mm thick marble mosaic tiles of approved make unless otherwise specified, shade and pattern and placed in cement mortar 1:4 to give overall thickness of 50 mm. Half tile skirting shall also be provided in these areas.

The flooring in the pumping stations, chlorination building, centrifuge building, workshop, D.G. room shall be 60 mm thick cement flooring with metallic concrete hardener topping, under layer of 42 mm thick cement concrete 1:2:4 (1 cement : 2 coarse : 4 graded stone aggregate 16 mm thick nominal size) and top layer of 18 mm thick metallic concrete hardener consisting of mix 1:2 (1 cement : 2 stone aggregate 6 mm nominal size) by volume & mixed with metallic hardening compound of approved quality @ 3 kg/m2 including cement slurry and rounding off edges.

The flooring in Operator’s room, loading/unloading bay, MCC cum Panel room shall be in 25 mm thick Kota stone slab of approved shade and pattern and placed over 20 mm thick base of cement mortar 1:4 to give overall thickness of 45 mm. Half tile skirting shall also be provided in these areas.

Toilet areas shall have 450 mm x 450 mm x 25 mm thick polished Kota stone tiles placed in cement mortar 1:4 to give an overall thickness of 50 mm. 2100 mm high dado, in 150 mm x 150 mm x 6 mm thick glazed tiles (approved make, shade and pattern) placed in cement mortar 1:3 shall also be provided in these areas.
The flooring along with skirting in administration cum laboratory building shall be 20 mm thick mirror polished, machine cut granite slab of approved shade and pattern placed in cement mortar (1:4). 150mm high skirting shall be provided in these areas. Granite stone shall be provided for laboratory platforms fixed over double sandwiched cuddappa support as directed and the edges of granite is to be embedded into the wall.

The toilet facilities shall include at least:

a. 3 Nos. Water closets with white porcelain Orissa pan minimum 580 mm long with low level flushing cistern of 10 litres capacity.

b. 4 Nos. urinals of sizes 600 mm x 400 mm x 300 mm flat back type in white porcelain separated by a marble partition of size 680 mm x 300 mm.

c. 3 Nos. wash basins of size 510 mm x 400 mm in white porcelain with inlet, outlet and overflow arrangements.

d. 3 Nos. mirror of size 400 mm x 600 mm wall mounted type fitted over wash basins.

e. 2 Nos. plastic liquid soap bottles

f. 2 Nos. chromium plated brass towel rails minimum 750 mm long.

g. All stopcocks, valves and pillar cocks shall be heavy duty chromium plated brass.

h. All fittings such as ‘P’ or ‘S’ traps, floor traps, pipes, down take pipes etc.

The sewage from toilet blocks shall be led to the wet well of terminal sewage pumping station if present or included under this contract or to the closest gravity sewer.

All staircases shall have 25 mm thick chequered mosaic tiles for treads and 25 mm thick plain mosaic tiles for risers of approved make and shade and half tile skirting set in cement mortar in 1:4 to give an overall thickness of 50 mm.

All concrete stairs shall have aluminum nosing over 2 mm thick rubber strip of width same as nosing for the full length of the tread. Nosing shall be fixed with countersunk screws. Stairways shall be provided to permit access between different levels within buildings. Staircase shall be minimum 1000mm wide unless specified otherwise. Staircases in general shall not be steeper than 40°. Staircases having space constraints may be steeper than 400. The maximum vertical run for a single flight of stairs shall be 3.0 M.
All roof tops and overhead tanks shall be made accessible with ladder provision. Vertical step ladders fitted with landing point extensions will be permitted where considered appropriate by the Engineer to access areas not frequently visited.

Steel staircases shall be constructed of standard channel stringers with M.S. grating treads 25mm thick with non skid nosing. Steel Ladders shall be minimum 600mm wide and shall not exceed 6m of straight run. The ladders shall be painted with epoxy paint.

All hand railings shall be provided with G.I “C” Class Pipe confirming to latest Indian standards. The minimum height of hand railing shall be 1m.

The reinforced concrete roofs shall be made waterproof by application of an approved roof polythene / bitumen membrane / brick bat coba. The finished roof surface shall have adequate slope to drain quickly the rain water to R.W down take inlet points.

All roof floors shall have minimum 750 mm height solid concrete block parapet wall where accessible is provided and shall have minimum 300 mm height solid concrete block parapet wall where accessible is not provided.

For roofing drainage, cast iron or uPVC rainwater down takes with C.I. bell mouth or u PVC bend and C.I. or uPVC grating at top shall be provided. For roof areas up to 40 sq m minimum two nos. 100 mm diameter down take pipes shall be provided. For every additional area of 40 sq m or part thereof, at least one no. 100 mm dia. down take pipe shall be provided.

Top surfaces of chajjas and canopies shall be made waterproof by providing a screed layer of adequate slope or application of an approved roof membrane and sloped to drain the rain water.

Building plinth shall be minimum 450 mm above average finished ground level around building or high flood level whichever is more.

All doors, windows, rolling shutters shall have lintels above. Chajja protection to lintels on external walls shall be such as to prevent the rain water splashing into the building. Chajja projection of minimum 750 mm for rolling shutters, 600 mm for doors and 450 mm for windows shall be provided to prevent the rain water splashing into the building. Chajja shall be projected 150 mm on either side from size of doors/windows/rolling shutters. All windows and ventilators shall have 25 mm thick Kota stone sills bedded in cement mortar (1:3).

All doors and windows shall be painted with two coats of synthetic enamel paint over a priming coat (ready mixed Zinc Chromate Yellow primer of approved brand and manufacturer confirming to I.S.: 127-106, 341 and 340).

All doors, windows and ventilators shall be made of aluminium confirming to latest version of IS: 1948. All fixtures for doors, windows and ventilators shall also be of aluminium. Aluminium grills
shall be provided in all the windows. Doors shall be in two panel and both panels shall be glazed/unglazed. Minimum weight of aluminum doors & windows shall be as follows

1. Single Glazed Window: (Weights indicated shall be aluminum)
   - Open able Outer Frame: Weight 0.70 kg/Rmt
   - Shutter Frame: Weight 0.97 kg/Rmt
   - Intermediate Mullion: Weight 0.97 kg/RM.t.
   - Beading: Weight 0.31 kg/Rmt
   - Fixing Louvers windows/ventilators
   - Outer Frame: Weight 0.46 kg/Rmt

2. Double Glazed Window
   - Outer Frame: Weight 0.72 kg/Rmt
   - Shutter Frame: Weight 0.97 kg/ Rmt
   - Intermediate Mullion: Weight 0.98 kg/ Rmt
   - Beading: Weight 0.31 kg/ Rmt

3. Sliding Windows
   - Bottom & Top Frame: Weight 0.70 kg/m
   - Shutter Frame: Weight 0.42 kg/m
   - Interlocking Section: Weight 0.47 kg/m

4. Aluminum Door
   - Outer Frame: Weight 2.508 kg/Rmt
   - Shutter Frame: Weight 2.508 kg/Rmt
   - Bottom Stile: Weight 2.508 kg/Rmt
   - Glazing shall be 5.5 mm thick glass.

a) Openings of the windows & ventilators shall be minimum 25% of the external wall area.
b) Ventilator shall be provided where height of floor is more than 3m.
c) All windows and ventilators shall have wire mesh. Frame of doors, windows and ventilators shall be of aluminum of standard rolled section. Doors, Windows and Ventilators shall be of size as per schedule to be submitted by the Operator for approval of Engineer. The minimum size shall be as per below:
   a. Door of opening size 1.2m x 2.1m
   b. Door of opening size 0.75m x 2.1m for toilets
   c. Glazed windows of minimum size 1.2m x 1.2m
   d. Ventilators of minimum size 0.6m x 0.6m
d) Rolling shutters shall be made of 80 x 1.25 mm MS laths. Rolling shutter shall be of minimum size 3m wide x 3.0m high. Rolling shutter shall be provided in MCC cum panel room, chlorine toner shed, at entry and exit of the pump house for access to pumps, motors, valves, panels and as wherever required.
e) All concrete channels and ducts used for conveying liquid shall have inside finish of type F2. The width of concrete channels shall not be less than 500 mm. All open channels shall be provided with Stainless Steel Type 304 hand railings or concrete walls to a minimum height of 1 m from
the access surface elevation. All concrete surfaces of structures conveying raw sewage or primary effluent shall be protected with Epoxy Coating as specified in Clause 10.21.

f) Kerbs to be provided below the hand railing on the catwalks/pathways should be as per relevant sections of Factory Act. It shall not be less than 150mm.

g) All exposed surfaces of inserts embedded in concrete shall be painted with two coats of enamel paint over one coat of red oxide zinc chrome primer. Surfaces in contact with concrete shall not be painted.

h) All structural steel members shall be painted with two coats of enamel paint over one shop and one field coat of red oxide zinc chrome primer.

i) All rooms in the treatment plant buildings shall be provided with appropriate sign boards indicating the function of the rooms written in Marathi and English Languages.

j) The design of buildings shall reflect the climatic conditions existing on site. Process buildings shall as far as is possible permit the entry of natural light, and the use of glazed panelling shall be kept to a minimum and preference given to wall openings protected by weather canopies.

k) Emergency exit doorways shall be provided from all buildings in order to comply with local and international regulations. Stairways and paved areas shall be provided at the exit points.

l) Toilet blocks in process buildings and control blocks shall be provided with a sink with two drinking water taps of 20 mm size with adequate inlet and outlet connections.

m) All the walkways in shall have minimum 1 m width and shall be covered with mosaic tiles.

n) Hand railings shall be made up of G.I “C” Class Pipe confirming to latest Indian standards.

o) For structures containing water or process liquid, the top of the wall shall be at least 0.5m higher than the maximum water surface level calculated at high flood level and peak plant flow. The top level of internal plant roads and approaches shall be at least 0.5m above the site High Flood Level.

p) If the High flood level is more then Ground Level then road shall be constructed on the earthen embankment. Earthen embankment shall be constructed with side slope of atleast 2 horizontal to 1 vertical. Stone pitching shall be provided at both sides of the embankment as per IS: 8237. Top width of embankment shall be taken as 6.0m. Top level of embankment shall be 0.5m above high flood level. Excavated earth from the plant can be used for embankment construction and if required, extra earth can be borrowed from the borrow pit as approved by Engineer.

4.2 Roadways, Pathways & Hard standings

a. Internal roads shall be provided around the treatment plant to link in with the existing units and the approach road and permit access to the plant for necessary maintenance, delivery of consumables and personnel access. All roads shall be of asphalt macadam and minimum 3.75 meters wide. Vehicular access shall be provided for all Plant structures and buildings. All roads shall be provided with drainage and shall be constructed to prevent standing water.

b. Hard standing areas with shading facility shall be provided to permit the parking of vehicles involved in the delivery of consumables from blocking site roadways during unloading or loading.

5 Site Drainage

The operator shall provide a site drainage system. The system shall comprise of the following:

- Storm Water Drainage
Foul Drainage (if any)

5.1 Storm Water Drainage  
(a) Storm water drains adjacent to the existing and proposed roads (under this Contract) shall be sized for a rainfall intensity of 50 mm/hr, allowing for 100% runoff. Drains adjacent to roads shall be in stone masonry in CM (1:4) of appropriate thickness, topped with 75 mm thick M10 concrete and internally flush pointed in cement mortar (1:4), 20 mm thick. The minimum width of drain shall be 450mm.  
(b) The storm water drainage system shall also be designed to cater the run-off from the existing plot areas and structures, if necessary depending upon the site topography.

5.2 Foul Drainage  
(a) The foul drainage system shall accept discharge from toilets, washrooms, offices and the laboratory. The foul drainage system shall be conveyed to the nearest public sewer wherever exist or to a pumping station or a new soak pit followed by septic tank shall be constructed.

6 Cable and Pipe work Trenches  
(a) Cable and pipe work trenches shall generally be constructed in reinforced concrete. However, 500 mm x 500 mm size or smaller trenches, not on fill may be constructed in 200 mm thick solid cement concrete blocks over 150mm thick M 15 PCC base. The trenches will be 20mm thick plastered internally with cement mortar (1:4) and externally in cement mortar (1:3).  
(b) All floor cut-outs and cable ducts, etc. shall be covered with M20 precast concrete covers (Heavy Duty) or MS grating as per direction of Engineer in outdoor areas and M.S. chequered plates, suitably painted of adequate thickness in indoor areas. All uncovered openings shall be protected with hand railing. The pipe, cable trenches shall be suitably sloped to drain off rainwater to a suitable location.  
(c) Layout of trenches outside the buildings shall allow space for construction of future trenches where necessary with due consideration for planning for future developments. This aspect shall be brought to the notice of the Engineer while planning the works.

7 Pipes and Ducts  
(a) R.C.C ducts for drainage shall have minimum 1 metre pre-cast cover (M20 concrete, Heavy duty) while laid under roads. Access shafts of size not less than 600 mm x 1000 mm shall be provided.  
(b) All drains (except storm water drains adjacent to roads) shall be covered and designed structurally for appropriate loads.

8 Main Gate
(a) Proposed treatment plant shall have minimum one main gate to access the plant irrespective of existing gate at the premises of existing plant site. Minimum width of main gate shall be 6m. Main gate shall have 1.5m wide wicket gate. Main gate shall have as external framework of GI pipes and internal framework of MS flats. Gate shall be fixed on RCC columns. The design and pattern of gate with drawing shall be submitted for approval of the Engineer. The gate shall have all necessary hinges, locking arrangement, rolling arrangement and painting complete, as approved by the Engineer.

9 Landscaping
(a) The site shall be landscaped once the works are substantially complete. Landscaping area shall be marked in the layout plan of STP.
(b) Landscaping shall include planting of suitable trees and development of lawn/grassed areas. Landscaping in general shall meet ecological and environmental conditions of the site. Road widths shall determine the size of the tree height and spread to be selected for planting. Trees suitable for local conditions shall be selected as approved by the Engineer. Medicinal and fruit trees shall be avoided. Landscaping shall be maintained in good condition till the completion of the contract.

10 Tree Planting
(a) Pits dug a few days in advance of actual planting shall be allowed to weather and be filled with top soil mixed with manure. Size of the pit shall be as per standard requirement. Only one tree shall be planted in each pit. A guard made of bamboo with wire mesh or bricks or M.S. ring as approved by Engineer, shall be provided.

11 EARTH WORK AND EXCAVATION
11.1 General
Applicable provisions of Conditions of contract shall govern work under this section. The Bidder shall report any water conditions encountered and will be given directions as to the type of procedure to be adopted in such cases. The Indian Standards wherever referred to herein shall be the latest edition of such Standards.

11.2 Excavation for Foundation, Trenches, Pits, etc.
All foundation trenches shall be excavated to the full-widths and depths shown on the drawings or to such greater or smaller depths as may be found necessary or so ordered to him.

Should any excavation be taken down below the specified levels, the operator shall fill in such excavation at his own cost with concrete as specified for foundations, well rammed in position until it is brought up to the level. The operator shall notify to the Owner when the excavation is completed and no concrete or masonry shall be laid until the Owner has approved of the soil for each individual footing, rafts, etc.
The operator shall keep the site clear of water at all times. To this end he shall provide arrangements for building or pumping of water as required. All foundation pits shall be refilled to the original surface of the ground with approved material, which shall be suitably consolidated. No extra will be paid for bailing out water collected in excavation due to rains, ordinary springs etc.

11.3 Earth Filling

The space around the foundations in the trenches or sites shall be cleared of all trash and loose debris and filled with approved excavated earth, all clods being broken. Filling shall be done in 200 mm layers; each layer to be moistened and well rammed. This shall be done in step with the foundation masonry or foundation concrete work the difference between the tops of masonry and filling not exceeding a day’s work. The top of filling shall be finished off 150 mm above ground level to allow for settlement only pit or depressions occurring within twelve months of completion shall be filled up and rammed by the Bidder or his own expense.

11.4 Shoring, Planking & Shuttering

Shoring shall be done when sides of excavation do not stand up by themselves and sloping or stepping is not feasible or economical.

The shoring shall consist of vertical planks 38 mm to 50 mm thick and of Available width and required length. The planks shall be held by walling, vertical places and struts, and this to form a frame. The struts shall be not more than 1.5 m. apart, and the timber shall be sufficiently strong not to wrap. The planks shall be held tight by means of wedges between them and walling. The planks shall be driven in by cutting the earth beneath their toes or driving each plank separately after removing the wedges. The planks shall be driven in vertically and shall be set touching one another.

The shoring shall be adequate to prevent caving in of the trench walls of subsidence of areas adjacent to the trench. In narrow trenches of limited depth, a simple form of shoring shall consist of a pair of 40 to 50 mm thick and 30 cm wide planks set vertically at intervals and firmly strutted. For wider and deeper trenches a system of wall plates (Wales) and struts of heavy timber section is commonly used. Continuous sheeting shall be provided outside the wall plates to maintain the stability of the trench walls. The number and the size of the wall plates shall be fixed considering the depth of trench and type of soil. The cross struts shall be fixed in a manner to maintain pressure against the wall plates which in turn shall be kept pressed against the timber sheeting by means of timber wedges or dog spikes.

11.5 Wet Foundation:

As soon as water is encountered in foundations, a sump shall be dug for removing the water. The bottom level of this sump shall be kept 500 mm or more below the lowest level of the excavation. The difference between the levels of the bottom of the excavation and of the sump shall be kept
constant as excavation depth is increased. If the excavation is to be taken to a substantial depth and a large quantity of water is encountered, two sumps shall be excavated and deepened alternatively so that the pump does not require to be stopped whilst the sump is deepened.

11.6 Earthwork in Site Levelling
All materials required for the purpose of filling shall be taken from high areas and stockpile, which are to be levelled to specified reduced level as required. Roots, sods, wood or other organic matter shall not be placed in the fill. Before a new layer is laid the existing ruts or other unevenness in the surface of the layer shall be removed and the surface of the layer shall be scarified and roughened by borrowing and ploughing to obtain bond with the material to be placed. The materials shall be placed continuous horizontal layers not greater than 200 mm thickness. The earth fill shall be kept slightly sloping from center to the edges to avoid formation of pools during the rain.
Section 4.  CONCRETE

12 Concrete
12.1 General

Applicable provisions of Conditions of Contract shall govern work under this section.

All concrete work, plain or reinforced shall be carried out in strict accordance with this specification and any working drawing or instructions given from time to time to the operator. The operator’s rates shall allow for wastage in all materials as well as for all tests of materials and for concrete. No concrete shall be cast in the absence of the Owner’s representative or any other person duly authorized by him. The operator’s Engineer shall personally check that both the formwork and reinforcement have been correctly placed and fixed, and shall satisfy himself that all work preparatory to the casting is completely ready, before calling the Owner’s representative for final inspection and approval and for which purpose at least 24 hours’ notice shall be given by the operator. The Indian Standards wherever referred to herein shall be the latest edition of such Standards.

12.2 Cement

Cement shall be ordinary Portland cement as per I.S. 269 or Sulphate Resistance Cement as per IS 12330. Cement tests shall have to be carried out at operator’s expense as and when directed.

12.3 Aggregate

The fine and coarse aggregate shall conform to IS: 383 & IS: 456. The necessary test indicated in IS – 383 and IS – 456 shall have to be carried out to ensure the acceptability and shall meet prior approval of the Owner.

12.4 Reinforcement

The epoxy coated reinforcement conforming to IS 13620 or latest relevant Indian Standards shall be of tested quality. It shall also comply with relevant part of IS. 456. All epoxy coated reinforcement shall be clean and free from dirt, oil, paint, grease, mill scale or loose or thick rust at the time of placing. The reinforcement shall be bent to the shapes shown on the drawings prior to placing and all bars must be bent cold. The Steel shall be placed in such a way that it is rigidly held in position while concrete is being cast. The correct clearance from the form shall be maintained by either precast mortar blocks or by metal supporting chairs to be supplied by the operator free of charge. The intersections of rods crossing one another shall bound together with soft pliable wire No. 16 S.W.G. at frequent intervals so that reinforcement will not be displaced during the process of depositing concrete. The loops of binding wire should be tightened by pliers.

12.5 Water

Water shall conform to IS: 456, clean and free from alkali, oil or injurious amounts of deleterious material. As far as possible, the water should be of such quality that is potable. If any chemical
analysis of the water is necessary and ordered the same shall be got done at approval laboratory at the operator’s expense.

12.6 Concrete Proportioning
The concrete proportion shall be as indicated on the approved drawings and shall conform to IS: 456. The minimum cover to main reinforcement shall be 25 mm or the diameter of the bar whichever is greater. In the case of surfaces exposed to corrosive action as in sumps, the cover shall be increased up to 50 mm as directed.

Type of joints, spacing of joints, use of all jointing materials and other features pertaining to the provision of movement joints in liquid retaining structures shall be got approved prior to commencement of construction. All reinforced concrete work shall be thoroughly and efficiently vibrated during laying by use of vibrators.

For liquid retaining structures M:30 grade (SRC) shall be used, the same shall be deemed to be satisfactorily watertight if the external faces show no signs of leakage and remain apparently dry over the period of observation of 7 days after allowing a period of 7 days for absorption after filling. Covered tank, where all faces are not accessible for inspection, shall be kept filled with water for 7 days and thereafter the drop of water over the next 7 days shall not exceed totally a depth of 12.5 mm per day. Approved corrective measures, if necessary, shall be undertaken by the Bidder at his own expense. The operator shall use appropriate water proofing compound during the process of pouring of concrete in required proportion.

12.7 Workmanship
All concreting work shall be carried out according to the IS: 456 ‘Indian Standard Code of Practice for Plain and Reinforced Concrete for general Building Construction’. It should, however, be noted that for Over 60 m3 of concrete placed or for every one day’s work a minimum of 6 (six) cubes shall be cast for test purposes and tested at the operator’s expense in an approved laboratory.

12.8 Formwork
The formwork shall conform to IS: 456. Centering ; Only steel / plywood centering shall be used

12.9 Curing
The concrete shall be cured according to IS: 456 or as directed.

12.10 Concrete Finish:
The concrete surface on removal of form work shall be such that no finishing is necessary. If however the surface is not satisfactory, the operator shall, if so instructed, remove unwanted projecting parts by chipping and smoothening the surface with cement at his own expense and coated with corrosion resistance epoxy paint.

12.11 Construction Joints / Water Stops
These shall be in accordance with IS: 456 or as shown on the approved drawings.

The centering for forming, the construction joint shall be firmly fixed and adequately slotted for reinforcement extending beyond the joint. If any concrete has set, care shall be taken not to disturb the reinforcing steel in casting the second half of a member with a construction joint and thereby crack the concrete previously placed. The PVC joints shall be of the ‘rebated’ or ‘keyed’ type and shall have a minimum width of 300 mm inclined ‘feather’ or ‘straight joints’ shall not be permitted. The Joints/Water stops shall be got approved by the Engineer before their placement into the structure.

12.12 Expansion Joints

Expansion joints shall be provided at positions shown on the approved drawing or as directed and shall comply strictly with the details shown on construction drawings. Reinforcement shall not extend across any expansion joint and the break between the two sections MUST be complete. Unless otherwise specified, the gap shall be filled with an elastic joint filler consisting of the following ingredients (by weight), preheated to a temperature of 190 (375 F).

a) Very fine sand 60%
b) Hot bitumen emulsion 33%
c) Cement 5%
d) Fine chopped hemp 2%

12.13 Operator’s Supervision

The operator shall provide constant and strict supervision of all the item of construction during progress of work, including the proportioning and mixing of the concrete and bending and placing of reinforcement. Before any important operation such as concreting or stripping of formwork is begun, adequate notice shall be given.

12.14 Laying Cement Concrete in Foundations & Under Floors

Before laying the concrete, the bottom and sides of the trench up to the proposed height of the concrete shall be moistened. The concrete shall be tamped immediately after laying.

12.15 Protective Epoxy Paint Treatment:

Epoxy Paint of standard specifications manufactured/purchased from a reputed firm approved by IS shall be applied to the outside Concrete surface of R.C.C. Underground sump and all mild steel works within and near the sump. The coverage capacity of layers shall be at 125 Microns D.F.T. 7.60 sq. mt./Litre .(Exposed steel inserts, embedded in concrete and ladders, submerged in water shall be provided with epoxy paint 360 microns)

12.16 Chases, Holes, Recesses and Inserts:
All chases, holes and recesses for foundation bolts, various services and other requirements must be formed as shown on the drawings or as directed by the Owner’s Engineer during the execution of the work, without extra charge. The operator shall fix all necessary inserts in the concrete for support of hangers for pipes and cables, ceiling clamps for lights and fans or for duct etc. If any of the inserts are to be supplied by other agencies not extra payment will be made to the Bidder for placing the inserts position.

12.17 Load Testing of Structures
Load tests shall be carried out in accordance with IS: 456, if required by the Executive Engineer.

**Section 5. BRICK WORK**

13 Brick Work

13.1 General
Applicable provisions of Conditions of Contract shall govern the work under this section. The operator shall build the whole of brickwork shown on the drawings with first-class bricks in cement mortar. The Indian Standard wherever referred to herein shall be the latest edition of such Standards.

13.2 Materials

<table>
<thead>
<tr>
<th>Bricks</th>
<th>The bricks used shall generally conform to IS: 1077</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cement</td>
<td>The cement used shall conform to IS: 269</td>
</tr>
<tr>
<td>Sand</td>
<td>The sand used shall conform to IS: 1344</td>
</tr>
<tr>
<td>Water</td>
<td>The water used shall be clean and free from injurious amounts of deleterious materials. As far as possible, the water should be of such quality that it is potable</td>
</tr>
</tbody>
</table>

13.3 Mortar Proportion
Unless otherwise specified, the proportions of cement-sand-mortar by volume for various classes of work shall be as under:

<table>
<thead>
<tr>
<th>Type of work</th>
<th>Cement</th>
<th>Sand</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ordinary brickwork for building</td>
<td>1</td>
<td>5</td>
</tr>
<tr>
<td>Brickwork in pillars</td>
<td>1</td>
<td>4</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>Half-brick thick or brick-on edge partition wall</td>
<td>1</td>
<td>4</td>
</tr>
</tbody>
</table>

13.4 Workmanship
The cement and sand shall be thoroughly mixed dry in specified proportions. Water shall then be added by a sprinkler just sufficient to make a stiff and workable paste. The mortar shall be used within half an hour of mixing. The mortar, which is unused within half an hour of mixing, shall be removed from the site.

13.5 Brick-work
All the bricks shall be kept in water till they are completely soaked & only thoroughly soaked bricks shall be used in the work. The operator shall set out & build all brickwork to the respective dimensions, thickness and height, as shown on the drawings.

The operator shall build all brickwork uniformly, no one portion being raised more than 1 meter above another at one time. The operator shall keep wet all brickwork for at least 10 days after laying. The surface of unfinished work shall be cleaned and thoroughly wetted before joining new work to it.

In curved brickwork, the bricks shall be dressed to shape obtain joints redial to the curve. The joints shall not exceed 12 mm in thickness and should extend the full thickness of the curved brickwork.

13.6 Damp-proof Course
Damp-proof course shall be provided at positions where ever necessary. In masonry walls of buildings, it shall normally be placed above the external ground level. It shall be laid for the full width of solid walls and shall be prepared as specified.

A layer of cement concrete 1:2:4 (cement: sand: coarse aggregate) mix, and of specified thickness shall be provided. If a damp-proof course requiring the use of bitumen felt is specified, bitumen used shall conform to IS: 1322 and workmanship shall conform to IS: 1609. All exposed surface of the damp-proof course shall be finished fair and smooth. The external edge shall be chamfered if specified, and shall be finished flush with masonry surface.

Section 6. FLOORS AND PAVEMENTS

14 General
Applicable provisions of Conditions of Contract shall govern work under this section. The Indian Standards wherever referred to herein shall be the latest edition of such standards.

14.1 Types of Floors and Pavements
The principal types of floors and pavements considered in this specification are as under:

a) Cast-in-situ artificial stone flooring (plain)
b) Natural stone slab flooring
c) Pre-cast artificial stone flooring (Plain/Textured)

14.2 Materials

- **Cement**
  Ordinary Portland cement and white and colored cement shall conform to IS: 269.

- **Lime**
  Where lime is required to be used, it shall conform to IS: 712 and slaking of lime shall be done according to IS: 1635.

- **Aggregates**
  The aggregates shall conform to IS: 383. Fine aggregates shall range in size from 1.5 mm to 6 mm. unless specified otherwise. Not more than 5 percent of grains shall pass IS sieve 15 (0.151 mm mesh) and not more than 10 per cent shall pass IS sieve 30 (0.296 mm mesh). Coarse aggregate shall all pass through 19 mm mesh, unless specified otherwise and shall be graded as directed. The coarse aggregate for concrete pavements for approaches and driveways shall all pass through 25 mm ring and shall be formed by mixing 80% of 25 mm to 12 mm size and 20% of 12 mm to 6 mm size. The above proportion shall be altered to suit workability if so approved.

- **Natural Stone Slabs**
  The stone slabs if used shall be best quality obtainable from Neemuch, Kotah, Shahabad, Tandur or other places as specified and shall be hard, even durable, uniform in color and free from cracks, flakes and other defects. No stone shall be thinner at its thinnest part than 25 mm. unless otherwise specified; the stones shall be 300 mm x 300 mm in size dressed square and with straight edges. The top surface of stones shall be smooth or polished as specified and edges dressed to a true fir or chisel dressed as directed.

- **Water**
  Water shall be clean and free from injurious amounts of deleterious materials. As far as possible, water shall be of potable quality.

14.3 Cast in situ Artificial Stone Flooring

Grey and colored artificial stone is to be composed of 4 parts of fine stone chips 12 mm and below 2 parts of sand and properly screened to one part of cement. The topping in all cases and to consist of clean and fine sand and cement (2:1) and sufficient skin thickness to be kept and
finally trowelled with neat cement finish perfectly smooth to satisfaction. In the case of dados and skirting the total thickness is to be 19 mm of which the bottom layer is to be 12 mm and the toping 6 mm thick in all cases both the layers are to be laid simultaneously without hiatus so that it will in effect be one complete layer; the mixing be made in two different lots.

14.4 Natural stone slab flooring

The stone slabs shall be evenly and firmly bedded to the required level and slopes as directed. Unless otherwise specified, the thickness of joints shall not exceed 6 mm for unpolished stone slabs and 1 mm for polished stones. The joints shall be raked out to an adequate depth and pointed flush or slightly sunk, as directed, with cement-sand mortar of 1:2 proportions. The stone slabs shall be laid to pattern which shall be approved prior to ordering the stones. The flooring shall be kept wet with wet sand or water for at least seven days. The flooring shall be well washed and shall be perfectly clean and free from all mortar stains etc. when completed.

Section 7. PLASTERING AND POINTING

15 General

Applicable provisions of Conditions of Contract shall govern work under this section. The Indian Standards wherever referred to herein shall be the latest edition of such Standards.

15.1 Cement Plaster Materials

Cement shall confirm to IS: 269 and Sand shall confirm to IS: 1542. Other materials, tools and Accessories, they shall confirm to relevant IS codes listed above and to the requirements specified in IS: 1661.

15.2 Proportioning and thickness of Cement Plasters:

The proportions of materials, number of coats and thickness of each coat shall be as a specified or as directed.

15.3 Workmanship

Unless otherwise specified, all plasterwork shall be carried out as per IS: 1661 “Code of Practice for Cement and Cement-Lime Plaster Finished on Walls and Ceilings”. Special finishing textures to the plaster shall be executed according to Clause 16 of IS: 1661 and/or as directed.

15.4 Curing

After the completion of the work, the pointed face shall be kept well wetted for at least for 10 days in the case of Cement Pointing.
Section 8. PAINTING AND GLAZING

16 General
Applicable provisions of Conditions of Contract shall govern work under this section. The Indian Standards wherever referred to herein shall be the latest edition of such standards.

16.1 Painting of Iron and Steel Work
Painting of iron and steel work shall generally be carried out as per IS: 1447 (Part I).

16.2 Preparation of Surfaces:
The surface to be painted shall be cleaned free of dirt, oil rust, mill scale and be thoroughly dry before painting. Cleaning, degreasing, and descaling wherever necessary shall be carried out as specified in IS: 1477 (Part I) and the method adopted for surface preparation shall have prior approval.

16.3 Primer Coat:
Unless otherwise specified, the primer coat for steel and iron work shall be of Red Lead paint, conforming to IS: 102. The Red Lead primer shall be applied by means of approved brushes. The Red Lead paint shall be allowed to dry sufficiently hard before the application of the succeeding coat. A red lead painted surface shall not however be left exposed permanently, as it is liable to heavy chalking. The primer coat shall be applied as specified in IS: 1477 (Part-I) and the number of coats shall be as necessary for as directed.

16.4 Finish Coat
The type of intermediate and finish coat and the number of coats to be applied shall be as necessary or as directed. Intermediate and finish coats may be oil bound bituminous, aluminum or other types of paints. Aluminum conforms to IS: 165. The intermediate and finish coats for structural steel work, sheet metal work and cast iron work shall be applied as specified in IS: 1477 (Part-I).

Section 9. Glazing Materials

17 Glass
All glass used in the work shall be best quality glass free from specks, bubbles, smokes, wanes, air holes and other defects. Unless other-wise specified, sheet glass shall be transparent and of the following weights. For panes up to 600 mm x 600 mm in size, glass weighing not less than 7.97 kg/sq.m. shall be used for panes 750 mm x 750 mm to 900 mm x 900 mm size, the weight of glass shall be 9.76 kg/sq.m. Unless other-wise specified, for sizes of glass above 900 mm x 900, plate glass shall be used.

17.1 Putty
Putty for use on wooden frames shall conform to IS: 419 and on metal frames to IS: 420.
17.2 Workmanship
All glass be cut according to the sizes required as per drawings. Glazing of metal doors, windows and ventilators shall conform to IS: 1081 and glazing of timber doors, windows, and ventilators shall conform to IS: 1003, unless specified otherwise. For glazing wooden doors and windows, the wooden frame, particularly the rebate, shall be well oiled to prevent oil from putty being sucked in by wood. The Bidder shall thoroughly clean all glass and replace all putty or glass damaged during the work.

Section 10. MISCELLANEOUS STEEL AND IRON WORK

18 General
Applicable provisions of Conditions of Contract shall govern work under this section.

The Indian Standards wherever referred to herein shall be the latest edition of such Standard.

18.1 Iron Grills
The grills for Windows, verandahs, balconies, etc. shall be of mild steel or wrought iron as specified for the work. The design of grills and shapes and sizes of various components shall be as approved. The edges, angles and corners shall be clean and true to shape. The joints shall be mechanically interlocked and overlapping areas spot welded in such a way that the grill is rigid.

Where moulded grills are specified, the moulded work shall be as approved, and shall have clean, straight and sharply defined profiles. The operator shall do the necessary cutting, fitting, drilling, tapping, scribing etc. required to fix grills to adjacent surfaces. The grills shall be fixed plumb, in line and level. Unless otherwise specified, grills shall be painted with two coats of red lead paint conforming to IS: 102 before they are fixed.

18.2 Rolling Shutters
Rolling shutters, where specified shall be of the size to suit the openings and shall be positioned as shown on the drawings and/or as directed.

The rolling shutter shall be fabricated from 18 B.G. Steel and machine rolled with 75 mm rolling contras with effective bridge depth of 12 mm lath sections, interlocked with each other and ends locked with malleable cast iron. The guides shall be either rolled or pressed deep channel sections 75 mm deep and 25 mm wide fitted with necessary fittings and fixtures.

The suspension shaft shall be formed from solid drawn seamless tubes 60 mm O.D. of wall thickness of 25 mm in 3 segments coupled 2 with 2 pairs C.I. dog-tailed flange coupling forming one complete unit eliminating deflection in the center to a minimum.

The springs shall be imported high tensile English flat springs 50/60 mm breadth and 1.6/1.8 mm thickness hardened and tempered. These shall be fitted inside the fabricated housing on either ends,
which counterbalance the shutter curtain. The ball bearings shall be double row self aligning ball bearing fitted inside C.I. housing fixed on side brackets holding the suspension shaft at either end.

The suspension of the curtain shall be belted in specially fabricated cages formed from MS flats, and plates all are welded. The hood cover shall be made of 20 gauge G.P. sheets with necessary stiffeners and framework to prevent sag, the bottom lock plate shall be made of 3 mm thick M.S. plate and 95 mm wide reinforced with angle/T iron of suitable section with 6 mm dia. M.S.rivets interlocked with last stride of curtain.

The locking arrangement shall consist of hasp and staple on the bottom plate, lockable from both sides. Unless otherwise specified, for overall area of rolling shutters up to 9 sq. m. pull and push type hand-operated shutters shall be used, for area between 9 and 12 sq. m. Pull and Push type shutters shall be provided with ball bearings; for area larger than 12 sq. m, Mechanical Gear type shutters shall be supplied.

18.3 Collapsible Gates
Collapsible gates shall be of the size and type as specified by the Owner’s Engineer. The gates shall be manufactured out of M.S. channel pickets of size 20 mm x 10 mm and flats 20 mm x 6 mm. The top runner flat shall be at least 50 mm x 12 mm in section. The bottom guide shall consist of a channel or two angles of specified size laid in the flooring to guide the free movement of the gate. The gate shall move in the guide channel on rollers of adequate size fixed at the top and bottom of the gate as specified. The gate shall be painted with one coat of red lead paint conforming to IS : 102 before fixing in position.

Section 11. WOODWORK AND JOINARY

19 Wood:
All wood required to be used, shall be dry, well-seasoned, Bulsar teak wood and shall be free from knots, cracks or any other kind of defects frames for doors and windows.

19.1 Jointing Materials:
All nails, screws, fixtures shall be of standard quality as approved by the Owner.

19.2 Cutting Edges:
Cutting edge for well to be fabricated as per the drawing approved by Owner’s engineer The structural steel to be used, should confirm to IS: 226-1961 and IS: 2062-1962. The steel shall be free from defects as mentioned in IS: 226-1962 and shall have a smooth uniform finish. Material shall be
free from loose mile scale, rusting or other defects affecting its strength and durability. The test certificates shall have to be submitted for the structural steel used in cutting edge.

21 ILLUMINATION:
All internal and external areas shall be provided with lighting. The illumination levels to be achieved shall be as follows:

<table>
<thead>
<tr>
<th>AREA</th>
<th>LUX</th>
</tr>
</thead>
<tbody>
<tr>
<td>Office and labs</td>
<td>300 Lux</td>
</tr>
<tr>
<td>Switchgear Room</td>
<td>200 Lux</td>
</tr>
<tr>
<td>Control Room</td>
<td>300 Lux</td>
</tr>
<tr>
<td>Pump House</td>
<td>200 Lux</td>
</tr>
<tr>
<td>DG set room</td>
<td>200 Lux</td>
</tr>
<tr>
<td>Chemical and general store</td>
<td>150 Lux</td>
</tr>
<tr>
<td>Chemical Plant room</td>
<td>200 Lux</td>
</tr>
<tr>
<td>Other indoor areas</td>
<td>100 Lux</td>
</tr>
<tr>
<td>Outdoor plant from and</td>
<td>50 Lux</td>
</tr>
<tr>
<td>Building entrance</td>
<td>100 Lux</td>
</tr>
<tr>

<tr>
<td>Outdoor Plant Area</td>
<td>50 Lux</td>
</tr>
<tr>
<td>Transformer Area</td>
<td>100 Lux</td>
</tr>
<tr>
<td>Roads</td>
<td>10 Lux</td>
</tr>
</tbody>
</table>

Fluorescent luminaries shall be used primarily for internal lighting. High pressure vapour or metal halide type luminaries shall be used in indoor application where their use is appropriate. If mercury or metal halide is used in indoor then they should be supplemented with fluorescent luminaries to assure that minimum illumination levels are maintained following momentary power dips. All other internal
areas shall be lit with fluorescent luminaries. Where specific recommendations of lux level are not covered above, illumination level in such areas shall be finalized in consultation with Owner.

Owner shall be required to measure levels of illumination after completion of lighting installation work and short fall in illumination level shall be made good by the Bidder. Complete set of calculations showing, room, index, copy MF shall be given during detailed engineering.

21.6.1 Switches / sockets of piano type shall be used in general and in offices of staff, control room, MMI room, decorative modular switches shall be used. Suitable fans shall be provided in rooms/ plant areas as per standards. For exhaust fans it must be provided in panel rooms, pump rooms, chemical rooms, stores, toilets and at least 20 air changes per hour must be maintained.

21.6.2 The following type of lighting fixtures shall be proposed:

a) Decorative type 2x36W fixtures for fluorescent luminaries inside office/ administrative buildings and control rooms.

b) Corrosion resistant fixture with canopy made of FRP for fluorescent luminaries for corrosive areas like chlorine handling or chemical store or area with corrosive smell/gases etc.

c) Industrial type vitreous enameled fixture for fluorescent luminaries inside 415V switchgear, MCC room and pump house.

d) In outdoor process areas, lighting fixtures shall be sodium vapour type subjected to minimum of IP protection class.

e) All outside lights as plant field lights, building outside lights, flood lights etc. which are to be switched on only during night hours should be controlled through photo cell/ clock switch installed at a central place. All lights shall have minimum IP65 protection class.

f) Street lighting wiring shall be through buried underground.

g) All bulb fittings (except fluorescent lamps) will have screw type caps.

h) For outdoor lighting, the lighting feeder shall be operated through a contactor, controlled by photocell/ clock switch and shall also have a manual by pass switch.

21.6.3 Luminaries shall be installed to permit ease of maintenance i.e. it shall not be necessary to shut down plant in order to carryout maintenance or to access luminaries located over areas of water etc. The Operator shall provide all equipment necessary to carryout maintenance on the lighting installation and demonstrate its operation to the satisfaction of Owner.
21.6.4 Indoor lighting circuit will be arranged in such a way that 50% lighting can be put off in each room through switches. All lighting circuits will be wired with 2.5sq.mm. Stranded copper wire or through 2.5 sq.mm. armoured cable laid in cable trays. Sub circuit from switch to fixture could be wired with1.5 sq.mm. stranded copper wire in MS conduits or armoured copper cable of similar size provided total voltage drop in any lighting distribution board to last lighting point shall not exceed 2%. All lighting circuits will have separate neutral, separate earth from Lighting Distribution Board. For illumination of roads, outdoors areas where operation of equipment or units required and sub station area, lighting fixtures of appropriate type (such as street lighting type, flood lighting type, post top lanterns etc.) incorporating high pressure sodium vapour lamps shall be proposed. Street light poles shall not have less than 7500 mm height above the finished road level and the arm shall not project more than 1200 mm along the road width. Poles of bigger heights may also be used if some outdoor areas are to be illuminated. Poles of 4 / 4.5 Mtrs using post top lantern may be used in gate office walk way or in front of office area. Complete area, streets, lanes, boundary shall be covered with street lighting.

21.6.5 Receptacles (Lighting & Small Power) :

a) Decorative and industrial type units of above shall be proposed in all plant areas, offices, stores, workshop, plant room and they shall be located at least two numbers in each room. Distance between two receptacles shall not be more than 8 – 10 mtr. All small 5 amps 5 pin lighting & small power sockets shall be wired by multi stranded copper wire of 2.5 sq. mm laid in rigid MS conduits along with earth wire of1.5 sq.mm flexible copper wire or equivalent size armoured cables. All wiring shall be coded with Red, Yellow, Blue & Black as per the phase used. If required, wiring can be done alternatively through armoured copper cables of similar size laid in MS perforated trays of minimum 2.0 mm thick.

b) Three phase power receptacles (convenience outlets) suitable for operation of 415V,3 Phase 4 wire, 50 Hz power supply shall be proposed. In indoor areas one such unit shall be provided to cover areas of 20 meter radius (or at least one in each room housing plant items ) and in outdoors areas on such unit shall be provided at 50 meter interval. Actual requirement of such units shall be finalized by MMC during detailed engineering. One three phase receptacle shall be provided near entrance of each building for utilities like welding.

c) Single phase 15 Amp 5 Pin / 6 Pin receptacles will be provided in each room and in halls they will be provided in such a way that with 15 meter cord we should reach every place in building. These shall be wired with 4 sq. mm copper earth wire in MS rigid conduits along with 2.5 sq. mm earth wire. Not more than two sockets shall be looped in one circuit. Alternatively they can also be connected through armoured cable of 4 sq. mm running in appropriate cable trays.
21.6.6 Separate lighting panels and lighting distribution boards shall be installed and they shall not take tapping for power from motor control centers or power distribution boards.

Section 12. WOODWORK AND JOINARY

20 Wood:
All wood required to be used, shall be dry, well-seasoned, Bulsar teak wood and shall be free from knots, cracks or any other kind of defects frames for doors and windows.

20.1 Jointing Materials:
All nails, screws, fixtures shall be of standard

Section 13. PIPING WORK

21 Cast Iron Pipes & Fittings

21.1 All protection and bedding of sewers work shall be carried out in strict accordance with the specification and methods laid out in the CPHEEO manual.

21.2 Applicable Codes
The manufacturing, testing, supplying, jointing and testing at work sites of cast iron pipes and fittings shall comply with all currently applicable statutes, regulations, standards and codes. In particular, the following standards, unless otherwise specified herein, shall be referred. In all cases, the latest revision of the codes shall be referred to. If requirements of this specification conflict with the requirements of the code of standards, this specification shall govern.

- IS:210 - Specification for grey iron casting
- IS: 290 - Specification for coal tar black paint.
- IS: 638 - Specification for sheet rubber jointing and rubber insertion jointing.
- IS:782 - Specification for caulking lead
- IS:1387 - General requirements for the supply of Metallurgical material
- IS: 1537 - Specification for vertically cast iron pressure pipes for water, gas and sewage.
- IS:1536 - Specification for centrifugally cast (spun) iron pressure pipes for water, gas and sewage
- IS: 1538 - Specification for cast iron fittings for pressure pipes for Water, gas and sewage.
- IS: 1500 - Method for Brinell hardness test for grey cast iron.
- IS: 2078 - Method for tensile testing of grey cast iron.
- IS:5382 - Specification for rubber sealing rings for gas mains, water mains, and sewers
- IS: 6587 - Specification for spun hemp yarn.
22 Mild Steel ERW Pipe

The manufacturing, testing, supplying, jointing and testing at work sites of mild steel pipes and fittings shall comply with all currently applicable status, regulations, standards and codes. In particular, the following standards, unless otherwise specified herein, shall be referred. In all cases, the latest revision of the codes shall be referred to. If requirements of this specification conflict with the requirements of the code standards, Engineer-in-Charge decision shall be final.

Materials
b. IS: 2062 : Specification for structural steel (fusion welding quality).
d. IS:3589 : Specification for electrically welded steel pipes for water, gas and sewage (150 mm to 2000 mm nominal dia).
e. IS:6392 : Specification for steel pipe flanges

Code of Practice
b. IS: 11906: Recommendations for cement mortar lining for mild steel pipes and fittings for transportation of water.

23 HDPE Pipes

These pipes have been used for carrying the effluent from distribution boxes to Feeding boxes of the Reactors. These pipes shall meet specifications as per IS: 4984.

23.1 Jointing
HDPE pipe shall be jointed properly with HDPE socketted specials to get smooth inner side surface without any extrusion to avoid any obstruction to the flow of wastewater. If in any particular case butt welding has to be done, smooth inner surface of pipe without intrusion inside shall be ensured.

24 Glazed Stone Wares Pipes

The drain pipes and filtrate pipes are to be made up of GSW. The GSW pipes to be provided should be of IS Specifications. They should be properly laid to proper gradient and as per drawings and approved by Engineer in Charge.

25 VALVES
25.1 Gate (Sluice) Valves

Gate Valves shall be either solid wedge or knife gate unless specifically defined on the drawings.
The materials used for the manufacture of each component shall be the best available for the specific purpose and shall not, in any case be inferior to the following:

- **Cast Iron** - IS. 210 Grade 20
- **Stainless Steel** - IS. 1570 Grade, B.S. 970 Type EN, ASTM A 473.
- **Gun Metal** - BS.1400-LG 2 -C or the equivalent Indian Standard.
- **Cast Steel** - Plain Carbon Steel complying with IS. 1570 Grade, or BS: 970 Grade 431 S 29.

Valve Bodies shall be in cast steel for sewage treatment plants, Spindle shall conform to Stainless Steel and Valve Gates shall conform to Stainless Steel

### 26 Specifications Referred

The specifications contained herein are not exhaustive and for such items of works which may arise and which are not covered by this specification, or by the relevant Indian Standards, the provisions in the P.W.D. Handbook Vol. I and II (latest edition) shall apply. A list of few important Indian Standards is given below: Wherever reference to the Indian Standards mentioned below or otherwise appears in this specification, it shall be taken as a reference to the latest version of the standard.

27 Technical Specifications for Electrical Works

All works shall be carried out in accordance with the requirements of:

i. IE Rules

ii. State Electricity Board

iii. Rules and regulations of Local authorities, and

iv. The standards in this specification

The Operator is responsible for applying and obtaining necessary statutory approvals and shall ensure workmanship of good quality and shall assign qualified supervisor / engineers and competent labour who are skilled, careful and experienced in carrying out similar works.

Latest applicable standards specified below.

## 28 Mechanical equipment

Mechanical equipment shall be required for following units based on chosen technology:

1. Inlet chamber and distribution box/channel.
2. Screen channels, mechanically cleaned fine screens.
3. Grit chambers with grit removal equipment and classifiers.
4. Parshall flumes, Plant by-pass and distribution box to Treatment units
5. Disinfection facilities and Parshall flume for Plant effluent
vi. Sludge pumps, thickened sludge pumps.

vii. Sludge gravity thickeners.

viii. Anaerobic digesters.

ix. Gas holders and gas burners.

x. Belt-filter press equipment and polymer feed for sludge drying in dewatering building.

xi. Filtrate sump and pumps in dewatering building.

xii. Compressors and accessories.

xiii. Various sizes of interconnecting piping.

xiv. Fire-fighting equipment as per state Government department of Fire services.
xv. Power generation units, with gas engines and accessories.

All mechanical equipment such as screens, de-gritting devices, sluice gates, sludge thickeners, centrifuges, belt presses etc which comes into contact with sewage or sludge shall be fabricated in non corrosive materials and metallic parts in contact with sewage shall conform to Stainless steel. All walkways shall be in RCC or stainless steel with stainless steel handrails. Provide appropriate explosion proof construction and devices at any enclosed locations components where incoming sewage is exposed to atmosphere.

Mechanical screens shall be operated with Shaftless screw conveyors to transfer screenings to the screw compactor to dewater and compact the screenings. The screen will be controlled by a timer as backup to level control, so that, the cleaning mechanism can run at a set interval.

The deposited grit will be removed from the grit chambers by appropriate and efficient removing mechanism. Grit removal shall be accompanied with a grit classifier and grit washing system to ensure the grit is free from organic matter before disposal.

All overflow weirs will be made from stainless steel and all fittings and fixtures will be stainless steel. Parshall flumes downstream of each grit chamber structure shall be required where an ultrasonic flow meter will be installed for measuring and adding the total flow of raw sewage entering the site.

Isolation weir gates and bye pass shall be required to control and/or isolate flow to any one units

Treated sewage shall be disinfected

The gravity thickeners shall be provided where required to reduce the volume of sludge before feeding the anaerobic digesters depending on chosen technology. Thickener fixed bridge and rotating scraper mechanism shall be in Stainless steel.

Thickened sludge will be pumped into sludge digesters wherein continuous pump recirculation/mixing shall be done to stimulate anaerobic sludge digestion. Design of the anaerobic digester shall allow sufficient height of the digester to remain filled with gas. This gas can be used for future power generation.

Storage of biogas shall be required and accomplished by either gas holders or, if floating digester covers are provided, be contained within the floating cover of the anaerobic digester.

A gas flow meter for measuring gas shall be provided and installed in the digester control room. The gas flow meter shall be electrical transmitting type, ring balancing with transmitter, indicator and integrator, recorder all complete.
The digested sludge shall be dewatered by belt-filter press equipment and addition of polymer. Necessary arrangements shall be made to dispose of the sludge after dewatering.

The treated effluent shall be conveyed to the disinfection point and final disposal point above the normal high water level of the nala or river identified for final disposal.

29 Process Instrumentation, Control. and SCADA System

The instrumentation shall include online measurement of influent and effluent parameters for sewage, sludge and sludge gas. Process Instrumentation, Control. and SCADA System shall include continuous monitoring the process parameters, process flow, tank level and other equipment protection devices. These measurements shall be connected to a network of Programmable Logic Control (PLC) based unit process controllers that will generate pre-programmed monitoring and control actions for process, equipment and other control devices.

A Supervisory Control and Data Acquisition (SCADA) system, networked to the PLC unit process controllers shall acquire and display process parameters, process flow, tank level, etc., monitor and issue remote control actions for maintaining process control. The SCADA system shall also achieve pre-determined process parameters and originate custom performance reports for management reporting.
FOR NETWORK

Section 14. General

The Sewerage Network to be Designed, Built, refurbished if applicable, operated and maintained, as detailed in the ITB/BDS sections, Tested and Commissioned by the Operator shall comply with the guidelines contained in “Manuals on Sewerage and Sewage Treatment - Part A - Engineering, Part B - O&M, and Part C - Management” Latest Edition(s) published by the Central Public Health & Environmental Engineering Organization (CPHEEO), Ministry of Urban Development, Government of India.

Documents Comprising the Technical Standards
The Technical Standards consist of Technical Specification to be followed during Construction of Sewerage Network and other ancillary/allied works for all Civil, Mechanical, Electrical, and Instrumentation required to be executed under this Contract. Notwithstanding the said Specifications, the Operator shall adopt and follow necessary standards and approved Codes /specification wherever required for fulfillment of all the works under this contract.

Supplementing the General Conditions and Design-Build and Operating Services
The Technical Standards specified in Schedule 10 shall be read along with the GCC / SCC and Design-Build and Operations Services Schedules for the purpose of providing greater specificity of the technical standards which the Operator shall meet.

General Quality Standards
The term “General Quality Standard” means a standard of performance which,
(a) Is competent, efficient, economical and in accordance with internationally accepted techniques used in the sewer disposal and civil works construction industries;
(b) Is in accordance with professional engineering, accounting and consulting standards, as applicable, recognized by national or international professional bodies;
(c) Is in accordance with sound management, commercial, technical, design and engineering practices;
(d) Employs appropriate technology and safe and effective equipment, machinery and methods;
(e) Is in accordance with national and local standards and codes in the Owner’s Country;
(f) Protects the interests of the Authorities;
(g) Is in accordance with the Applicable Law;
(h) Is in accordance with the technical specifications and design standards of the Owner as provided to the Operator;
(i) Is in accordance with the applicable Environmental Assessment and Environmental Management and Mitigation Plan; and
(j) Is in accordance with the Design-Build Documents as approved by the Owner.
In the event of any conflict or inconsistency between any standards that comprise the General Quality Standard, local and national standards in the Owner’s Country shall prevail over international standards.

The Operator shall, at all times, carry out the Services in accordance with the Technical Standards as specified and, where a specific technical standard of quality of performance has not been specified, the Operator shall perform the Services to the standard of “General Quality Standards”.

If the Owner is subjected to fines or penalties as a result of the operator’s breach of these Technical Standards, such fines or penalties shall be paid by the Operator

**Design-Build Services**

In respect of the Design-Build Services, the operator shall ensure that the design of the Sewerage Network is prepared by qualified designers who are professionally recognized to design the Sewerage Network and allied services.

The Operator warrants that the operator and its designers have the experience and capability necessary for the design. Planning of the entire system should be done in such a manner so as to optimize capital and operational costs of treatment of sewage and maintenance of the Plant on whole on sustainable basis.

**Section 2  SCOPE OF WORK & CONTRACTUAL REQUIREMENTS**

The scope of work under this contract shall include but not limited to the following and as specified in Bill of Quantities.

i. Review of Owner’s proposals and designs: The Operator has to (i) undertake field survey of the entire area proposed for coverage with sewerage, (ii) check the actual levels with the levels used in the owner’s proposal, (iii) review designs of sewerage system and sewage pumping proposals provided by the owner, (iv) re-design the sewers (using CAD Software) and undertake detailed design of sewage pumping systems wherever necessary and prepare revised drawings, (v) submit the revised designs & drawings and obtain approval of the Owner. The payment will be made as per the quoted rates in bill of quantities for conducting survey, reviewing and redesigning. The Bidder has to consider this aspect and make provision, while quoting the rates for Sewer pipe (less than 300mm), supply, laying and jointing item in the tender.

ii. Conducting Survey for laying of lateral sewers (less than 300 mm diameter) for proposed alignment and levels, at every 30 meters interval and other necessary locations before execution of the work including all data required for generating L section and GIS maps of sewer network. Submission of survey drawings showing L-Sections, ground levels at every
30 meters interval and other necessary locations, detailed strip plans showing adjacent structures etc., in AutoCAD for approval of the Engineer before execution of the work.
iii. Also, conducting Survey for laying of sewers (equal to or greater than 300 mm diameter) for proposed alignment and levels, at every 30 meters interval and other necessary locations before execution of the work including all data required for generating L section and GIS maps of sewer network. Submission of survey drawings showing L-Sections, ground levels at every 30 meters interval and other necessary locations, detailed strip plans showing adjacent structures etc., in AutoCAD for approval of the Engineer before execution of the work. The Operator shall take prior approval of the Owner before surveying in any changes in locations or alignments from the original proposals.

iv. Earth work excavation for pipeline trenches and manhole chambers including depositing on bank including, danger lighting and using sight rails and boning rods at every 100 meters and wherever necessary, including shoring, strutting, bailing out water, as directed with all lifts etc., complete & lead as per Bill of quantities for different strata and depth ranges.

v. De-watering for Excavation in all classifications in watery situation or foul conditions towards, including overnight recuperation for all depth ranges, with all lead and lifts etc., complete.

vi. Providing erecting and removing casurina pole three tier Barricading using poles of 7.50 to 10 cms. Dia. and 1.50m height above ground fixed vertically at intervals of 2.0 to 2.5 m C/C and horizontally at 0.50 m, above ground level, including fixing poles in the ground for a minimum depth of 0.30 m and tied with coir rope firmly including cost and conveyance of all materials, labour, lead and lift charges complete.

vii. Carting of excavated Earth of all types to a lead distance detailed in bill of quantities & stacking of earth at identified suitable site and re-carting back the stacked earth to the same site by vehicle, including loading, unloading charges for to & fro, with all lifts, labour, HOM of machinery etc. complete. Lead distance indicated is one side distance only. Bidder shall quote the rate for to & fro lead distance.

viii. Disposing off the excess excavated earth of all types to a distance detailed in bill of quantities by vehicle, including neatly stacking, loading, unloading, with all lifts, labour, HOM of machinery etc. complete.

ix. Providing and installing steel trench sheeting or sheet piling for both sides of the trench with mild steel sheets not less than 6.5 mm thick, stronger knife edge, recessed spreader sockets, 3" single or double wall shields, to be designed by the Operator to withstand all types of soils, maximum depths of 6m to 12m, as per the design drawing and or as approved by the Engineer-in-charge. Including labour charges for installing and removing the sheet piling at various reaches of sewer line construction, including loading, unloading, transporting to the suitable location etc complete as directed by the Engineer-in-charge. (Measurement shall be taken one side only).

x. Manufacturing / Procurement, Supplying, Laying and Jointing the specified diameters of following pipes, for sewers in ......... 85 AREA:

---

85 *Project shall specify the relevant details.*
- **Glazed Stoneware (GSW) pipes** confirming to IS: 651 with latest revisions & amendments, Spigot & Socket (S&S) type jointed with hemp yarn dipped in tar and with CM 1:1.5 as per IS: 4127 or with rubber gaskets applied with approved glue before inserting of gaskets at manufacturing site, as per standards EN:295, including cleaning the socket & spigot ends with soap solution and applying talcum powder for detecting cracks and jointing at site by pushing, etc. complete. (For cement joint sulphate resisting cement shall be used)

- **RCC NP3 S&S RCC SPUN / VIBRATED CAST PIPES (REINFORCED)** as per IS:458, with latest revisions & amendments, and manufactured using Sulphate Resisting Cement (SRC) confirming to IS 12330, with rubber rings as per IS:5382, and laying as per IS:783 with latest revisions & amendments etc. complete.

- **DI K-7 class pressure pipes with CM lining using SRC** as per IS: 8329 with latest revisions & amendments, with rubber rings as per IS: 5382, and laying as per IS: 12288 with latest revisions & amendments, with matching specials, fittings and jointing materials for sewers at road / railway crossings by trench less method etc. complete.

- **Corrugated HDPE pipes conforming to BIS 16908- part 2-2013**
xi. Construction of all appurtenant structures such as Wire cut Brick, RCC Cast in-situ / Pre-cast manhole structures, using SRC (sulphate resisting cement confirming to IS 12330 with latest revisions) with SFRC frames & covers, plastic encapsulated M.S. footsteps, drop manholes, ventilating shafts, pipe supports, drain and road crossings, etc. as per Bill of Quantities, approved drawings and relevant IS codes including all temporary works and safety measures.

xii. Interlinking the existing sewer lines with proposed lines and vice versa.

xiii. The contract covers, Conducting Level Survey of proposed and Existing sewerage system by Collecting ground levels, invert level of sewers, size and type(material of construction) of Sewers and at every manhole, including depth of manhole and measuring length in between manholes and safely closing the manhole cover, preparation and submission of Drawings in AutoCAD with all particulars in complete manner as per specification and as directed by the Engineer in charge for cross verifying the adaptability of existing sewer network with the proposed, which will be verified by Owner’s engineers, and decision will be given to retain or reject the part or whole of the existing sewer network. Levels shall be carried from the nearest Bench mark given by EMPLOYER for conducting this survey.

xiv. Providing PVC / GSW pipes for House Service Connections from Manholes / Sewer lines as per specifications and approved drawings and as directed by the Engineer etc. including all materials such as connecting pipes, earthwork, pipe line laying and jointing, bedding etc. complete as per Bill of Quantities items of work.

xv. Construction of sewage pumping stations including Electro mechanical works

xvi. Backfilling the trenches in layers of specified thickness, material as per detailed specifications and items in bill of quantities.

xvii. Providing Road or Railway crossing by adopting Trench less Method (i.e. pipe ramming method/ manual pipe jacking method) as per items in bill of quantities at locations shown in the approved drawings, specifications and as directed by the Engineer.

xviii. Taking all measures for complying to the Environmental Management Plan and monitoring the same as per detailed specifications.

xix. Operator shall be responsible for providing insurance as provided in Contract data.

xx. Testing and commissioning the sewers after laying and construction of manholes as per detailed specifications.

xxi. Restoration of Bituminous road with WBM and 20mm thick premix carpet with liquid seal coat as per MORTH specifications and cement concrete roads as per specifications and as directed by the Engineer including preparation of sub-grade, all construction materials, tools and plants etc., complete.

xxii. Submission of as built drawings of sewer lines & its appurtenances, including L-sections and plans as per specifications including existing laterals for which the Operator has conducted the existing system level survey showing the entire sewer network in the scope of this contract. The scope also covers associated civil works including protective works, encasing of pipes with concrete and RCC NP-3 / D.I. and HDPE, PVC pipes at road crossings, all safety measures etc.

xxiii. All works shall be done as per the specifications in Bill of Quantities and in compliance to the Technical, Financial bids and as directed by the Engineer. The work shall be executed on item rate basis. Indicative Drawings related to the works to be done, are given for guidance of the
Operator. For the execution of Works, exact details will be given in construction drawings based on the alignment drawings given by the Operator. The prospective bidder is expected to visit the site of works at his own expense to fully study the local conditions and to familiarize with the working area and local conditions and include all such factors in his quoted rates.

xxiv. Trial run of the System:-After commissioning of works or a section of the completed works, the Operator shall conduct trial run to demonstrate satisfactory performance to the Engineer prior to declaring commencement of O&M.

Operator’s Inspection of Sites

The Operator is deemed to have visited the sites and familiarized himself of the conditions and restrictions under which the work will be executed. The omission of any details shall not relieve the Operator of his prima facie obligation and responsibility under the Contract to carry out and successfully complete the contract. The Owner will entertain no monetary or other claims, made by the Operator on the grounds of ‘want of knowledge’.

Work plan

The Operator shall prepare the work plan for the execution of works, which includes procurement of pipes before starting of the works. The Operator shall submit the planning (Survey, reviewing and redesigning, Construction, Quality control, and Commissioning) within 14 days after issue of letter of acceptance and take necessary approvals for the same. The planning’s shall be done on MS project and indicate, resources such as material, manpower, cash-flow etc. to complete the works as per agreed time. The planning shall include all allowances to guard against delays caused due to inclement weather or its effects (such as floods or draughts), fire or industrial disputes, unless such events could not reasonably have been foreseen by an experienced Operator.

Alignment Survey and the L-Sections

The Operator shall carry out the Survey work for laying of lateral sewers (less than 300 mm diameter) for proposed alignment and levels, at every 30 meters interval and other necessary locations, before execution of the work, including all data required for generating L section and GIS maps of sewer network. Operator shall submit the survey drawings showing L-Sections, ground levels at every 30 meters interval and other necessary locations, detailed strip plans showing adjacent structures etc., in latest version of AutoCAD for approval of the Engineer before execution of the work. The Operator shall be deemed to have considered this aspect and made provision, while quoting the rates for Sewer pipe (less than 300mm), supply, laying and jointing item in the tender. If the alignment and flow directions of the sewers are to be changed according to the site conditions and the Engineer In-charge agrees to that, the Operator has to redo the alignment and level survey at every 30 m and junction points, and submit all the details in latest version of Auto Cad in soft form to OWNER, for re-design of that particular stretch and take up the work on receipt of approved designs from OWNER.
Also, the Operator shall carry out the Survey work for laying of branch/ sub-main /main / trunk sewers (more than 300 mm diameter) for proposed alignment and levels, at every 30 meters interval and other necessary locations, before execution of the work, including all data required for generating L section and GIS maps of sewer network. Operator shall submit the survey drawings showing L-Sections, ground levels at every 30 meters interval and other necessary locations, detailed strip plans showing adjacent structures etc., in latest version of AutoCAD for approval of the Engineer before execution of the work. The Operator shall take prior approval for location and length of the survey work for this paid item. The payment will be made as per the quoted rates for conducting survey in bill of quantities. If the alignment and flow directions of the sewers are to be changed according to the site conditions and the Engineer In-charge agrees to that, the Operator has to redo the alignment and level survey at every 30 m and junction points, and submit all the details in latest version of Auto Cad in soft form to OWNER, for re-design of that particular stretch and take up the work on receipt of approved designs from OWNER. The alignments, L-section and location of manholes may be changed at site if required, and after approval of the Engineer.

The Survey work for all the sewer lines (for all diameters of sewers) alignment shall also include the following:

a) All the Survey works shall be carried out from G.T.S. Benchmarks, using Total Station instrument of standard make, and by qualified survey personnel. The survey shall consist of field data collection and related attribute information collection of all the aspects using GPS and transferring to GIS map of sewer network before and after laying of sewer pipes and allied structures, as required by OWNER.

b) Field attribute collection for Mapping with respect to existing sewerage network does not require any digging in the field. The existing maps / OWNER field staff knowledge can be utilized by the Operator to provide the data for mapping the said network and it will be paid as per the survey work item in Bill of quantities.

c) Network entity’s attribute information like pipe dia, pipe type, ground material, depth of the pipe, manhole type; manhole size, manhole depth etc. shall be submitted.

d) The data pertaining to House Service Connections (connection to consumers) have to be collected up to building footprint and submitted.

e) The Operator shall communicate regularly, with the OWNER regarding the GIS mapping survey data and for clarifications.
Section 3 Technical Specifications

1 Applicable I.S. codes or other Standards

The Technical Standards and Specifications contained in this contract shall be read along with the following standard specifications (latest versions) published by the Bureau of Indian Standards listed below:

IS: 3764 with latest revisions & amendments ~ Excavation work- code of safety
IS: 8112 with latest revisions & amendments specification for 43 grade OPC cement
EN: 295 with latest revisions & amendments ~ Specification for GSW pipes with rubber gasket joints.
IS: 783-1959 with latest revisions & amendments ~ Code of Practice for Laying of Concrete Pipes
IS: 12288 with latest revisions & amendments ~ Code of practice for use & laying of ductile iron pipes
IS: 16098 (part 2): 2013 - Structured wall piping system for non-pressure drainage & sewerage
IS: 4111 (Part 1 to 4) with latest revisions & amendments ~ Code of practice for ancillary structures in sewerage system.
IS 12592 with latest revisions & amendments ~ Specification for manholes covers and frames.
IS: 3597 with latest revisions & amendments ~ Method of tests for concrete pipes.
IS: 5382 with latest revisions & amendments ~ specification for rubber sealing rings for gas mains, water mains and sewers.
IS: 383-1970 with latest revisions & amendments ~ Aggregates of Concrete
IS: 516 with latest revisions & amendments ~ Methods of test for strength of concrete
IS: 2212-1962 with latest revisions & amendments ~ code of practice for Brickwork
IS: 2250 with latest revisions & amendments ~ Code of practice for preparation and use of masonry mortars
IS: 73 with latest revisions & amendments ~ Specification for Paving Bitumen.
IS: 215 with latest revisions & amendments ~ Specification for Road Tar.
IS: 460 (Part 1 to 3) with latest revisions & amendments ~ Specification for Test Sieves.
IS: 2386 (Part 1 to 8) with latest revisions & amendments ~ Methods of test for aggregates for concrete.
IS: 2720 with latest revisions & amendments ~ Method of Test for soils.
IS: 6241 with latest revisions & amendments ~ Method of test for determinations of stripping value of road aggregates
IRC: 16 with latest revisions & amendments ~ specification for priming of Base course with Bituminous Primers.
IRC: 17 with latest revisions & amendments ~ Tentative for single coat Bituminous surface Dressing.
IRC: 19 with latest revisions & amendments ~ Standard specification and code of practice for water bound macadam
IRC: 29 with latest revisions & amendments ~ Specification for bituminous concrete for road pavement
IS 6280 – 1971 – Sewage Screens
IS 8413 – 1982 – Biological Treatment Equipment – Part II and its modifications
IS 10261 – Requirements for settling tank for waste water
IS 105533 – Part I, II, III – Chlorination Plants
IS 5600 – 1970 - Sewage and Drainage Pumps
IS 6279 – 1971 – Grit Removal devices
The list is not exclusive and the operator shall be responsible to follow the appropriate standards.

**Equivalency of Standards and Codes**

Wherever reference is made in the Contract to specific standards and codes to be met by the goods and materials to be furnished, and work performed or tested, the provisions of the latest current edition or revision of the relevant standards and codes in effect shall apply, unless otherwise stated in the Contract. Where such standards and codes are national, or relate to a particular country or Region, other authoritative standards which ensure an equal or higher quality than the standards and codes specified will be acceptable subject to the Engineer's prior review and written approval. Differences between the standards specified and the proposed alternative standards must be fully described in writing by the Operator and submitted to the Engineer at least 28 days prior to the date when the Operator desires the Engineer's approval. In the event the Engineer determines that such proposed deviations do not ensure equal or higher quality, the Operator shall comply with the standards specified in the documents.

**2 Samples and Tests**

a) The Operator shall be responsible to develop a quality control program and to provide all necessary materials, apparatus, instruments, equipment, facilities, and qualified staff for sampling, testing and quality control of all the materials used for the works under this Contract.

b) The Operator shall obtain the approval of the Engineer for the quality control programme developed by him and incorporate any modifications suggested by the Engineer at no extra cost. Without limiting the generality of the foregoing, the Operator shall either –establish a testing laboratory at the site of works which is adequately equipped and staffed to carry out all sampling and testing in accordance with the requirement set out in the Specifications and /or
these Special Specifications and provide all field equipment and apparatus as necessary to conduct all specified in-situ tests and/or any Tests on Completion, or arrange for routine sampling, testing and reporting, as required, through a certified independent testing laboratory approved by the Engineer.

c) All costs of such sampling, testing and reporting of test results will be borne by the Operator, and the Operator shall include sufficient provisions in his tendered rates to allow for independent sampling and laboratory testing under the direction of the Engineer of the required tests at no additional cost. The Operator shall furnish certified copies of all test reports to the Engineer within 5 days of completion of the specified tests (The tests shall be conducted immediately prior/after delivery at site as directed by the Engineer In-charge / on due date of sample testing, as per relevant IS for In-situ items.)

d) The Operator shall, within 21 days after the date of the Letter of Acceptance, submit to the Engineer for his consent a detailed description of the arrangements for conducting the quality control program during execution of the Works, including details of his testing Laboratory, equipment, staff and general procedures. If following submission or at any time during the progress of Works, it appears to the Engineer that the Operator's quality control programme is not adequate to ensure the quality of the Works, the Operator shall produce a revised program as desired by the Engineer, which will be adequate to ensure satisfactory quality control.

e) Tests during Construction

For ensuring the requisite quality of construction, the Materials and Works shall be subject to the quality control tests as described in relevant IS as specified/applicable and as directed by the Engineer. The testing frequencies set forth are desirable minimum and the Engineer shall have full authority to get the additional tests carried out by the Operator as frequently as he may deem necessary, to satisfy himself that the Materials and Works comply with the appropriate Specifications. Where no specific testing procedure is mentioned, the tests shall be carried out as per the prevalent accepted Engineering practices as per the directions of the Engineer.

f) Third Party Inspections

The Operator shall, at his own or manufacturer’s cost, at manufacturers premises, provide the necessary gauges, supply and prepare all test pieces and supply all labour and apparatus for testing which may be necessary for carrying out the tests as required as per relevant latest Indian Standard for all materials specified.

The Owner appointed Third party inspection agency will inspect and certify the quality of specified materials as per relevant latest Indian Standard with all amendments. The inspection and certification charges will be paid directly by OWNER to the Third Party Inspecting and certifying Agency. The Operator shall be responsible to obtain permission and provide all facilities to carry out such testing as required.

A mutually agreed quality assurance plan with, minimum requirements as specified below will be developed which provides for inspection and certification by the Third party inspection agency at specified times during the manufacture, fabrication and installation at site of such items.
List of Items, which will be subject to, third party inspection and stages of inspections are as tabulated below:

<table>
<thead>
<tr>
<th>Sl. No.</th>
<th>ITEMS</th>

</table>
| 1).    | RCC Pipes & rubber rings. | Visual and dimension check.  
Quality of raw materials as per IS: 458 with latest revision and amendments.  
Physical requirements as per IS: 458 with latest amendments.  
Hydrostatic Test  
Three edge bearing Test & permeability test as per IS: 458 with latest amendments.  
All other Tests as may be found necessary as per relevant Indian standards.  
Rubber ring for corrosion/elongation as per relevant IS Code and  
All other tests as per relevant standards as mentioned in this Technical specifications and approved QAP. |
| 2).    | Stoneware Pipes, specials & rubber rings. | General Quality, Visual and dimension check as per as per IS: 651 with latest revision and amendments.  
Hydraulic and water Absorption test as per as per IS: 651 with latest revision and amendments.  
Acid and Alkali resistance test as per as per IS: 651 with latest revision and amendments.  
Crushing strength test as per as per IS: 651 with latest revision and amendments.  
EPDM Rubber rings for Elongation and other test as per relevant standard.  
All other tests as per relevant standards as mentioned in this Technical specifications and approved QAP. |
| 3).    | PVC pipes and Specials | 1. General Quality, Visual and dimension check as per as per relevant IS with latest revision and amendments.  
2. Hydraulic test as per relevant IS with latest revision and amendments.  
3. Acid and Alkali resistance test as per as per relevant IS with latest revision and amendments.  
4. All other tests as per relevant standards as mentioned in this Technical specifications and approved QAP. |
| 4).    | DI Pipes, rubber rings & Specials. | Visual and Dimensions Check  
Review of Chemical and Physical test certificates as per relevant IS standards. |

3. **Sign Board**

The Operator shall provide sign boards at the sites of the Works of approved size and design as directed by the Engineer, which provides (i) the name of the Project and National Mission for Clean Ganga; (ii) the logo of “Namami Gange” (iii) the names and addresses of the Owner, Operator and Consultants; (iv) short description of the Project, (v) the Contract amount (vi) the starting and completion dates. Such sign boards shall be located at specified places in the project coverage area as directed by the Engineer. Operator shall take care of signboard and replace it in case of loss, damage, theft etc., the sign boards may be in English or Hindi/ local language or in both as directed by the Engineer.

4. **Protection of Utilities**

a. The Operator is required to examine carefully the locations of the works and their alignments. Operator is to make enquiries and co-ordinate with all the departments /authorities concerning all utility lines such as water pipes, sewers, gas pipe, telephone (underground and /or overhead) lines,
optic fibre cables, electric and telecommunication cables (underground and/or overhead), any other utility lines etc.; to determine and verify to his satisfaction the character, sizes, position and lengths of such utilities from authentic records.

b. The Operator shall be wholly responsible for the protection of such utilities as may be required, and shall not make any claim for extra work or extra time that may be required to protect such utilities. Any damage to the Utilities shall be restored/ repaired at Operator’s own cost. Shifting of any utilities if required will be taken up by OWNER or any other agency separately after site inspection.

c. In case of water supply house Service connections, if the connections encountered in the corridor of execution of the Bill of Quantities item of work of this package is damaged even after taking all precautions by the Operators for the safety of the structures, the cost of the item shall be paid to the Operator as per approved Bill of Quantities item rates in the contract.

d. In case the alignment of the pipeline crosses the high tension electrical transmission lines belonging to the other authorities/ departments, the Operator shall take all precautions necessary to see that the work is carried out with care and safety, without disturbing such transmission lines. The Operator will be responsible to carry out all construction activities in such reaches in consultation with the owners of such facilities. However, satisfactory completion of the entire work will be the responsibility of the Operator.

5. Performance Requirements:
The performance requirements have been spelt out in various parts of the Contract specification. The Operator shall ensure that, he fully understands and complies with all the requirements specified in the Contract. However, in the event of any conflicting performance requirements spelt out in the documents, the Operator shall promptly bring such matters in writing to the attention of the Engineer for Engineers decision. The Engineer’s decision will be conveyed to the Operator in writing and which is final. The Operator shall fully comply with Engineer’s decision on the matter. The Operator is deemed to have read and understood all performance requirements before bidding and he shall have no claim whatsoever with respect to the Engineer’s final decision on the matter.
6. **Operator’s Obligations:**

The Clauses in this section are meant to provide general guidelines and Compliance requirements to the Operator. It does not however relieve the Operator from taking every other step and precautions as deemed necessary to complete the works successfully within the specified Contract period and bid amount. Also, compliance to the approved Environmental management plan and monitoring the same is part of the contract.

**Environmental Management Plan and Monitoring.**

The Operator shall be responsible for the mitigation measures to be taken for complying to the Environmental management plan and monitor as described below.

**Environmental Management Plan - Construction Phase**

[EA to insert project specific EMP here.]

7. **Penalty on account of non-compliance**

If the operator in the opinion of the engineer in-charge does not comply to the environmental management plan and monitoring, the engineer in-charge reserves the right to stop the work and any delay on account of this will be on the part of the operator and penalty as per liquidated damages clause in conditions of contract and contract data shall be imposed upon approval by the concerned engineer, owner.

8. **Confined Space Safety Procedure:**

The Operator shall implement a well-prepared Space Entry Safety Procedure to work in Confined areas / Elevated areas. Such procedures shall incorporate all aspects of staff work activities, internationally adopted best practices, site staff and workmen training, hazard awareness, first aid procedures, particularly applicable to workmen in Elevated / Confined space, provision and use of appropriate safety equipment’s, personal hygiene, safety / emergency procedures, method of easy evacuation of workers etc. The Operator has to develop and implement his own safety procedures. He should also provide necessary insurance to the workers involved in the execution of work.

9. **Special Traffic Precautions**

Operator’s Attention is specially drawn to the requirements by the traffic police and road authorities and specification regarding traffic control, access and reinstatement of road surface. It is necessary to obtain permission from traffic Inspector of Police prior to taking up any stretch of road for excavation and sewer laying. It is necessary to carry out the work in such a manner as to cause minimum interference with the public use of roads, footpaths and other thoroughfares.
10. Working in Restricted areas
In addition to the clause stated in other section of the special specification the Operator shall determine prior to constructing the lengths of sewers where access to properties commercial, domestic and institutional will be restricted.

The identification of these areas shall be agreed in consultation with the Engineer, Police and Urban local body. In this case it may be necessary to operate one-way traffic system or to close roads. The Operator shall be responsible for liaising with the police and other local representatives to obtain permission to close roads or restrict traffic movement. No additional time will be allowed for these pre-construction activities. Where roads are closed alternative routes are to be determined in conjunction with the authorities. Sign Boards are to be placed at both junctions of the route indicating “ROAD CLOSED & WORK UNDER PROGRESS”. The expense for the same shall be borne by the Operator. The Operator shall discuss these arrangements with the occupants of houses affected to ensure that their disruption is kept to a minimum. The Operator is to offer assistance to residents who are infirm or need special arrangements for access during construction.

In narrow roads and streets it may not be possible to operate excavation machinery in such cases hand excavation is to be done. The method of operation, length of sewer to be excavated, method of barricading, property access, dewatering, shoring, pipe laying, backfilling and road reinstatement shall be stated in a ‘Method Statement’ to be submitted at least 4 weeks before work is scheduled to commence in a particular location. The written agreement of the Engineer shall be obtained to the method statement. If any additional safeguards are required by the Engineer these shall be incorporated in the method statement at no extra cost and the method statement is to be resubmitted.

The Operator will ensure that the noise created by his activities is suppressed. Adequate silencers fitted to construction machinery, particularly compressors and drills. Dust is to be kept to a minimum by using water sprinklers. Utility service connections shall be maintained to every property throughout the construction phase and thereafter. If any defect/damage is caused it shall be repaired immediately and at the Operator’s expense. The disruption to the normal activities of residents and other members of the public is to be kept to an absolute minimum. Providing adequate noise control and other nuisances are kept to a minimum, extended working hours may be permitted with the agreement of the Engineer and local residents. No additional payment shall be made for any of these arrangements unless otherwise specified. Adequate lighting shall be provided by the Operator at his cost if night working is adopted.

11. Interfaces with other packages
If this contract Package will have interface with other contracts, the Operator shall only undertake the end connections of sewers at the interface points, after the sewer has passed the hydraulic test on completion of end connections. The Operator shall lay the bedding and backfill for sewers in normal manner.

12. Measurements & Payments
a. MEASUREMENTS

i. Quantities
The quantities set out in the Bill of Quantities are the estimated quantities for the Works, and they are not be taken as the actual and correct quantities of the Works to be executed by the Operator in fulfillment of his obligations under the Contract.

ii. Works to be measured
The Engineer shall, except as otherwise stated, ascertain and determine by measurement the value of the works in accordance with the contract and the Operator shall be paid that value in accordance with applicable clauses of this contract. The Engineer shall, when he requires any part of the works to be measured, give reasonable notice to the Operator’s authorized agent, who shall:

Forthwith attend or send a qualified representative to assist the Engineer or his representative in making such measurement, and supply all particulars required by the Engineer or his representative.

Should the Operator not attend, or neglect or omit to send such representative, then the measurement made by the Engineer or his representative or approved by him shall be taken to be the correct measurement for such part of the works. For the purpose of measuring such Permanent Works as are to be measured by records and drawings, the Engineer shall prepare such records and drawings as the work proceeds as he deems necessary or appropriate and the Operator, as and when called upon to do so in writing, shall within 14 days, attend to examine and agree such records and drawings with the Engineer and shall sign the same when so agreed. If after examination of such records and drawings, the Operator does not agree the same or does not sign the same as agreed, they shall nevertheless be taken to be correct, unless the Operator, within 14 days of such examination, lodges with the Engineer notice of the respects in which such records and drawings are claimed by him to be incorrect. On receipt of such notice, the Engineer shall review the records and drawings and either confirm or vary them.

iii. Method of Measurement
The Works shall be measured net, notwithstanding any general or local custom, except where otherwise provided for in the Contract.

b. PAYMENTS
No part payments will be made for all items of works under this contract, except for pipeline works, which will be paid as mentioned in contract data.

13. Earthwork excavations

a. General
The Earthwork Excavation for laying of sewers shall be carried out as per applicable IS specifications, specification in the Bill of quantities and applicable clauses in this specifications.

The Operator shall make all excavations required for laying and jointing of the pipeline and construction of pertinent structures as required by the project. Except where otherwise required by the project or instructed by the Engineer, all excavation shall be in open cut, to the specified widths and depths with shoring, strutting and bracing. The Operator is advised to satisfy himself and shall be deemed to have
quoted rates accordingly with regard to the likely conditions that may be met with during the execution of the works, with regard to the underground obstructions or conditions, necessary dewatering requirements including well point system or other means of dewatering the trenches before, during and after excavation, laying of bedding material, laying and jointing sewers, hydraulic testing and till backfilling, construction of manholes, pipe supports etc., in sub terrain underground water, rain water, sewage and waste water etc.

Earth work excavation for pipeline trenches and manhole chambers including depositing on bank including, danger lighting and using sight rails and boning rods, including shoring, strutting, bailing out water at every 100 metres wherever necessary as directed in the various strata with lead upto 30 meters and all lifts etc., complete. A minimum of three numbers of sight rails are to be maintained at all times during pipe laying between manholes, including barricading as per directions of Engineer In-charge of work. (The Excavation cost should include the cost of shoring, strutting to facilitate for laying, jointing & testing of sewers, manholes).

Classification of Excavation

**All Soils includes the following,**

(a) Soft clay, soft murrum, gravel shale etc. including. Stiff heavy clay, hard shale or compact murrum requiring drifting tool or pick axe or both and shovel closely applied.

(b) Gravel, soft laterite, kankar and cobble stone having maximum diameter in anyone direction between 75 mm and 300 mm.

(c) Soling of road paths etc., and hard core.

(d) Macadam surfaces such as water-bound and bitumen/tar bound.

(e) Lime concrete, stone masonry in lime/cement mortar below ground level.

(f) Generally any material which requires the close application of pick axe or scarifiers to loosen and not offering resistance to digging, greater than that offered by the hardest of any soil mentioned above.

**Disintegrated Rock (D.I.R.) soft rock and medium hard rock includes,**

(a) Ordinary rock comprising of lime stone, sand stone, hard laterite fissured rock, conglomerate or other soft or disintegrated rock which may be quarried or split with crow bars.

(b) Un-reinforced cement concrete which may be broken up with crow bars or pick axe and stone masonry in cement mortar below ground level.

(c) Boulders which do not require blasting having maximum diameter in any direction of more than 300 mm; found lying loose on the surface or embedded in river bed, soil, talus, slope, wash, and terrace material of dissimilar origin.

(d) Hard laterite does not require blasting. It is to be classified under ordinary rock which does not require blasting.

**Hard Rock includes,**
Any rock or cement concrete or RCC, excavation of which require the use of mechanical equipment or chiselling.

All soils
The Earth work excavation in all soils, including the ones mixed with boulders of up to 30 cms size, includes excavation both by manual and machine excavation based on location of excavation and space constraints. The quoted rates are applicable for both manual and machine excavation, the location and extent of manual and machine excavation should be as described below.

Manual excavation
The manual excavation for laying the sewers in pipeline trenches shall be carried out as decided and directed by the Engineer in-charge, along the alignment of such narrow roads and main roads where it is not possible for machine excavation and, at excavations in deeper depths of more than 3m, providing all safety measures to workmen at Operator’s risk, also, manual excavation is to be adopted at the possible locations of underground utilities to safeguard against damage.

Machine excavation
The machine excavation for laying the sewers in pipeline trenches shall be carried out along the alignment of wide roads and in depths where there are no underground utilities without causing any damage to public property, and inconvenience to public

Disintegrated Rock, Soft Rock and Soft Shale
This category includes excavation in disintegrated rock, soft rock, soft shale and in medium rock comprising of lime stone, hard shale, schist, fissured rock, and all types of laterite with varying densities and composition requiring chiseling which can be cut by shovel and but without resorting to blasting.

Hard Rock
This category includes excavation in hard rock requiring hand and/or mechanical chiselling. In case of difference in opinion between the classifications of rocks, the decision of the Engineer shall be final and binding on the Operator.

14 Shoring and Bracing
   a) As per Specifications and directions of the Engineer, the Operator shall supply, fix and maintain necessary sheathing, shoring and bracing etc., in steel or wood, as may be required to support the sides of the excavation, to protect workmen in the trench and to prevent any trench movement which might any way injure or delay the work, change the required width of the trench, make unsafe condition for adjacent pavements, utilities, buildings or other structures above or below ground.
b) Sheathing, shoring and bracing shall be withdrawn and removed as the backfilling is being done, except when the Engineer may agree that such sheathing, shoring and bracing be left in place, at the Operator's request. In any case, the Operator shall cut off any such sheathing at least 600 mm below the surface and shall remove the cut off material from the trench.

c) All sheathing, shoring and bracing which is left in place under the foregoing provisions shall be removed in a manner so as to, not endanger the completed work or other structures, utilities or property, whether public or private.

**Excavation in Rock**

Excavation in rock shall be carried out without resorting to any kind of blasting, to a depth, 150 mm more than the bottom level of pipe and to a width equal to the diameter of the pipe plus specified working space on either side as given in drawing / as mentioned above. Unless otherwise directed by the Engineer, rock excavation shall be progressed at least by 20 m in advance of the pipe length proposed to be laid.

**Limits of excavation.**

The trench for laying of sewers and construction of manholes shall be excavated in accordance with the relevant applicable Indian standard, as per the approved drawings, or as directed by the Engineer. The width at bottom of trenches for sewers, unless otherwise specified in the approved construction drawings, or directed and approved by Engineer, for different diameters of pipes laid at different depths shall be as given below,

a) For all diameters, up to an average depth of 1.20 m, width of trench in mm is equal to diameter of pipe plus 300 mm.
b) For all diameters for depths above 1.20 m, width of trench in mm is equal to diameter of pipe plus 400 mm.
c) Not with standing (a) and (b) the total width of trench should not be less than 0.75 meters for depths exceeding 0.90 meters.

The width at top of trenches for sewers shall depend on depth of sewer, location and alignment of sewer, as per the approved construction drawings and directions of Engineer. Unless other wise specified in the drawings or directed by Engineer, for providing of sheet piling as per specifications in Bill of quantities, the top widths for excavations up to 2 meters depth shall be equal to bottom width (i.e. vertical side cuts.) and for depths beyond two meters depth, for all types of soils/rock, steps shall be provided of 0.30 m width on either side of the trench at every lift of 2 meters and as per the directions of Engineer. The quoted rates for excavations in accordance with the above specifications shall include all shoring and strutting for all depths.

The depth of excavations shall limit to the specified gradients/reduced levels as per the approved construction drawings at ends, considering the necessary beddings / encasement / surround.

The Operator shall not excavate beyond the dimensions specified as above. Should the excavation occur beyond the dimensions specified therein, because of the negligence of the Operator, the Operator shall fill the excess space with granular material or concrete as directed by the Engineer. Nothing extra shall be paid to the Operator on account of this. The Operator shall quote the rates for excavation items, limiting the trench widths as above for whatsoever depths encountered, including necessary arrangements as
required. Any extra claim and increase in quantity other than the widths specified above, shall not be entertained or paid.

15 Trial pits
Trial pits shall be excavated by the Operator, as directed to do so, along the lines of the trenches as shown on the drawings in advance of the excavations for the purpose of satisfying himself as to the location of underground utilities, obstructions or soil strata’s and conditions. Trial pits shall be excavated preferably by manual excavation. The Operator has to take the permission of the concerned Executive Engineer, OWNER, before taking up the work.
It involves, Earth work excavation for trial pits in all kinds of strata and for all depths, recording necessary details of underground utilities and kind of strata, including depositing on bank excavated earth, including barricading, posting safety sign boards, shoring, strutting, bailing out water, wherever necessary as directed with all lead and lifts etc., complete. Any damage to the existing utilities unless otherwise specified shall be repaired at Operator’s own cost. The Precautionary measures shall be taken by the Operator while making trial pits and shall inform the Engineer before commencing such works. The Operator will be paid as per the item in BOQ on account of this work.

a. Dewatering
Extra charges will be paid at quoted rates, for excavation in all classifications in watery situation or foul conditions towards dewatering including overnight recuperation for specified depth ranges with all lead and lifts etc., complete, including cost of installation and running of dewatering system such as well point system / any other system wherever required.
Dewatering shall be done in accordance with specifications. The Operator shall be responsible for the adequate pumping, drainage and bailing out of water from the excavation in case of inundation etc., of trenches. The sewer lines shall be laid above normal ground water table level and as directed by the Engineer. Dewatering shall be either continuous or intermittent using Diesel pump or any other method approved by the Engineer. The method of dewatering shall depend on site condition and should be furnished by the Operator and approved by the Engineer. The method of dewatering shall be either well point system or sump pumping. The effectiveness of each method will depend upon the nature of the soil, the proportions of the trench and degree of lowering required. Pumping test may be necessary to determine which method is Suitable.
If sump pumping is not practicable other control methods shall be considered and should be approved by the Engineer. The trenches should be kept dry till the completion of work, which includes excavation, pipeline laying, jointing, testing and commissioning and backfilling. Precaution should be taken against the floatation of the pipes.
The Operator shall conduct ground studies if found necessary and the cost for such studies has to be borne by the Operator himself. The Operator shall be responsible for the adequate pumping, drainage and bailing out of water met due to all causes from the excavation for laying sewer lines, construction of manholes, wet wells and all types of constructions. In case of failure to make such provisions or any other provisions, which may result in unsuitable sub-grade conditions, the Operator shall replace and repair the sub-grade as directed to the satisfaction of the Engineer, at his own cost and responsibility.
Should the Operator select to use a gravel sub-grade with or without un jointed pipes with the gravel layers to facilitate flow of water to pumps or other points of disposal, such gravel sub grade with or without conveying pipes shall not be measured or paid as an extra item.
**Sump pumping**
This method may be used in highly and moderately permeable soils such as gravels, sand and gravel mixtures. This method is simple and cheap to install and used with watertight trench sheeting to limit the volume of flow. To prevent the boiling in the bottom of the trench the following precaution should be taken:

- Drive sheeting deeper to lengthen drainage path
- Use open pipe surrounded in gravel as a sump.
- Move the sump to one side of the trench

To prevent removal of fines from soil causing loss of strength in the soil and undermining of the trench bottom and side support:

- Surround suction inlet with protected graded filter
- Increase flow rate through the soil by using open pipe surrounded with gravel.

The delivery side of the pump should be monitored by taking samples of water and checking the proportion of fines being removed. If fines are being continuously withdrawn or there are signs of trench instability, sump pumping should be stopped and alternative methods to the considered.

**Well pointing**
In this method, well points are installed at regular intervals on one or both sides of the trench and linked parallel to a header main connected to a pump. Well points are usually installed at 0.6 to 2.0m centre to centre by jetting them in ground with dense layers or cobbles & boulders it may be necessary to pre bore the layers. The efficiency of the well points is increased by sanding in the well point and riser using a column of sharp sand. This Method has an advantage of drawing water away from the trench and in suitable conditions is effective in lowering the water by 4 to 6m. It will also reduce the hydrostatic heads on the trench support system. It is of greatest use, in sand, the heavy flows in permeable ground, such as gravels, the well points should not to be so close together that the method becomes impractical. In clays the rate of seepage is too small for the system to be properly effective. Silts can be stabilized in certain conditions by using special procedures.

The well pointing shall be either single sided well point or double sided well point. For higher depths double sided well point with multi stage shall be considered. Should the Operator select to use a gravel sub-grade to facilitate flow of water to pumps or other points of disposal, such gravel sub-grade shall not be measured or paid for as an extra item. Operator should assess the availability of extra earth required for refilling in case of shortage in any particular reach well before quoting rates. Even in case the Operator resorts to mechanical excavation, the Operator should take care of proper refilling, consolidation and disposal of surplus earth. Disposal of ground water is to be away from the area of influence of the pipe laying area Suitable temporary pipelines are to be laid to existing watercourses.

**b. Slips and slides**
The Operator is responsible for proper protection of excavations made by him from any slips and slides. All slides and caving shall be handled, removed or corrected by the Operator without any extra compensation at whatever time and under whatever circumstances they may occur. The excavations shall be made good and brought to necessary depth, width and levels without any extra cost. Special care should be taken to protect the safety of the workmen, staff and public or whoever at the site.
c. **Stacking of excavated material**

Pursuant to specification in Bill of Quantities or directions of Engineer in-charge of execution, the excavated material shall be stacked at suitable locations so as not to cause any inconvenience to the public or traffic, with all safety measures in accordance with IS 3764 with latest revisions and amendments. The excavated material shall be placed away from the sides of the trench. The excavated materials shall be stacked at a suitable distance, keeping in view the safety aspect of working personnel due to sliding and slippage based on nature of soil and condition. The Operator shall be solely responsible for the untoward incident caused due to his negligence of stacking the excavated material. Under circumstances where in, sewers have to be laid in narrow pathways, the excavated material shall be transported or placed with all lifts & lead as detailed in bill of quantities to the nearby suitable place or as decided by the Engineer and brought back after laying and jointing for refilling of the trenches as per specifications under clause 19.12.

d. **Barricading**

The Operator shall Provide, erect and remove casurina pole three tier barricading using poles of 7.50 to 10 cms. Dia. And 1.50m height above ground fixed vertically at intervals of 2.0 to 2.5 mtrs. C/C and Horizontally at 0.50 mtrs, above ground level, including fixing poles in the ground for a minimum depth of 0.30 mtr. and tied with coir rope firmly including cost and conveyance of all materials, labour, lead and lift charges complete. The work will be paid as per the item in the BOQ.

e. **Carting and Re-Carting of Excavated earth**

The carting of excavated earth, of all types and at all depths, from trenches is to be carried out, for laying of sewers and construction of manholes in narrow roads and other roads where there is a space constraint, and at locations directed by the Engineer In-charge. where the trenches are to be backfilled with the same excavated earth, the excavated earth shall be Carted to a lead distance detailed in bill of quantities & stacking of earth at identified suitable site and re-carting back the stacked earth to the same site by vehicle, including loading, unloading charges for to & fro, with all lifts, labour, HOM of machinery etc. complete. Lead distance indicated is one side distance only. Bidder shall quote the rate for to & fro lead distance., Also, Disposing off the excess excavated Earth of manhole chambers & pipeline trenches of all types to a lead distance detailed in bill of quantities by vehicle, including neatly stacking, loading, unloading, with all lifts, labour, HOM of machinery etc. complete

The responsibility of locating the site for stacking or disposal of excavated earth shall be the responsibility of the Operator, in coordination with the OWNER. Stacking/Disposal of earth shall not cause inconvenience to public or other agencies and should not cause environmental problems. The location and extent of the above specified work shall be taken up by the Operator, only after the approval and proper directions by the concerned Engineer, OWNER. The work will be paid as per the item in BOQ.

f. **Safety measures**

Pursuant to Specifications in bill of quantities, relevant Indian standards or directions of the Engineer, the Operator shall provide adequate safety measures. They shall include:

(a) Barricading all sides of the open trenches.

(b) Red danger lights as can be easily visible from dusk to dawn at an interval of 20 m and at all the road crossings.

(c) Traffic signals and display boards giving direction for diversion of traffic at the appropriate places as may be directed by the Engineer.
(d) Adequately safe wooden plank / board or steel plate over the trenches at every 15 meters interval or less depending upon access requirement to commercial, institutional and domestic properties to facilitate crossing by the public residing on either side of the trench.

(e) Round the clock watch and ward maintaining all safety regulations at the site of work and protecting the site from unauthorized intrusions.

(f) The work due to the above facilities/arrangements by the Operator will be paid for the items in bill of quantities and the cost for the remaining shall be deemed to be included in the relative items of work.

Progress of Excavation

(g) The Operator shall adjust excavation of trenches in such lengths that the pipes can be laid in such exposed portion of the trench within 3 days / less than 3 days as per criticality of site condition and directions of the Engineer.

(h) Unless otherwise directed by the Engineer, the following limitations for lengths of open trenches shall rule for a pipeline in one continuous reach.

(i) Not more than 50 m in built up area and 150 m elsewhere shall be opened in advance of pipe laying.

(j) Not more than 50 m of pipeline left uncovered after pipe laying in built up areas and not more than 150 m elsewhere.

g. Excavation for Manholes, Other Appurtenant and Structures.

(a) Excavation for Manholes and other appurtenant structures shall be done in accordance with the applicable clause of this Section. The Operator shall excavate as required for all the structures with foundations to firm, undisturbed earth up to the level of the underside of the structure.

(b) If the excavation is in rock, the Operator shall excavate all rock at least to the minimum limits shown in approved drawings.

(c) The standard details for trenches and to the grade of the bottom of Manholes and other structures are as per applicable clauses in this section and construction drawings issued for the execution of work. Where the bottom of the structure is in rock, it should be ensured that no rock shall project above the lower surface of the concrete in such a manner so as to reduce the required thickness of concrete placed simultaneously as an integral part of the foundation and to the outside of structure foundation where structure is to be built.

(d) The Operator shall excavate the trench / pit to provide necessary working space on all sides and for accommodating any sheathing, shoring or bracing etc.

h. Works Included in Excavation

The following works as per specifications are also included in excavation and the term 'Excavation' shall construe to mean all such items of work. The quoted rates should include the same:

(a) Provision of side space or additional space in the trench / pit for working and /or accommodating sheathing, shoring, bracing, etc.

(b) Supply, installation and removal after the work, all sheathing, shoring and bracing required, protecting the excavation where required or where such work is recommended by the Engineer.
(c) The bidder shall verify the site conditions and wherever such dewatering is required it is considered that the rates quoted for dewatering item of work are inclusive of dewatering of surface and sub-surface water.

(d) Protection of excavations.

(e) Providing adequate safety measures.

(f) Additional work in connection with overhead wires and poles.

(g) Excavations for socket and collar hollows.

(h) Supplying and fixing of sight rails and boning rods in the trench to facilitate measurement of work etc. complete.

(i) Temporary approaches to roads, properties etc., affected by excavation at no extra cost.

i. **Sheet piling**

(a) Trenching at locations along the alignments of Trunk sewers or other locations where vertical cutting of trenches is necessary as directed by Engineer, Sheet piling shall be provided as per the item in bill of quantities and the specifications in this section.

(b) The Operator shall provide and install steel sheeting or sheet piling for both sides of the trench for various depths detailed in bill of quantities, with mild steel sheets not less than 6.5 mm thick, stronger knife edge, recessed spreader sockets, single or double wall shields to be designed by the Operator to withstand all types of soils, maximum depths upto 12 m, as approved by the Engineer including all materials, equipment and labour charges for installing and removing the sheet piling at various reaches of sewer line construction, including loading, unloading, transporting to the suitable location etc complete as directed by the Engineer-in-charge.

(c) The location and extent of sheet piling shall be got approved by the Operator from the concerned Engineer, OWNER prior to starting this work. Measurement for the sheet piling work shall be taken and paid for, on one face of wall shield only. Sheet piling will be measured for payment by the number of square meters of sheet piling completed and accepted, as computed from the horizontal and vertical payment lines shown on the plans or as ordered. The limits used for payment will be the actual horizontal limit of temporary sheet piling installed and accepted, and the vertical limit will be as measured from the bottom of the exposed face of the sheeting to the top of the trench. No measurement will be made for end extensions.

25 **Measurements for excavation**

(a) The Earthwork excavation shall be measured net. Unit of measurement shall be in cubic meters, and the measurements are limited to deci-meters (Two decimal places). Dimensions for the purpose of payment shall be reckoned on the horizontal area of the excavation at the base for foundation of the walls, columns, footings, tanks, rafts or other foundations/structures to be built, multiplied by the mean depth from the surface of the ground in accordance with the specifications and construction drawings. Excavations in side slopes will not be paid for. Operator may make such allowance in his rates to provide for excavation in side slopes keeping in mind the nature of the soil and safety of excavation. No payment will be made for working space except where clearly indicated in the drawing or is essential in the opinion of the Engineer. Where concreting is
proposed against the excavated sides, no such over excavation will be permitted. In such cases over excavation shall be made good by the Operator with concrete of the class as in the foundations at his own cost.

(b) Trench excavation for sewers shall be measured using the dimensions detailed in the standard section shown on the construction drawings. Excavation beyond the widths or depths required will not be paid for, any additional concrete or bedding material required as a result of over excavation will be at the Operator’s expense.

(c) Backfilling for trenches shall be measured and paid separately. Volume of rock excavated shall be calculated on the basis of length, breadth and depth of excavation indicated on the construction drawings and the limits of excavation clause of this section. No payment will be made for excavation/over break beyond payment line specified. Where such measurement is not possible as in the case of strata intermixed with soil, excavated rock shall be properly stacked as directed by the Engineer and the volume of rock stacked will be calculated on the basis of stack measurements after making appropriate allowance for voids. The allowance to be made for voids shall be decided by the Engineer.

(d) Excavation in paved roads, pavements and concrete shall be billed separately and will be measured in cubic meter The quantities of paved roads and pavements will be calculated from the length of the trench excavated measured between the centers of two adjacent manholes multiplied by the standard width indicated on the drawings or the applicable clause in this section for the particular diameter of pipe and the actual measured depth of the road surfacing material. The quantities of concrete broken out during excavation will be calculated from the actual measured quantities.

- **Glazed Stoneware (GSW) Pipes**

  **Manufacture of pipe**
  The Stoneware Pipes shall conform to IS: 651-2007 with latest amendment. The method of manufacture of GSW pipes with rubber joints shall be such that the form and dimensions of the finished pipes are accurate. The pipe shall be free from visible defects such as fire cracks or hair cracks without any broken blisters.
  The thickness of barrel and socket for various diameters of pipes shall be as specified in IS: 651 / EN 295 as applicable. The push on type jointed, stoneware pipes of 1.0m length shall have pre-fixed Rubber Gaskets confirming to EN: 681 fixed with approved glue at manufacturing unit. Each pipe unit shall be of 0.6-1.0 m length, exclusive of the internal depth of socket.

  **Testing of pipes at manufacturing unit**
  During manufacture, tests on Glazed stoneware pipes shall be carried out as per IS: 651 / EN 295 standards. The pipes shall be tested in accordance with relevant clauses of this Technical specification and with Clause 7 of IS: 651/ any other latest relevant IS standard, and tested in accordance with the methods described in relevant IS including the following,
  1. Hydraulic test
  2. Absorption test
  3. Test for Acid Resistance
4. Test for Alkali Resistance
5.Crushing Strength test.

**Marking**
Marking shall be done conforming IS: 651 / EN 295 or any other relevant IS codes approved by the Engineer. The following information shall be clearly marked on each pipe,

a). Internal diameter of pipe.
b). Class of pipe.
c). Date of manufacture and
d). Name of manufacture or his registered trade-mark or both.

**Carting & Handling**
All Pipes and fittings/specials shall be transported from the factory to the work sites at places along the alignment of pipeline as approved by Engineer in lengths not more than the length of the transporting vehicle. Operator shall be responsible for the safety of pipes and fittings/specials in transit, loading/unloading. Every care shall be exercised in handling pipes and fittings/specials to avoid damage. While unloading, the pipes and fittings/specials shall not be thrown down from the truck on to hard surfaces. They should be unloaded on timber skids with steadying ropes and / or by any other approved means. Padding shall be provided between coated pipes, fittings/specials and timber skids to avoid damage to the coating. Suitable gaps between pipes should be left at intervals in order to permit access from one side to the other. As far as possible, pipes shall be unloaded on one side of the trench only. The pipes shall be checked for any visible damage (such as broken edges, cracking or spalling of pipe) while unloading and shall be sorted out for replacement. Any pipe, which shows damage in the opinion of Engineer, shall be discarded and replaced by new one without extra cost. Dragging of pipes and fitting/specials along road or pipeline alignment shall be prohibited.

**Trenching**
Trenching includes all excavation which shall be carried out either by hand or by machine and shall be carried out in accordance with all requirements of Earth work excavations clause. Wherever a socket or collar of pipe or fitting / special occurs, a grip is to be cut in the bottom of the trench or concrete bed to a depth of at least 75 mm below the bed of the pipe so that the pipe may have a fair bearing on its shaft and does not rest upon its socket. Such grip shall be of sufficient size in every respect to admit the hand all round the socket in order to make the joint, and the grip shall be maintained clear, until the joint has been approved by Engineer.

**Bedding**
Before laying of GSW sewer pipes, necessary bedding (granular, concrete cradle, concrete arch etc.) shall be provided in accordance with approved construction drawings and as per detailed specifications 24.1 to 24.6 of this section

**Laying of pipe**
Laying of GSW pipes shall conform to the Code of Practice IS: 4127 / EN 295. Pipes shall be laid underground with a minimum earth cover of 1m. Pipes shall be generally laid in sections of 300 m or for
the entire length of GSW portion of branch sewers whichever is less. The stoneware pipes shall be laid with sockets facing up the gradient, on desired bedding. All pipes shall be laid perfectly true, both to line and gradient. At the close of each day’s work or at such other times when the pipe is not being laid, the end of the pipe should be protected by a close fitting stopper. Any Pipes, fittings or materials placed / used, before there testing and approval shall be removed and replaced with tested and approved material. Wherever **GSW Pipes are laid in depth’s equal to or greater than 4.50 meters**, the GSW pipe shall be encased all-round with 1:1.5:3 concrete as per item in Bill of Quantities, clauses/specifications in this section and approved drawings. The pipe encasement shall be done with all necessary care, so that the pipe does not get damaged during concreting and it shall be the responsibility of the Operator to replace the GSW pipes if damaged, without any extra cost.

**Jointing of pipes**

- The jointing of GSW pipes shall be carried out by the following two methods as described below, Jointing of GSW pipes shall be made by placing tarred gasket of hemp yarn soaked in thick cement slurry round the spigot of each pipe which shall be slipped into the socket of the previously laid pipe. The pipes shall then be adjusted and fixed in the correct position. After adjusting, the gasket shall be caulked tightly, so as to fill not more than 1/4th of the total depth of the socket. The remainder of the socket shall be filled with stiff mixture of cement mortar in the proportion of 1:1.5 (1 cement: 1.50 fine sand). Finally, a fillet shall be formed round the joint with a trowel forming an angle of 45degree with the barrel of the pipe.

- All extraneous material shall be removed from the inside of the pipe and the joints shall be cured for at least seven days.

- The jointing of salt glazed stoneware (SGSW) pipes shall also be made with EPD Mrubber rings (seals according to EN 681 and ASTM 425) as per Bill of Quantities item of work and in accordance with procedure in standard EN 295. The GSW pipes shall be confirming to IS 651 / 1992 (with fifth revision) in all respects. The rubber seal joints pipe will not have grooves in interior of socket and exterior of the spigot. The rubber gasket shall be prefixed at socket at the factory by the manufacturer and will be rigidly fixed with appropriate glue. The rubber gasket will be fixed with glue at the entrance of the socket and spigot end will be push fit to have leak proof joint.

**Measurement of pipes**
The length of the sewer pipes shall be measured between the inner surfaces of consecutive manholes at the invert level of the pipes along the central line of pipeline to the nearest centimeter.

**Testing at work site**
After laying and jointing of pipes is completed, the pipe line shall be tested at work site as per all the requirements in of this section and as approved by the Engineer.

**Backfilling**
Backfilling shall be in accordance with requirements specified in this section for backfilling.
REINFORCED CEMENT CONCRETE PIPES

Manufacture of pipe
The RCC pipes to be used for lateral, branch and trunk / outfall sewers shall be of class NP-3, Spigot and Socket (S&S) type, RCC SPUN / VIBRATED CAST PIPES (REINFORCED), with rubber gasket jointing, manufactured in Conformity with IS 458. All the Pipes shall be manufactured using Sulphate Resisting cement only. The ends of the pipes shall conform to Clause 5.3 of IS 458 as applicable for S&S joints. The rubber ring shall conform to IS 5382 and IS 12820 as applicable for sewer lines and shall be of type ‘IA’. The diameters of pipes shall be as required for sewers as per designs and drawings. The method of manufacture shall be such that the form and dimensions of the finished pipes are accurate within the limits specified in relevant IS: 458. Pipes manufactured in compliance with IS: 458 shall be either water cured or steam cured in accordance with the relevant requirements of IS: 458. The Internal diameter, wall thickness, length of barrel, reinforcement (longitudinal and spiral), type of ends and minimum clear cover to reinforcement, strength test requirements, tolerances on - overall length, internal diameter or dimensions of sockets / spigots of pipes shall be as per the relevant clauses / tables of IS: 458. Minimum clear cover to reinforcement shall be 15 mm. The tolerances regarding overall length, internal diameter of pipes or socket and barrel wall thickness shall be as per relevant clauses of IS: 458. Each pipe unit shall be in lengths of 2 m to 4 m based on availability, ease in handling, transportation and laying.

The workmanship and finish for the pipe will conform to the relevant Indian standard specification; Cleaning of pipes shall conform to relevant Indian Standard specification.

Special coating for Inside Surface of RCC Pipes
The RCC pipes shall be provided with special coatings wherever there is possibility of excess generation of hydrogen sulphide gas during transportation of sewage through sewers. The location, length of coatings shall be as given in construction drawings or as approved by the Engineer.

The work involves, Supply and application of Polymer based protective Elastomeric coating / Lining with zero V.O.C. for complete inside surface of RCC sewers, with minimum dry film thickness of 1mm, Acid resistant, Abrasive resistant, Adhesive to concrete surface, Durable and pinhole / break free, with smooth surface after application, complete as per the Clauses in this Section, including all labour, HOM of machinery, with all lead lifts, taxes etc. complete. spray coating / Lining shall be applied by approved and controlled mechanical spray method, for RCC sewers of diameters 400mm to 800 mm prior to delivery of sewers to site or applied at site, as approved by approving authority, including all surface preparation, testing, as per directions of the Engineer in charge. Rate shall be inclusive of cost of all materials, tools and plants, testing and inspection etc. complete, or Polymer based protective Elastomeric smooth coating / Lining with zero V.O.C. by spray method for complete inside surface of RCC sewers, with minimum dry film thickness of 1mm, Acid resistant, Abrasive resistant, Adhesive to concrete surface, Durable and pinhole / break free, smooth surface after application, complete as per the Clauses in this Section, including all labour, HOM of machinery, with all lead, lifts, taxes etc. complete, spray coating / Lining applied by approved method, for RCC sewers of diameters equal to and greater than 900mm prior to delivery of sewers to site or applied at site, as approved by approving authority, including all surface preparation, testing, and directions of the Engineer.
in charge, Rate shall be inclusive of cost of all materials, tools and plants, testing and inspection etc. complete.

Specifications for Protective Coating to inside surface of RCC sewers

POLYMER BASED COATING: The inside of RCC pipes (of dia 400mm & above) & manholes (if required) shall be coated with an approved dual-component, solvent-free polymer protective coating of minimum 1mm dry film thickness. The protective coating shall be spray-applied to the inside of the pipes using suitable plural component spray equipment so as to form a completely impermeable, pin-hole-free & seamless lining. It shall form a good bond with host concrete surface, be resistant to acids & abrasion. It shall meet the following properties.

| Tensile strength ( to ASTM D412)                      | >20 n/sq mm                       |
| Elongation ( to ASTM D-412 )                          | > 425%                            |
| Water absorption( to ASTM D 570 (2hr @95 C)          | 0.16                              |
a) The coating shall be suitable for long term service at any temperature within the range between -10 Deg C and 100 Deg C and resistant to raw sewer, industrial sewer, treated sewer, effluents, chemicals, sea water, abrasives. The coating shall not be affected by high humidity or moisture during application.

b) All the coating materials including primer & finish coats shall be from a single manufacturer of repute, certified to ISO 9002 standards having a minimum 10 years experience in similar products & in projects of similar size and value as this project.

c) The material provided shall be tested in both liquid (lab-draw down films) and field applied samples and shall meet the properties specified for the project and defined in the approved manufacturer’s product data sheet.

d) All pre-coating concrete repairs, coating and lining works shall be carried out only by experienced & reputed Operator’s who are authorized, approved, and certified applicators of the approved coating manufacturer & certified by the manufacturer for the type of application detailed in this project.

e) The Operator should submit, the approved coating manufacturer’s detailed Method Statement for Coating Application along with their Quality Assurance / Inspection & Testing Plan to engineer in charge prior to commencement of coating activity.

**Surface Preparation & Primer application**

i. Prior to commencement of coating activity, all concrete surfaces to be coated shall be free from oil, grease, loose particles, decayed matter, moss, curing compound residue or algal growth. All such contamination and laitance must be removed by use of abrasive sweep blasting, high pressure water jetting, or other approved manual/mechanical means.

ii. Concrete element’s surface irregularities, honeycombs spews must be removed and repaired by a method approved by the engineer.

iii. Primer as recommended by the approved coating manufacturer shall be applied prior to coating application & the correct over coating time intervals shall be followed as per manufacturer’s approved method statement of application.

iv. The coating system shall be spray applied & shall gel/set rapidly. It shall form a uniform monolithic film without any layering.

v. The pipes shall be coated either at pipe factory or at other department-approved coating yard prior to actual laying.
Testing

I. The finished coating shall be uniform, smooth & have a dry film thickness of minimum 1000 microns, when tested with a standard dft gauge/ Elcometer.

II. The dry film thickness shall be measured at points as instructed & predetermined by the engineer in charge by fixing SS strips. The coating shall be uniform, smooth & pin hole free.

Personal Safety Requirements

a) The personnel at site shall strictly adhere to Standard guidelines during the chemical coating activity, at all times. The approved coating manufacturer shall supply complete standard requirement schedules for the personnel to follow, prior to start of any coating application. The general requirements are:-

b) Observe the owners standard policy at all times and obey all written and verbal instructions from site managers and representatives.

c) Wear all PPE at all times including Hard Hat, Safety glasses, Boots, Gloves and masks as required.

d) When preparing and applying coatings and chemical materials all PPE must be worn including Gloves, safety glasses and protective paper masks.

e) When using high pressure plural component spray equipment, all personnel working in the application area must wear double filter breathers with OSHA or of atleast equivalent make.

**Testing of pipes at manufacturing unit**
During manufacture, tests on concrete shall be carried out as per IS: 456, IS 458 / relevant IS with latest revisions and amendments.
The specimen of pipes shall be tested in accordance with with IS: 458 and tested in accordance with the methods described in IS: 3597 including the following,
a) Hydrostatic test.
b) Three edge bearing test
c) Absorption test.

**Marking**
Marking shall be done as per IS: 458 or any other relevant IS codes approved by the Engineer. The following information shall be clearly marked on each pipe,
a) Internal diameter of pipe.
b) Class of pipe.
c) Date of manufacture and
d) Name of manufacture or his registered trade-mark or both.

**Carting & Handling**
Carting and handling of RCC pipes and fittings shall be in accordance with relevant clause of this section (GSW pipes specifications).

**Trenching**
Trenching includes all excavation which shall be carried out either by hand or by machine and shall be carried out in accordance with all requirements of Earth work excavations clause. Wherever a socket or collar of pipe or fitting / special occurs, a grip is to be cut in the bottom of the trench or concrete bed to a depth of at least 75 mm below the bed of the pipe so that the pipe may have a fair bearing on its shaft and does not rest upon its socket. Such grip shall be of sufficient size in every respect to admit the hand all round the socket in order to make the joint, and the grip shall be maintained clear, until the joint has been approved by Engineer.
**Bedding**
Necessary bedding (granular, concrete cradle, concrete arch etc.) shall be provided in accordance with approved construction drawings and specifications before laying of RCC sewer pipes.

**Laying of the pipe**
Laying of concrete pipes shall conform to the Code of practice of IS: 783. Pipes shall be laid underground with a minimum earth cover of 1m. Pipes shall be generally laid in sections as per standard practices and as directed by the Engineer. The RCC pipes shall be laid with sockets facing up the gradient, on desired bedding. All pipes shall be laid perfectly true, both to line and gradient. At the close of each day’s work or at such other times when the pipe is not being laid, the end of the pipe should be protected by a close fitting stopper.

All pipes, fittings and material shall be tested and approved by the Engineer before being laid. Any pipes, fittings or material placed before they are tested and approved shall be removed and replaced with tested and approved material. Before laying the pipe, necessary bedding shall be provided wherever required as mention in this section.

**Jointing of pipes**
The pipe joints shall be flexible joints, jointed by rubber ring of type ‘IA’, as per IS 783-1985. The sections of the pipe shall be jointed in such a manner that there shall be as little unevenness as possible along the inside of pipe. Care should be taken while jointing to provide the correct gap between the end of spigot and back of the socket to ensure flexibility at each joint and correct location. The joints shall be finished as directed by the Engineer.

The quality of rubber rings, tolerances, etc., shall be in conformity with IS 5382-1985 and latest revisions. After jointing, extraneous material, if any, shall be removed from the inside of the pipe

**Measurement of pipes**
The length of the sewer pipes shall be measured between the inner surfaces of consecutive manholes at the invert level of the pipes along the central line of pipeline to the nearest centimeter.

**Testing at work site**
After laying and jointing of pipes is completed, the pipe line shall be tested at work site as per all the requirements of this specifications and as approved by the Engineer.

**Backfilling**
Backfilling shall be in accordance with requirements specified in these specifications.

28 **DUCTILE IRON (DI) PIPES**

**Manufacture of pipe**
DI pipes and fittings (Class K7) shall be in accordance with IS: 8329 and IS: 9523. Pipes and fittings shall be procured from reputed manufacturers with Engineer's approval. Engineer shall at all reasonable times have free access to the place where the Pipes and fittings are manufactured for the purpose of examining and testing the pipes and fittings and for witnessing the test and manufacturing.
All tests specified either in this specification or in the relevant Indian Standards specified above shall be performed by the Manufacturer / Operator at his own cost and in presence of Engineer if desired. For this, sufficient notice before testing of the pipes and fittings shall be given to Engineer.

If the test is found unsatisfactory, Engineer may reject any or all pipes and fittings of that lot. The decision of Engineer in this matter shall be final and binding on the Operator and not subject to any arbitration or appeal. The pipes and fittings shall be striped, with all precautions necessary to avoid warping or shrinking defects. The pipes and fittings shall be free from defects. Any defect in pipes and fittings in the opinion of Engineer shall be rejected and shall be replaced by new one.

In the case of spigot and socket pipes and fittings, the socket shall be without the centre ring. In the case of flanged pipes, the flanges shall be at the right angles to the axis of the pipe and machined on face. The bolt holes shall be drilled and located symmetrically off the centreline. The bolt hole shall be concentric with the bore and bolt holes equally spaced. The flanges shall be integrally cast with the pipes and fittings and the two flanges of the pipe shall be correctly aligned.

**Materials**
The materials used in the manufacture of pipes and fittings shall comply with requirements specified in IS: 8329 and IS: 9523.

**Dimensions and Tolerances**
The internal diameter, thickness and length of barrel, dimensions of pipes and fittings shall be as per relevant tables of IS: 8329/IS: 9523 for different class of pipes and fittings. Each pipe shall be of uniform thickness throughout its length.

The tolerances for pipes and fittings regarding dimensions, mass, ovality and deviations from straight line in case of pipes shall be as per IS: 8329/IS: 9523.

**Coatings**
Unless otherwise specified, DI pipes and fittings shall be coated with Bitumen in accordance with relevant IS Specifications. All buried DI pipes and fittings shall also have factory or site applied polythene sleeving. Coating shall not be applied to pipe and fittings unless its surface is clean, dry and free from rust. Pipe coatings shall be inspected at site and any damage or defective areas shall be made good to the satisfaction of the Engineer.

Bitumen coating shall be of normal thickness of 75 microns unless otherwise specified. It shall be cold applied compound complying with the requirements of relevant Indian standards, suitable for tropical climates, factory applied in accordance with the manufacturer's instructions.

Damaged areas of coating shall be repainted on site after removing any remaining loose coating and wire brushing any rusted areas of pipe.

Polythene Sleeving: Where polythene sleeving is specified to be applied in addition to bitumen coating, it shall comply with ISO 8180. Site applied sleeving shall be stored under cover out of direct sunlight and its exposure to sunlight shall be kept to a minimum. Pipes having a factory applied sleeving must be stored in the same conditions. Joints in the sleeving shall be properly overlapped and taped in accordance with manufacturer's instructions to provide continuous sleeving.
Cement mortar lining: All pipes and fittings shall be internally lined with cement mortar in accordance with relevant IS. The cement used shall be Sulphate Resisting Cement confirming to IS: 12330. No admixtures in the mortar shall be used without the approval of the Engineer.

Pipe linings shall be inspected on site and any damage or defective areas shall be made good to the satisfaction of the Engineer. Lining shall be uniform in thickness all along the pipe. The minimum thickness of factory applied cement mortar lining shall be as per IS: 11906.

**Testing of pipes at manufacturing unit**
During manufacture, tests on pipes shall be carried out in accordance with these technical specification by the Third party inspecting agency.

**Marking**
Marking shall be done as per IS: 8329 and IS: 9523 or any other relevant IS codes approved by the Engineer. The following information shall be clearly marked on each pipe,

a) Internal diameter of pipe.
b) Class of pipe.
c) Date of manufacture and
d) Name of manufacture or his registered trade-mark or both.

**Carting & Handling**
Carting and handling of D.I. pipes and fittings shall be in accordance with the specifications in this section.

**Trenching**
Trenching includes all excavation which shall be carried out either by hand or by machine and shall be carried out in accordance with all requirements of -Earth work excavations clause. Wherever a socket or collar of pipe or fitting / special occurs, a grip is to be cut in the bottom of the trench or concrete bed to a depth of at least 75 mm below the bed of the pipe so that the pipe may have a fair bearing on its shaft and does not rest upon its socket. Such grip shall be of sufficient size in every respect to admit the hand all round the socket in order to make the joint, and the grip shall be maintained clear, until the joint has been approved by Engineer.

Wherever D.I. pipes are laid over pillar supports for nala crossings etc. the pipes shall be placed as per the construction drawings and as directed by the Engineer In-charge.

**Bedding**
The type of bedding (granular, concrete cradle, concrete arch etc.) shall be as per approved construction drawings and specifications in this section.
Laying of the pipe
Laying of DI pipes shall conform to the Code of practice of IS: 12288. Pipes shall be laid as per the requirement in the drawing and as directed by the engineer. Laying of pipes shall be as per IS specified in Bill of Quantities and approved construction drawings. All pipes, fittings and material shall be tested and approved by the Engineer before being laid. Any pipes, fittings or material placed before they are tested and approved shall be removed and replaced with tested and approved material. Before laying the pipe, necessary bedding shall be provided wherever required. Polyethylene sleeves wounded pipes shall be used for water logged areas as per specification and as directed by the Engineer.

Jointing of pipes
Jointing of DI pipes and fittings shall be done as per IS: 12288 and manufacturer's recommendations. After jointing, extraneous material, if any, shall be removed from the inside of the pipe. Rubber sealing rings/gaskets used for jointing shall conform to IS: 638, IS: 12820 and IS: 5382.

Spigot and Socket joints: These shall have sockets, which are integral with the pipe and incorporate an electrometric rubber ring gasket conforming to IS: 12820. The gaskets/sealant used for joints shall be suitable for water conveyance. In jointing DI pipes and fittings, the Operator shall take into account the manufacturer's recommendations as to the methods and equipment to be used in assembling the joints. In particular the Operator shall ensure that the spigot end of the pipe to be jointed is smooth and has been properly chamfered, so that the rubber ring as per IS: 12820 and IS: 5382 is correctly positioned in line, before the joint is made. The rubber rings and any recommended lubricant shall be obtained only through the approved supplier and as directed by the Engineer.

Gaskets for Flanges
All gaskets used between flanges of pipes shall be of natural rubber conforming to IS: 638 of thickness 3 mm suitable for waste water conveyance and as specified by manufacturer.

Flanged joints
These shall be of PN 1.0 rating and shall comply with dimensions and drilling details as specified in IS: 8329. These shall have isolation gaskets between the flanges, isolation sleeves around all bolts and isolation washers under all bolt heads and nuts. All material shall be supplied by a reputed manufacturer and shall be approved by the Engineer.
Each bolt should be tightened a little at a time taking care to tighten diametrically opposite bolts alternatively. The recommended bolting torque to be followed for assembling flanges shall be as specified in manufacturer's instructions. The practice of fully tightening the bolts one after another is highly undesirable. The bolts shall be of mild steel unless otherwise specified. They shall be coated with coal tar epoxy coating after tightening.

Measurement of pipes
The length of the sewer pipes shall be measured between the inner surfaces of consecutive manholes or start to end points of laid alignment (at road crossings and Nala Crossings) at the invert level of the pipes along the central line of pipeline to the nearest centimetre.

**Testing at work site**
After laying and jointing of pipes is completed, the pipe line shall be tested at work site as per all the requirements of technical specifications and as approved by the Engineer.

**Backfilling**
Backfilling shall be in accordance with requirements specified for backfilling.

29 **Corrugated HDPE pipes**:

Manufacture, factory testing and laying and jointing of Corrugated HDPE pipes used for this contract shall be conforming to BIS 16908- part 2-2013. Earthwork excavation, backfilling, testing etc. shall conform to relevant clauses applicable for SWG pipes.

30 **BEDDING, ENCASING, SUPPORTS & BACKFILLING FOR SEWERS.**

30.1 **BEDDING FOR THE SEWERS.**
Bedding shall be provided all along the stretch of the pipeline as shown on the approved construction drawings or as directed by the Engineer, which differs based on the depth and nature of foundation over which the pipeline is laid. Pipe shall be generally laid on murrum / gravel bedding as per approved construction drawings and specifications. When rock is met with, along the alignment, sewers shall be invariably provided with gravel / murrum bedding. Wherever the pipeline crosses under the road, Concrete arch bedding shall be provided in such situations. The various types of bedding, according to which the Operator shall execute the work, are specified below.

30.2 **Earth Bedding.**
The trench excavations where the earth at foundation level of sewers is found to be of good quality, suitable for laying of pipe and does not require any import of murrum /gravel etc. for foundation of sewers and as approved by the Engineer. Any extra bedding material need not be provided; the excavation shall be carried out to the exact gradient specified so that no making of the sub-grade by backfilling is required. Filling and removing earth or similar materials beneath the allowable depth as above to adjust with the grade will not be permitted except filling with compacted granular bedding material or murrum as directed by the Engineer.

---

Projects using corrugated HDPE pipes should supplement the provisions as required.
30.3 Gravel Bedding.
Wherever bottom of the trench at sewer foundation level at the specified gradient is met with rock or found to be unsuitable as decided by the Engineer, the rock or earth shall be removed up to minimum 150 mm below the bottom level of the pipe to a minimum width as specified, equal to the width of the trench as per the approved construction drawing and the resulting space shall be filled up with good quality gravel/murrum and compacted to desired density as per approved drawings and item in Bill of quantities. The granular material shall be filled in the trench up to the level of ¼ the outer diameter of the pipeline above the bottom of trench, and well compacted and as in the approved drawing. Unless otherwise directed by the Engineer, rock excavation shall progress at least 20 m in advance of the pipe length proposed to be laid.

The graded granular bed material used in bedding and surround shall consist of durable gravel / murrum. Any imported bed and surround materials shall be as per the approval of the Engineer and shall be supplied with certification, which gives details of its content, source and grading. In all cases the soluble sulphate and chloride content of the granular material shall not exceed 0.5% and 0.06% by weight respectively. All graded material shall pass through test sieves to IS 460 (Part 1) in the following proportions by mass:

<table>
<thead>
<tr>
<th>Aperture Size</th>
<th>% Passing</th>
</tr>
</thead>
<tbody>
<tr>
<td>50 mm</td>
<td>100 %</td>
</tr>
<tr>
<td>37.5 mm</td>
<td>90 – 100 %</td>
</tr>
<tr>
<td>20 mm</td>
<td>35 – 70 %</td>
</tr>
<tr>
<td>14 mm</td>
<td>25 – 55 %</td>
</tr>
<tr>
<td>10 mm</td>
<td>10 – 40 %</td>
</tr>
<tr>
<td>5 mm</td>
<td>0 – 5 %</td>
</tr>
</tbody>
</table>

30.3.1 The gravel/murrum shall be evenly spread over the full width of the formation and compacted to 95% of maximum dry density to the specified gradient in accordance to IS 2720: Part-7, a level slightly higher than level corresponding to the underside of the pipe barrel to allow for settlement of the pipe to the correct level.

30.3.2 Following, placement and jointing of the pipe, further granular material shall be placed in the trench, special care being taken to fill under the sides of the pipes to ensure full contact with the barrel of the pipe. The granular material shall then be placed and compacted evenly to the specified depth.

30.3.3 Field joints which have not been tested shall be left exposed for a minimum length of 150 mm each side of the joint. Trench supports shall be withdrawn gradually in accordance with the progress of the fill with provision that such withdrawal shall not prejudice the safety of the works. After each section of the pipeline has passed the hydraulic test, the exposed joints shall be backfilled and compacted to the above specification.
Concrete Arch / Cradle bedding and concrete encasement/surround
Where the pipes are laid on a soft soil or super imposed load over pipe sewer laid exceeds the minimum crushing strength even after providing murrum/gravel bedding or with maximum water table level, lying at the invert level of the pipe, or rising above the invert level of the pipe but below the top of the barrel, or as per the approved construction drawings or as directed by the Engineer, the pipe sewers shall be bedded or surrounded in concrete to the specified gradient in accordance with the specifications in this section and applicable relevant Indian Standard for laying of sewers.

30.4.1 Before laying/placing of the bedding, all types of refuse, organic matter etc. shall be removed to the satisfaction of the engineer and the bottom/sub-grade shall be to the specified gradient, dimension and well compacted to the desired density. The pipes shall be supported near each joint with proper supports to avoid any damage to the joints while concreting. Concrete shall not be placed until the pipes have been jointed, inspected and tested. All water in the trench must be bailed out prior to taking up concreting work & the concrete shall be placed to ensure full contact with the pipe barrel throughout its length. The concrete shall be made discontinuous at all flexible pipe joints by a diaphragm of fibre board or other compressible material of at least 20 mm thickness extending for the full area of the surround. The bottom of the trench may be sloped on the sides or kerbed. The concrete grade shall be of 1:2:4 proportion for concrete cradle bedding and 1:1.5:3 proportion for concrete arch bedding or concrete surround as on approved construction drawings. For concrete arch bedding, the pipe shall be provided with approved gravel bedding to the desired compaction below in layers, and concrete arch above as per drawing.

30.4.2 The materials used in the concreting works shall comply to the relevant Indian standards and specifications in clause of specifications for general civil works. Dry mix shall not be permitted and the slump for concrete for the arching shall not be more than 25 mm. When concrete is to be placed over the pipe for arch portion or surround, it shall be placed carefully so as not to damage or injure the joints or displace the pipe. Back filling shall be done in a careful manner and at such time after the concrete is set, so as not to damage the concrete. Joints shall be avoided as far as possible under the roads. Where pipes are laid below storm water drains, at road crossings and where the depth of cover is less than 1.0m, and GSW pipes laid in 4.50m and below depths, the pipeline shall be encased / bedded. The concrete encasement shall be of RCC/PCC as specified.

Special bedding in poor sub grades
During the progress of work, if the sub grade is observed to be of poor quality which is unsuitable for laying the pipe line and which is not the result of the Operator's negligence, the Engineer may direct the Operator to strengthen the sub grade as per, Specifications in Bill of Quantities and in the approved drawings. The strengthening shall be done either by approved gravel, with depth not exceeding 300 mm and/or by plain concrete of mix 1:2:4 complying to the specifications in this document or as directed by the engineer.

Measurements for Bedding.
For providing Gravel and Concrete cradle/arch/surround bedding in accordance with above Clauses of this Section, the measurement for bedding actually used based on the neat line dimensions of the trench and deducting the volume occupied by the pipe will be considered.
30.7 PIPE SUPPORT STRUCTURES.

30.7.1 Anchor, Thrust Blocks.
Anchor blocks shall be provided wherever required in the sewers and for gradients steeper than 16% as per approved construction drawings or as directed by the Engineer and thrust blocks shall be provided for both horizontal and vertical bends wherever required in the rising main pipeline or gravity sewer works (In case of bends in house service connections) wherever necessary to effectively transfer the hydrostatic thrust developed to the surrounding ground. They shall be constructed at the locations shown in the construction drawings and are of the respective dimensions shown therein depending on the angle of the bends, and the pressures developed in the rising main/gravity main. All the anchor/thrust blocks shall be of 1:1.5:3 proportion plain or reinforced cement concrete. The surrounding virgin land of the anchor/thrust blocks shall not be disturbed, to effectively transfer the load/thrust developed by/in the main. The Operator should make his own arrangement for any dewatering or bailing out of water.

30.7.2 Pedestals
Pedestals shall be constructed as per, specifications and construction drawings, wherever needed, and as per the directions of the Engineer. Pedestals shall also be provided for the stretches of the pipe, where the pipe is to be gradually brought above the ground for crossing any obstructions as shown in the drawings. The concrete used for pedestals shall be of 1:1.5:3 proportion RCC with materials and work complying to specifications mentioned in clauses for standard specifications for civil works.

Pipe supports shall be placed at a distance of 2.5/5.0 m centre-to-centre depending upon the pipe material and length of pipe available. The dimensions of pipe supports for pipelines of various diameters shall be as shown in the concerned drawing and shall have sufficient height above ground to be able to support the pipe and surround up to a height of 200mm above the crown of sewer and minimum 150mm both the sides of the sewer.

There shall be no joints at the location of the pipe supports. The joints shall be located on any one side of the support, at a minimum distance from the face of the support as given on drawings.

30.8 Measurements for Anchor, Thrust blocks and pipe supports
For providing Anchor, Thrust blocks and pipe supports in accordance with above Clauses of this Section, the measurement shall be based on the neat line dimensions of the structure and deducting the volume occupied by the pipe will be considered.

30.9 BACKFILLING OF TRENCHES AND AROUND FOUNDATIONS OF STRUCTURES

30.9.1 General
Filling of the trenches for sewers shall not be commenced until the sewers are tested and passed. The Operator shall use approved selected surplus soils from excavated materials for backfilling in accordance with the requirements in relevant Clauses in IS: 4127 and IS: 783 or with quarry dust as specified hereafter and as shown on drawings. The excavated materials suitable for backfilling shall be stored not closer than 600 mm from the edge of the trench and shall not obstruct any public utilities or interfere with
travel by local inhabitants or general public. Handling and storage of excavated materials must meet with the regulations of the Local Government Authorities.

30.9.2 The materials for backfilling are:

a) **Excavated earth.**
Backfilling for locations of trenches along roads of lesser traffic and interior roads and valley portions, as decided and directed by the Engineer In-charge shall be done by with the available earth obtained from excavation including watering and consolidation to 95% proctor density by mechanical and manual means., complete with all lead and lifts.

b) **Quarry dust filling.**
Backfilling for locations of trenches along main roads and all road crossings, as decided and directed by the Engineer In-charge shall be done by with the Quarry dust of size not exceeding 5.6mm including watering and consolidation to 95% proctor density by mechanical and manual means., complete with all lead and lifts.

30.10 **Method of Backfilling**

On completion of the pipe laying operations in any section, for a length of about 100 m and while further work is still in progress, refilling of trenches shall be started by the Operator with a view of restricting the length of open trenches. Pipe laying shall closely follow the progress of trench excavation and the Operator shall not permit unreasonably excessive lengths of trench excavation to remain open while awaiting testing of the pipeline. If Engineer considers that the Operator is not complying with any of the foregoing requirements, he may prohibit further trench excavation until he is satisfied with the progress of laying, testing of sewers and refilling of trenches.

Trenches and excavated pits for structures shall be backfilled to original ground level or to such other levels, as the Engineer may direct. All backfilling shall be carried out in orderly manner expeditiously and consistent with good workmanship. Mechanical vibrators/equipments shall be used for compaction only after the back fill has reached its final level as required by the Engineer as the backfill top shall form the base for restoration road works. Backfill material put into the trenches/pits for backfilling, shall unless otherwise specified be compacted and built up as to minimize future settlement. For this, care shall be exercised in selecting backfill material free from large hard clay lumps, especially in cramped areas directly adjoining the walls of structures.

Care shall be taken not to injure or disturb the pipes, joints and coatings, after the pipe is properly bedded, jointed and inspected and all measurements for the location of Junctions are properly recorded by the Engineer and sufficient time is allowed for the joint materials or cement concrete or mortar to set. Backfilling around and over the pipe, conduit, or structure shall be taken up uniformly on all sides and in the sequence and manner specified hereinafter, with care to avoid the displacement or damage to the pipe, conduit or structure. Trenches and pits should be carefully guarded till backfilling.

For the purpose of backfilling, the depth of trench shall be divided into the following three zones measured from bottom to top of trench, as follows:
Zone A: From bottom of trench or top of the concrete, when concrete bedding is provided, to the level of the centre line of the pipe.

Zone B: From the level of the centre line of the pipe to a level 300 mm above the top of the pipe.

Zone C: From a level 300 mm above the top of the pipe to the top of the trench.

Backfilling in Zone A shall be done by hand with fine earth from excavated material as approved by the Engineer placed in layers of 80 mm and compacted by tamping. The backfilling material shall be deposited in the trench for its full width of each side of the pipe, fittings and appurtenance simultaneously.

Backfilling in Zone B shall be done by hand or approved mechanical methods, special care being taken to avoid injuring or moving the pipe. The type of backfill material to be used and the method of placing and consolidating shall be as approved by Engineer to suit individual locations.

Backfilling in Zone C shall be done by hand or approved mechanical methods. Unless otherwise specified backfilling by hand shall be done in layers of 300mm, each layer well compacted before laying the next layer.

As necessary to attain compaction to 95% of the maximum dry density as per part-7, of IS: 2720, the backfill material shall be moistened by sprinkling with water to optimum moisture content. After placing each layer of backfill material, the layer shall be thoroughly and uniformly compacted by means of mechanical or hand tampers. The compacting equipment and the manner of its use shall be subject to the approval of the Engineer. After the backfill material is placed in Zone A and Zone B as specified above, the remaining portion i.e., Zone C of the trench may be machine backfilled. Small pebbles of size less than 50 mm, if any, shall be so distributed throughout the mass, that all interstices are solidly filled with fine material. Machine backfill shall be so conducted that the material deposited in the trench shall not fall directly on top of the pipe from such a height as might result in damage to the pipe joints or alignment. If the trench is subjected to conditions, which might cause flotation of the pipe before sufficient backfill has been placed; the Operator shall take the necessary precautions to prevent floatation of the pipe, conduit or structure. Before final acceptance of the work, additional tamped earth shall be added to restore the settled trench surface to the required level of the adjacent earth surface or to the base of crushed rock wearing surface or to the finished earth base.

As per the applicable clauses in this Specifications, if from the excavated soil, enough backfill material is not available, imported, selected and approved backfill material from the borrow pits shall be placed for backfill. The Operator shall include the above under backfilling rates. Also for backfilling of trenches, where the excavation is in the rock, refilling shall be made with the surplus soft soil with all lead and lifts. Accordingly, the same shall be taken into account by the Operator while quoting the rates for backfill.

Should any subsidence take place either in the filling of the trenches or near about it during the works, the Operator shall make good the same at his own cost.
30.11 Disposal of Surplus Excavated Material
The excavated material, which is in surplus to the requirements after backfilling shall be removed/disposed off as directed by the Engineer with all lifts to a lead distance detailed in bill of quantities, from the site. For this, payment will be made as per the item in BOQ. The landfill site is to be identified by the Operator and got approved by the Engineer in charge of Execution. No surplus or excess material shall be disposed in a stream / channel nor in any place where the pre-construction surface drainage may have to be provided, without written permission of the Engineer.

30.12 Measurements
Backfilling complied to the specifications in this section and in bill of quantities will be measured net in cubic meters, limiting to the dimensions of excavation and deducting the volume occupied by the sewers, bedding, encasement etc as applicable. The payment for backfilling will be made only after the Operator has cleared the road / pathway, of the soil and construction material debris, etc., due to the trench excavations and sewer line works to the satisfaction of the Engineer incharge.

31 Ancillary STRUCTURES – MANHOLES, DROP MANHOLES AND VENTILATING SHAFTS
The Operator shall construct Wire cut brick, RCC-Manholes, Drop arrangements with HDPE pipes, Cast iron Ventilating shafts, Valve Chambers, at the locations shown on approved construction drawings, as directed by the Engineer as per the specification in the applicable Indian standards mentioned and as mentioned hereafter. The materials used and construction procedure adopted for the ancillary structures shall comply to the specifications as mentioned below and clause in standard specifications for civil works.

31.1.1 Excavation
Earth work excavations for the Manholes, Drop arrangements and C.I. Ventilating shaft arrangements etc. shall be carried complying to specifications in this section and specifications in bill of quantities.

31.1.2 Backfilling
Backfilling for sewer ancillary structures shall be in accordance with requirements specified for Backfilling.

31.2 Manholes
Manholes shall be built at every change of alignment, gradient or diameter, at the head of all sewers and branches, at every junction of two or more sewers as shown on the drawings complying to IS: 4111 Part1-1967 and latest revisions and as per specifications in this section or as directed by Engineer. Sulphate resisting cement confirming to IS: 12330 shall be used for all the items of works for manholes. The shape of the manholes generally is circular with conical shape at top for Brick manholes, unless specifically stated as on drawings.

The Operator shall be wholly responsible for giving suitable connections at the junctions of sewer lines with the manholes. The minimum depth of manhole shall be one meter or as in construction drawings or as directed by Engineer.
For House service connections directly to manholes, 110/160mm PVC pipes shall be placed during construction of manholes as per specifications in this section and items in BOQ, if the provisional pipes for House service connections are not placed due to the negligence of the Operator, the Operator has to redo the total work of dismantling of manhole shaft and placing of the pipes etc. at his own cost.

The Manholes have been divided into different categories based on depth, diameter and material of construction. Any manholes required to be provided extra, at the locations shown by the Engineer, shall be provided by the Operator, for which payment shall be made at the quoted rates.

### 31.2.1 Wire cut Brick Manholes

### 31.2.2 Construction

The work shall be executed in accordance with the approved construction drawings and specifications involving,

a). Providing and constructing of 1:3:6 Cement Concrete foundation using approved quality aggregates of 40mm and downsize with an offset of 150mm all round the chamber.

b). Providing and constructing wire cut brick masonry in C.M 1:4 proportion using modular wire cut bricks of class designation 75 of approved quality and confirming to IS : 1077 with a tapering top portion as per approved construction drawings and providing cement mortar plaster in CM 1:3 proportion, 12mm thick inside and outside except for the conical surface outside, where the thickness of plaster shall be 20mm thick. Samples of bricks shall be tested as per IS : 3495 by the Operator. Bricks rejected by the Engineer shall be removed from the site within 24 hours.Construction of Brick works shall be in accordance with IS 2212:1962 and latest revisions.

c). Providing and constructing benching with Cement Concrete 1:2:4 to the dimensions as on drawings with 1:6 slope in the concrete towards the central drain, plastered with CM 1:3 proportion, 20mm thick and finished with smooth coat of neat cement and fixing of inlet and outlet sewers in the walls with the internal periphery protected with an arch of 1:2:4 Cement Concrete with graded metal of 10mm to 20mm size.

d). Supplying and fixing of, 3 mm thick plastic (as per IS: 10910) encapsulated over 12mm dia. Fe-415 steel (as per IS: 1786) bar footsteps staggered at 300mm apart and providing and fixing of heavy duty circular steel fibre reinforced concrete (SFRC) manhole frame and covers of 560 mm diameter conforming to IS 12592 and the payment for providing of SFRC heavy duty manhole frame and covers shall be paid separately as per quoted rate for the item in bill of quantities.

e). The channel for the manhole shall be constructed in cement concrete of M15 grade. Both sides of the channel shall be taken up to the level of the crown of the outgoing sewer. They shall be benched up in concrete and rendered in cement mortar (1:1) of 20 mm thickness and formed to a slope of 1 in 12 towards the channel.
f). The manhole construction work includes curing, pouring tar over MH frame and cover, cost of tar, engraving manhole number and flow direction on the inner surfaces etc., with all lead and lifts, finishing etc complete. The cement used for the construction of masonry works and internal & external plastering works of manholes shall be of sulphate resisting cement only confirming to IS:12330.

31.2.3 Testing
All Brick Manholes shall be tested as per relevant provisions in CPHEEO Manual & relevant IS with latest revisions & amendments and specifications in this section for Testing and commissioning.

31.2.4 Measurement & payment
The depth of manhole shall be measured from the top of cover to the invert level of the deepest outgoing sewer from the manhole. The quoted rate for the Manholes for various depths as per the specifications and drawings shall include the cost of sulphate resisting cement, bedding concrete, benching concrete, wire cut brick masonry, plastering, foot steps, fixing SFRC manhole frame with cover, dewatering to keep the manhole dry until final testing etc complete.

The Rates for any fractional variation (increase or decrease) in the depth of the manhole on decimetre basis, shall be paid as per actuals, by adding the difference in rates between the immediately preceding and succeeding depths of such fractional depth of manhole on linear basis.

For Example: To pay 1.22M depth manhole:
Rate for 1M depth Manhole excluding manhole frame & cover and including encapsulated foot steps rate Rs. X.
Rate for 2 M depths Manhole excluding manhole frame & cover and including encapsulated foot steps rate Rs. Y.
Therefore rate for 1.22M depth Manhole = Rs. X + (Y-X)/1.00 x 0.22.

Note: For the depths of manholes less than the lowest depths of Bill of Quantities item, the preceding manhole depth shall be taken as zero with zero value to arrive at the rate

31.3 RCC Manholes
31.3.1 Construction
The construction of RCC manholes shall be by Cast In-situ of Circular in shape or approved type Pre-Cast RCC, constructed using form vibrators of standard type, using SRC Cement confirming to IS: 12330. The type of manhole to be constructed shall be as approved by OWNER, Operator shall take prior approval for the Design and Process of manufacture of the Pre-cast RCC manholes, the type of vibration for compaction of concrete for pre-cast manholes shall be invariably of form or table vibrator type.

The work of Cast In-situ RCC manholes includes,
a). Providing and constructing of 1:3:6 Cement Concrete foundation using approved quality aggregates of 40mm and downsize with an offset as given in the drawings.

b). Providing and laying granite jelly cement concrete 1:1.5:3 for beds of manholes etc., using 20mm and down size jelly including laying, tamping, etc. for a depth, as per drawings, with water proof compound for top plaster in CM 1:3 curing and smooth finishing for exposed faces with necessary centering and form work etc., complete as per specification, drawing and as directed by the Engineer.

c). Providing and laying cement concrete of 1:1.5:3 proportion for vertical walls using 20mm and down size jelly including laying, tamping, mixing of required quantity of water proof compound for every one bag of cement for plastering in CM 1:3 curing and smooth finishing for exposed faces with necessary centering and form work etc., complete as per specification, drawing and as directed by the Engineer.

d). Providing and constructing benching with Cement Concrete 1:1.5:3 to the dimensions as on drawings with 1:6 slope in the concrete towards the central drain, plastered with CM 1:3 proportion, 20mm thick and finished with smooth coat of neat cement and fixing of inlet and outlet sewers in the walls with the internal periphery protected with an arch of 1:1.5:3 Cement Concrete with graded metal of 10mm to 20mm size.

e). Providing and laying cement concrete of grade 1:1.50:3 proportion with 12mm to 20mm I.S.I gauge of approved gradation hard broken granite/aggregate including cost and conveyance of all materials with wood or steel shuttering form work including machine mixing , centering form work, scaffolding, tamping , vibrating , curing and smooth finish with CM 1:3, 12mm thick for inside surface for RCC Covering Flat Slab with all lead and lifts, etc. complete as per drawing, specification and as directed by the Engineer.

f). Providing, Supplying and fabricating of TMT (Fe-500) reinforcement steel of all sizes, including straightening, cutting, bending, hooking, lapping and/or welding wherever required, placing in position, tieing with binding wire of approved quality and gauge including the cost of binding wire and anchoring to adjoining members wherever necessary including all laps and wastages etc., with all lead and lifts, complete as per design, specification and directed by Engineer.

g). Supplying and fixing of, 3 mm thick plastic (as per IS: 10910) encapsulated over 12mm dia. Fe-415 steel (as per IS: 1786) bar footsteps staggered at 300mm apart and providing and fixing of heavy duty circular steel fibre reinforced concrete (SFRC) manhole frame and covers of 560 mm diameter conforming to IS 12592 and the payment for providing of SFRC heavy duty manhole frame and covers shall be paid separately as per quoted rate for the item in bill of quantities.

h). The RCC Manhole cost includes all materials, steel, curing, pouring tar over MH frame and cover, cost of tar, engraving manhole number and flow direction on the inner surfaces etc., with all lead and lifts, finishing etc complete. The cement used for the construction of RCC manhole and internal & external plastering works of manholes shall be of sulphate resisting cement only, confirming to IS:12330.
The work of construction of **Pre-cast RCC manhole** includes,

a). Providing & laying mechanically mixed cement concrete of M-15 grade with stone aggregate (with 20 mm nominal size graded stone aggregate) in benching, Neat cement punning over PCC benching, as given in the drawings.

b). Construction of approved type vibrated Pre-Cast RCC Manhole Chambers constructed using Sulphate resistant Cement & form vibrator of standard type for Circular Manhole Chambers of various internal dia (as indicated in BOQ) at bottom and 0.50 dia at top made up of pre-cast monolithic base, modular riser and top cone in M- 30 grade concrete placed & aligned to provide vertical sides, with O ring rubber gasket at each joint, water tight & adjustment rings over top cone, complete and all connections shall have, a water tight seal between the pipe and the manhole complete as per standard design & drawing.

c). Making connection of drain or sewer line with existing manhole including breaking in to and making good the walls, floors etc. with CC 1:1:5:3. Finishing with CM 1:3 with a floating coat of neat cement and making necessary channels for drain etc. as per specification, drawing and as directed by the Engineer.

d). Providing, Supplying and fabricating of TMT (Fe-500) reinforcement steel of all sizes, including straightening, cutting, bending, hooking, lapping and/or welding wherever required, placing in position, tieing with binding wire of approved quality and gauge including the cost of binding wire and anchoring to adjoining members wherever necessary including all laps and wastages etc., with all lead and lifts, complete as per design, specification and directed by Engineer.

e). providing MS Foot rests (PVC encapsulated) and fixing in manhole with CC Block of 1:3:6 (1 cement : 3 coarse sand : 6 graded stone aggregate of 20 mm nominal size) of size 20x20x10 cm with 20mm square bar foot rest, and providing and fixing of heavy duty circular steel fibre reinforced concrete (SFRC) manhole frame and covers of 560 mm diameter conforming to IS 12592 and the payment for providing of SFRC heavy duty manhole frame and covers shall be paid separately as per quoted rate for the item in bill of quantities.

f). The RCC Manhole cost includes providing danger lighting & use of sight rails & boning roads shoring & strutting wherever required, including sand bedding, watering, curing, cost of all materials, labour, supply & fabrication of steel, pouring tar over MH frame and cover, cost of tar, engraving manhole number and flow direction on the inner surfaces etc., with all lead and lifts, finishing etc complete. The cement used for the construction of RCC manhole and internal & external plastering works of manholes shall be of sulphate resisting cement only, confirming to IS:12330.

31.3.2 Testing
All RCC Manholes shall be tested as in specifications for Testing and commissioning.

31.3.3 Measurement & payment
The depth of manhole both for Cast In-Situ / Pre-Cast RCC manholes shall be measured from the top of cover to the invert level of the deepest outgoing sewer from the manhole. The quoted rate for the Manholes for various depths as per the specifications and drawings shall include the cost of sulphate resisting cement, bedding concrete, benching concrete, RCC floor & roof slab, shaft walls, plastering, footsteps, fixing SFRC manhole frame with cover, dewatering to keep the manhole dry until final testing etc complete.

The Rates for any fractional variation (increase or decrease) in the depth of the manhole on decimetre basis, shall be **paid as per actuals**, by adding the difference in rates between the immediately preceding and succeeding depths of such fractional depth of manhole on linear basis.

For Example: To pay 1.22M depth manhole:
Rate for 1M depth Manhole excluding manhole frame & cover and **including** encapsulated foot steps rate Rs. X.
Rate for 2 M depths Manhole excluding manhole frame & cover and **including** encapsulated foot steps rate Rs. Y.
Therefore rate for 1.22M depth Manhole
= Rs. X + (Y - X)/1.00 x 0.22.

**Note:** For the depths of manholes less than the lowest depths of Bill of Quantities item, the preceding manhole depth shall be taken as zero with zero value **to arrive at the rate.**

### 31.4 Drop Manholes
In a manhole, wherever the difference between the invert level of downstream sewer and the invert level of the upstream sewer is greater than 60 cm, a drop manhole shall be provided at that position. The locations and construction of the drop manholes shall be provided as on drawings.
HDPE Grade PE-100 pipes confirming to PN 6 as per IS:4984 with latest revisions and amendments suitably supported with MS fasteners at 300 mm c/c. for diameters pipe line as per Bill of Quantities, construction drawings and as directed by Engineer, specials conforming to IS: 1729 shall be used for providing the drop in the manhole & a suitable expander/reducer T-Joint at the top with incoming sewer and 45 degree bend at the bottom with HDPE specials to the direction of flow in the receiving sewer, encasing the pipe with cement concrete of 1:2:4 proportion including necessary centering and form work, vibrating, curing, including cost and conveyance of all materials, labour with all lead and lifts, etc., complete as per specification and as in construction drawing. The benching concrete in the manhole should surround the joint of the terminating bend and a neat channel shall be made in the benching concrete to direct the flow to the receiving sewer. A continuation of the incoming sewer should be built through the shaft wall to form a rodding and inspection eye, which should be provided with half blank flange as on drawing.
The drop manhole arrangements shall be tested along with sewer lines.
31.5 Vent shafts
CI Vent shafts shall be erected at places as on construction drawings or as directed by Engineer and as per Bill of Quantities. The work includes providing and fixing 150mm diameter, Cast Iron pipe for ventilating shaft of 5 meters high with specials and cowl and with suitable grips in C.C. 1:2:4 pillar using 10mm to 20mm graded hard granite/trap/basalt or any other approved metal with 15 cms thick C.C. around up to 1.22 mtrs above the GL and with a foundation base of 90x90x90 cms plastered with 12 mm thick CM 1:3 to all exposed faces and linking the shaft to the manhole by means of 15 cm dia GSW pipes and specials, jointing with tar dipped hemp 1:1 1/2 CM caulking, curing with all lead and lifts etc., complete for all materials earth work excavation and refilling in all strata, and disposal of surplus earth as directed with all lead and lifts etc. complete. (Sulphate resistant cement shall be used).

32 HOUSE SERVICE CONNECTIONS (HSC) AND EXISTING SEWERAGE SYSTEM SURVEY

32.1 House Service Connections
House service connections shall be provided to collect sewage from individual houses as per approved drawings, specifications and items in Bill of Quantities.

For connecting sewers directly to Manholes PVC pipes shall be used and for connecting sewers directly to the Sewer (i.e. online connection) GSW pipes and specials shall be used as on drawings and as decided upon by the Engineer in-charge.

The survey for house service connections from the Nearest Manhole or sewer line as decided by the Engineer, to the property boundary shall be finalized before taking up the work. All the property connections/ House Service Connections (HSC) shall be done simultaneously while sewers are laid in a particular road/ area/ zone.

32.1.1 House Service Connection to Manholes
The Location of House service connections directly to manholes shall be as decided by the Engineer In-charge. The work involves placing of required number of 110/160mm PVC Pipes, of length 200mm more than the shaft wall thickness on both sides, at time of construction of manholes, at a depth of about 1m below ground level or as directed by the Engineer In-charge including providing and laying granite or basalt or trap jelly cement concrete of proportion 1:2:4 for bed and surround of PVC pipe in wall shaft and making the joint water tight.

After completion of the manhole construction, and for providing House service connection up to the property boundary 110mm dia 6 ksc PVC pipes or 160mm dia 6 ksc PVC pipes are to be laid and jointed with required slope, after excavation from property boundary to outside of manhole, and a 90° Bend with cleaning eye and cap is fixed for the pipe, inside the manhole as per specifications and drawings. The items shall include all labour, lead and lifts and handling charges as per Bill of Quantities PVC pipe joints are to be made with suitable solvents as per relevant IS Code.

32.1.2 House Service Connection to Sewers (Online connections)
For House service connections directly to lateral sewers, the connections are divided into shallow depth and deeper depths as shown on drawings. The work shall be executed as per details on drawings and items in bill of quantities, and it involves earthwork excavations as per BOQ specifications, providing, laying and jointing of GSW Junctions, GSW pipes, of specified sizes. The pipes, specials and laying shall confirm to IS 651:1992, IS 4127 with latest amendments and specifications in BOQ.

The cement used for jointing shall be of Sulphate Resisting Cement confirming to IS 12330-1988 with latest amendments.

32.2 Location and Protection of Existing Public and Private Utilities
Prior to excavation, the Operator shall contact all concerned authorities such as Power distribution companies, ULB, police, telecommunications, forest department, etc and householders in roads where work is to take place and inform them of the nature of the work and its likely duration. Information should be obtained from utilities companies about the location of their utilities, preferably in the form of record drawings, and the Operator should carry out utilities tracing using electronic equipment to verify the positions of utilities. Trial excavations should also be carried by hand to further confirm locations of utilities. The Engineer will only permit trench excavation to proceed when he is satisfied that adequate efforts have been made to establish the alignments and depths of existing utilities.

Any damage to water supply utility connections which may occur during execution of House service connections, even after taking all necessary precautions by the Operator shall be paid as per rates quoted for the specified item indicated in Bill of Quantities.

The damaged water supply house connections shall be restored with MDPE pipes including Encasing the MDPE Pipe with 40mm dia., MDPE Pipe at sewer crossings etc. The cost includes encasing the MDPE Pipe with 40mm dia. MDPE Pipe with all works complete as directed by the Engineer In-charge for items under heading “Miscellaneous works” in bill of quantities. The decision in this matter made by the Engineer in charge of work / concerned Engineer of OWNER shall be final and binding upon the Operator. For damaged soak pits and not to cause inconvenience to the public, the soak pits damaged during excavation shall be restored as per items in bill of quantities. However for any damage to other service utilities, the Operator shall make good the same at his own cost. No extra payment towards this will be made.

32.3 Existing sewerage system Survey
It is anticipated that in the existing sewerage system, leaving the portion executed by OWNER, the system is not maintained properly and the system may not be functioning properly at certain locations. Hence the level survey of the existing sewerage system executed by the agencies other than OWNER has been included in this tender. It is the intended to retain portion of existing system which is properly functioning and suitable to be included into proposed network.

The contract covers, Conducting Level Survey of Existing UGD system by Collecting ground levels, invert level of sewers, Size and type(MOC) of Sewers and at every manhole, including depth of manhole and measuring length in between manholes and safely closing the manhole cover, preparation and
submission of Drawings in AutoCAD with all particulars in complete manner as per specification and as directed by the Engineer in charge. (The Manholes and sewers will be de-silted and cleared using sewer cleaning machine by OWNER, Levels shall be carried by the Operator, from the nearest Bench mark given by OWNER).

OWNER will cross verify the adaptability of existing sewer network with the proposed network, and decision will be given to retain or reject the part or whole of the existing sewer network and the Operator shall carry out the same in accordance with the items in the Bill of quantities and as directed by Engineer. For laying of new sewers in place of damaged and unserviceable existing sewers, the earthwork excavation shall be measured including existing damaged sewers under all soils classification, the new sewer lines in place of damaged one’s, dismantling of existing damaged manholes and reconstruction of the same shall be done as per items in BOQ. The diversion of sewage for in service sewer lines and manholes, if required during this work will be done by the OWNER.

The Operator shall collect all necessary specified details required for developing sewer network plan for providing the existing system network plan in Auto Cad. And also incorporate the same in the “AS BUILT DRAWINGS” of executed new works.

**Payment:** - payment to Operator on completion of this item of work complying to the specifications above will be paid as per quoted rate and unit of measurement is meters.

### 33 TESTING AND COMMISSIONING

#### 33.1 Testing at site
All sewers and appurtenances shall be tested before commissioning and trial run as per the specifications in this section. After laying and jointing of sewer pipes and before backfilling the trenches, the complete length of the sewer is to be checked for water tightness and the sole responsibility of arranging the necessary equipments and apparatus lies with the Operator at his own cost. Any damage during testing shall be Operator's responsibility and shall be rectified by him free of cost. Water for testing shall be arranged by the Operator at his own cost.

#### 33.2 Water Test for Sewers
After laying and jointing of sewer pipes and before backfilling the trenches, the complete length of the sewer is to be checked for water tightness. Owner may exempt water test for lateral sewers, where house service connections are to be connected immediately.

**The procedure for testing is as detailed below,**

a) Each section of sewer shall be tested for water tightness from manhole to manhole To prevent change in alignment and disturbance after the pipes have been laid, it is desirable to backfill the pipes up to the top keeping at least 90cm length of the pipe open at the joints in case of longer length pipes.
b) In case of concrete and stoneware pipes with cement mortar joints, pipes shall be tested three
days after cement mortar joints have been made. It is necessary that the pipelines are filled
with water for about a week before commencing the application of pressure to allow for the
absorption by pipe wall.

c) The sewers are tested by plugging the upper end with a provision for an air outlet pipe with
stop cock. The water is filled through a funnel connected at the lower end provided with a
plug. After the air has been expelled through the air outlet, the stop cock is closed and the
water level in the funnel is raised to 2.50m above the invert at the upper end. Water level in
the funnel is noted after 30 minutes and quantity of water required to restore the original
water level in the funnel is determined. The pipeline under pressure is then inspected while
the funnel is still in position. There shall not be any leaks in the pipe or the joints (small
sweating on the pipe surface is permitted). Any sewer or part thereof that does not meet the
test shall be emptied and repaired or re-laid as required and tested again.

d) The leakage or quantity of water to be supplied to maintain the test pressure during the period
of 10 minutes shall not exceed 0.2 lit/mm dia. of pipe per kilometer length per day.

e) Exfiltration test for detection of leakage shall be carried out at a time when the ground water
table is low.

f) For concrete, R.C.C. pipes of more than 600mm dia. the quantity of water inflow can be
increased by 10% for each additional 100mm of pipe dia.

g) After completion of the test all temporary seals shall be removed, the test water shall be
drained out / pumped out and the line cleaned properly.

33.3 Test for Straightness and obstruction
As soon as a stretch of sewer is laid and tested, before commissioning the cleanliness of the pipeline is to
be checked by the following tests as applicable and as decided by the Engineer.

33.3.1 Torch & Mirror Test
In this method of testing, a torch will be held one end of the pipeline inside a manhole and its image through
the pipeline will be reflected and seen on a mirror held at the opposite end of the pipeline, inside the next
manhole. Any obstruction / debris / major mis-alignment will not give a clear image in which case the
pipeline will again be cleaned / rectified and the tests re-done.

33.3.2 Ring Test
In this method of testing two steel/ wooden rings of suitable thickness and design shall be fixed facing
each other at a distance of 2 feet or more. The block of rings shall be inserted from one end of the
pipeline, inside manhole and pulled by a rope fixed to the block from the other end of the pipeline, inside
the next manhole. The rings shall be of dia 75 mm less than the inside diameter of pipe under testing. The
rope used for pulling the ring block may be inserted in the pipeline by suitable means. Any construction /
debris / major misalignment will prevent the ring to pass through the pipeline in which case the pipeline will again be cleaned / rectified and the test redone, and no extra payment will be made. Alternately upon the approval of the Engineer, the sewer may be tested by inserting at the high end of the sewer, a smooth ball of a diameter 13 mm less than the pipe bore. In the absence of obstruction, such as yarn or mortar projecting through the joints, the ball should roll down the invert of the pipe and emerge at the lower end. Any construction / debris / major misalignment that prevents the ball to pass through the pipeline in which case, the pipeline shall be again cleaned / rectified and the tests redone, and no extra payment will be made.

33.3.3 Water Test for Manholes
The entire height of Brick and RCC manhole shall be tested for water-tightness by closing both the incoming and outgoing ends of the sewers and filling the manhole with water. A drop in water level not more than 50mm per 24 hours shall be permitted. In case of high subsoil water it should be ensured that there is no leakage of ground water into the manhole by observing the manhole for 24 hours after emptying it.

33.3.4 Test Records
Complete test records shall be maintained for all tests carried out for sewers both during construction and after being in service. The tests carried out as in specifications, approved QAP shall be documented in the formats as approved by the Engineer and shall be carried out in the presence of the Engineer or his representative and shall be certified by the Engineer or his representative and the Operator. All completed Test records/documents shall be submitted to the Engineer before submission of bills.

33.4 Commissioning
After satisfactory completion of works and Testing of the sewer lines and appurtenances as per specifications in above clauses, the system shall be commissioned for trial run and operation.

34 Final Finishing
The Operator will ensure that the entire structure along with all its installations is in finished and in new and fully operative condition when handed over. He shall have repaired and removed all signs of damage that might have been done during the course of construction of manholes and laying of sewers. He shall also see that the entire exterior has been finished properly and the entire site is cleared of all extra construction material, debris, and excavated soil. This shall have to be done to the satisfaction of the Engineer.

35 As Built Drawings
The Operator shall submit to the Engineer within two months of actual completion of the work, “As Built” Drawings as specified below and operation and maintenance instructions for the whole of the Works. These Drawings shall be accurate and correct in all respects, including the existing sewer network for which the Operator has done the condition assessment survey, shall be submitted to, and approved by the Engineer. Completion Drawings as below on two prints and one polyester film shall be supplied by
the Operator, along with a soft copy in CD. These drawings shall be developed in Auto CAD. Drawing shall be of standard size as below,

i). Strip Plans and L-sections of Under Ground Drainage system showing pipe work in package area on scale as per standard practices to the satisfaction of the Engineer, showing sewer alignments, levels, appurtenances, sizes and material of pipe etc. complete.

ii). Structural Drawings showing reinforcement details of all the components covered under this contract as per standard practices.

36 Sewer crossings By Trench-less Method across National Highways / State Highways / Railway crossings / at any other Specified Locations

All works for Road and Railway crossings by Trench less method i.e. by Pipe Ramming /Manual pipe jacking shall be carried out as per specifications in this section mentioned below and for details and specifications not included in this section shall be carried out as per “Standard contract clauses for Trench less Contracts” and “Standard Guidelines for Trench less contracts”, 2008.

37 Design & Submittals

37.1 Design

The Operator shall be responsible for the design of the pipes used for the trenchless method including all joints, for the design of the thrust and reception pits including support and thrust wall and for the design of the jacking system in general. His design will be reviewed by the Engineer but this will not relieve him of his responsibility for the adequacy of the design.

37.2 Submittals

In addition to the applicable requirement of this Specification, the following shall be submitted by the Operator and approved by the Engineer prior to commencement of any works;

1) Programme or work with resource and equipment allocation.

2) Design Calculations:

a) Pipes including jacking and frictional forces in the axial direction and earth, traffic and surcharge loading in the vertical direction and the pipes resistance to these loads. Also allowable deflections at joints to limit damage to the joint from eccentric loading under thrust and sealing limits,
b) Thrust and reception pits to resist external soil and water pressures and stresses resulting from jacking machine. Drawings showing on plan and sections, the method of supporting excavations and equipment layout shall be included. All calculation shall be certified/ signed by a qualified Engineer.

37.1.3 Method Statement which shall include:

a) List of equipment and resources.
b) Detailed step by step procedure describing how work will be carried out including clear definition of responsibilities and authority.
c) Support of existing services and adjacent structures.
d) Safety arrangement for compliance with safety requirements.
e) Locking pipe in position during insertion of next pipe.
f) Sealing thrust and reception pits during exiting and entering of pipe.

38 Railway Crossings

For Railway Crossings, The Operator has to decide the following issues. Check the profile of track and the strength of the bridge, longitudinally and laterally, the type strata and evolve a complete system from starting and completion with due interaction with owners, Southern Railway (SR) Authorities. The system shall be so evolved that there shall not be any hindrance to any day-to-day activities taking place in the area. He shall spell out likely danger, difficulty, and hindrance and suggest & provide suitable remedial measures to obviate them, keeping authorities in confidence. Suitable sign boards shall be designed and exhibited at proper places in local and English language to keep users informed of the guidance, notice etc.,

39 Site Investigation

After award of the Contract, the Operator shall be responsible for all necessary geotechnical site investigations, including ground water level monitoring, which he considers necessary but as a minimum at the proposed access pit locations, and central median. The Operator’s site investigation programme shall be submitted to the Engineer for review. The results of such investigations shall be submitted to the Engineer and shall include recommendation for pipe laying, excavation support and soil stabilization if required.

The Operator shall be responsible for obtaining existing utility structures information after Conducting Ground Penetrating Radar Survey in a corridor of 4-6 meter width to detect buried utilities like pipes, cables etc. in such corridor, Marking of the detected utilities on the map of corridor with information of locations and depths to the top of various utilities detected. Work to be conducted using 500MHz and 300MHz antenna for best possible resolution and penetration.
39.1 Utility Service structures
The Operator shall replace at his own cost towards damage of any utility service structures during the excavation and rehabilitate if necessary at his own cost.

40 SPECIAL CONDITIONS FOR PIPE RAMMING (PR)

40.1 Description
This method involves the forming of a bore from a drive pit, by driving a steel casing with an open end using a percussive hammer or pushing device that serves as a casing for carrier (sewer pipes). In this process of horizontal ramming of steel pipe involves an open steel pipe string being jacked dynamically with the aid of modified displacement hammer or a horizontal ram from the starting shaft though the subsoil to the target shaft. The soil core entering the pipe is removed continuously, at suitable intervals or after completion of jacking.

40.2 Materials
   a). Pipe

   Pipe used in this method includes an external casing pipe (also called jacking pipe) and may include an interior carrier pipe.

   b). Allowable Forces

   Considerable ramming / jacking forces may be required to install pipe using this method.

   i) Casing pipe shall be obtained from one manufacturer. Pipe shall be specifically designed and certified for Horizontal auger boring by the pipe manufacturer.

   ii) The allowable jacking strength capacity of casing pipe shall be capable of withstanding the maximum jacking forces imposed by the operation. The specified allowable jacking capacity of the casing pipe shall be 3 times greater than the maximum jacking forces imposed by jacking operations as identified by theoretical calculations.

   iii) Steel casing pipe shall have minimum yield strength of 35,000 psi.

40.3 Casing Pipe
   a). Casing pipe shall be used within the entire roadbed influence area. The roadbed influence area is defined as the subsurface area located under the road and shoulder surface, between each shoulder point or back of curb; and continues transversely outward and downward from each shoulder point or back of curb on a 1 on 1 slope

   b). Casing pipe materials shall be steel.
c). Only new casing pipe shall be used.

d). Casing pipe shall normally be constructed without any longitudinal seams. However, longitudinally welded casing pipe is allowed for 1.2 m or larger diameter pipes when a certified welder performs all the welding.

e). Casing pipe shall have smooth interior and exterior walls to reduce jacking force and prevent casing rotation.

f). The inside diameter (ID) of the casing pipe shall be at least 150 mm larger than the largest outside diameter (OD) of the carrier pipe to allow the carrier pipe to be inserted or removed subsequently without disturbing the casing or the roadbed.

g). Casing pipe shall be round. Steel casing pipe shall have roundness tolerance, so that the difference between the major and minor outside diameters shall not exceed 1% of the specified nominal outside diameter, or 6 mm, whichever is less.

h). Casing pipe shall have square and machine beveled ends. The pipe end maximum out-of-square tolerance shall be 1 mm, (measured across the diameter).

i). Casing pipe shall be straight. The maximum allowable straightness deviation over any 3m length of steel casing pipe is 3 mm.

j). Pipe shall be without any significant dimensional or surface deformities. All pipes shall be free of visible cracks, holes, foreign material, foreign inclusions, blisters, or other deleterious or injurious faults or defects. Any section of the pipe with a gash, blister, abrasion, nick, scar, or other deleterious fault greater in depth than ten percent (10%) of the wall thickness, shall not be used and shall be immediately removed from the site.

k). Any of the following defects warrants pipe rejection:

   i). Concentrated ridges, discoloration, excessive spot roughness, and pitting

   ii) Insufficient or variable wall thickness

   iii). Pipe damage from bending Crushing, stretching or other stress

   iv). Pipe damage that impacts the pipe strength, the intended use, the internal diameter of the pipe and internal roughness characteristics

   v). Any other defect of manufacturing or handling.
l). Casing pipe shall be provided with inside two coats of food grade epoxy painting over one coat of epoxy primer and outside two coats of anti-corrosive red oxide primer of approved quality.

m) The casing pipe shall be tested for seepage test after completion.

40.4 Carrier Pipe

Carrier Pipe material is of either Ductile iron or RCC NP-3. The carrier pipe shall be inserted into the casing pipe in conjunction with the casing spacers.

The work includes, Supplying & Conveying of different diameters k-7 Class, Ductile Iron carrier Pipes detailed in bill of quantities, confirming to IS 8329 with latest amendments and conveying to worksite lowering and placing horizontally into casing pipe with all necessary arrangements, true to line and level and perfect linking at joints, testing and commissioning, including cement mortar lining of thickness as per IS using sulphate resisting cement confirming to IS 12330, loading and unloading at both destinations and cuts of pipes wherever necessary including jointing of DI pipes and specials with rubber gaskets including cleaning the socket and spigot ends with soap solution and applying soft soap to the spigot and socket ends before insertion of rubber gaskets, jacking and fixing in perfect conditions including cost of soap solution, soft soap, waste etc. and giving necessary hydraulic test to the required pressure as per ISS with all lead and lifts including cost of jointing materials etc., complete (Operator will make his own arrangements for procuring water for testing)

Supplying of different diameters S&S RCC SPUN / VIBRATED CAST PIPES (REINFORCED) of NP-3 class detailed in bill of quantities, conforming to IS 458:1988 with latest amendments using Sulphate resistant cement, and conveying to worksite, rolling and lowering into trenches, laying true to line and level including loading and unloading at both destinations and jointing of pipes & specials including cost of specials including perfect linking of joints with jack to correct position including cost of jointing materials ie., rubber rings confirming to IS : 5382 for S&S RCC pipes with all lead and lifts as directed and giving necessary hydraulic test as per ISS and testing & commissioning etc., complete. (Operator will make his own arrangements for procuring water for testing)

40.5 Construction

40.5.1 Minimum Allowable Depth

The minimum allowable depth of PR installed pipe under the road and shoulder surface should be usually twice the nominal diameter (OD) or 1 m or the minimum allowable depth as per the project requirement, whichever is higher.

In location where the road surface is super elevated, the minimum depth of the bore shall be measured from the lowest side of the pavement surface.

40.5.2 Equipment

Equipment used for this method shall have the basic operations of boring, removing tailings, and jacking pipe.
40.5.3 Method
The starting shaft shall be excavated to accommodate the steel pipe sections to be jacked and the ram. Steel support profiles shall be placed to direct the movement. If a long jacking is necessary string fabrication shall be done at site.

40.5.4 Access Pits
a) Location

A minimum distance of 6 m, from the edge of the paved shoulder or curb to the face of any access pit, equipment, and supplies, shall be maintained in areas posted at 50 kmph or less; otherwise, a minimum distance of 9 m shall be maintained.

b). Sheeting and Bracing

Sheeting and bracing shall be required whenever any part of the access pit excavation is located within the roadbed influence area. Steel sheet pilling shall be furnished and installed. An additional earth retention structure shall be required above and below the bore hole on the drilling face of all access pits to prevent loss of material during construction.

c) Protection

i). At the discretion of Engineer, and depending on the pit distance from the road embankment, traffic barriers may be required to be installed adjacent to access pit locations according to the owner’s plans. If instructed, temporary beam guardrail shall also be installed according to the current owner’s specifications.

ii). Fencing barriers shall be installed adjacent to access pits, open excavations, equipment and supplies with suitable fencing and plastic drums to prohibit pedestrian access to the work site. Equipment shall not be used as fencing to protect access pits.

iii). The Operator shall construct and operate safe access pits according to all applicable regulatory requirements.

40.5.5 Overcut Allowance

Overcut is the annular space between the excavated hole and the outside diameter of the casing pipe. No overcut shall be allowed in case of pipe Ramming.

40.5.6 Water tight Joints

Water tight pipe joints are required to ensure the integrity of the roadbed. Pipe shall be constructed to prevent water leakage or earth infiltration throughout its entire length.
A watertight specification for each type of pipe material can be obtained through each pipe material industry. Necessary reference must be made to the appropriate industry specification for more detailed information.

40.6 SPECIAL CONDITIONS FOR MANUAL PIPE JACKING
Manual pipe jacking involves forming entry and exit pits, lowering of pipe segment aligning, laying, jointing of product pipe line through jacking process from the jacking pit.

40.6.1 Scope of Work
The scope of work includes all labour, materials and equipments and to perform all the work necessary to design and construct pipe lines crossing under paved roads, railway crossing using Manual pipe jacking. Construction shall be by using appropriate equipment and Operator shall propose the location of all working shafts having due regard to existing services, minimizing disruption to traffic and pedestrian movement. Locations shall be approved by the engineer prior to the commencement of construction. The Operator shall obtain approval of his method statement from the Engineer before commencement of the work.

40.6.2 Design
The Operator shall be responsible for the design of the pipes used for the trenchless method including all joints for the design of thrust and reception pits including support and thrust wall for the design of the jacking system in general. His design will be reviewed by the Engineer but this will not relieve him of his responsibility for the adequacy of the design.

40.6.3 Submittals
In addition to the applicable requirements of this specification, the following shall be submitted by the Operator and approved by the Engineer prior to commencement of any works;

1) Programme of work with resource and equipment allocations.
2) Additional soil investigations
3) Design calculations for the non disruptive method
   a) Pipes including jacking and friction forces in the axial direction and earth, traffic and surcharge loading in the vertical direction and pipes resistance to these loads. Also allowable deflections at joints to limit damage to the joint from eccentric loading under thrust and sealing limits.
   b) Thrust and reception pits to resist external soil and water pressures and stresses resulting from jacking machine. Drawing showing on plan and sections the method of supporting excavations and equipment layout shall be included. All calculations shall be certified / signed by a qualified Engineer.
4) Materials specifications and product data.
5) Method statement shall include

a) List of equipment and resources
b) Detailed step by step procedure describing how work will be carried out including clear definition of responsibilities and authority
c) Support of existing services and adjacent structures
d) Safety arrangement for compliance with safety requirements.
e) Arrangements for dealing with ground water taking due regard to controlling the loss of materials and preventing settlement around pits pit pipe interface and tunnel face
f) Dealing with different ground conditions
g) Locking pipe in position during insertion of next pipe
h) Sealing thrust and reception pits during exiting and entering of pipe
i) Control of overbreak
j) Grout mix design and method of grouting

40.6.4 Casing Pipe

a). Casing pipe shall be used within the entire roadbed influence area. The roadbed influence area is defined as the subsurface area located under the road and shoulder surface, between each shoulder point or back of curb; and continues transversely outward and downward from each shoulder point or back of curb on a 1 on 1 slope

b). Casing pipe materials shall be steel.

c). Only new casing pipe shall be used.

d). Casing pipe shall normally be constructed without any longitudinal seams. However, longitudinally welded casing pipe is allowed for 1.2 m or larger diameter pipes when a certified welder performs all the welding.

e). Casing pipe shall have smooth interior and exterior walls to reduced jacking force and prevent casing rotation.

f). The inside diameter (ID) of the casing pipe shall be at least 150 mm larger than the largest outside diameter (OD) of the carrier pipe to allow the carrier pipe to be inserted or removed subsequently without disturbing the casing or the roadbed.

g). Casing pipe shall be round. Steel casing pipe shall have roundness tolerance, so that the difference between the major and minor outside diameters shall not exceed 1% of the specified nominal outside diameter, or 6 mm, whichever is less.
h). Casing pipe shall have square and machine beveled ends. The pipe end maximum out-of-square tolerance shall be 1 mm, (measured across the diameter).

i). Casing pipe shall be straight. The maximum allowable straightness deviation over any 3m length of steel casing pipe is 3 mm.

j). Pipe shall be without any significant dimensional or surface deformities. All pipes shall be free of visible cracks, holes, foreign material, foreign inclusions, blisters, or other deleterious or injurious faults or defects. Any section of the pipe with a gash, blister, abrasion, nick, scar, or other deleterious fault greater in depth than ten percent (10%) of the wall thickness, shall not be used and shall be immediately removed from the site.

k). Any of the following defects warrants pipe rejection:

i). Concentrated ridges, discoloration, excessive spot roughness, and pitting

ii) Insufficient or variable wall thickness

iii). Pipe damage from bending Crushing, stretching or other stress

iv). Pipe damage that impacts the pipe strength, the intended use, the internal diameter of the pipe and internal roughness characteristics

v). Any other defect of manufacturing or handling.

l). Casing pipe shall be provided with inside two coats of food grade epoxy painting over one coat of epoxy primer and outside two coats of anti-corrosive red oxide primer of approved quality.

m). The casing pipe shall be tested for seepage test after completion.

40.6.5 Carrier Pipe

Carrier Pipe material is of either Ductile iron or RCC NP-3. The carrier pipe shall be inserted into the casing pipe in conjunction with the casing spacers.

The work includes, Supplying & Conveying of different diameters k-7 Class, Ductile Iron carrier Pipes detailed in bill of quantities, confirming to IS 8329 with latest amendments and conveying to work site lowering and placing horizontally into casing pipe with all necessary arrangements, true to line and level and perfect linking at joints, testing and commissioning, including cement mortar lining of thickness as per IS using sulphate resisting cement confirming to IS 12330, loading and unloading at both destinations and cuts of pipes wherever necessary including jointing of DI pipes and specials with rubber gaskets including cleaning the socket and spigot ends with soap solution and applying soft soap to the spigot and socket ends before insertion of rubber gaskets, jacking and fixing in perfect conditions including cost of
soap solution, soft soap, waste etc. and giving necessary hydraulic test to the required pressure as per ISS with all lead and lifts including cost of jointing materials etc., complete (Operator will make his own arrangements for procuring water for testing)

Or Supplying of different diameters S&S RCC SPUN / VIBRATED CAST PIPES (REINFORCED) of NP-3 class detailed in bill of quantities, conforming to IS 458:1988 with latest amendments using Sulphate resistant cement, and conveying to worksite, rolling and lowering into trenches, laying true to line and level including loading and unloading at both destinations and jointing of pipes & specials including cost of specials including perfect linking of joints with jack to correct position including cost of jointing materials i.e., rubber rings confirming to IS : 5382 for S&S RCC pipes with all lead and lifts as directed and giving necessary hydraulic test as per ISS and testing & commissioning etc., complete. (Operator will make his own arrangements for procuring water for testing)

40.6.6 Quality Assurance
The pipe line installation by manual pipe jacking shall be executed by firms having a record of at least three years of successful trouble free execution of similar works

40.6.7 Delivery Storage and Handling
All materials shall be properly protected so that no damage or deterioration shall occur during a prolonged delay

40.6.8 Site Investigation
Soil conditions and ground conditions shall constitute the Operator’s risk. After award of the contract the Operator shall be responsible for carrying out all geotechnical site investigation including ground water level monitoring which he considers necessary but as a minimum at the proposed access pit locations and central median. The Operator’s site investigation programme shall be submitted to the engineer for review. The results of such investigation shall be submitted to the engineer and shall include recommendations for pipe laying, excavation support and soil stabilization if required.

40.6.9 Health and Safety
The Operator shall adopt safe working practices for pipe jacking in accordance with appropriate standards. Only authorized persons shall be allowed access to the site. The Operator shall provide a safety officer suitably experienced in tunneling operations and with adequate authority to control and implement safe working practices.

The Operator shall make suitable arrangements for accommodating his personnel at the site including the following as a minimum:

1) Telephone service.
2) Approved gas detectors.
3) First aid kit.
4) One vehicle.

The excavated pits shall have a separate cage type ladder bay complete with ladder in addition to any other bay or bays required for the construction of the works.

The pits shall be fenced off on all sides with close steel panels at least 1.8m in height and equipped with safety warning lights. The panels (maximum space between 100mm) shall be joined by steel rods supported on concrete blocks.

Adequate lighting and ventilation shall be provided to the pits and electricity shall be supplied at no greater than 110/220 volts.

40.6.10 Skilled Operators and Supervision

All operators in the employment of the Operator shall be skilled and experienced in their respective trades and in particular shall be fully skilled in shaft sinking and manual pipe jacking.

The pipe manufacturer has to guarantee that this pipe and its material are suitable for its intended use.

Standard pipes shall be a minimum in length subject to the installation method used. Where required, pipes shall incorporate lubricant injection holes spaced equally around the circumference. Concrete pipes with a liner shall only be permitted to have lubricant injection holes in the concrete. Lubrication holes shall be clear of joints and shall be plugged on completion of the work. The liner shall be made good and continuous. Pipes may incorporate lifting holes and fixing holes for securing temporary apparatus. All such holes shall be threaded to enable plugs to be screwed into the sockets to withstand any external water pressures.

Joints which shall be used in conjunction with a resilient packing, shall be capable of accepting repeated annular deflections of up to 10 without.

i) damage to pipe or loss of structural strength.

ii) The ingress or egress of water or lubricant under the maximum operational or test pressures.

iii) The ingress of soil / groundwater on to the bearing surfaces.

The joint design for concrete pipes shall be such that the areas available for transmitting the maximum permitted thrust force will be sufficient to ensure that with an annular deflection of 10 and with resilient
packing material in place the maximum pressure applied to the joint bearing surface will not exceed 23.5 N/mm\(^2\) for drives in excess of 100 metres and up to 150 metres in length.

Unless independently authenticated test results acceptable to the Engineer are available, two consecutive axial loading tests incorporating a 10 angular deflection with the application of double the maximum permissible thrust force (or, if greater, of the greatest thrust force that the proposed thrust equipment can apply) shall have been successfully conducted without any visible crushing, cracking or spalling of the pipe being evident, before any pipes will be accepted for use. The test shall be extended to record the loading at which any visible signs of failure become evident, and shall be carried out in an approved manner to simulate actual working conditions. Pipes which have been submitted to the proof load test will not be permitted in the Works.

Where the Operator elects to construct certain sections within larger diameter pipes and grout the annular space, the external pipe may be of steel with full circumferential weld. The steel pipe and the grout shall be regarded as sacrificial and the inner pipe shall be designed as a stand alone pipe, capable of withstanding installation and grouting forces and soil, traffic and groundwater loads subject to the method.

40.7 Grout

40.7.1 As Slurry replacement:
The grout shall consist of Portland cement and water as determined by geotechnical data and directed by the Engineer. It’s normal strength shall be at least 20 N/mm\(^2\). admixtures shall be used only if tests have shown to the satisfaction of the Engineer that their use improves the properties of the grout, e.g. by increasing workability or slightly expanding the grout.

40.7.2 As Annular Space Filling

A low strength, non shrink grout or foam concrete shall be used and placed at low pressures. The density of the mix shall be in the range 900 – 1200 kg/m\(^3\) and the free water / cement ratio not greater than 0.6.

The carrier pipe and joints shall be protected from the possible adverse physical or chemical – effect of grout. Compressible material shall be wrapped around pipe.

The internal pipe shall be filled with water to avoid floatation forces, hydration temperatures and to resist forces during grouting. A 5m high free vented standpipe should be used.

A free venting standpipe of not less than 100mm dia. Shall be installed on the grout injection feed to restrict grouting pressures to a maximum of 1 bar.
40.8 **Thrust and Reception Pits**

The dimensions of thrust and reception pits shall be limited to the minimum required to construct the Works.

Thrust and reception pits shall be constructed within a sheet pile cofferdam or caisson if the ground conditions dictate. The pit bottom shall be sealed with concrete. Entry and exit sealing rings shall be provided.

The Operator shall determine the excavated dimensions of the drive and reception shafts as required to suit the site conditions. Minimum shaft dimensions shall be used at all locations where utilities, roads or trees exist adjacent to the required shaft locations.

Excavations shall be supported according to type of pit as specified below:

**Type ‘A’**  Thrust and reception pit in all types of soils except rock, with high groundwater able and with the excavation secured by precast reinforced concrete caisson.

The caisson bottom shall be sealed with a concrete plug which shall be placed underwater and designed to resist water uplift as well as forces from the jacking equipment to be installed in the pit. All the joints between caisson rings shall be sealed with the joint sealant and the caisson grouted from outside in order to make in water tight. A reinforced concrete wall shall be provided in the thrust pit to resist the jacking force. A properly braced concrete wall shall be provided in the thrust and reception pits in order to install the entry and the exit rings.

**Type ‘B’**  Same as Type ‘A’ but the excavation is secured by inter–locked steel sheet piles. The sheet piles shall be braced by suitable steel framing welded to the sheet piles. No struts shall be used for bracing. The first set of bracing shall be at 0.5m from the ground surface.

**Type ‘C’**  Same as Type ‘A’ but in dry conditions.

**Type ‘D’**  Same as Type ‘B’ but in dry conditions.

**Type ‘E’**  Same as Type ‘A’ except that the pit is partially in soil and partially in rock. The portion in soil is secured by caisson as in Type ‘A’ where as the portion in the rock can be unsupported. Special precautions shall be taken to seal the interface between the caisson and the rock so that it is water and soil tight.

**Type ‘F’**  Same as Type ‘E’ except that excavation in soil is secured by sheet piles instead of a caisson.

**Type ‘G’**  Same as Type ‘E’ but in dry conditions.

**Type ‘H’**  Same as Type ‘F’ but in dry conditions.
**Type ‘I’**

The thrust and reception pits are in rock in an area of high groundwater table. The excavation can be unsupported. A reinforced concrete wall shall be provided in the thrust pit to resist the jacking force. Properly braced concrete walls shall be provided in the thrust and reception pits in order to install the entry and exit rings.

**Type ‘J’**

Same as Type ‘I’ except in dry conditions.

The pits shall be completely dry prior to commencing and throughout Jacking works. Dealing with groundwater where required shall be conducted in a slow manner. Standby facilities shall be provided.

The thrust wall shall be perpendicular to the proposed line of thrust. The thrust wall shall be sufficient to accept repeatedly the maximum permitted thrust force without undue movement. It will not be permissible to thrust directly off any permanent part of any shaft, chamber or pumping station unless this is specifically designed to withstand the thrust reaction.

Thrust wall shall not be joined to the jacking rig base concrete.

The maximum permissible thrust force.

1. 50% of the sum of the maximum forces recorded at the rigs used to construct the tail tunnel, or
2. If the over break to the tail tunnel has been grouted up, 100% of the sum of the maximum forces recorded at the rigs used to construct the tail tunnel.

Any tail tunnel which has been used as a reaction surface shall pass the specified water tightness test at a time not less than 14 days after the load has been removed.

The design of thrust wall and any other associated Temporary Works shall be such as to prevent damage to any part of the Permanent Works or any immediately adjacent service or structure.

Any void between the soil face used to provide a reaction to the thrust force and the thrust wall shall be filled completely with grout.

The Operator shall take any measures necessary to prevent damage or deterioration of the soil reaction face during the construction of the Temporary and Permanent Works from whatever possible cause, such ingress of water, softening, corrosive soil or loss of fines from a granular soil.
40.9 Pipe Installation within Sleeves
Pipe sections shall be placed and joined individually within the sleeve or mounted on guide rails or trolleys in such a manner as to transmit the pulling / pushing forces through the carriage and not through pipe.

40.10 Thrust System
The rig shall distribute the thrust to the pipes via a thrust ring and packing. The jacks shall apply the thrust to the thrust ring by means of a symmetrical distribution. Inter – jack stations shall be used where frictional resistance or other causes would otherwise result in unacceptable thrust forces.

If used, spacer blocks shall be true and free from any distortions.

All thrust rings shall be true and free from any distortions and sufficiently stiff so as to transfer the load from the jacks uniformly to the packing.

Other than at the shield, each group of jacks shall be interconnected to ensure that an evenly distributed load is applied to the thrust ring. Each jack shall incorporate a load cell.

At the rig and at intermediate stations automatic thrust recording equipment monitoring load cells incorporated in each jack is to be provided together with a pressure metering device. Other continuous records including cutter torque, rate of progress, slurry progress, pitch, roll, slurry slow, earth face pressure, etc. shall be provided.

Copies of these records clearly stating the units measured shall be submitted daily to the Engineer.

The thrust force shall not exceed the maximum permissible thrust force as determined by the Operator, based on calculations submitted by the Operator and approved by Engineer and on consideration of the behavior of the pipe joint at the maximum permitted angular deflection of 0.5 with the maximum permissible bearing stress in conjunction with the stress / strain relationship obtained from the packing compression tests.

40.11 Lubrication Holes
Where lubrication holes are required, these shall be threaded to enable plugs to be screwed into the socket and withstand the external pressure. Non – return valves shall be fitted where opening a hole would permit ground loss. Lubrication holes shall be plugged watertight on completion, lining or coating shall be made good. The pressure of the lubricant shall be maintained until it is replaced by grout.

40.12 Grouting
Upon completion of a section, if grouting is required or specified, the grout shall be pumped through all lubrication holes. The pressure and quantity of grout injected shall be calculated by the Operator and approved by the Engineer. Grouting shall commence at the lower holes and shall be carried out
systematically working from one end of pipe jack to the other. Where injection holes can be opened without loss of ground, grout shall be pumped through the lower injection holes until it emerges from the upper holes.

Grouting progress shall be continuously monitored to ensure no over pressurization.

Upon completion of the pipeline, the Operator shall continue to monitor the settlement point elevations regularly during the maintenance period and report to the Engineer on a monthly basis. If the specified limits are exceeded then the Operator should report immediately and submit a proposal to rectify the road surface and prevent further settlement.

41 INSPECTION

a). PRE – INSPECTION PLAN REVIEW

a). Review geotechnical and soil reports.

b). Ensure MDOT facilities and nearby utility information are shown on the plans and profile and that the proposed alignment does not interfere with them.

c). Note the minimum cover above the top of the pipe and below the pavement surface, or ground elevation (for longitudinal installation outside the influence of the roadway) is ____ m.

d). Note proposed pipe characteristics:

   - Pipe material __________________________
   - Pipe Diameter_________________________mm,
   - Pipe wall thickness _________________mm,
   - Over – cut diameter _________________mm,
   - Back ream dia. Increase ________________mm,

 e). Ensure that the appropriate penetration angle and curvature rate are identified.

f). Review contingency plan.

g). Review job site layout including: distance from access pits to roadbed, proposed sheeting and bracing, materials storage and fabrication area, safety devices (barrels, guardrail etc.) and dewatering pit locations.

h). Review steel pipe coating requirements.

i). Note unique or special items / circumstances: ______________
b) CONSTRUCTION INSPECTION

a). Verify traffic control is consistent with the permit requirements, and the permits are available on-site.

b). Verify job site layout is consistent with the approved plans, especially the alignment of the pipe and machine.

c). Verify continuous monitoring records indicate bearing and grade of the leading edge of the pipe is consistent with the approved plans, dewatering effort is satisfactory, soil volume removed is consistent with projection, and that workers understand the contingency plan.

d) Verify pipe characteristics are consistent with permit requirements.

e) Verify steel pipe is new with smooth interior and exterior surfaces, is used within the entire influence area of the roadbed, has clean and square ends, joints are watertight, defective pipe is not used, and damaged pipe is removed.
Verify each end of the pipe is sealed with a cap, restoration is completed, and attach Inspector’s Daily Report (IDR).

Permit No. _____________________________________________
Inspector: ______________________________________________
Date: _________________________________________________

42 Other Related works

42.1 Settlement/Heaving Monitoring

The trench less method of pipe laying shall be performed in a manner that will minimize the movement of the ground in front of, above, and surrounding the ramming/jacking operation: and will minimize subsidence of the surface above and in the vicinity of the ramming. The ground shall be supported in a manner to prevent loss of ground and keep the perimeter and face of the boring stable at all times, including during shutdown periods.

Potential settlement shall be monitored at each edge of right of way, each shoulder point, each edge of pavement, the each edge of each lane (or centerline for two lane roads), and otherwise at 15m intervals along the pipe centerline.

A survey shall be performed one day prior to initiating this operation at each required monitoring location. A similar survey shall then be performed at each location, on a daily basis, until the permitted activity has received a final inspection. This survey establishes the pre-existing and post construction
conditions, and the amount of settlement. All survey readings shall be recorded to the nearest one-hundredth (0.01) of a meter. Whenever possible, trench less pipe installations shall not be installed directly under a pavement crack. Digital photograph of a pavement condition shall also be taken prior and after the pipe installation.

All operations shall stop immediately whenever monitored points indicate a vertical change in elevation of 12mm or more, or any surface disruption is observed. The Operator shall then immediately report the amount of settlement to the Engineer with all records.

42.2 **Ground Water Control**

Dewatering shall be conducted wherever there is high ground water table level to prevent flooding and facilitate the operation. The water table elevation shall be maintained at least 600mm below the bottom of the casing at all times. When needed, dewatering may be initiated prior to any excavation and will be paid as per the item in bill of quantities.

Minor water seepage or pockets of saturated soil may be effectively controlled through bailing or pumping. This control shall be accomplished without removing any adjacent soil that could weaken or undermine any access pit, its supports, or other nearby structure.

Larger volume of ground water shall be controlled with one or more well points or with staged deep wells. Well points and staged deep well pumping system shall be installed and operated without damaged to property or structures, and without interference with the rights of the public, owners of private property, pedestrians, vehicular traffic, or the work of other Operator’s. Any pumping methods of dewatering and control of ground water and seepage shall have properly designated filters to ensure that the adjacent soil is not pumped along with the water. Well diameter, well spacing and the pump’s pumping rate, shall provide adequate draw down of the water level. Wells shall be located to intercept ground water that otherwise would enter the access pit excavation and interfere with the work. Upon removal of a well, the hole shall be filled and grouted.

Existing storm sewer shall only be used to discharge water from the dewatering operation in accordance with a permit obtained from the appropriate storm sewer owner. Filters of sediment control devices shall be required to ensure that the existing system is not adversely affected by construction debris or sediment.

If grouting is used to prevent ground water from entering the area of the access from pit, the grouting shall be installed without damage to property or structures and without interference with the rights of the public, owners of private property, pedestrians, vehicular traffic, or the work of other Operator.

Whenever a significant amount of unexpected groundwater enters an access pit, and a catastrophic pit failure is imminent, the pit shall be backfilled immediately, until the groundwater level is at least 600 mm below the bottom of the casing.
42.3 Boring failure
Should anything prevent complete of this operation, the reminders of the pipe shall be constructed by the methods approved by the Engineer. Abandonment of any component of the installation shall be allowed as approved by the Engineer. If obstruction is encountered which prevents completion of installation of pipes, pipe remain shall be taken out of service and immediately filled with flowable fill.

42.4 Contamination
When an area of contaminated ground is encountered, all operations shall stop immediately, and shall not proceed until approved by the Engineers. Any slurry shall be tested for contamination and disposed off, in a manner, which meets local, State and/ of federal requirements.

42.5 Bulk head
Casing ends shall be enclosed or bulk headed with a 1:1.5:3 proportion concrete, or approved alternate to seal the ends to prevent water leakage or earth infiltration. The concrete shall extend longitudinally into the pipe end opening to create a minimum 300 mm thick bulk head barrier, or as required by permit. Engineers may allow rubber bulkheads in special situations.

42.6 Work site Restoration
a). Access pits and excavation shall be backfilled with suitable material, and in a method approved by Engineer.

b). The disturbed grass surface area shall be top soiled, seeded, fertilized, mulched, and anchored according to the current owners specifications. If a final site restoration is not completed within 5 days after completion of the operation, the installation of temporary soil erosion and sedimentation control measures shall be provided.

c). upon completion of the work, the Operator shall remove and properly dispose off all access materials and equipments from the work site.

d). The permit, including the surety requirements, shall remain in effect for a minimum of one year after completing the work to monitor for settlements of the pavement and/or slope.

42.7 Payments
The payment for the works under Trench less method of pipe laying by Pipe Ramming/Manual pipe Jacking method will be made after executing according to the above specifications as per the relevant items in BOQ. All costs for works executed under the above specifications that are apart from the items in bill of quantities, shall be included in the item for installation of Casing Pipe by ramming / Manual pipe jacking method, No extra claim in this regard is entertained.

42.8 Interface between contracts
The Operator shall under take the end connections at the interface points only after the pipe line as passed the Hydraulic tests on completion. After completing the end connections the Operator shall lay the bed and surround and backfill the trench in the normal manner.

43 Reinstatement of roads
The road restoration / reinstatement shall be carried out after completion and necessary testing of all the
Works and only after approval of the Engineer.

Operator shall make good of the road surface to the original grade, level and specifications as per Bill of Quantities. Trenches shall be backfilled in layers as per clause mentioned in this section, well watered and well compacted before road restoration to avoid settlement of restored strip. In case any settlement of the road restoration strip, the Operator has to rectify the surface by redoing the restoration work at no extra cost to the owner as per Bill of Quantities. Road restoration shall be done as per the requirements of the concerned local authorities, requirements specified in this section of Technical specifications, applicable IRC guidelines and as directed by the Engineer. The replacement of road structures shall be carried out as soon as practicable and in conformity with IRC guidelines after backfilling has been completed. Suitable excavated road pavement which complies with the requirements of the Engineer may be used at the sub-base levels. Compaction shall be carried out with approved mechanical compacting equipments.

The edges of the trench shall be cut to form a straight line consistent with fixed width of trench. A vertical joint shall be formed between the new work and the existing road surface and shall be painted with hot bitumen or rich cement slurry as the case may be, as approved by the Engineer. The joint between the base course and wearing course shall be stepped 75 mm. The finished levels of the completed reinstatement shall conform with the adjoining carriageway surface. Reinstatement of the wearing courses shall match as nearly as practicable the colour or other characteristics of the existing surface.

43.1 WATER BOUND MACADAM SUB – BASE / BASE.

43.1.1 Scope
This work shall consist of clean, crushed aggregates mechanically interlocked by rolling and bonding together with screening, binding material where necessary and water laid on properly backfilled pipeline and manhole trenches and finished in accordance with the requirements of these specifications and as directed by the Engineer.

The scope involves Providing, laying, spreading and compacting stone aggregates of specific sizes to Water Bound Macadam specification including spreading in uniform thickness, hand packing, rolling with 3 wheeled steel/vibratory roller 8-10 tones in stages to proper grade and camber, applying and brooming requisite type of screening/binding materials to fill up the interstices of coarse aggregates, watering and compacting to the required density with all lead & lifts etc complete with the following two layers of materials each compacted to 75 mm thick,

(i). Materials (Refer table 400 - 7, 8 & 9) Using Screening Crushable type such as Moorum or Gravel Grading-II (Clause: 404 of MORT & H).
(ii). Material (Refer table 400 - 7, 8 & 9) Using Screening Crushable type such as Moorum or Gravel Grading-III (Clause: 404 of MORT & H).

43.1.2 Materials
(a) **Coarse aggregates** - Coarse aggregates shall be either crushed or broken stone, crushed slag, over burnt (Jhama) brick aggregates or any other naturally occurring aggregates such as kankar and laterite of suitable quality. Materials other than crushed or broken stone and crushed slag shall be used in sub-base courses only. If crushed gravel / shingle is used, not less than 90 per cent by weight of the gravel/shingle pieces retained on 4.75 mm sieve shall have at least two fractured faces. The aggregates shall conform to the physical requirements set forth in Table 400-6. The type and size range of the aggregate shall be specified in the contract or shall be as specified by the engineer. If the water absorption value of the coarse aggregate is greater than 2 per cent, the soundness test shall be carried out on the material delivered to site as per IS: 2386 (Part 5).

(b) **Crushed or broken stone** - The crushed or broken stone shall be hard, durable and free from excess flat, elongated, soft and distinguished particles, dirt and other deleterious material.

**Table 400-6, Physical requirements of coarse aggregates for water bound macadam for sub– base courses.**

* Aggregate may satisfy requirements of either of the two sets.
** Aggregates like brick metal, kankar, laterite etc. which get softened in presence of water shall be tested for Impact value under wet condition in accordance with IS : 5640.
*** The requirement of flakiness index and elongation index shall be enforced only in the case of crushed broken stone and crushed slag.

(c) **Crushed slag** - Crushed slag shall be made from air-cooled blast furnace slag. It shall be of angular shape, reasonably uniform in quality and density and generally free from thin, elongated and soft pieces, dirt or other deleterious materials. The weight of crushed slag shall not be less than 11.2 KN per m3 and the percentage of glossy material shall not be more than 20. It should also comply with the following requirements:

Note: The compacted thickness for a layer with Grading 1 shall be 100 mm while for layer with other grading i.e., 2 & 3, it shall be 75 mm.

(f) **Screenings** - Screenings to fill voids in the coarse aggregate shall generally consist of the screen material as the coarse aggregate. However, where permitted, predominantly non-plastic material such as murrum or gravel (other than rounded river borne material) may be used for this purpose provided liquid limit and plasticity index of such material are below 20 and 6 respectively and fraction passing 75 micron sieve does not exceed 10 per cent.

Screenings shall conform to the grading set forth in Table 400-8. The consolidated details of quantity of screenings required for various grades of stone aggregates are given in Table 400 – 9. The table also gives the quantities of materials (loose) required for 10 m2 for sub-base base compacted thickness of 100/75 mm. The use of screenings shall be omitted in the case of soft aggregates such as brick metal, kankar, laterites, etc. as they are likely to get crushed to a certain extent under rollers.

**Table 400 – 8, Grading for screenings**

*(g) Binding material* - Binding material to be used for water bound macadam as a filter material meant for preventing gravelling, shall comprise of a suitable material approved by the engineer having a Plasticity Index (PI) value of less than 6 as determined in accordance with IS : 2720 (Part 5).
The quantity of binding material where it is to be used will depend on the type of screenings. Generally, the quantity required for 75 mm compacted thickness of water bound macadam will be 0.06 – 0.09 m³ / 10m² and 0.08 – 0.10 m³/ 10 m² for 100 mm compacted thickness.

The above mentioned quantities should be taken as a guide only, for estimation of quantities for construction etc.

Application of binding materials may not be necessary when the screenings used are of Crushable type such as murrum or gravel.

43.2 Construction operations
(a) Preparation of base - The surface of the sub-grade /sub-base/base to the specified lines and cross fall (camber) shall be made free of dust and other extraneous material. Any ruts or soft yielding places shall be corrected in an approved manner and rolled until firm surface is obtained if necessary by sprinkling water. Any sub-base /base / surface irregularities, where predominant, shall be made good by providing appropriate type of profile corrective course (levelling course) to applicable clause of these specifications.

As far as possible, laying water bound macadam course over an existing thick bituminous layer may be avoided since it will cause problems of internal drainage of the pavement at the interface of two courses. It is desirable to completely pick out the existing thin bituminous wearing course where water bound macadam is proposed to be laid over it. However, where the intensity of rain is low and the interface drainage facility is efficient, water bound macadam can be laid over the existing thin bituminous surface by cutting 50 mm x 50 mm furrows at an angle of 45 degrees to the centre line of the pavement at one meter intervals in the existing road. The directions and depth of furrows shall be such that they provide adequate bondage and also serve to drain water to the existing granular base course beneath the existing thin bituminous surface.

(b) Inverted choke - If water bound macadam is to be laid directly over the sub-grade, without any other intervening pavement course, a 25 mm course of screenings (Grading B) or coarse sand shall be spread on the prepared sub-grade before application of the aggregates is taken up. In case of a fine sand or silty or clayey subgrade, it is advisable to lay 100 mm insulating layer of screening or coarse sand on top of fine grained soil, the gradation of which will depend upon whether it is intended to act as a drainage layer as well.

As a preferred alternative to inverted choke, appropriate geo-synthetics performing functions of separation and drainage may be used over the prepared subgrade as directed by the engineer. Section 700 shall be applicable for use of geo-synthetics.

(c) Spreading coarse aggregates - The coarse aggregates shall be spread uniformly and evenly upon the prepared sub-grade/sub-base/base to proper profile by using templates placed across the road about 6 m apart, in such quantities that the thickness of each compacted layer is not more than 100 mm for Grading
1 and 75 mm for Grading 2 and 3, as specified in specifications above. Wherever possible, approved mechanical devices such as aggregates spreader shall be used to spread the aggregates uniformly so as to minimize the need for manual rectification afterwards. Aggregates placed at spread in one or more layers by any approved means so as to achieve the specified results.

The spreading shall be done from stockpiles along the side of the roadway or directly from vehicles. No segregation of large or fine aggregates shall be allowed and the coarse aggregate as spread shall be of uniform gradation with no pockets of fine material.

The surface of the aggregates spread shall be carefully checked with templates and all high or low spots remedied by removing or adding aggregates as may be required. The surface shall be checked frequently with a straight edge while spreading and rolling so as to ensure a finished surface as per approved drawings.

The coarse aggregates shall not normally be spread more than 3 days in advance of the subsequent construction operations.

(d) Rolling - Immediately following the spreading of the coarse aggregate, rolling shall be started with three wheeled power rollers of 80 to 100 KN capacity or tandem or vibratory rollers of 80 to 100 KN static weight. The type of roller to be used shall be approved by the engineer based on trial run. Except on super-elevated portions where the rolling shall proceed from inner edge to the outer, rolling shall begin from the edges gradually progressing towards the centre. First the edge/edges shall be compacted with roller running forward and backward. The roller shall then move inward parallel to the centre line of the road, in successive passes uniformly lapping preceding tracks by at least one half width.

Rolling shall be discontinued when the aggregates are partially compacted with sufficient void space in them to permit application of screenings. However, where screenings are not to be applied, as in the case of crushed aggregates like brick metal, laterite and kankar, compaction shall be continued until the aggregates are thoroughly keyed. During rolling, slight sprinkling of water may be done, if necessary. Rolling shall not be done when the sub-grade is soft or yielding or when it causes a wave-like motion in the sub-grade or sub-base course.

The rolled surface shall be checked transversely and longitudinally, with templates and any irregularities corrected by loosening the surface, adding or removing necessary amount of aggregates and re-rolling until the entire surface conforms to desired cross fall (camber) and grade. In no case shall the use of screenings be permitted to make up depressions.

Material which gets crushed excessively during compaction or becomes segregated shall be removed and replaced with suitable aggregates.

(e) Application of screenings - After the coarse aggregate has been rolled to as per above specification, screenings to completely fill the interstices shall be applied gradually over the surface. These shall not be damp or wet at the time of application. Dry rolling shall be done while the screenings are being spread so that vibrations of the roller cause them to settle into the voids of the coarse aggregates.
The screenings shall not be dumped in piles but be spread uniformly in successive thin layers either by the spreading motions of hand shovels or by mechanical spreaders, or directly from tipper with suitable grit spreading arrangement. Tipper operating for spreading the screenings shall be so driven as not to disturb the coarse aggregate.

The screenings shall be applied at a slow and uniform rate (in three or more applications) so as to ensure filling of all voids. This shall be accompanied by dry rolling with mechanical brooms, hand-brooms or both. In no case screenings shall be applied fast and thick as to form cakes or ridges on the surface in such a manner as would prevent filling of voids or prevent the direct bearing of the roller on the coarse aggregate. These operations shall continue until no more screenings can be forced into the voids of the coarse aggregate. The spreading, rolling, and brooming of screenings shall be carried out in only such lengths of the road which could be completed within one day’s operation.

(f) Sprinkling of water and grouting - After the screenings have been applied, the surface shall be copiously sprinkled with water, swept and rolled. Hand brooms shall be used to sweep the wet screenings into voids and to distribute them evenly. The sprinkling, sweeping and rolling operation shall be continued, with additional screenings applied as necessary until the coarse aggregate has been thoroughly keyed, well-bonded and firmly set in its full depth and a grout has been formed of screenings. Care shall be taken to see that the base or sub-grade does not get damaged due to the addition of excessive quantities of water during construction.

In case of lime treated soil sub-base, construction of water bound macadam on top of it can cause excessive water to flow down to the lime treated sub-base before it has picked up enough strength (is still “green”) and thus cause damage to the sub-base layer. The laying of water bound macadam layer in such cases shall be done after the sub-base attains adequate strength, as directed by the engineer.

(g) Application of binding material - After the application of screenings in accordance with the above clause, the binding material where it is required to be used shall be applied successively in two or more thin layers at a slow and uniform rate. After each application, the surface shall be copiously sprinkled with water, the resulting slurry swept in with hand brooms, or mechanical brooms to fill the voids properly, and rolled during which water shall be applied to the wheels of the rollers if necessary to wash down the binding material sticking to them. These operations shall continue until the resulting slurry after filling of voids, forms a wave ahead of the wheels of the moving roller.

(h) Setting and drying - After the final compaction of water bound macadam course, the pavement shall be allowed to dry overnight. Next morning hungry spots shall be filled with screenings or binding material as directed, lightly sprinkled with water if necessary and rolled. No traffic shall be allowed on the road until the macadam has set.

The engineer shall have the discretion to stop hauling traffic from using the completed water bound macadam course, if in his opinion it would cause excessive damage to the surface. The compacted water bound macadam course should be allowed to completely dry and set before the next pavement course is laid over it.
43.2.1 **Reconstruction of defective macadam**

The finished surface of water bound macadam shall conform to the tolerance of surface regularity as prescribed in the relevant IS standards. However, where the surface irregularity of the course exceeds the tolerances or where the course is otherwise defective due to sub-grade soil mixing with the aggregates, the course to its full thickness shall be scarified over the affected area, reshaped with added material or removed and replaced with fresh material as applicable and re-compacted. In no case shall depressions be filled up with screenings or binding material.

43.2.2 **Arrangement for traffic**

During the period of construction, the arrangement of traffic shall be done by the Operator in accordance with the applicable clause of this section.

43.2.3 **Measurements for payment**

Water bound macadam shall be measured as finished work in position in cubic metres as per Bill of Quantities item of work.

43.3 **PRIMING OF BASE COURSE WITH BITUMINOUS PRIMERS**

43.3.1 **Scope**

This specification relates to the operation of priming an absorbent base course, preparatory to a subsequent bituminous treatment, through application of a low viscosity bituminous material by spraying.

The specification is intended to indicate what is considered to be a good practice for priming and shall apply unless modified by special provisions to take into account any unusual conditions.

The scope involves, Providing and applying primer coat with bitumen emulsion on prepared surface of granular Base of low porosity such as WBM including clearing of road surface and spraying primer at the rate of 0.75 kg/sqm using mechanical means. As per MORTH specification clause No. 502 complete in all respects with all lead & lifts etc complete.

43.3.2 **Materials**

The bituminous primer to be used should be such that it can penetrate into the base course to perform its intended function.

43.3.3 **Types of primer**

Table 11.2.1 can be used as guidance for choice of primer on different types of surfaces.

<table>

<td>MC-2 or SC-2</td>
</tr>
<tr>
<td>High porosity</td>
<td>MS</td>
<td>MC-3 or RC-1</td>
<td>RT-3 or RT-4</td>
</tr>
</tbody>
</table>

The primers shall conform to IS: 8887 – 1978 (for cationic emulsions), IS: 217-1961 (for cut-backs), and IS: 215-1981 (for road tars), as applicable.

43.3.4 **Viscosity**
For selecting the appropriate type of primer out of the materials indicated in Table 1, the atmospheric temperature during application should be given consideration. Also, within the range of viscosity specified, the primer for use may be selected keeping in view the level of porosity of the surface to be treated.

43.3.5 **Quantity of primer**
The primer shall be applied at the rate of 0.75 kg/sqm.

43.4 **Construction**

a. **Weather and seasonal limitations**
Cut-back and road tar primers shall not be applied on wet surface or during dust storm or when the weather is foggy or rainy. Bitumen emulsion can be applied on wet surface. However, emulsions shall not be applied during dust storm or when it is actually raining. Atmospheric temperature during priming should be above $10^\circ$ C.

b. **Equipment**
All equipment required for the execution of work should be in good working condition at site.

c. **Preparation of base course surface**
The base course surface to be primed shall be swept clean and free from dust. All loose materials and other foreign matter on the surface shall be removed completely, if necessary by using power blowers or sweepers.

Large irregularities, potholes, depressions, etc. shall be repaired prior to priming. Minor depressions may be ignored until the surface is primed. After which these might be patched with a suitable premixed material prior to the subsequent bituminous treatment.

The underlying surface shall be dry prior to priming. Except that in the case of bitumen emulsions, it may be desirable to dampen the surface slightly in order to obtain better penetration of the primer.
Pre-wetting should be done by water spraying, using equipment capable of uniform application of water over the entire surface. The spraying may be taken up 2 to 12 hours before priming, in such quantity that the surface during priming is damp but not saturated with water. Traffic shall be kept off the prepared areas prior to priming.

d. Application of primer
After the base to be primed has been prepared as described above, the primer shall be uniformly applied over the surface using mechanical sprayers. Rate of application of primer shall correspond to the quantities given in specifications unless specified otherwise. The spraying should preferably be carried out using sprayer mounted on distributor truck or with hand sprayer using mechanical pump. The use of hand-held containers such as watering cans, perforated buckets etc., is unacceptable and should not be permitted under any circumstances. Quantity should be checked periodically using Tray Coating Test or any other suitable means.

Temperature of application of primer should be high enough to permit the primer to be sprayed effectively through the jets of the spray bar and to cover the base course surface effectively.

e. Curing
The primed surface shall be allowed to cure fully. No traffic shall be allowed over the primed surface during this period and in any case not before 24 hours if the primer is a cut-back bitumen and 6 hours in the case of bitumen emulsion. Any pool of excess cut-back primer, which has not been completely absorbed by any part of the base course surface during the curing period, should be carefully swept over the adjacent surface, and then a light sand blotter course applied. The amount applied should be just sufficient to blot up the excess bitumen and prevent it being picked up under traffic. If an excess of bitumen residue is found on the primed surface after bitumen emulsion has broken, a very light sand dusting may be applied to soak up the surplus material.

All loose sand should be swept from the base course surface prior to any subsequent bituminous treatment.

43.5 Tack Coat
Providing and applying tack coat with bitumen emulsion using emulsion pressure distributor at the rate of 0.375 kg/sqm on the prepared granular surface cleaned with mechanical broom such as WBM surface as per MORTH specification clause No. 503 complete in all respects with all lead & lifts etc complete for old surfaces at vertical and horizontal joints.

43.6 Specifications for single coat bituminous surface dressing (20mm thick pre-mix bituminous surfacing).

43.6.1 Scope
This specification is intended to indicate what is considered to be good practice for construction of single coat bituminous surface dressing and shall apply unless modified by special provisions to take into account unusual conditions. The work specified consists of a wearing surface composed of a single application of bituminous material covered with one application of cover material of size as specified below, applied on a previously prepared base or pavement.

The specific scope involves, Providing, laying and rolling of open-graded premix surfacing of 20 mm thickness composed of 13.2 mm to 5.6 mm aggregates either using penetration grade bitumen 80/100 or cut-back or emulsion to required line, grade and level to serve as wearing course on a previously prepared base, including mixing in suitable plant, laying and rolling with a smooth wheeled roller 8-10 tonne capacity, finished to required level and grades. Mechanical method using Penetration grade Bitumen and HMP of appropriate capacity, as per MORTH specification No.511 complete in all respects. (Bitumen 1.46kg/sqmt. Metal = 0.027) with 40-60 TPH hot mix with all lead & lift etc complete.

43.6.2 Materials

b. Cover materials

(i). General requirements - The cover material shall consist of crushed stone, crushed slag, crushed gravel (shingle) or other stones, as specified, and shall have clean, strong, durable, and fairly cubical fragments free from disintegrated pieces, salt, alkali, vegetable matter, dust and adherent coatings. The aggregate shall preferably be hydrophobic in nature and of low porosity.

(ii). Physical requirements - The aggregate shall satisfy the requirements given in Table below.

<td>IS: 2386 (Part III)</td>
</tr>
</tbody>
</table>
Where all these conditions cannot be satisfied, it is left to the Engineer-in-charge to allow reasonable tolerances.

**Size** - The size of chippings to be used shall depend on whether the treatment is for the first coat or for the subsequent or renewal coat and shall be as per the size specified below. For single application of the aggregate, it is desirable to keep the grading of the various sizes as specified in Table below.

<table>
<thead>
<tr>
<th>Sieve designation nominal size of aggregate</th>

</tr>
<tr>
<td>II For subsequent or renewal coats 10 mm</td>
<td>100 percent passing through 12.5 mm square mesh sieve and retained on 6.3 mm square mesh sieve.</td>
</tr>
</tbody>
</table>

Note – It is essential to sieve the aggregates through proper size sieves to ensure the size stipulated in the specifications. The sieve sizes indicated above are as per IS: 460 – 1962.

43.6.3 Construction methods

a. **Weather and seasonal limitations** - Preferably, the surface dressing work shall be carried on only when the atmospheric temperature in shade is 16°C or above. No bituminous material shall normally be applied when the surface or the cover material is damp, when the weather is foggy or rainy or during dust storm, except, in case of emulsions, the surface should be slightly damp.

b. **Equipment** - All equipment necessary for the proper construction of work shall be on the site of the work in good condition.

c. **Preparation of road surface** - The underlying course on which surface dressing is to be laid shall be prepared, shaped and conditioned to a uniform grade and section as specified. Any depressions or potholes shall be properly made up and thoroughly compacted sufficiently in advance. The defective parts should be clearly cut out and the patches of new material put in, and not put on the existing surface.

Where the existing surface shows signs of "fattening-up", such position should be rectified. It is important that the surface be dry and thoroughly cleaned immediately before applying the binder. The surface should be swept clean free of caked earth and other foreign matter cleaned first with hard brushes, then with softer brushes and finally blowing off with sacks or gunny bags to remove the fine dust. The base shall be applied with Tack coat uniformly preferably by a mechanical sprayer.

d. **Application of bituminous material** - After the surface to be treated has been prepared, as specified
above, bituminous material shall be sprayed uniformly over the dry surface preferably using mechanical
sprayers. The binder shall be applied at a temperature appropriate to the type of binder and equipment
used. The premix open graded surfacing consisting of aggregates 13.2mm to 5.60mm shall be applied to
an uniform thickness as per applicable IS standards to get the final compacted thickness of 20mm.

e. Rolling cover materials - Immediately after the application of the cover materials as described, the
entire surface shall be rolled with a 8 to 10 tonne smooth wheeled road roller. The rolling shall begin at
the edge and proceed lengthwise, over the-area to be rolled lapping not less than one third of the roller
tread and proceed towards the centre. When the centre is reached, the rolling shall then start at the
opposite side and again proceed towards the centre. In the super-elevated portions, the rolling should
proceed from the inner to the outer edge. While the rolling is in progress, additional aggregate shall be
spread by hand in whatever quantities may be required to fill irregularities and to prevent picking up of
the aggregate by the roller. Rolling shall be continued until the particles are firmly embedded in the
bituminous materials and present a uniform closed surface. Excessive rolling which results in the crushing
of the aggregate particles shall be avoided.

f. Finishing - The finished surface shall be uniform and conform to the lines, grades and typical cross
sections shown in the specifications.

g. Opening to traffic - When straight run bitumen or road tar is employed as the binder, the finished
surface shall be thrown open to traffic on the following day but if in special circumstances, the road is
required to be opened to traffic immediately after rolling, speed of the traffic shall be limited to 16 km per
hour till the following day.
Where cutback bitumen and emulsion is employed, the finished surface shall be kept closed to the traffic
until it has sufficiently cured to hold the cover aggregates in place.
Controlling of traffic shall be done by some suitable device, such as barricading and posting of watchmen,
etc.

43.6.4 SEAL COAT.
The scope of work involves Providing and laying seal coat sealing the voids in bituminous surface laid to
the specified levels, grade and cross fall using Type A seal coat as per MORTH specification clause No.
513 complete in all respects with all lead & lift etc complete.(Bitumen = 0.98 kg/sqmt. Metal =0.009).

43.7 SPECIFICATIONS FOR CONSTRUCTION OF CONCRETE ROADS

43.7.1 Scope

This is intended to indicate what is considered to be good practice for the construction of cement concrete
road pavements, including preparation of the subgrade and sub-base underneath these pavements. This
does not however cover the requirements of fully mechanized constructions.

The scope involves providing specified thickness of 1:3:6 proportion cement concrete as base course and
specified thickness of 1:1.5:3 proportion cement concrete as wearing course as per approved construction drawings and specifications.

43.7.2 Materials

**a. Ordinary Portland Cement** - This should comply with the requirements of IS - 8112 with latest revisions (Specification for Ordinary Portland Cement)

**b. Aggregates**

**General** - Aggregates should comply with IS - 383 -1970 "Specification for Coarse and Fine Aggregates from Natural Sources for Concrete (Second Revision)" with special reference to the additional requirements stipulated for use in road works excepting in the case of Los Angeles Abrasion Test limit.

The Los Angeles Abrasion Test limits shall be not more than 35 per cent and 50 per cent for concrete wearing course and sub-base course respectively. In addition, the limits of deleterious material shall not exceed the requirements set out in IS - 515 -1959 “Specification for Natural and Manufactured Aggregates for Use in Mass Concrete.” Weathered rock should not be used. In order to make good concrete, it is important to avoid crushed aggregate of poor shape. Very angular, flaky, elongated or splintery aggregates give a harsh mix of low workability. Maximum size of aggregate should not exceed \( \frac{1}{4} \)th of the pavement slab thickness. In case of pavements having reinforcement, maximum size of aggregate should also not exceed \( \frac{1}{4} \)th of minimum clear spacing between reinforcing bars.

**c. Coarse aggregates**

**Continuous grading** - Continuously graded coarse aggregate should be furnished in at least two separate sizes with separation at 20 mm I.S. sieve when combined material graded from 40 to 4.75 mm is specified, and at 25 mm I.S. sieve when combined material graded from 50 to 4.75 mm is specified.

**d. Fine aggregate** - Fine aggregate shall preferably be natural sand. Crushed stone sand may also be used satisfactorily in concrete. The fine aggregate shall conform to IS: 383 -1970, the permissible percentage passing limits on 300 and 150 -micron sieves shall be 15 -55 per cent and 0 -20 per cent respectively instead of 15 -50 percent and 0 -15 per cent as stipulated in IS Specification. Crushed sand is usually more angular in shape than naturally occurring sand, and for this reason may tend to make the mix a little harsher. In some cases, it may prove advantageous to use a mixture of naturally occurring sand and crushed stone sand if the former is not obtained in adequate supply or where its grading is poor. Bulking due to presence of moisture in the fine aggregate should be accounted for when volumetric batching is employed.

**e. Water** - Water used in mixing or curing of concrete shall be clean and free from injurious amounts of oil, salt, acid, vegetable matter or other substances harmful to the finished concrete. It shall meet the requirements stipulated in clauses of IS: 456 -2000 "Code of Practice for Plain and Reinforced Concrete". Potable waters are generally
considered satisfactory for mixing or curing.

**f. Dowel and tie bars** - Dowel and tie bars shall be plain round steel bars conforming to the requirements of IS: 432 -1966.

**g. Premoulded joint filler** - Premoulded joint filler shall be of the thickness shown on the drawings within a tolerance of ±1.5 mm. It shall be 25 mm less in depth than the thickness of the slab, within a tolerance of ±3 mm and of the full width between road forms. Holes to accommodate dowel bars shall be accurately bored or punched out. The joint filler shall comply with the requirements of IS: 1838 -1961 "Specification for Preformed Fillers for Expansion Joint in Concrete, Non-extruding and Resilient Type (Bitumen-impregnated Fiber)."

### 43.7.3 Water content and workability

The water content per batch of concrete should be maintained constantly except for suitable allowances to be made for free moisture and absorption by aggregates determined from time to time during construction. Adjustments for workability shall be made by variations in the ratio of the coarse to fine aggregate or improving upon their grading without change in cement content or water-cement ratio. The slump of the concrete mix for pavements compacted by vibration should not be more than 25 mm, preferably between 0 and 12 mm, and that by manual compaction not more than 50 mm. No price adjustment would be permissible for variations in the gradations of the aggregates or in the ratio of coarse to fine aggregates necessitated from adjustment at site.

### 43.7.4 Tools, equipment and appliances

#### 43.7.5 General

All tools, equipment and appliances necessary for proper preparation of sub-grade, laying of sub-base and batching, mixing, placing, finishing and curing of concrete shall be at the project site in good working condition and shall have been inspected by the engineer before the paving operations are permitted to start. Throughout the construction of the project, the construction agency shall maintain all necessary tools, equipment and appliances in first class working condition to ensure proper execution of the work. Arrangements shall also be made for requisite number of stand-by units in the event of breakdowns during construction.

#### 43.7.6 List of tools, equipment and appliances

A list of tools, equipment and appliances required for the different phases of concrete road construction is given below.

This list pertains to semi-mechanised type of construction only, as practised most in this country.

**(a) Subgrade and sub-base compaction** -

(i) Compaction equipment  (three wheeled or tandem roller, pneumatic roller, vibratory roller
or sheep-foot roller)
(ii) Watering devices (water lorries, bhisties/water carriers or watering cans),

(b) Preparation of sub-base for concreting and formwork
(i) Scratch templates or strike boards
(ii) Bulk-heads
(iii) Pick axes, shovels and spades
(iv) Formwork and iron stakes

(c) Concrete manufacture
(i) Shovels and spades
(ii) Sieving screens
(iii) Weigh batcher
(iv) Aggregate measuring boxes (only where volume batching of aggregates is permitted as a special case)
(v) Water pump
(vi) Water measures
(vii) Concrete mixer

(d) Transportation, laying and compaction of concrete
(i) Wheel barrows/iron pans
(ii) Wooden bridges
(iii) Spades
(iv) Concrete vibrators (both internal and screed board types)
(v) Wooden hand tampers

(e) Finishing operations - surface and joints
(i) Wooden bridges
(ii) Floats (longitudinal and long-handled wooden floats)
(iii) Templates
(iv) Three-meter long straight edges including one master straight edge
(v) Graduated wedge gauges
(vi) Mild steel sections and blocks for making joint grooves
(vii) Edging tools including double-edging tools
(viii) Canvas belts
(ix) Long handled brooms
(x) Diamond cutter (when making saw-cut joints)
(xi) Grinder (for grinding local high spots)

(f) Curing
(i) Hessian cloth burlap or polyethylene sheeting
(ii) Watering devices as in a (ii) (for ponding operation)

(g) Cleaning and sealing of joints
(i) Iron raker
(ii) Coir brush
(iii) Cycle pump/pneumatic air blower
(iv) Kerosene stove
(v) Thermometer
(vi) Transferring pot
(vii) Painter's brush
(viii) Pouring kettle
(ix) Scraper

43.8 Sub-base
Plain cement concrete of 1:3:6 proportion for specified thickness as in construction drawing shall be laid in accordance with the respective specification in Bill of Quantities and the surface finished to the required lines, levels and cross-section.

43.9 Forms
Steel forms - All side forms shall be of mild steel unless use of wooden sections is specially permitted. The steel forms shall be mild steel channel sections of depth equal to the thickness of the pavement. The sections shall have a length of at least 3 m except on curves of less than 45 m radius, where shorter sections may be used. When set to grade and staked in place, the maximum deviation of the top surface of any section from a straight line shall not exceed 3 mm in the vertical plane and 5 mm in the horizontal plane. The method of connection between sections shall be such that the joint formed shall be free from difference in level, play or movement in any direction. The use of bent, twisted or worn-out forms will not be permitted. At least three stake pockets for bracing pins or stakes shall be provided for each 3 m of form and the bracing and support must be ample to prevent springing of the forms under the pressure of concrete or the weight or thrust of machinery operating on the forms.

The supply of forms shall be sufficient to permit their remaining in place for 12 hours after the concrete has been placed, or longer if necessary in the opinion of the engineer.

Wooden forms - Wooden forms may be used only when specifically permitted in the drawing with the exception that their use is herein approved for all curves having radii of less than 45 m. Wooden forms shall be dressed on one side. They shall have minimum base width of 100 mm for slab thickness up to 200 mm and a minimum base width of 150 mm for slabs over 200 mm thick. Their depth shall be equal to the thickness of the pavement. These forms when used on straight shall have a minimum length of 3 m. Forms shall be held by stakes set at intervals not exceeding 2 m. Two stakes, one on each side, shall be placed at each joint. The forms shall be firmly nailed or secured to the side stakes, and securely braced at joints, where necessary, so that no movement will result from the pressure of the concrete or the impact of the tamper and during finishing work. Wooden forms shall be capped along the inside upper edge with 50-mm angle iron well recessed and kept flush with the face of the wooden forms.

Setting of forms - The forms shall be jointed neatly and shall be set with exactness to the required grade and alignment. Both before and after the forms are placed and set the sub grade or sub-base under the forms shall be thoroughly tamped in an approved manner. Sufficient rigidity shall be obtained to support the forms in such a position that during the entire operation of compacting and finishing of concrete they
shall not at any time deviate more than 3 mm from a straight edge 3 m in length. Forms, which show a variation from the required rigidity or alignment and levels shown in the drawing, shall be reset or removed, as directed. The length and number of stakes shall be such as to maintain the forms at the correct line and grade. All forms shall be cleaned and oiled each time before they are used. Forms shall be set for about 200m ahead of the actual placing of concrete.

43.10 Joints

General - The location and type of joints shall be as shown in the drawing. The edge of the slab at all joints shall be rounded off with an edging tool having a radius of 6 ± 1mm. The concrete along the face of all joints and around all tie bars and dowels shall be compacted with an internal vibrator inserted in the concrete and worked along the joint and around all tie bars and dowels to ensure a concrete free from honeycombing.

Types of joints - There are three general types of joints. These are –

Expansion joint - Such joint provides the space into which pavement can expand thus relieving compressive stresses due to expansion and inhibiting any tendency towards buckling of concrete slabs.

Contraction joint - Such joint relieves tensile stresses in the concrete and prevents formation of irregular cracks due to restraint in free contraction of concrete. Contraction joints also relieve stresses due to warping.

Warping joint - Such joint relieves stresses due to warping. These are commonly used for longitudinal joints dividing the pavement into lanes.

In addition, construction joints are provided whenever construction operations require them. These are full depth joints and may belong to any of the above types. All joints shall be carefully installed in accordance with the location and details given on the plans.

Transverse joints
General - Transverse joints can be expansion, contraction or construction joints and shall be placed as indicated on the drawing. They shall make a right angle with the centre line of the pavement and surface of the subbase/subgrade. Contraction and expansion joints shall be continuous from edge to edge of the pavement through all lanes constructed at the same or different times.

a. Transverse expansion joints - These shall extend over the entire width of the pavement. They shall be of the dimensions and spacing as shown on the construction drawing.

Dowel bars (see Supplementary Note N. 4) as per dimensions, location and spacing shown on the drawing are required at expansion joints to transfer wheel loads to the adjacent slab. For slabs of thickness less than 150 mm no dowel bars may be provided (IS: 6509 -1972). The pre-moulded expansion joint filler, a compressible material used to fill the gap between adjacent slabs at expansion joint shall conform to IS:
The height of the filler board shall be such that its top is 25 mm below the surface of the pavement. The dowel bars shall be held accurately in position during the placement, compaction and finishing of concrete at and near the expansion joint. This and the protection of the joint groove during construction may be achieved by means of sufficiently strong bulkheads (as per IRC: 43 -1972) with holes drilled along the centre line to accommodate the dowel bars and a mild steel section (as per IRC - 43 -1972) respectively. The latter shall be oiled or greased before placing in position to avoid bonding with concrete. The top and bottom edges of the bulkheads and mild steel section shall be shaped to correspond to the camber of the pavement at the joint. If considered convenient, two -piece split bulkheads may also be used. When dowel bars are provided, bulkheads shall be used in pairs, one at the joint location, and the other some distance away to hold the projecting ends of the dowel bars to maintain their alignment. For cases where dowel bars are not provided, one single bulkhead without holes will be adequate.

The bulkheads shall be securely staked in place at right angles to the centre line and surface of the pavement with sufficient stakes to hold them in the specified position.

After the concrete has sufficiently hardened the mild steel metal section shall be removed carefully without disturbing the edges. The edges shall then be rounded with an edging tool. For facilitating removal of the mild steel section as well as edging operation, the top of the section may be flared on both sides with the required curvature of a rounded edge.

Under no circumstances shall any concrete be left above the expansion 'joint filler or across the joint at any point. Any concrete spanning the ends of the joint next to the forms shall be carefully cut away after the forms are removed.

b. Transverse contraction joints - These shall be placed as shown on the drawing and shall be of the weakened plane or "dummy" groove type. They shall be constructed by forming in the surface of the slab a slot not less than 6 mm wide and having a depth equal to one -third to one -fourth the depth of the pavement at the thinnest part of its section. This slot may be formed in a manner approved by the engineer such as by pushing into the concrete a flat bar or the web of a "T" bar using a suitable vibratory device, removing the bar, and keeping the slot open. It shall be ensured that no spalling of concrete occurs while removing the bar. The edges of the joint shall be rounded with an edging tool before the concrete hardens.

c. Transverse construction joints - These shall be placed whenever placing of concrete is suspended for more than 30 minutes. Excepting in the case of emergency, construction shall always be suspended at the regular site of expansion or contraction joints. If the construction joint is located at the site of an expansion joint, regular expansion joint shall be provided; if at the site of a contraction joint or otherwise, the construction joint shall be of butt type with dowels.

At all construction joints, bulkhead shall be used to retain the concrete and care shall be taken in striking
off and finishing the surface to the top face of the bulkhead. When work is resumed, the surface of concrete laid subsequently, shall conform to the grade and cross-section of previously laid pavement, and a straight edge 3m in length shall be used parallel to the centre line, to check any deviation in the surface of the two sections. Any deviation from the general surface in excess of 3 mm shall be corrected.

**Longitudinal joints**

These shall be of the plain butt type and shall be formed by placing the concrete against the face of the slab concreted earlier. The face of the slab concreted earlier, shall be painted with bitumen before placing of fresh concrete.

Tie bars shall be used at longitudinal joints and they shall be of the dimensions and at spacing shown in the construction drawing. Tie bars shall be supported so as not to be displaced during construction operations. Tie bars shall be bonded in the slabs across longitudinal joints, and whilst casting the first slabs, they may be bent so that one end of them lies along the forms. After removal of the forms, bars shall be straightened so that they extend into the concrete placed on the other side of the joint.

### 43.11 Construction

#### a. Storage and handling of cement

Cement shall not be stored for a long time and should be used normally within six months of its date of receipt. Even during this period of storage it is essential that cement shall be protected from moisture by storing it in suitable sheds. Storage shed with a concrete floor laid on a well-drained foundation may be satisfactory. Cement in bags shall be stored on boards raised above the floor level for the purpose of ventilation, and the bags shall not touch the walls of the shed. Different consignments should be separately stacked and used in order in which they have been received. When bulk supply cement is used, special storage facilities such as covered hopper bins will be required. Supply of cement should be co-coordinated with its consumption so that it is not stored right through the rainy season, when normally concreting is discontinued. Cement having lumps which have been caused due to improper storage or by pressure due to over-loading of bags shall not be considered for use unless these lumps can be easily powdered with pressure between fingers. Before such cement is used, representative sample containing also the lumps in fair proportion shall be taken and tested as per IS - 269 -1976, 8112 -1976, 1489 -1976, 455 -1967 or 8041E -1976 as the case may be, to fulfill the minimum requirements.

#### b. Storage and handling of aggregates

The location and preparation of sites, minimum size of stack and the methods adopted for dumping and stacking to prevent segregation of coarse and fine material shall be subject to the approval of the engineer. Aggregates from different sources and/or of different grading shall not be stacked together. Each separate size of coarse aggregate shall be stacked separately. The storing of aggregates upon the carriageway or shoulders shall not be permitted.

If aggregates are stored in conical stacks, segregation will be increased by the rolling of the coarser particles down the sides of the stacks. To avoid this, stacks should be built up in approximately
horizontal layers. Dry fine aggregate segregates and gets blown away easily it may be helpful to moisten it. To assist in controlling the water/cement ratio, large fluctuations in the moisture content of aggregates may be reduced by storing the bulk of the material well in advance of use. For this purpose, all washed aggregates shall be stacked for draining at least 12 hours before being batched. It is also a good practice to reserve the bottom 150 -300 mm or so of the stacks as a drainage layer. Where this cannot be done, the aggregates should not be placed on the ground. In such case, somewhat raised planks, metal sheets or concrete base should be provided and laid to slopes.

The aggregates shall be handled from the stacks and fed into the mixer in such a manner as to secure the stipulated grading of the material. Aggregates that have become mixed with earth or other foreign material shall not be used. They shall be washed clean before use.

c. Batching of materials

All batching of materials shall be by weight or volume as approved by the Engineer. the proportion of ingredients shall be as specified in the item of work in Bill of Quantities, The Engineer may permit the use of fractional bags of cement provided they are accurately weighed and are handled in a manner meeting with his approval. Water may be measured by volume. It should, however, be borne in mind that weigh batching is definitely much more desirable than volume batching. If batching by volume is permitted, as a special case, separate measuring boxes shall be provided for the different aggregates. The boxes shall be of strong construction provided with handles for convenient lifting and loading into the mixer. They shall be of such size that it should be possible to measure out the requisite quantity of aggregate per batch in whole box or by multiples thereof and capable of being lifted by two men. Each box shall be provided with a straight edge of required length for striking off after filling. If so directed by the engineer, improved facilities such as tipping boxes of accurate capacity working on run-out rails arranged for direct delivery into the hopper of the mixer shall be provided by the construction agency. In volume batching, suitable allowance shall be made for the hulking of fine aggregate due to the presence of water. For this purpose the bulking shall be determined as per relevant Indian Standard Specification.

d. Mixing

General - The mixing of concrete shall be done in a batch mixer of approved type, which will ensure a uniform distribution of materials throughout the mass, so that the mix is uniform in colour and homogeneous. All concrete shall be mixed in quantities for immediate use.

The mixer shall be equipped with approved water-measuring device capable of accurate measurement of water required per batch. The mixer shall preferably be equipped with a mechanically operated pump for filling the mixer tank.

The mixer, if so specified, shall be equipped with an approved timing device which will automatically lock the discharge lever during the full time of mixing and release it at the end of the mixing period; the device shall also be equipped with a ball, adjusted to ring each time the lock is released. If the timing device gets broken, the mixer will be permitted to be used while the same is being repaired, provided an approved time-piece equipped with minute and second bands is provided. Each batch shall be mixed for
at least one and a half minutes. Spilling of the materials at either end of the mixer shall be corrected by reducing the size of the batch and in no case shall the volume of the mixed material per batch exceed the manufacturers guaranteed capacity of the mixer. The type, size and number of mixers shall be so chosen as to provide the required output without overloading. The mixing speed of the drum shall not be less than 15 revolutions per minute nor the peripheral speed of the drum greater than 60 m per minute. The batch of cement, fine aggregate and coarse aggregate shall be fed into the mixer simultaneously with the water being introduced either at the same time or before the dry materials. The entire contents of the drum shall be discharged before any materials are placed therein for the succeeding batch.

The skip shall be so maintained and operated that each batch will be completely discharged into the mixing drum at the loading of the mixer. The mixer shall be cleaned at suitable intervals while in use.

Pick-up and throw-over blades in the drum of the miner which are worn down 20 mm or more in depth shall be replaced with new blades.

**Time of mixing** - The mixing of each batch will continue not less than one and half minute after all the materials are discharged into the mixer.

**Re-tempering** - The re-tempering of concrete i.e. remixing with or without additional cement, aggregate or water shall not be permitted.

**Control of workability and strength**

**a. Workability of concrete** - The workability of concrete shall be checked by performing "slump test" or "compacting factor test" in accordance with IS ; 1199 -1959 “Method of Sampling and Analysis of Concrete.” The frequency of testing shall be one test per 10 m³ of concrete and the permissible tolerances from the specified value for workability shall be -

- Slump: ± 12 mm
- Compacting factor: ± 0.03

Where variations beyond the permitted tolerances are observed, necessary adjustment shall be made keeping the water cement ratio same.

**b. Strength of concrete** - The strength of concrete shall be determined either by compressive or flexural strength tests (preferably the latter, since concrete pavements are designed on the basis of flexural strength of concrete) depending on the facilities available. For this purpose, during the progress of the work, cube/beam samples shall be cast for testing at 7 and 28 days. Sampling and testing shall be done in accordance with IS - 1199 -1959 “Method of Sampling and Analysis of Concrete" and IS - 516 -1959 "Method of Test for Strength of Concrete" respectively. The minimum frequency of samples shall be 3 cube/beam samples for each age of 7 and 28 days for every 30 m³ of concrete.

On a paving job, the strength of concrete should be continuously monitored to ensure that the desired strength is achieved. In certain cases, because of change in the source of cement or control or climatic
factors, the strength may show some variations, which would require re-designing of the mix.

**Transporting and placing of concrete** -

The concrete shall be mixed in quantities required for immediate use and shall be deposited on the sub-base to the required depth and width of the pavement section, in successive batches and in continuous operation without the use of intermediate forms or bulk-heads between joints. Care shall be taken to see that no segregation of materials results whilst the concrete is being transported from the mixer to the place where it is deposited. The usual method of transport of concrete in India is in pans as head loads or in small wheel barrows. The spreading shall be as uniform as possible to avoid re-handling of the concrete. Where, however, a certain amount of re-distribution is necessary, it shall be done with shovels and not with rakes. While being placed, the concrete shall be tamped with suitable tools for slab thicknesses of 12.5 cm and less so that formation of voids or honeycomb pockets is prevented. The concrete shall be particularly well placed and tapped against the forms and along all joints. For higher thicknesses an internal vibrator shall be employed in lieu of rodding of the concrete. To effect adequate compaction, the concrete shall be placed with appropriate surcharge over the final slab thickness. The amount of surcharge will depend on the mode of placement of concrete and shall be determined by trial. In general, the required surcharge is about 20 per cent of the required slab thickness. Any portion of the batch of concrete that becomes segregated while depositing it on sub-grade shall be thoroughly mixed with the main body of the batch during the process of spreading. In case of unavoidable interruption, a full depth transverse joint shall be made at the point of stoppage of work provided the section on which the work has been suspended is about 2 to 3 hours long. In placing of concrete for two course construction, necessitated by either positioning of the reinforcement, a richer mix for the wearing surface, or when thickness of the concrete is beyond 20 cm, the bottom layer of concrete shall be struck off to the required levels by a vibrating screed working on the side forms with notches corresponding to the depth of the top course of concrete. The vibrating screed should have a vibrating unit mounted on it similar to that of the screed used for compaction of the final surface of concrete. The time lag between laying of the two courses shall not exceed the initial setting time of cement.

**Placement of steel**

**a. Reinforcement** - Reinforcing steel shall be free from dirt, scale or other foreign matter and rust of such degree or development as to impair bond of the steel with the concrete. The width of fabric sheets or bar mats shall be such that when properly placed into the work the extreme longitudinal bars or wires of the sheets or mats will be located not less than 50 mm and not more than 100 mm from the edges of the slab. Except for dummy joints, the length of fabric sheets or bar mats shall be such that when properly placed into the work, the reinforcement will be clear of transverse joints by not less than 50 mm and not more than 100 mm as measured from the centre of the joint to the ends of longitudinal bars or wires of the sheet or mat.

While overlapping the sheets or mats in either direction, the overlap shall be at least equal to the spacing between the bars or wires in the respective direction or 40 times the diameter of the bar or wire,
whichever is more.

Whilst using reinforcement in one layer, the concrete shall be placed in two stages. The initial layer shall be uniformly struck off to a depth corresponding to the reinforcement shown in the drawings and lightly compacted by a screed to obtain uniform levels. The reinforcing fabric sheet or bar mat shall then be placed on the compacted layer of concrete and remaining depth shall be filled in with concrete thereafter.

In doing this operation, the initial layer of concrete shall be struck off to the entire width of the slabs and of sufficient length to permit sheet or mat of reinforcement to be laid full length without further manipulations of the reinforcement. Displacement of the reinforcement during concreting operations shall be prevented.

b. Load transfer devices - dowels - Transverse expansion joints shall be equipped with dowels of the dimension and at the spacing and location indicated on the drawing. They shall be firmly supported in place, accurately aligned parallel to the sub-grade/sub-base, parallel to each other and parallel to the centre line of the pavement, by means of appropriate dowel supports. The dowel supports shall ensure that the dowels are not displaced during construction. The permissible tolerances in dowel bar alignment in both vertical and horizontal directions shall be ±1 mm in 100 mm for dowels of 20 mm and smaller diameters and ±0.5 mm in 100 mm for. dowels of diameter greater than 20 mm. One-half of each dowel shall be painted with a thin film of bitumen and equipped with a tight fitting metal sleeve of the dimensions shown on the drawing to provide space for the dowel when pavement expands and the join closes. This sleeve shall be partly filled with cotton waste to prevent it being pushed too far on the dowel during construction.

These sleeves are not required on dowels, if used, in dummy contraction or construction joints.

c. Tie bars - Tie bars provided in longitudinal joints of plain butt type to prevent opening of such joints shall be bonded to the adjacent slabs on both sides of the longitudinal joint. They are installed by providing appropriate (drilled) holes in the side forms depending on the size and spacing of bars. They are bent aside temporarily to avoid obstruction to construction traffic and straightened later at the time of laying of slab in the adjacent lane.

Compaction and finishing

Compaction - The pavement shall be compacted either by means of a power-driven pavers-cum-finisher or by a vibrating screed along with internal vibrators where the slab thickness is more than 12.5 cm. For lesser thicknesses vibrating screed may be supplemented with manual rodding. For areas where the width of the slab is very small as at the corner of street junctions, etc. compaction with wooden hand tampers may be adopted subject to the approval of the engineer. In no case, however, hand compaction shall be permitted for slab thicknesses beyond 10 cm. All compaction shall be done in accordance with the following requirements –
(i) Where hand tamping is permitted as a special case –

(i) Concrete with surcharge, as soon as placed, shall be struck off uniformly and screeded, to such level above the base that when compacted and finished, the pavement shall conform to the grade and cross-section indicated by the plans. The entire surface shall then be tamped and the tamping operation continued until a close knit dense surface is obtained.

(ii) The tamper shall rest on the side forms and shall be drawn ahead with a sawing motion, in combination with a series of lifts and drops alternating with lateral shifts, the aim of this operation being compaction and screeding to the approximate level required. Subsequent tamping should advance about 75 mm at a time in the direction in which the work is proceeding, and in the final stages tamping should be closer, about 12 mm at a time until a level and dense surface is obtained.

(iii) Segregated particles of coarse aggregate which collect in front of the tamper or screed shall be thrown outside the forms or thoroughly mixed by hand with the un compacted mass of concrete already placed. Under no circumstances shall such segregate particles be carried forward and pushed on to the base in front of the mass.

(iv) Compaction by tamping or screeding shall be carried on till the mortar in the mix just works up to the surface. Care shall be exercised and the operation of tamping so controlled as to prevent an excess of mortar and water from being worked on to the top. Repeated operation other than to secure the necessary compaction and to eliminate voids shall be avoided.

(v) Immediately after the tamping or screeding has been completed and before the concrete has hardened, While the concrete is still in a plastic stage, the surface shall be inspected for irregularities with a profile checking template and any needed correction made by adding or removing concrete followed by further compaction and finishing.

Floating - As soon as practicable after the concrete has been compacted, its surface shall be smoothened by means of a longitudinal float, operated from a foot-bridge. The longitudinal float shall be worked with a sawing motion, while held in a floating position parallel to the carriageway centre line and passed gradually from one side of the pavement to the other. Movements ahead along the centre line of the carriageway shall be in successive advances of not more than one half the length of the float.

Straight-edging - After the longitudinal floating has been completed and excess water has disappeared, but while the concrete is still plastic, the slab surface shall be tested for trueness with a 3 m straight edge. The straight edge shall be held in successive positions parallel to the road centre line in contact with the surface and the whole area gone over from one side of the slab to the other. Advance along the road shall be in successive stages of not more than one -half length of the straight edge. Any area of depression
found shall be scooped to a depth of 4-5 cm, filled immediately with freshly mixed concrete, struck, compacted, and re-finished. High areas shall be cut down and re-finished. The straight edging and re-floating shall continue until the entire surface is found to be free from observable departures from the straight edge and the slab has the required grade and camber.

The slab surface shall be retested for trueness, before the concrete begins to set, with the 3 m long master straight edge and the graduated wedge gauge.

The straight edge shall be placed on the surface in successive positions, parallel to the carriageway centre line. Irregularities shall be measured with the help of the wedge gauge moved transversely at various points until it touches both the straight edge and the concrete surface.

At any point tested the concrete shall not show a departure greater than 3 mm from the true surface. If at any place the departure exceeds this value not more than 3 passes of the vibrating screed shall be allowed and the surface tested again in the specified manner. If the irregularity still exceeds the limit aforesaid, the concrete shall be removed to a depth of 50 mm or up to the top surface of the reinforcement, if any. The area of concrete to be removed shall be demarcated by the length of the straight edge in the position of measurement across the full width of the slab. Where the point of measurement in default is less than 4.5 m from the nearest transverse expansion joint, the whole area up to the joint shall be removed to the required depth. The concrete so removed shall not be re-used in the carriageway. Fresh concrete shall be placed, compacted and finished in the manner already described in these specifications and shall again be subject to test for accuracy of finish.

The foregoing procedure shall be adopted at each shifting of the straight edge and the whole area shall be gone over from one side of the slab to the other. The straight edge shall advance Longitudinally in successive stages of not more than one-half the length of the straight edge.

No extra payment shall be made for the removal of the rejected concrete and or laying fresh concrete.

Although the concrete may be removed immediately following measurement of the irregularity and while it is still wet, this shall not mean any waiver from complying with the requirements of this clause, if for any reason the concrete to be removed has already hardened. After straight edging of the surface, it shall be finished by brooming in the manner described as mentioned in the following paragraphs.

**Brooming** - After belting and as soon as surplus water if any has risen to the surface, the pavement shall be given a broom finish with an approved long handled steel or fiber broom conforming to the stipulations laid down in JRC - 43 - 1972. The broom shall be pulled gently over the surface of the pavement from edge to edge. Adjacent strokes shall be slightly overlapped. Brooming shall be perpendicular to the centre line of the pavement and so executed that the corrugations thus produced will be uniform in character and width, and about 5 mm deep. Brooming shall be completed before the concrete reaches such a stage that the surface is likely to be torn or unduly roughened by the operation. The broomed surface shall be free from porous or rough spots, irregularities, depressions and small
pockets, such as may be caused by accidentally disturbing the particles of coarse aggregate embedded near the surface.

**Curing of concrete** - Immediately after the finishing operations have been completed the entire surface of the newly laid concrete shall be covered against rapid drying, and cured. Failure to provide sufficient cover material of the stipulated type or inadequate supplies of water for curing shall be adequate cause for immediate suspension of concreting operations.

**Initial curing** - After completion of the finishing operations, the surface of the pavement shall be entirely covered with wet hessian cloth, burlap or jute mats. The coverings used shall be of such length (or width) that when laid will extend at least 500 mm beyond the edges of the slab, shall be so placed that the entire surface and both the edges of the slab are completely covered. They shall be placed as soon as the concrete has set sufficiently to prevent marring of the surface. Prior to their being placed, the coverings shall be thoroughly wetted with water and placed with the wettest side down. They shall be so weighed down as to cause them to remain in intimate contact with the surface covered. They shall be maintained fully wetted and in position for 24 hours after the concrete has been placed, or until the concrete is sufficiently hard to be walked upon without suffering any damage. To maintain the coverings wet, water shall be gently sprayed so as to avoid damage to the fresh concrete. If it becomes necessary to remove the coverings for any reason, the concrete slab shall not be kept exposed for a period of more than half an hour. Worn coverings or coverings with holes shall not be permitted. Coverings reclaimed from previous use other than curing concrete shall be thoroughly washed prior to use 'for curing purposes, if the covering is furnished in strips, the strips shall be laid to overlap at least 150 mm. Covering shall be placed from suitable wooden bridges (IRC -43 -1972). Walking on freshly laid concrete to facilitate placing coverings shall not be permitted.

**Final curing** - Upon the removal of the covering the slab shall be thoroughly wetted and then cured by one of the following methods of final curing -

(a) **Curing with wet earth** - Exposed edges of the slab shall be banked with a substantial berm of earth. Upon the slab shall then be laid a system of transverse and longitudinal dykes of clay about 50 mm high, covered with a blanket of sandy soil free from stones to prevent the drying up and cracking of clay. The rest of the slab shall then be covered with sufficient sandy soil so as to produce a blanket of earth not less than 40 mm depth after wetting. The earth covering shall be thoroughly wetted while it is being placed on the surface and against the sides of the slab and kept thoroughly saturated with water for 14 days and thoroughly wetted down during the morning of the 15th day and shall thereafter remain in place until the concrete has attained the required strength and permission is given to open the pavement to traffic. When such permission is granted, the covering shall be removed and the pavement swept clean. If the earth covering becomes displaced during the curing period, it shall be replaced to the original depth and re-saturated,
Removing forms - Forms shall not be removed from freshly placed concrete until it has set, or at least 12 hours, whichever is later. They shall be carefully removed in such a manner that no damage is done to the edges of the pavement. After the forms have been removed, the slab edges shall be cleaned and any limited honey-combed areas pointed up with 1-2 cement sand mortar, after which the sides of the slab shall be covered with earth to the level of the top of the slab for final curing. Slabs with excessive honey-combing as a result of inadequate compaction shall be removed between nearest transverse joints.

Concreting during monsoon months - When concrete is being placed during monsoon months and when it may be expected to rain, sufficient supply of tarpaulins or other waterproof cloth shall be provided along the line of work. Any time when it rains, all freshly laid concrete, which has not been covered for curing purposes, shall be adequately protected by means of tarpaulins or other waterproof cloth. Any concrete damaged by rain shall be removed and replaced.

Concreting in hot weather - As placing of concrete in air temperatures above 40°C, or above 35°C combined with relative humidity below 25 percent and/or wind velocity higher than 10 km/hour, is attended with defects like loss of workability through accelerated setting, formation of plastic shrinkage cracks, etc., it is recommended that unless adequate precautions are taken, no concreting shall be done in conditions more severe than the above. The procedures recommended for adoption in case of hot weather concreting is given in IRC - 61 -1976 “Tentative Guidelines for the Construction of Cement Concrete Pavements in Hot Weather.” Brief details of the procedure are given below - Aggregates, cement and water shall be protected from the direct sun and mixing operations shall also be carried out in shade. In addition portable shelters shall be provided to protect the concrete during placing and finishing operations. This may be in the form of gable frames to cover the full length of the concrete pavement laid in a day. The surfaces of the formwork and subgrade coming in contact with concrete shall be moistened prior to placing of the concrete to prevent absorption of mixing water. Since the setting time of concrete is considerably reduced under such temperatures, labour force shall be reinforced to minimise the time between mixing and placing of concrete. The protective cover shall be adequate to exclude exposure of the concrete directly to the sun and also eliminate contact with drying winds. Prior to removal of the portable shelters, the hardened concrete shall be covered with wet hessian or burlap or the like followed by one of the usual methods of curing like ponding, etc. In addition, the moist curing period shall be extended to 4 weeks.

Work on gradients - The progress on gradient of all operations of placing, compacting and finishing of concrete should proceed from the lower to the higher reaches. The concrete mix shall be stiffer than that used on level reaches.

Protection of concrete - Suitable barricades shall be erected and maintained and watchmen employed to exclude traffic from the newly constructed pavement for the period herein prescribed, and these barriers shall be so arranged as not in any way to interfere with or impede traffic on any lane intended to be kept open and necessary signs and lights shall be maintained clearly indicating any lanes open to the traffic. Where, as shown on the plans or indicated in the special provisions, it is necessary to provide for traffic across the pavement, suitable and substantial crossings to bridge over the concrete shall have to be provided. Such crossings, as constructed, shall be adequate for the traffic and approved by the Engineer.
Any part of the pavement damaged by traffic or other causes occurring prior to its final acceptance shall be repaired or replaced in a manner satisfactory to the Engineer. The pavement shall be protected against all traffic usage including that of construction -traffic.

**Sealing of joints** - After the curing period is over and before the pavement is opened to traffic, the temporary seal and all other intruded materials in the transverse expansion and contraction joints as well as longitudinal joints shall be removed completely and the groove; filled with the approved joint sealing compound as per IRC - 57 -1974 "Recommended Practice for Sealing of Joints in Concrete Pavements". The joint opening shall be thoroughly cleared of all foreign matter before the primer followed by sealing material is placed. If necessary, the foreign matter shall be blown out by compressed air pressure. All contact faces of the joint shall be cleaned with a wire brush to remove loose material and shall be surface dried before the primer is applied.

**Opening to traffic** - In general, traffic shall be excluded from the newly constructed pavement for a period of 28 days where Ordinary Portland Cement, Portland Blast Furnace Slag Cement and Portland Pozzolona Cement are used, or for a period of 7 days where Rapid Hardening Cement is used. In all cases, before the pavement is opened to traffic it shall be cleaned and the joints shall be sealed.

44 **General Civil Specifications**

The following civil specifications shall be applicable for providing and executing all such items which are not mentioned in foregoing paras but are necessary to be provided and for the items in bill of quantities which are mentioned above but require some elaboration. No extra cost shall be paid for such items. It should clearly be understood by the Operator that all civil specifications mentioned here below shall be treated as part of the technical specifications already mentioned. The specific requirement of different items of work involved in the construction, completion and commissioning of the system as a whole, shall be provided in accordance with the requirement given in these civil specifications.

44.1 **Site Clearance**

Before taking up construction, site shall be cleared of all jungles, bushes and unwanted vegetation growth. After completion of plant, the entire site area shall be cleared of all left over material and debris. The work shall be carried out in accordance with the specifications in bill of quantities and payment shall be as per quoted rates for the respective items.

44.2 **Sections for excavation for all underground structures and pipe lines**

Operator shall prepare sectional drawings showing the details of excavation for all underground structures and pipe lines, in all kinds of soils, boulders, soft and hard rock etc., based on test results of soil testing and investigation reports complying to specifications in this document for earthwork excavations and shall submit to the Engineer for review and approval, prior to starting of the work. If during excavation any change in section is considered necessary for reasons of safety of workers, the Engineer will issue
directions for compliance by the Operator. The Operator shall comply with the Engineer’s directions without any extra charge or payment.

44.3 Form Work
Formwork, shuttering, centering, scaffolding etc., shall be of steel plates or plywood, lined with MS-sheets and for scaffolding steel tubular shall be used. Joints should be sufficiently tied to prevent loss of cement slurry from the concrete. All forms, shuttering shall be levelled, aligned, and thoroughly cleaned, before they are used for concreting. Formwork shall be removed after specified days of curing with the prior written permission of the Engineer. The surface of RCC after removal of formwork / shuttering shall be smooth and even and without honeycombing or undulations.

44.4 Procedure and Materials used in concrete works.
The procedure for concrete works shall be in accordance with the specifications in the bill of quantities, specifications in this section and complying to standard practices in IS:456-2000 with latest amendments, all concrete works shall be executed in accordance with standard practices, including volumetric batching using boxes of standard size, concrete mixers with hopper, compaction using vibrators and according to the directions of the Engineer In-charge of works.

Aggregates

All aggregates, fine and course used in concreting works shall comply to the standards laid down in IS: 456-2000 with latest amendments and specifications in applicable clauses in this section.

Water
The water used in all concreting works shall be of potable quality and tested before usage in the construction works and shall be confirming to IS: 456-2000.

Cement
The cement used shall be of sulphate resisting cement confirming to IS: 12330 as specified and wherever the concrete is coming in contact with sewage. For other concreting works like encasing pipe, pedestals and other structures where there is no contact with sewage, it shall be OPC confirming to IS:8112 with latest amendments and revisions.

Minimum clear cover over Reinforcement

Minimum clear cover over the steel reinforcement shall be 50mm for the members contact with soil/ground water. For other faces the clear cover over the reinforcement shall be as per latest IS Codes.

Tested Steel
Only tested and approved steel shall be used for reinforcement in RCC works, and the Operator shall produce the test certificates to the Engineer. The type of steel used shall be of TMT of grade of steel Fe: 500 confirming to relevant IS.

**44.5 Restoration of Storm water drains & other miscellaneous works.**
The storm water drains and cover slabs damaged during execution of works which is not due to the negligence of the Operator as decided by the Engineer shall be restored as per the items in bill of quantities. The specifications in this section are deemed to govern the applicable items in the bill of quantities. All masonry works, concrete works shall be in accordance with relevant IS as mentioned in section 6 and or as directed by the Engineer. Other repairs works under heading “Miscellaneous works” in bill of quantities shall be executed in accordance with the specifications and as directed by the Engineer, the finished item of work shall give neat appearance and should serve the intended purpose of the component to the satisfaction of the Engineer.

**45 Design Submissions:**
Complete detailed design /hydraulic calculations & drawings of foundations and superstructure together with general arrangement drawings and explanatory sketches shall be submitted to the Owner. Separate calculations for foundations or superstructures submitted independent of each other shall be deemed to be incomplete and will not be accepted. Though no GA drawings of all units are required along with the bid, a schematic layout /GAD shall be submitted along with the bid. The design considerations described herewith establish the minimum basic requirements of plain and reinforcement concrete structures, masonry structures and structural steel works. However, any particular structure shall be designed for the satisfactory performance of the functions for which the same is being constructed. The Operator shall also take care to check the stability of partly.

**45.1 Design Standards**
All designs shall be based on the latest International or Indian Standard (IS) Specifications or Codes of Practice. The design standards adopted shall follow the best modern engineering practice in the field based on any other international standard or specialist literature subject to such standard reference or extract of such literature in the English language being supplied to and approved by the Owner or Owner’s Representative. In case of any variation or contradiction between the provision of the IS Standards or Code and the specifications given with the submitted bid document, the provision given in the Specification shall be followed.

**45.2 Design Loadings**
All buildings and structures / underground structures shall be designed to resist the worst combination of the following loads/stresses under test and working conditions these include dead load, live load, wind load, seismic load, stresses due to temperature changes, shrinkage and creep in materials, dynamic loads and uplift pressure.

**45.2.1 Dead Load:** This shall comprise all permanent construction including walls, floors, roofs, partitions, stairways, fixed service equipment and other items of machinery. In estimating the loads of process
equipment all fixtures and attached piping shall be included, but excluding contents shall be considered. The following minimum loads shall be considered in design of structures:

<table>
<thead>

In the absence of any suitable provisions for live loads in IS Codes or as given above for any particular type of floor or structure, assumptions made must receive the approval of the Owner’s Representative prior to starting the design work. Apart from the specified live loads or any other loads due to material stored any other equipment load or possible overloading during maintenance or erection/construction shall be considered and shall be partial or full whichever causes the most critical condition.

45.2.3 **Wind Load:** Wind loads shall be as per IS: 875-2002 Part-III.

45.2.4 **Dynamic Load:** Dynamic loads due to working of plant items such as pumps, blowers, compressors, switchgears, traveling cranes, etc shall be considered in the design of structures.

45.2.5 **Other Loads:** In addition to earth pressure and water pressure etc., the surcharge of 1 Ton/sq.m shall be taken into account in the design for channels, tanks, pit etc.

45.2.6 **Earthquake Load:** This shall be computed as per IS: 1893 – 2000.

45.3 **Joints**
Movement joints such as expansion joints, complete contraction joints, partial contraction joints and sliding joints shall be designed to suit the structure as per relevant IS code provisions. Expansion joints of
suitable gap at intervals not more than 30 m shall be provided in walls, floors and roof slabs of water retaining structures.

Construction joints shall be provided at right angles to the general direction of the member. The locations of construction joints shall be decided on convenience of construction. To avoid segregation of concrete in walls, horizontal construction joints are normally to be provided at every 2 m height, GI 18 gauge/PVC water stops of suitable type and minimum 230 mm width, 6 m thick shall be used for walls and base slabs.

45.4 Waste Water Retaining Structures

Liquid retaining/conveying structures including the members covering the same (such as roof of a chamber, channel etc.) shall be designed by uncracked method of design as per BIS: 3370 and 6494. Basement RC walls and slabs below ground shall also be designed by uncracked method of design as liquid retaining structures. Shear shall be checked by working stress method as per BIS: 456. Minimum temperature and shrinkage reinforcement shall be 0.3% in each direction.

All underground or partly underground liquid containing structures shall be designed for the following conditions:

- Liquid depth up to full height of wall: no relief due to soil pressure from outside to be considered.
- Structure empty (i.e. empty of liquid, any material, etc) full earth pressure including saturated condition and surcharge pressure wherever applicable to be considered.
- Structures shall be designed for uplift in empty conditions as per water table indicated in the geotechnical report or high flood level, whichever is maximum. No reduction factor for the uplift force shall be considered.
- The dead weight of the empty structures should provide a safety factor of not less than 1.2 against uplift pressures during construction and in service.
- Wall shall be designed under operating conditions to resist earthquake forces from earth pressure mobilization and dynamic water loads;
- Underground or partially underground structures shall be checked against stresses developed due to any combination of full and empty compartments with appropriate ground/uplift pressures from below to base slab
- The walls and base slabs shall be designed for saturated earth/water pressure corresponding to high flood level or finished plot level whichever is higher.
- For design purpose, sub soil water level is to be considered as 2 meter below the average natural ground level.

45.5 Foundation

- The minimum depth of foundations for all structures, equipment’s buildings and frame foundations and load bearing walls shall be as per IS: 1094.
- The earth fill above virgin ground level till formation level shall be taken as a surcharge load and shall be added in the loads coming on foundations appropriately
• Care shall be taken to avoid the foundations of adjacent buildings or structure foundations, either existing or not within the scope of this Contract Suitable adjustments in depth, location and sizes may have to be made depending on site conditions. No extra claims for such adjustments shall be accepted by the Owner.
• Special attention is drawn to danger of uplift being caused by the ground water table
• Plinth level of all structures/top of tanks shall be at least (1000) mm above high flood level.

45.6 Design Requirements
The following are the design requirements for all reinforced or plain concrete structures:
• All blinding and leveling concrete shall be minimum 100 mm thick in concrete grade M15 for Building & 150 mm thick in concrete grade M 30 for Water Retaining Structures as per IS -3370 (Part- 1)-2009 latest version.
• All structural reinforced concrete shall be with a maximum 25 mm aggregate size for footings and base slabs and with a maximum 20 mm aggregate size for all the Water Retaining Structures & other structural members.
• All liquid retaining structures shall be designed as per IS: 3370. The minimum grade of concrete shall be M30 using Sulphate resistant Cement.
• All Buildings, Pipe Pedestals, Thrust Block, Pump Foundation & other structures shall be designed as per IS-456. The minimum grade of concrete shall be M20.
• The maximum free water cement ratio shall not exceed 0.5 for all liquid retaining structures.
• The amount of reinforcement in each of the two directions at right angles within each surface zone should not be less than the minimum specified as IS:3370 or IS:456 which ever is applicable for the type of structure.
• Use of pressure relief valves to reduce uplift pressure due to ground water table shall not be allowed.
• All buildings shall have a minimum 1.0 m wide, 100mm thick plinth protection paving in M15 grade concrete or stone slabs/tiles. All plinth protection shall be supported on well-compacted strata. The following minimum thickness shall be used for different reinforced concrete members irrespective of design thickness.

**46 MATERIALS IN GENERAL**

The term “materials” shall mean all materials, goods and articles of every kind whether raw, processed or manufactured and equipment and plant of every kind to be supplied by the Operator for incorporation in the Works.

Expect as may be otherwise specified for particular parts of the works the provision of clauses in “Materials and Workmanship” shall apply to materials and workmanship for any part of the works. All materials shall be new and of the kinds and qualities described in the Contract and shall be at least equal to approved samples.

As soon as practicable after receiving the order to commence the works, the Operator shall inform the Owner’s Representative of the names of the suppliers from whom he proposes to obtain any materials but he shall not place any order without the approval of the Owner’s Representative which may be withheld until samples have been submitted and satisfactorily tested. The Operator shall thereafter keep the Owner’s Representative informed of orders for and delivery dates of all materials.
Materials shall be transported handled and stored in such a manner as to prevent deterioration damage or contamination failing which such damaged materials will be rejected and shall not be used on any part of the Works under this contract.

46.1 Cement
The Cement shall be Sulphate Resistant Cement grade-53 in all water retaining structures and OPC 53 grade cement for other structures, confirming to the relevant B.I.S. codes and approved by the Owner’s Representative. Manufacturers Test Certificate shall have to be furnished. Minimum cement consumption for RCC M20 shall be considered as 350 kg/cum and for RCC M25 shall be 380 kg/cum. mixing of fly ash in the concrete shall not be considered. Approved Manufacturers of Cement of reputed firm with ISO certification shall be used.

46.2 Reinforcement Steel
Reinforcement Steel shall confirm to BIS Specification 432-1966 (with up to date revision) and B.I.S. Specification 1786-1985 (with up to date revision). All Reinforcement Steel will be TMT Grade approved by the Owner.

Minimum Cement Content
The minimum cement content for each grade of concrete shall be as per table below.

47 SAMPLES AND TESTS OF MATERIALS
The operator shall submit samples of such materials as may be required by the Owner and shall carry out the specified tests directed at the site or at the supplier’s premises or at the laboratory approved by the Owner or the Owner’s Representative. Samples shall be submitted and tests carried out sufficiently early to enable further samples to be submitted and tested if required by the Owner. The operator shall give the Owner seven days’ notice in writing of the date on which any of the materials will be ready for testing or inspection at the supplier’s premises or at a laboratory approved by the Owner. Owner or the Owner’s Representative shall attend the test at the appointed place within seven days of the said date on which the materials are expected to be ready for testing or inspection according to the Operator, failing which the test may proceed in his absence unless instructed by the Owner’s Representative to carry out such a test on a mutually agreed date in his presence. The operator shall in any case submit to Owner within seven days of every test such number of certified copies (3) of the test results as the Owner’s Representative may require.
Approval by the Owner’s Representative as to the placing of orders for materials or as to samples or tests shall not prejudice any of the Owner’s Representative powers under the Contract. The provisions of this clause shall also apply to materials supplied under any nominated sub-contract.

48 ORIENTATION
The works shall be laid out within the confines of the site in order to be compatible with the existing infrastructural facilities, inlet and outlet pipe work/channels and nearby water bodies. Underground services requiring to be relocated in order to accommodate the proposed site layout shall be relocated by the operator to alignments approved by the Owners Representative.

48.1 Buildings and Structures
All the building and structure works shall generally comply with the following Owner’s Requirements unless otherwise specified elsewhere:

All building works shall be of reinforced concrete framework.

All external walls shall be in 230 mm thick brick masonry built in cement mortar (1:5). Transoms and mullions of 115 mm x 230 mm size with four numbers 6 mm bars and 6 mm links at 150 mm c/c shall be provided to form panels not exceeding 3,500 mm x 3,500 mm in size. All internal partition walls except for toilets shall be in 230 mm thick brick masonry built in cement mortar 1:5 with transoms and mullions as in (b) above. Toilet partition walls shall be in 115 mm thick brick masonry built in cement mortar 1:4 and shall have transoms and mullions as in (b) above and shall form panels not exceeding 1,200 mm x 1,200 mm in size.

Finishes to concrete liquid retaining structures shall be:

a. F1 - External surfaces, buried
b. F2 - External surfaces exposed and up to 300 mm below ground level
c. F2 - Internal surfaces

Finishes to other concrete structures shall be:

a. F1 – Buried
b. F1 - Exposed, where plastering is specified
c. F2 – Exposed

All internal masonry surfaces finish shall have 12 mm thick plain faced cement plaster in cement mortar (1:4) with neat cement finish on top. Over this, one coat of primer and two coats of plastic emulsion paint of approved quality and shade shall be provided.

All external masonry and concrete with rough board finish shall have 20 mm thick sand faced cement plaster in two coats, base coat 12 mm thick in cement mortar 1:4 and finishing coat 8 mm thick in cement mortar 1:4. Waterproofing compound of approved make and quality shall be added to the cement mortar in proportions as specified by the manufacturer.

All external surfaces above ground level shall have one coat of primer and two coats of waterproof cement based paint of approved quality and shade. A coat of silicone water repellent paint shall also be applied thereon.

Toilet areas, walls and ceilings, shall have one coat of primer and two coats of plastic emulsion paint. Toilet floor slab shall be filled with brick bat coba (broken bricks in lime) and provided with
waterproofing as per the specifications of an approved specialist waterproofing company. The finished floor level in toilet areas shall be 25 mm below general finished floor level elsewhere in the building. The flooring in all areas except toilets and staircases, pumping stations, chlorination building, centrifuge building, workshop, store room D.G. room shall be in 250 mm x 250 mm x 20 mm thick marble mosaic tiles of approved make unless otherwise specified, shade and pattern and placed in cement mortar 1:4 to give overall thickness of 50 mm. Half tile skirting shall also be provided in these areas. The flooring in the pumping stations, chlorination building, centrifuge building, workshop, D.G. room shall be 60mm thick cement flooring with metallic concrete hardener topping, under layer of 42mm thick cement concrete 1:2:4 (1 cement : 2 coarse : 4 graded stone aggregate 16mm thick nominal size) and top layer of 18mm thick metallic concrete hardener consisting of mix 1:2 (1 cement : 2 stone aggregate 6mm nominal size) by volume & mixed with metallic hardening compound of approved quality @ 3 kg/m2 including cement slurry and rounding off edges. The flooring in Operator's room, loading/unloading bay, MCC cum Panel room shall be in 25mm thick Kota stone slab of approved shade and pattern and placed over 20 mm thick base of cement mortar 1:4 to give overall thickness of 45 mm. Half tile skirting shall also be provided in these areas. Toilet areas shall have 450 mm x 450 mm x 25 mm thick polished Kota stone tiles placed in cement mortar 1:4 to give an overall thickness of 50 mm. 2100 mm high dado, in 150 mm x 150 mm x 6 mm thick glazed tiles (approved make, shade and pattern) placed in cement mortar 1:3 shall also be provided in these areas. The flooring along with skirting in administration cum laboratory building shall be 20 mm thick mirror polished, machine cut granite slab of approved shade and pattern placed in cement mortar (1:4). 150mm high skirting shall be provided in these areas. Granite stone shall be provided for laboratory platforms fixed over double sandwiched cuddappa support as directed and the edges of granite is to be embedded into the wall. The toilet facilities shall include at least:
i. 3 Nos. Water closets with white porcelain Orissa pan minimum 580 mm long with low level flushing cistern of 10 litres capacity.
j. 4 Nos. urinals of sizes 600 mm x 400 mm x 300 mm flat back type in white porcelain separated by a marble partition of size 680 mm x 300 mm.
k. 3 Nos. wash basins of size 510 mm x 400 mm in white porcelain with inlet, outlet and overflow arrangements.
l. 3 Nos. mirror of size 400 mm x 600 mm wall mounted type fitted over wash basins.
m. 2 Nos. plastic liquid soap bottles
n. 2 Nos. chromium plated brass towel rails minimum 750 mm long.
o. All stopcocks, valves and pillar cocks shall be heavy duty chromium plated brass.
p. All fittings such as ‘P’ or ‘S’ traps, floor traps, pipes, down take pipes etc.

The sewage from toilet blocks shall be led to the wet well of terminal sewage pumping station if present or included under this contract or to the closest gravity sewer.

All staircases shall have 25 mm thick chequered mosaic tiles for treads and 25 mm thick plain mosaic tiles for risers of approved make and shade and half tile skirting set in cement mortar in 1:4 to give an overall thickness of 50 mm.

All concrete stairs shall have aluminum nosing over 2 mm thick rubber strip of width same as nosing for the full length of the tread. Nosing shall be fixed with countersunk screws. Stairways shall be provided to permit access between different levels within buildings. Staircase shall be minimum 1000mm wide unless specified otherwise. Staircases in general shall not be steeper than 40°. Staircases having space constraints may be steeper than 400. The maximum vertical run for a single flight of stairs shall be 3.0 M. All roof tops and overhead tanks shall be made accessible with ladder provision. Vertical step ladders fitted with landing point extensions will be permitted where considered appropriate by the Engineer to access areas not frequently visited.

Steel staircases shall be constructed of standard channel stringers with M.S. grating treads 25mm thick with non skid nosing. Steel Ladders shall be minimum 600mm wide and shall not exceed 6m of straight run. The ladders shall be painted with epoxy paint.

All hand railing shall be provided with G.I “C” Class Pipe confirming to latest Indian standards. The minimum height of hand railing shall be 1m.

The reinforced concrete roofs shall be made waterproof by application of an approved roof polythene / bitumen membrane / brick bat coba. The finished roof surface shall have adequate slope to drain quickly the rain water to R.W down take inlet points.

All roof floors shall have minimum 750 mm height solid concrete block parapet wall where accessible is provided and shall have minimum 300 mm height solid concrete block parapet wall where accessible is not provided.

For roofing drainage, cast iron or uPVC rainwater down takes with C.I. bell mouth or u PVC bend and C.I. or uPVC grating at top shall be provided. For roof areas up to 40 sq m minimum two nos. 100 mm diameter down take pipes shall be provided. For every additional area of 40 sq m or part thereof, at least one no. 100 mm dia. down take pipe shall be provided.

Top surfaces of chajjas and canopies shall be made waterproof by providing a screed layer of adequate slope or application of an approved roof membrane and sloped to drain the rain water.

Building plinth shall be minimum 450 mm above average finished ground level around building or high flood level whichever is more.

q. Doors and Windows

All doors, windows, rolling shutters shall have lintels above. Chajja protection to lintels on external walls shall be such as to prevent the rain water splashing into the building. Chajja projection of minimum 750 mm for rolling shutters, 600 mm for doors and 450 mm for windows shall be provided to prevent the rain water splashing into the building. Chajja shall be projected 150 mm on either side from size of doors/windows/rolling shutters. All windows and ventilators shall have 25 mm thick Kota stone sills bedded in cement mortar (1:3).
All doors and windows shall be painted with two coats of synthetic enamel paint over a priming coat (ready mixed Zinc Chromate Yellow primer of approved brand and manufacturer confirming to I.S.: 127-106, 341 and 340).

All doors, windows and ventilators shall be made of aluminum confirming to latest version of IS: 1948. All fixtures for doors, windows and ventilators shall also be of aluminum. Aluminum grills shall be provided in all the windows. Doors shall be in two panel and both panels shall be glazed/unglazed. Minimum weight of aluminum doors & windows shall be as follows

Single Glazed Window : (Weights indicated shall be aluminum)
- Open able Outer Frame: Weight 0.70 kg/Rmt
- Shutter Frame: Weight 0.97 kg/Rmt
- Intermediate Mullion: Weight 0.97 kg/RMt.
- Beading: Weight 0.31 kg/Rmt
- Fixing Louvers windows/ventilators
- Outer Frame: Weight 0.46 kg/Rmt

Double Glazed Window
- Outer Frame: Weight 0.72 kg/Rmt
- Shutter Frame: Weight 0.97 kg/Rmt
- Intermediate Mullion: Weight 0.98 kg/Rmt
- Beading: Weight 0.31 kg/Rmt

Sliding Windows
- Bottom & Top Frame: Weight 0.70 kg/m
- Shutter Frame: Weight 0.42 kg/m
- Interlocking Section: Weight 0.47 kg/m

Aluminum Door
- Outer Frame: Weight 2.508 kg/Rmt
- Shutter Frame: Weight 2.508 kg/Rmt
- Bottom Stile: Weight 2.508 kg/Rmt
- Glazing shall be 5.5 mm thick glass.

Openings of the windows & ventilators shall be minimum 25% of the external wall area. Ventilator shall be provided where height of floor is more than 3m. All windows and ventilators shall have wire mesh. Frame of doors, windows and ventilators shall be of aluminum of standard rolled section. Doors, Windows and Ventilators shall be of size as per schedule to be submitted by the Operator for approval of Engineer. The minimum size shall be as per below:
  a. Door of opening size 1.2m x 2.1m
  b. Door of opening size 0.75m x 2.1m for toilets
  c. Glazed widows of minimum size 1.2m x 1.2m
  d. Ventilators of minimum size 0.6m x 0.6m
Rolling shutters shall be made of 80 x 1.25 mm MS laths. Rolling shutter shall be of minimum size 3m wide x 3.0m high. Rolling shutter shall be provided in MCC cum panel room, chlorine toner shed, at entry and exit of the pump house for access to pumps, motors, valves, panels and as wherever required.

q) All concrete channels and ducts used for conveying liquid shall have inside finish of type F2. The width of concrete channels shall not be less than 500 mm. All open channels shall be provided with Stainless Steel Type 304 hand railings or concrete walls to a minimum height of 1 m from the access surface elevation. All concrete surfaces of structures conveying raw sewage or primary effluent shall be protected with Epoxy Coating as specified.

r) Kerbs to be provided below the hand railing on the catwalks/pathways should be as per relevant sections of Factory Act. It shall not be less than 150mm.

s) All exposed surfaces of inserts embedded in concrete shall be painted with two coats of enamel paint over one coat of red oxide zinc chrome primer. Surfaces in contact with concrete shall not be painted.

t) All structural steel members shall be painted with two coats of enamel paint over one shop and one field coat of red oxide zinc chrome primer.

u) The design of buildings shall reflect the climatic conditions existing on site. Process buildings shall as far as is possible permit the entry of natural light, and the use of glazed panelling shall be kept to a minimum and preference given to wall openings protected by weather canopies.

v) Emergency exit doorways shall be provided from all buildings in order to comply with local and international regulations. Stairways and paved areas shall be provided at the exit points.

w) Toilet blocks in process buildings and control blocks shall be provided with a sink with two drinking water taps of 20 mm size with adequate inlet and outlet connections.

x) All the walkways in shall have minimum 1 m width and shall be covered with mosaic tiles.

y) Hand railings shall be made up of G.I “C” Class Pipe confirming to latest Indian standards.

z) For structures containing water or process liquid, the top of the wall shall be at least 0.5m higher than the maximum water surface level calculated at high flood level and peak plant flow. The top level of internal plant roads and approaches shall be at least 0.5m above the site High Flood Level.

aa) If the High flood level is more then Ground Level then road shall be constructed on the earthen embankment. Earthen embankment shall be constructed with side slope of atleast 2 horizontal to 1 vertical. Stone pitching shall be provided at both sides of the embankment as per IS: 8237. Top width of embankment shall be taken as 6.0m. Top level of embankment shall be 0.5m above high flood level. Excavated earth from the plant can be used for embankment construction and if required, extra earth can be borrowed from the borrow pit as approved by Engineer.

48.2 Site Drainage
The operator shall provide a site drainage system. The system shall comprise of the following:

Storm Water Drainage
Foul Drainage (if any)

48.2.1 Storm Water Drainage
Storm water drains adjacent to the existing and proposed roads (under this Contract) shall be sized for a rainfall intensity of 50 mm/hr, allowing for 100% runoff. Drains adjacent to roads shall be in stone masonry in CM (1:4) of appropriate thickness, topped with 75 mm thick M10 concrete and internally flush pointed in cement mortar (1:4), 20 mm thick. The minimum width of drain shall be 450mm. The storm water drainage system shall also be designed to cater the run-off from the existing plot areas and structures, if necessary depending upon the site topography.

48.2.2 Foul Drainage
(b) The foul drainage system shall accept discharge from toilets, washrooms, offices and the laboratory. The foul drainage system shall be conveyed to the nearest public sewer wherever exist or to a pumping station or a new soak pit followed by septic tank shall be constructed.

48.3 Cable and Pipe work Trenches
(a) Cable and pipe work trenches shall generally be constructed in reinforced concrete. However, 500 mm x 500 mm size or smaller trenches, not on fill may be constructed in 200 mm thick solid cement concrete blocks over 150mm thick M 15 PCC base. The trenches will be 20mm thick plastered internally with cement mortar (1:4) and externally in cement mortar (1:3).
(b) All floor cut-outs and cable ducts, etc. shall be covered with M20 precast concrete covers (Heavy Duty) or MS grating as per direction of Engineer in outdoor areas and M.S. chequered plates, suitably painted of adequate thickness in indoor areas. All uncovered openings shall be protected with hand railing. The pipe, cable trenches shall be suitably sloped to drain off rainwater to a suitable location.
(c) Layout of trenches outside the buildings shall allow space for construction of future trenches where necessary with due consideration for planning for future developments. This aspect shall be brought to the notice of the Engineer while planning the works.

48.4 Pipes and Ducts
(a) R.C.C ducts for drainage shall have minimum 1 metre pre-cast cover (M20 concrete, Heavy duty) while laid under roads. Access shafts of size not less than 600 mm x 1000 mm shall be provided.
(b) All drains (except storm water drains adjacent to roads) shall be covered and designed structurally for appropriate loads.

48.5 Landscaping
(a) The site shall be landscaped once the works are substantially complete. Landscaping area shall be marked in the layout plan of Sewerage Network.
(b) Landscaping shall include planting of suitable trees and development of lawn/grassed areas. Landscaping in general shall meet ecological and environmental conditions of the site. Road widths shall determine the size of the tree height and spread to be selected for planting. Trees suitable for local conditions shall be selected as approved by the Engineer. Medicinal and fruit trees shall be avoided. Landscaping shall be maintained in good condition till the completion of the contract.

48.6 Tree Planting
(a) Pits dug a few days in advance of actual planting shall be allowed to weather and be filled with top soil mixed with manure. Size of the pit shall be as per standard requirement. Only one tree shall be planted in each pit. A guard made of bamboo with wire mesh or bricks or M.S. ring as approved by Engineer, shall be provided.
49 CONCRETE

49.1 General
Applicable provisions of Conditions of Contract shall govern work under this section.
All concrete work, plain or reinforced shall be carried out in strict accordance with this specification and any working drawing or instructions given from time to time to the operator. The operator’s rates shall allow for wastage in all materials as well as for all tests of materials and for concrete. No concrete shall be cast in the absence of the Owner’s representative or any other person duly authorized by him. The operator’s Engineer shall personally check that both the formwork and reinforcement have been correctly placed and fixed, and shall satisfy himself that all work preparatory to the casting is completely ready, before calling the owner’s representative for final inspection and approval and for which purpose at least 24 hours’ notice shall be given by the operator. The Indian Standards wherever referred to herein shall be the latest edition of such Standards.

Cement
Cement shall be ordinary Portland cement as per I.S. 269 or Sulphate Resistance Cement as per IS 12330. Cement tests shall have to be carried out at operator’s expense as and when directed.

Aggregate
The fine and coarse aggregate shall conform to IS: 383 & IS: 456. The necessary test indicated in IS – 383 and IS – 456 shall have to be carried out to ensure the acceptability and shall meet prior approval of the Owner.

Reinforcement
The reinforcement conforming to latest relevant Indian Standards shall be of tested quality. It shall also comply with relevant part of IS. 456. All the reinforcement shall be clean and free from dirt, oil, paint, grease, mill scale or loose or thick rust at the time of placing. The reinforcement shall be bent to the shapes shown on the drawings prior to placing and all bars must be bent cold. The Steel shall be placed in such a way that it is rigidly held in position while concrete is being cast. The correct clearance from the form shall be maintained by either precast mortar blocks or by metal supporting chairs to be supplied by the operator free of charge. The intersections of rods crossing one another shall bound together with soft pliable wire No. 16 S.W.G. at frequent intervals so that reinforcement will not be displaced during the process of depositing concrete. The loops of binding wire should be tightened by pliers.

Water
Water shall conform to IS: 456, clean and free from alkali, oil or injurious amounts of deleterious material. As far as possible, the water should be of such quality that is potable. If any chemical analysis of the water is necessary and ordered the same shall be got done at approval laboratory at the operator’s expense.

49.2 Concrete Proportioning
The concrete proportion shall be as indicated on the approved drawings and shall conform to IS: 456. The minimum cover to main reinforcement shall be 25 mm or the diameter of the bar whichever is greater. In the case of surfaces exposed to corrosive action as in sumps, the cover shall be increased up to 50 mm as directed.
Type of joints, spacing of joints, use of all jointing materials and other features pertaining to the provision of movement joints in liquid retaining structures shall be got approved prior to commencement of construction. All reinforced concrete work shall be thoroughly and efficiently vibrated during laying by use of vibrators.

For liquid retaining structures M:30 grade (SRC) shall be used, the same shall be deemed to be satisfactorily watertight if the external faces show no signs of leakage and remain apparently dry over the period of observation of 7 days after allowing a period of 7 days for absorption after filling. Covered tank, where all faces are not accessible for inspection, shall be kept filled with water for 7 days and thereafter the drop of water over the next 7 days shall not exceed totally a depth of 12.5 mm per day. Approved corrective measures, if necessary, shall be undertaken by the Operator at his own expense. The operator shall use appropriate water proofing compound during the process of pouring of concrete in required proportion.

49.3 Workmanship
All concreting work shall be carried out according to the IS: 456 ‘Indian Standard Code of Practice for Plain and Reinforced Concrete for general Building Construction’. It should, however, be noted that for Over 60 m3 of concrete placed or for every one day’s work a minimum of 6 (six) cubes shall be cast for test purposes and tested at the operator’s expense in an approved laboratory.

49.4 Formwork
The formwork shall conform to IS: 456.

49.5 Curing
The concrete shall be cured according to IS: 456 or as directed.

49.6 Concrete Finish:
The concrete surface on removal of form work shall be such that no finishing is necessary if however the surface is not satisfactory, the operator shall if so instructed, remove unwanted projecting parts by chipping and smoothen the surface with cement rendering at his own expense.

49.7 Construction Joints / Water Stops
These shall be in accordance with IS: 456 or as shown on the approved drawings.
The centering for forming, the construction joint shall be firmly fixed and adequately slotted for reinforcement extending beyond the joint. If any concrete has set, care shall be taken not to disturb the reinforcing steel in casting the second half of a member with a construction joint and thereby crack the concrete previously placed. The PVC joints shall be of the ‘rebated’ or ‘keyed’ type and shall have a minimum width of 300 mm inclined ‘feather’ or ‘straight joints’ shall not be permitted. The Joints/Water stops shall be got approved by the Engineer before their placement into the structure.

49.8 Expansion Joints
Expansion joints shall be provided at positions shown on the approved drawing or as directed and shall comply strictly with the details shown on construction drawings. Reinforcement shall not extend across any expansion joint and the break between the two sections MUST be complete. Unless otherwise specified, the gap shall be filled with an elastic joint filler consisting of the following ingredients (by weight), preheated to a temperature of 190 (375 F).

a) Very fine sand 60%
b) Hot bitumen emulsion 33%
c) Cement 5%
d) Fine chopped hemp 2%

49.9 **Operator’s Supervision**
The operator shall provide constant and strict supervision of all the item of construction during progress of work, including the proportioning and mixing of the concrete and bending and placing of reinforcement. Before any important operation such as concreting or stripping of formwork is begun, adequate notice shall be given.

49.10 **Laying Cement Concrete in Foundations & Under Floors**
Before laying the concrete, the bottom and sides of the trench up to the proposed height of the concrete shall be moistened. The concrete shall be tamped immediately after laying.

49.11 **Protective Epoxy Paint Treatment:**
Epoxy Paint of standard specifications manufactured/purchased from a reputed firm approved by IS shall be applied to the outside Concrete surface and all mild steel works within the sewage pumping station. The coverage capacity of layers shall be at 125 Microns D.F.T. 7.60 sq. mt./Litre.

49.12 **Chases, Holes, Recesses and Inserts:**
All chases, holes and recesses for foundation bolts, various services and other requirements must be formed as shown on the drawings or as directed by the Owner’s Engineer during the execution of the work, without extra charge. The operator shall fix all necessary inserts in the concrete for support of hangers for pipes and cables, ceiling clamps for lights and fans or for duct etc. If any of the inserts are to be supplied by other agencies not extra payment will be made to the Operator for placing the inserts position.

49.13 **Load Testing of Structures**
Load tests shall be carried out in accordance with IS: 456, if required by the Executive Engineer.

50 **BRICK WORK**

50.1 **General**
Applicable provisions of Conditions of Contract shall govern the work under this section. The operator shall build the whole of brickwork shown on the drawings with first-class bricks in cement mortar. The Indian Standard wherever referred to herein shall be the latest edition of such Standards.

50.2 **Materials**

<table>
<thead>
<tr>
<th>Material</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bricks</td>
<td>The bricks used shall generally conform to IS: 1077</td>
</tr>
<tr>
<td>Cement</td>
<td>The cement used shall conform to IS: 269</td>

<tr>
<td>Sand</td>
<td>The sand used shall conform to IS: 1344</td>
</tr>
<tr>
<td>Water</td>
<td>The water used shall be clean and free from injurious amounts of deleterious materials. As far as possible, the water should be of such quality that it is potable</td>
</tr>
</tbody>
</table>
50.3 Mortar Proportion

Unless otherwise specified, the proportions of cement-sand-mortar by volume for various classes of work shall be as under:

<table>
<thead>
<tr>
<th>Type of work</th>
<th>Cement</th>
<th>Sand</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ordinary brickwork for building</td>
<td>1</td>
<td>5</td>
</tr>

<tr>
<td>Half-brick thick or brick-on edge partition wall</td>
<td>1</td>
<td>4</td>
</tr>
</tbody>
</table>

50.4 Workmanship

The cement and sand shall be thoroughly mixed dry in specified proportions. Water shall then be added by a sprinkler just sufficient to make a stiff and workable paste. The mortar shall be used within half an hour of mixing. The mortar, which is unused within half an hour of mixing, shall be removed from the site.

50.5 Brick-work

All the bricks shall be kept in water till they are completely soaked & only thoroughly soaked bricks shall be used in the work. The operator shall set out & build all brickwork to the respective dimensions, thickness and height, as shown on the drawings.

The operator shall build all brickwork uniformly, no one portion being raised more than 1 meter above another at one time. The operator shall keep wet all brickwork for at least 10 days after laying. The surface of unfinished work shall be cleaned and thoroughly wetted before joining new work to it.

In curved brickwork, the bricks shall be dressed to shape obtain joints radial to the curve. The joints shall not exceed 12 mm in thickness and should extend the full thickness of the curved brickwork.

50.6 Damp-proof Course

Damp-proof course shall be provided at positions where ever necessary. In masonry walls of buildings, it shall normally be placed above the external ground level. It shall be laid for the full width of solid walls and shall be prepared as specified.

A layer of cement concrete 1:2:4 (cement: sand: coarse aggregate) mix, and of specified thickness shall be provided. If a damp-proof course requiring the use of bitumen felt is specified, bitumen used shall conform to IS: 1322 and workmanship shall conform to IS: 1609. All exposed surface of the damp-proof course shall be finished fair and smooth. The external edge shall be chamfered if specified, and shall be finished flush with masonry surface.

51 FLOORS AND PAVEMENTS

51.1 General

Applicable provisions of Conditions of Contract shall govern work under this section. The Indian Standards wherever referred to herein shall be the latest edition of such standards.

51.1.1 Types of Floors and Pavements

The principal types of floors and pavements considered in this specification are as under:

a) Cast-in-situ artificial stone flooring (plain)
b) Natural stone slab flooring

c) Pre-cast artificial stone flooring (Plain/Textured)

51.2 Materials

51.2.1 Cement
Ordinary Portland cement and white and colored cement shall conform to IS: 269.

51.2.2 Lime
Where lime is required to be used, it shall conform to IS: 712 and slaking of lime shall be done according to IS: 1635.

51.2.3 Aggregates
The aggregates shall conform to IS: 383. Fine aggregates shall range in size from 1.5 mm to 6 mm, unless specified otherwise. Not more than 5 percent of grains shall pass IS sieve 15 (0.151 mm mesh) and not more than 10 per cent shall pass IS sieve 30 (0.296 mm mesh). Coarse aggregate shall all pass through 19 mm mesh, unless specified otherwise and shall be graded as directed. The coarse aggregate for concrete pavements for approaches and driveways shall all pass through 25 mm ring and shall be formed by mixing 80% of 25 mm to 12 mm size and 20% of 12 mm to 6 mm size. The above proportion shall be altered to suit workability if so approved.

51.2.4 Natural Stone Slabs
The stone slabs if used shall be best quality obtainable from Neemuch, Kotah, Shahabad, Tandur or other places as specified and shall be hard, even durable, uniform in color and free from cracks, flakes and other defects. No stone shall be thinner at its thinnest part than 25 mm, unless otherwise specified; the stones shall be 300 mm x 300 mm in size dressed square and with straight edges. The top surface of stones shall be smooth or polished as specified and edges dressed to a true fir or chisel dressed as directed.

51.2.5 Water
Water shall be clean and free from injurious amounts of deleterious materials. As far as possible, water shall be of potable quality.

51.3 Cast in situ Artificial Stone Flooring
Grey and colored artificial stone is to be composed of 4 parts of fine stone chips 12 mm and below 2 parts of sand and properly screened to one part of cement. The topping in all cases and to consist of clean and fine sand and cement (2:1) and sufficient skin thickness to be kept and finally trowelled with neat cement finish perfectly smooth to satisfaction. In the case of dados and skirting the total thickness is to be 19 mm of which the bottom layer is to be 12 mm and the toping 6 mm thick in all cases both the layers are to be laid simultaneously without hiatus so that it will in effect be one complete layer; the mixing be made in two different lots.

51.4 Natural stone slab flooring
The stone slabs shall be evenly and firmly bedded to the required level and slopes as directed. Unless otherwise specified, the thickness of joints shall not exceed 6 mm for unpolished stone slabs and 1 mm for polished stones. The joints shall be raked out to an adequate depth and pointed flush or slightly sunk, as directed, with cement-sand mortar of 1:2 proportions. The stone slabs shall be laid to pattern which
shall be approved prior to ordering the stones. The flooring shall be kept wet with wet sand or water for at least seven days. The flooring shall be well washed and shall be perfectly clean and free from all mortar stains etc. when completed

52 PLASTERING AND POINTING

52.1 General
Applicable provisions of Conditions of Contract shall govern work under this section. The Indian Standards wherever referred to herein shall be the latest edition of such Standards.

52.2 Cement Plaster Materials
- Cement: Cement shall confirm to IS: 269.
- Sand: Shall confirm to IS: 1542.

Other materials, tools and Accessories, they shall confirm to relevant IS codes listed above and to the requirements specified in IS: 1661.

52.2.1 Proportioning and thickness of Cement Plasters:
The proportions of materials, number of coats and thickness of each coat shall be as specified or as directed.

52.2.2 Workmanship
Unless otherwise specified, all plasterwork shall be carried out as per IS: 1661 “Code of Practice for Cement and Cement-Lime Plaster Finished on Walls and Ceilings”. Special finishing textures to the plaster shall be executed according to Clause 16 of IS: 1661 and/or as directed.

52.2.3 Curing
After the completion of the work, the pointed face shall be kept well wetted for at least for 10 days in the case of Cement Pointing.

53 PAINTING AND GLAZING

53.1 General
Applicable provisions of Conditions of Contract shall govern work under this section. The Indian Standards wherever referred to herein shall be the latest edition of such standards.

Painting of Iron and Steel Work
Painting of iron and steel work shall generally be carried out as per IS: 1447 (Part I).

53.2 Preparation of Surfaces:
The surface to be painted shall be cleaned free of dirt, oil rust, mill scale and be thoroughly dry before painting. Cleaning, degreasing, and descaling wherever necessary shall be carried out as specified in IS: 1477 (Part I) and the method adopted for surface preparation shall have prior approval.

53.2.1 Primer Coat:
Unless otherwise specified, the primer coat for steel and iron work shall be of Red Lead paint, conforming to IS: 102. The Red Lead primer shall be applied by means of approved brushes. The Red Lead paint shall be allowed to dry sufficiently hard before the application of the succeeding coat A red
lead painted surface shall not however be left exposed permanently, as it is liable to heavy chalking. The primer coat shall be applied as specified in IS: 1477 (Part-I) and the number of coats shall be as necessary for as directed.

53.2.2 Finish Coat
The type of intermediate and finish coat and the number of coats to be applied shall be as necessary or as directed. Intermediate and finish coats may be oil bound bituminous, aluminum or other types of paints. Aluminum conforms to IS: 165. The intermediate and finish coats for structural steel work, sheet metal work and cast iron work shall be applied as specified in IS: 1477 (Part-I).

53.3 Glazing Materials

53.4 Glass
All glass used in the work shall be best quality glass free from specks, bubbles, smokes, wanes, air holes and other defects. Unless otherwise specified, sheet glass shall be transparent and of the following weights. For panes up to 600 mm x 600 mm in size, glass weighing not less than 7.97 kg/sq.m. shall be used for panes 750 mm x 750 mm to 900 mm x 900 mm size, the weight of glass shall be 9.76 kg/sq.m. Unless otherwise specified, for sizes of glass above 900 mm x 900, plate glass shall be used.

53.4.1 Putty
Putty for use on wooden frames shall conform to IS: 419 and on metal frames to IS: 420.

53.4.2 Workmanship
All glass be cut according to the sizes required as per drawings. Glazing of metal doors, windows and ventilators shall conform to IS: 1081 and glazing of timber doors, windows, and ventilators shall conform to IS: 1003, unless specified otherwise. For glazing wooden doors and windows, the wooden frame, particularly the rebate, shall be well oiled to prevent oil from putty being sucked in by wood. The Operator shall thoroughly clean all glass and replace all putty or glass damaged during the work.

54 MISCELLANEOUS STEEL AND IRON WORK

54.1 General
Applicable provisions of Conditions of Contract shall govern work under this section. The Indian Standards wherever referred to herein shall be the latest edition of such Standard.

54.2 Iron Grills
The grills for Windows, verandahs, balconies, etc. shall be of mild steel or wrought iron as specified for the work. The design of grills and shapes and sizes of various components shall be as approved. The edges, angles and corners shall be clean and true to shape. The joints shall be mechanically inter-locked and overlapping areas spot welded in such a way that the grill is rigid. Where moulded grills are specified, the moulded work shall be as approved, and shall have clean, straight and sharply defined profiles. The operator shall do the necessary cutting, fitting, drilling, tapping, scribing etc. required to fix grills to adjacent surfaces. The grills shall be fixed plumb, in line and level. Unless otherwise specified, grills shall be painted with two coats of red lead paint conforming to IS: 102 before they are fixed.
54.3 Rolling Shutters
Rolling shutters, where specified shall be of the size to suit the openings and shall be positioned as shown on the drawings and/or as directed.

The rolling shutter shall be fabricated from 18 B.G. Steel and machine rolled with 75 mm rolling contras with effective bridge depth of 12 mm lath sections, interlocked with each other and ends locked with malleable cast iron. The guides shall be either rolled or pressed deep channel sections 75 mm deep and 25 mm wide fitted with necessary fittings and fixtures.

The suspension shaft shall be formed from solid drawn seamless tubes 60 mm O.D. of wall thickness of 25 mm in 3 segments coupled with 2 pairs C.I. dog-tailed flange coupling forming one complete unit eliminating deflection in the center to a minimum.

The springs shall be imported high tensile English flat springs 50/60 mm breadth and 1.6/1.8 mm thickness hardened and tempered. These shall be fitted inside the fabricated housing on either ends, which counterbalance the shutter curtain. The ball bearings shall be double row self aligning ball bearing fitted inside C.I. housing fixed on side brackets holding the suspension shaft at either end. The suspension of the curtain shall be belted in specially fabricated cages formed from MS flats, and plates all are welded. The hood cover shall be made of 20 gauge G.P. sheets with necessary stiffeners and framework to prevent sag, the bottom lock plate shall be made of 3 mm thick M.S. plate and 95 mm wide reinforced with angle/T iron of suitable section with 6 mm dia. M.S.rivets interlocked with last stride of curtain.

The locking arrangement shall consist of hasp and staple on the bottom plate, lockable from both sides. Unless otherwise specified, for overall area of rolling shutters up to 9 sq. m. pull and push type hand-operated shutters shall be used, for area between 9 and 12 sq. m. Pull and Push type shutters shall be provided with ball bearings; for area larger than 12 sq. m. Mechanical Gear type shutters shall be supplied.

54.4 Collapsible Gates
Collapsible gates shall be of the size and type as specified by the Owner’s Engineer. The gates shall be manufactured out of M.S. channel pickets of size 20 mm x 10 mm and flats 20 mm x 6 mm. The top runner flat shall be at least 50 mm x 12 mm in section. The bottom guide shall consist of a channel or two angles of specified size laid in the flooring to guide the free movement of the gate. The gate shall move in the guide channel on rollers of adequate size fixed at the top and bottom of the gate as specified. The gate shall be painted with one coat of red lead paint conforming to IS : 102 before fixing in position.

55 WOODWORK AND JOINERY

55.1 Wood:
All wood required to be used, shall be dry, well-seasoned, Bulsar teak wood and shall be free from knots, cracks or any other kind of defects frames for doors and windows.

55.2 Jointing Materials:
All nails, screws, fixtures shall be of standard quality as approved by the Owner.
55.3 Cutting Edges:
Cutting edge for well to be fabricated as per the drawing approved by Owner’s engineer. The structural steel to be used, should confirm to IS: 226-1961 and IS: 2062-1962. The steel shall be free from defects as mentioned in IS: 226-1962 and shall have a smooth uniform finish. Material shall be free from loose mill scale, rusting or other defects affecting its strength and durability. The test certificates shall have to be submitted for the structural steel used in cutting edge.

ILLUMINATION:
All internal and external areas shall be provided with lighting. The illumination levels to be achieved shall be as follows:

<table>
<thead>
<tr>
<th>AREA</th>
<th>LUX</th>
</tr>
</thead>
<tbody>
<tr>
<td>Office and labs</td>
<td>300 Lux</td>
</tr>
<tr>
<td>Switchgear Room</td>

</tbody>
</table>

Fluorescent luminaries shall be used primarily for internal lighting. High pressure vapour or metal halide type luminaries shall be used in indoor application where their use is appropriate. If mercury or metal halide is used in indoor then they should be supplemented with fluorescent luminaries to assure that
minimum illumination levels are maintained following momentary power dips. All other internal areas shall be lit with fluorescent luminaries. Where specific recommendations of lux level are not covered above, illumination level in such areas shall be finalized in consultation with Owner. Owner shall be required to measure levels of illumination after completion of lighting installation work and short fall in illumination level shall be made good by the Operator. Complete set of calculations showing, room, index, copy MF shall be given during detailed engineering.

Switches / sockets of piano type shall be used in general and in offices of staff, control room, MMI room, decorative modular switches shall be used. Suitable fans shall be provided in rooms/ plant areas as per standards. For exhaust fans it must be provided in panel rooms, pump rooms, chemical rooms, stores, toilets and at least 20 air changes per hour must be maintained.

The following type of lighting fixtures shall be proposed:

a) Decorative type 2x36W fixtures for fluorescent luminaries inside office/ administrative buildings and control rooms.

b) Corrosion resistant fixture with canopy made of FRP for fluorescent luminaries for corrosive areas like chlorine handling or chemical store or area with corrosive smell/gases etc.

c) Industrial type vitreous enameled fixture for fluorescent luminaries inside 415V switchgear, MCC room and pump house.

d) In outdoor process areas, lighting fixtures shall be sodium vapour type subjected to minimum of IP protection class.

e) All outside lights as plant field lights, building outside lights, flood lights etc. which are to be switched on only during night hours should be controlled through photo cell/ clock switch installed at a central place. All lights shall have minimum IP65 protection class.

f) Street lighting wiring shall be through buried underground.

g) All bulb fittings (except fluorescent lamps) will have screw type caps.

h) For outdoor lighting, the lighting feeder shall be operated through a contactor, controlled by photocell/ clock switch and shall also have a manual by pass switch. Luminaries shall be installed to permit ease of maintenance i.e. it shall not be necessary to shut down plant in order to carry out maintenance or to access luminaries located over areas of water etc. The Operator shall provide all equipment necessary to carry out maintenance on the lighting installation and demonstrate its operation to the satisfaction of Owner.

Indoor lighting circuit will be arranged in such a way that 50% lighting can be put off in each room through switches. All lighting circuits will be wired with 2.5sq.mm. Stranded copper wire or through 2.5 sq.mm. armoured cable laid in cable trays. Sub circuit from switch to fixture could be wired with 1.5 sq.mm. stranded copper wire in MS conduits or armoured copper cable of similar size provided total voltage drop in any lighting distribution board to last lighting point shall not exceed 2%. All lighting circuits will have separate neutral, separate earth from Lighting Distribution Board. For illumination of roads, outdoors areas where operation of equipment or units required and sub station area, lighting fixtures of appropriate type (such as street lighting type, flood lighting type, post top lanterns etc.) incorporating high pressure sodium vapour lamps shall be proposed. Street light poles shall not have less than 7500 mm height above the finished road level and the arm shall not project more than 1200 mm along the road width. Poles of bigger heights may also be used if some outdoor areas are to be
illuminated. Poles of 4 / 4.5 Mtrs using post top lantern may be used in gate office walk way or in front of office area. Complete area, streets, lanes, boundary shall be covered with street lighting.

Receptacles (Lighting & Small Power) :

d) Decorative and industrial type units of above shall be proposed in all plant areas, offices, stores, workshop, plant room and they shall be located at least two numbers in each room. Distance between two receptacles shall not be more than 8 – 10 mtr. All small 5 amps 5 pin lighting & small power sockets shall be wired by multi stranded copper wire of 2.5 sq. mm laid in rigid MS conduits along with earth wire of1.5 sq.mm flexible copper wire or equivalent size armoured cables. All wiring shall be coded with Red, Yellow, Blue & Black as per the phase used. If required, wiring can be done alternatively through armoured copper cables of similar size laid in MS perforated trays of minimum 2.0 mm thick.

e) Three phase power receptacles (convenience outlets) suitable for operation of 415V,3 Phase 4 wire, 50 Hz power supply shall be proposed. In indoor areas one such unit shall be provided to cover areas of 20 meter radius (or at least one in each room housing plant items ) and in outdoors areas on such unit shall be provided at 50 meter interval. Actual requirement of such units shall be finalized by MMC during detailed engineering. One three phase receptacle shall be provided near entrance of each building for utilities like welding.

f) Single phase 15 Amp 5 Pin / 6 Pin receptacles will be provided in each room and in halls they will be provided in such a way that with 15 meter cord we should reach every place in building. These shall be wired with 4 sq. mm copper earth wire in MS rigid conduits along with 2.5 sq. mm earth wire. Not more than two sockets shall be looped in one circuit. Alternatively they can also be connected through armoured cable of 4 sq. mm running in appropriate cable trays. Separate lighting panels and lighting distribution boards shall be installed and they shall not take tapping for power from motor control centers or power distribution boards.

56  Section IV Electro Mechanical Works

56.1 Technical Specifications for Electrical Works: All works shall be carried out in accordance with the requirements of:

   i. IE Rules
   ii. State Electricity Board
   iii. Rules and regulations of Local authorities, and
   iv. The standards in this specification

The Operator is responsible for applying and obtaining necessary statutory approvals and shall ensure workmanship of good quality and shall assign qualified supervisor / engineers and competent labour who are skilled, careful and experienced in carrying out similar works.

56.2 IS codes for electrical Works:

IS : 2633 Methods of testing weight, thickness and uniformity of coating on hot dipped galvanized articles
IS : 209 Specifications for Zinc
56.3 Specifications for mechanical equipment: Mechanical equipment: will be required for following units

1. Screen channels, mechanically cleaned fine screens.
2. Sluice gates
3. Grit chambers with mechanical grit removal equipment
4. Parshall flumes
5. Various sizes of interconnecting piping.
6. Fire-fighting equipment as per state Government department of Fire services.

All mechanical equipment such as screens, degritting devices, sluice gates, etc which comes into contact with sewage shall be fabricated in non-corrosive materials and metallic parts in contact with sewage shall conform to Stainless steel. All walkways shall be in RCC or stainless steel with stainless steel handrails. Provide appropriate explosion proof construction and devices at any enclosed locations components where incoming sewage is exposed to atmosphere.

Mechanical screens shall be operated with Shaftless screw conveyors to transfer screenings to the screw compactor to dewater and compact the screenings. The screen will be controlled by a timer as backup to level control, so that, the cleaning mechanism can run at a set interval.

The deposited grit will be removed from the grit chambers by appropriate and efficient removing mechanism. Grit removal shall be accompanied with a grit classifier and grit washing system to ensure the grit is free from organic matter before disposal.

Parshall flumes downstream of each grit chamber structure shall be required where an ultrasonic flow meter will be installed for measuring and adding the total flow of raw sewage entering the site.

Isolation weir gates and bye pass shall be required to control and/or isolate flow to any one units

56.4 IS codes for mechanical equipment:

- IS 6280 – 1971 – Sewage Screens
- IS 8413 – 1982 – Biological Treatment Equipment – Part II and its modifications
- IS 10261 – Requirements for settling tank for waste water
- IS 105533 – Part I, II, III – Chlorination Plants
- IS 5600 – 1970 - Sewage and Drainage Pumps
- IS 6279 – 1971 – Grit Removal devices
The list is not exclusive and the operator shall be responsible to follow the appropriate standards:
Instrumentation, Control and SCADA System
A Supervisory Control and Data Acquisition (SCADA) system will be installed in the Sewage Pumping station networked to the PLC and shall acquire, display, monitor and issue remote control actions for maintaining the pumps. The SCADA system shall also originate custom performance reports for management reporting.

Section- V TRAINING AFTER COMMISSIONING & DEFECT LIABILITY PERIOD

57 TRAINING OF OWNER'S PERSONNEL

The Operator shall be responsible to provide practical training in all aspects of the operation, maintenance, and facilities to all personnel selected by the Owner, who will ultimately be responsible for the operation, maintenance and repair of the system and its facilities after defects liability period. For this purpose, the Operator shall provide a comprehensive training program for the Owner’s personnel during the entire period of the trial run, and for as long thereafter as may be reasonably required to ensure that the designated personnel are adequately trained to take up their responsibilities. All costs for the Operator’s personnel and the training facilities required for the training during trial run period, and any incidental training expenses, shall be borne by the Operator.

58 TRIAL RUN OF THE SYSTEM

After commissioning of works, the Operator shall maintain the works for 3 (three) months to demonstrate satisfactory performance to the Engineer prior to taking over by the Owner. The cost of electricity, if required for operation & maintenance of works during the period of this trial run will be borne by the Owner. The cost towards Operator’s Engineer and other operating personnel during the said period of trial run, along with cost of tools and spare parts which are required for operation and maintenance of the works and equipment during the trial run period shall be borne by the Operator and shall be included in the quoted bid price. In the event that the system or any of the facilities do not satisfactorily achieve the required performance standards during this period, the trial run period shall be extended until such time as the Operator has satisfactorily rectified any deficiencies as may be necessary to satisfy the performance requirements. No additional compensation will be paid to the Operator for such extension.
Schedule 11

Allowed and Suggested alignments / Locations for design of the Sewerage Network and/or I&D Works

TO (i) DESIGN AND BUILD SEWAGE TREATMENT PLANT OF INSTALLED CAPACITY .... MLD AND ALL APPURtenant STRUCTURES AND ALLIED WORKS; (ii) SURVEY, REVIEW THE DESIGNS, REDESIGN WHERE NECESSARY, AND BUILD NEW UNDERGROUND SEWERAGE NETWORK AND/OR DIVERSION WORKS WITH INTERCEPTION SEWER OF ABOUT .... KM LENGTH INCLUDING SURVEY, DESIGN, CONSTRUCTION OF .... No. PUMPING STATIONS AND ALL APPURtenant STRUCTURES AND ALLIED WORKS; AND (iii) OPERATION & MAINTEnANCE OF THE COMPLETE WORKS OF SEWAGE TREATMENT PLANT, SEWERAGE NETWORK AND/OR INTERCEPTION AND DIVERSION WORKS AND PUMPING STATIONS FOR A PERIOD OF 15 YEARS IN ......., STATE OF ......., INDIA.
